A sound mind in a sound body is man's most precious possession. Physical fitness develops the organic fitness is the basis of dynamic and creative activity. By participating in vigorous physical activities, physical strength and organic vigour can be improved to a large extent. The building of physical strength helps one to have good endurance to withstand strain and be efficient in the performance of activities.

## Statement of the Problem

The purpose of this study was to assess the effect of yogic practices on selected health related physical fitness and physiological variables among high school boys.

## Hypothesis

It was hypothesized that there would be significant improvement due to 12 weeks yogic practices on selected health related physical fitness variables flexibility, cardiovascular endurance muscular endurance and body mass index of high school boys.

## Methodology

The purpose of the study was to find out effect of yogic practices on selected health related physical fitness and physiological variables among high school boys . 30 High school boys from Z.P. High School, Lingapuram, Ramakuppam Mandal, Chittoor District (A.P) were randomly selected as subjects and their age was between 12 and 15 years. They were assigned into two groups of which one group served as yogic practices groups, and the other group served as control group.

**Dépendent Variables**

**Health Related Physical Fitness Variables**

1. Flexibility
2. Cardiovascular Endurance
3 .Muscular Endurance

4.Body Mass Index

**Physiological Variables**

1.Systolic Blood Pressure
2.Diastolic Blood Pressure
3.Resting Pulse Rate
4.Respiratory Rate

**Independent Variables**

1.Yogic practices

**Experimental Design**

The study was formulated as a true random group design, consisting of a pre-test and post-test. The subjects (n=30) were randomly assigned to two equal groups of 15 High school boys in each. The groups were assigned as Experimental Groups and control group respectively. Pre tests were conducted for all the subjects on selected health related physical fitness and physiological variables such as flexibility, cardiovascular endurance, muscular endurance and body mass index, systolic blood pressure, diastolic blood pressure, resting pulse rate and respiratory rate. The experimental group participated in yogic practices for a period of 12 weeks.The post tests were conducted on the above said dependent variables after a period of yogic practices. The differences between the initial and final scores on selected variables were considered as the effect of 12 weeks yogic practices. To test statistical significance of the differences, ANCOVA was employed. In all cases 0.05 level was fixed as significance to accept or reject the formulated hypotheses

**Criterion Measures**

1. Flexibility was measured using sit and reach test.
2. Cardio vascular endurance was measured through 12 minutes run/ walk test.
3. Muscular Endurance was measured through sit ups.
4. Systolic Blood Pressure and Diastolic Blood Pressure were measured through Sphygmomanometer and stethoscope.
5. Resting pulse rate was measured by counting pulses at radial artery using the fingers in a minute.
6. Respiratory rate was measured by counting the number of times the chest is raising in a minute.

**Results on Flexibility**

**Table I**
**Computation of Analysis of Covariance On Flexibility**

| Speed Avg | Experimental group | Control group | Source of Variance | Sum of Squares | Df | Mean Squares | Obtained F |
|---|---|---|---|---|---|---|---|
| Pre Test Mean | 5.53 | 6.13 | Between | 2.70 | 1 | 2.70 | 0.46 |
| | | | Within | 163.47 | 28 | 5.84 | |
| Post Test Mean | 8.80 | 6.60 | Between | 36.30 | 1 | 36.30 | 7.26* |
| | | | Within | 140.00 | 28 | 5.00 | |
| Adjusted Post Test Mean | 9.02 | 6.38 | Between | 51.50 | 1 | 51.50 | 27.09* |
| | | | Within | 51.32 | 27 | 1.90 | |
| Mean Diff | 3.27 | 0.47 | | | | | |

Table F-ratio at 0.05 level of confidence for 1 and 28 (df) =4.19, 1 and 27(df) =4.21 .* Significant

The pre-test mean on experimental group was 5.53, and control group was 6.13 and the obtained F value was 0.46, which was less than the required F value of 4.19 to be significant. Hence, it was not significant and the groups were equal at initial stage.
The comparison of post-test means, experimental group 8.80 and control group 6.60 proved to be significant at 0.05 level as the obtained F value 7.26 was greater than the required table F value of 4.19 to be significant at 0.05 level.
Taking into consideration the initial and final mean values adjusted post-test means were calculated and the obtained F value of 27.09 was greater than the required F value to be significant 4.21 and hence, there was significant difference. Thus, it was proved that experimental group gained mean difference on physiological variable, Flexibility 3.27 was due to yogic practices given to stressed software executives was found to be significant at 0.05 level.

**Results on Cardiovascular Endurance**

**Table II**
**Computation of Analysis of Covariance On cardiovascular Endurance**

| | Experimental Group | Control Group | Source of Variance | Sum of Squares | Df | Mean Squares | Obtained F |
|---|---|---|---|---|---|---|---|
| Pre Test Mean | 1818.00 | 1856.67 | Between | 11213.33 | 1 | 11213.33 | 0.64 |
| | | | Within | 488423.33 | 28 | 17443.69 | |
| Post-Test Mean | 1969.33 | 1885.00 | Between | 53340.83 | 1 | 53340.83 | 4.69* |
| | | | Within | 318493.33 | 28 | 11374.76 | |
| Adjusted Post Test Mean | 1971.34 | 1882.99 | Between | 57233.44 | 1 | 57233.44 | 4.93* |
| | | | Within | 313213.88 | 27 | 11600.51 | |
| Mean Diff | 151.33 | 28.33 | | | | | |

Table F-ratio at 0.05 level of confidence for 1 and 28 (df) =4.19, 1 and 27(df) =4.21 .* Significant

The pre-test mean on experimental group was 1818.00, and control group was 1856.67 and the obtained F value was 0.64, which was less than the required F value of 4.19 to be significant. Hence, it was not significant and the groups were equal at initial stage. The comparison of post-test means, experimental group 1969.33 and control group 1885.00 proved to be significant at 0.05 level as the obtained F value 4.69 was greater than the required table F value of 4.19 to be significant at 0.05 level.Taking into consideration the initial and final mean values adjusted post-test means were calculated and the obtained F value of 4.93 was greater than the required F value to be significant 4.21 and hence, there was significant difference. Thus, it was proved that experimental group gained mean difference on physiological variable, Cardiovascular Endurance 151.33 was due to yogic practices given to stressed software executives was found to be significant at 0.05 level.

**Results on Muscular Endurance**

**Table III**
**Computation of Analysis of Covariance on Muscular Endurance**

| | Experimental Group | Control | Source of Variance | Sum of Squares | Df | Mean Squares | Obtained F |
|---|---|---|---|---|---|---|---|
| Pre Test Mean | 35.60 | 36.67 | Between | 8.53 | 1 | 8.53 | 0.36 |
| | | | Within | 668.93 | 28 | 23.89 | |
| Post Test Mean | 38.07 | 35.73 | Between | 40.83 | 1 | 40.83 | 2.00 |
| | | | Within | 571.87 | 28 | 20.42 | |
| Adjusted Post Test Mean | 38.49 | 35.31 | Between | 74.60 | 1 | 74.60 | 12.86* |
| | | | Within | 156.58 | 27 | 5.80 | |
| Mean Diff | 2.47 | -0.93 | | | | | |

Table F-ratio at 0.05 level of confidence for 1 and 28 (df) =4.19, 1 and 27(df) =4.21 .* Significant

The pre-test mean on experimental group was 35.60, and control group was 36.67 and the obtained F value was 0.36, which was less than the required F value of 4.19 to be significant. Hence, it was not significant and the groups were equal at initial stage. The comparison of post test means, experimental group 38.07 and control group 35.73 proved to be insignificant at 0.05 level as the obtained F value 2.00 was lesser than the required table F value of 4.19 to be significant at 0.05 level. Taking into consideration the initial and final mean values adjusted post test means were calculated and the obtained F value of 12.86 was greater than the required F value to be significant 4.21 and hence, there was significant difference. Thus, it was proved that experimental group gained mean difference on physiological variable, Muscular Endurance 2.47 was due to yogic practices given to stressed software executives was found to be significant at 0.05 level.

**Results on Body Mass Index**

**Table IV**
**Computation Of Analysis of Covariance on Body Mass Index**

| | Experimental group | Control | Source of Variance | Sum of Squares | Df | Mean Squares | Obtained F |
|---|---|---|---|---|---|---|---|
| Pre Test Mean | 19.94 | 19.79 | Between | 0.17 | 1 | 0.17 | 0.77 |
| | | | Within | 6.21 | 28 | 0.22 | |

| Adjusted Post Test Mean | 16.92 | 18.88 | Between | 28.79 | 1 | 28.79 | 45.10* |
| | | | Within | 17.24 | 27 | 0.64 | |
| Mean Diff | -1.53 | 0.33 | | | | | |

Table F-ratio at 0.05 level of confidence for 1 and 28 (df) =4.19, 1 and 27(df) =4.21 . * Significant The pre test mean on experimental group was 18.27, and control group was 18.73 and the obtained F value was 0.09, which was less than the required F value of 4.19 to be significant. Hence, it was not significant and the groups were equal at initial stage. comparison of post-test means, experimental group 16.73 and control group 19.07 proved to be insignificant at 0.05 level as the obtained F value 3.31 was lesserr than the required table F value of 4.19 to be significant at 0.05 level.Taking into consideration the initial and final mean values adjusted post-test means were calculated and the obtained F value of 45.10 was greater than the required F value to be significant 4.21 and hence, there was significant difference. Thus, it was proved that experimental group gained mean difference on physiological variable, Respiratory Rate -1.53 was due to yogic practices given to stressed software executives was found to be significant at 0.05 level.

**Conclusions**

It was concluded that 12 weeks yogic practices significantly improved selected health related physical fitness variable, such as flexibility , cardiovascular endurance , muscular endurance, body mass Index, systolic blood pressure, diastolic blood pressure, resting pulse rate, resting pulse rate, respiratory rate of high school boys.

శ్రీపాద సుబ్రహ్మణ్యశాస్త్రి (23-04-1891 -- 25-02-1961) కవి, పండితులు, వైద్యులు, పత్రికాధిపతి, సంపాదకులు, నాటకకర్త, నటుడు, నాటక ప్రయోక్త, అవధాని, నవలాకారుడు, వ్యాసకర్త, బహుగ్రంథకర్త అన్నింటినీ మించి తెలుగు కథకుడు. తొలి తరం కథారచయితల్లో ఒకరు.

శుద్ధ శ్రోత్రియ కుటుంబంలో శాస్త్రిగారు శ్రీ లక్ష్మీపతి సోమయాజులు, మహాలక్ష్మీ సోదెమ్మ దంపతులకి 23-04-1891 న నేటి తూర్పుగోదావరి జిల్లా రామచంద్రాపురం తాలూకాలోని పొలమూరు గ్రామంలో జన్మించారు. వీరి తండ్రి వేదం, శ్రౌతం, జ్యోతిష్యం, స్మార్తం, ధర్మశాస్త్రం, మంత్రశాస్త్రంలో గొప్ప పేరున్నవారు. ఆంగ్లచదువులు స్వధర్మ నష్టమని వీరి భావన. అలాగని తెలుగునిచేరదీయలేదు. ఇంట్లో అంతా సంస్కృతమే. కూడుబెట్టే భాష సంస్కృతమేనని వీరి నమ్మకం. అందుకే శాస్త్రిగారిని మూడవ తరగతిలోనే 'బడి' మాన్పించారు. కులవిద్యలు కూటికనవసరమని 'వైదిక విద్య'లో ప్రవేశపెట్టారు. తెలుగు, ఇంగ్లీషు చదువుకోవాలనే బలమైన వీరి కోరికకు తండ్రి, చిన్నన్నలు అడ్డుగోడగా నిలిచారు. వీరి పెద్దన్న గారి ప్రోత్సాహంతో తెలుగు వచనం, కావ్యాలు చదవడం మొదలుపెట్టారు. వీరేశలింగంగారిని, బ్రహ్మసమాజ సిద్ధాంతాలని చదివిన మీదట కులవిద్యల మీద నిరసన పెరిగింది. తెలుగు మీద పద్యం కంటే వచనం మీద ఇష్టం పెరిగింది. చిన్నప్పటి నుంచే కథలు రాయాలనే కోరిక మెండుగా ఉన్నా 1915 నాటికి కథరాసే అవకాశం అనుకోకుండా వీరికి కలిగింది. 'ఆంధ్రపత్రిక'లో పనిచేసే కోటంరాజు పున్నయ్య పత్రిక కోసం అప్పటికప్పుడు ఒక కథ రాసివ్వమంటే ఒక గంట వ్యవధిలో రాసిచ్చారు. దానిపేరు 'ఇరువురమొక్కచోటికే పోదము' ఇది వీరి తొలికథ.

మొత్తంగా వీరివి 75 కథలు ఇందులో 65 సాంఘీకాలు, 10 చారిత్రకాలు అని, వీరి కథల మీద పరిశోధన చేసిన 'చామర్తి కనకయ్య' గారు చెప్తారు. మొదట్లో సరళ గ్రాంథికంలో రచనలు చేసినా, తర్వాత పూర్తి వ్యావహారికంలో కథలు రాశారు. తెలుగుతనానికి చిరునామాగా మారారు. జాతి కథకునిగా గుర్తింపు పొందారు.

ఆత్మాభిమానం మెండుగా గల మనిషి వ్యక్తిగతంగానూ, సాహిత్య, కళారంగాల్లోనూ మచ్చలేని జీవితం వీరిది. సున్నిత మనస్కులు, విశాల భావాలు గలవారు, కొన్ని విషయాల్లో చాలా ఖచ్చితమైన మనిషి. ముఖ్యంగా తెలుగు భాషంటే వల్లమాలిన మమకారం కలిగిన వీరి 'శుభీకే శిర ఆరోహ!' అనే కథ హిందీ ఆధిపత్యాన్ని నిరసించేదే. అవకాశమున్న ప్రతిచోటా తెలుగుభాష, సంస్కృతుల గొప్పతనాన్ని తెలియజేస్తారు. పరాయిభాషల ఆధిపత్యాన్ని నిరసిస్తారు. అందుకే 'తెనుగు భాషలో మధురాతి మధురమైన తెనుగు భాషలో - నా జాతివాళ్ళు చిన్నచూపే చూస్తూ ఉండినా, మాధుర్యం గుర్తించి శక్తిన్నీ అవగాహన చేసుకుని పాశ్చాత్యులు కూడా ముక్తకంఠంతో కీర్తించిన నా మాతృభాషలో కలం పట్టి నాలుగు బంతులు

రాసే అదృష్టం నాకు కలిగింది' అని తెలుగు కథలు రాసి మురిసిన వారు, మనం మురుసుకునేలా చేసినవారు శ్రీపాద.

తెలుగు భాషలోని తీయదనం స్త్రీల దగ్గరే ఉందంటూ "జాతీయమైన తెలుగు భాష కావాలంటే స్త్రీల దగ్గరే నేర్చుకోవాలి, మర్యాదగల తెలుగు భాష కావాలంటే మళ్ళీ క్షత్రియ రమణుల దగ్గర నేర్చుకోవాలి, మరో దారి లేదు" అంటారు. ఇటువంటి తెలుగులో తెలుగు కథానిక/కథ జీవనదిలా కొనసాగుతోంది. ప్రాచీన కాలం నుంచి, పాశ్చాత్య సాహిత్య ప్రభావం పడిన దగ్గర నుంచీ కథగా, కథానికగా ప్రవహిస్తూనే ఉంది. ఇతర జాతులకి, దేశాలకి ఎంతో కథావాఙ్మయ భిక్ష పెట్టిన గడ్డ, భారతగడ్డ. భారతీయ కథా సాహిత్యంలో తలమానికంగా చెప్పే 'గుణాఢ్యుని', 'బృహత్కథ' తెలుగు నేలపై పురుడుపోసుకుంది. అటువంటి తెలుగు నేలపై ఎంతో కథాసాహిత్యం పరిఢవిల్లుతూనే ఉంది. అసలు కథ చెప్పడం, వినడం మానవ స్వభావంలో ఒక భాగం అందుకే కథ మనిషి జీవితంతో పెనవేసుకుపోయింది. ప్రతిభావంతులైన కథకులు తమ కథల ద్వారా వారి కాలం నాటి సమాజాన్ని చిత్రించారు. తనను తాను దిద్దుకోటానికి సమాజాలకి అవి పాఠాలుగా నిలిచాయి. వారు భావితరాలకి ఆదర్శంగా నిలిచారు. అటువంటి తెలుగు కథకుల్లో శ్రీపాద ఒకరు. ఆధునిక తొలి తెలుగు కథగా 'దిద్దుబాటు' ఆ కథకునిగా గురజాడ తెలుగు కథానికకు మేలుకొలుపు పాడారు. వారి ఆశయాలకు కొనసాగింపా? అన్నట్లు శ్రీపాద సుబ్రహ్మణ్యశాస్త్రి గారి కథలు నిలుస్తాయి.

శ్రీపాద తమ కథలను 'చిన్నకథ' లనే పిలిచారు. కథ, కథానిక లన్న పేరు వాడలేదు. వీరి కథలు పెద్దవిగా ఉండటం వలన కొందరు విమర్శకులు వీటిని 'పెద్దకథలు' అన్నారు. 'చిన్న నవలలు' అనీ, 'నవలిక' అని కొందరు పిలిచారు. ఏమైనా శ్రీపాద వారి కథలు లక్షణపరంగా సంప్రదాయకథలు,ఆధునిక కథానికల కలబోతగా ఉంటాయి.

కథా వస్తువుని ఎంచుకోవడం, కథను నడిపించటంలో వీరిది ప్రత్యేకశైలి. సామాజిక సమస్యలని గుర్తించి వాటి నేపథ్యంలో కథావస్తువును ఎంచుకోవడం వీరి చాలా కథలు ఈ కోవకిందకి వస్తాయి. అయితే ఎక్కడా సంఘటనలే కథను కల్పించినట్లు అనిపించదు. కథ ఎంపికకు మూలమైన ఆ సంఘటనలే కథలో సహజంగా ఇమిడి పోయేలా అల్లుకోవడం, సన్నివేశాలు కల్పించుకోవడం వీరి ప్రతిభకు నిదర్శనం. అయితే కొన్ని కథలు అప్పటి వాస్తవ సంఘటనలని ఆధారం చేసుకుని రాశారు. ఉదా. 'అన్నంతపనీ జరిగింది' కథలో వ్యావహారిక భాషని సమర్థిస్తూ రాసిన ఈ వాక్యాలు కల్పించినట్లుగాక సహజంగా కథలో అమరిపోయేలా ....." అదేనోయ్! వ్యావహారికం దేశం అంతటా అప్పుడే పాకిపోయింది కాదూ! మహాదిట్టమైన వాడోయ్ గిడుగు రామమూర్తి పంతులు. నవీన వాఙ్మయ నిర్మాతలయిన యువకులనందర్నీ తోపు చేసుకున్నాడు పంతులు. ముసలి తలకాయలు గ్రాంథికమో అంటూ యెంత గోలపెడితే మాత్రం ఆ వాదం యింకెన్నాళ్ళ నిలుస్తుందీ! మా అమ్మాయిక్కూడా రామమూర్తి పంతులు వాదమే నచ్చింది...." అంటూ వ్యావహారిక భాష ప్రాముఖ్యాన్ని దాని 'చేవ'ని, పెద్దల ప్రయత్నాలని, గ్రాంథిక వాదులగోలని నేర్పుగా ప్రస్తావిస్తారు. అలాగే 'శుభకే శిర ఆరోహ!" అనే కథలో హిందీ భాష, సంస్కృతులు తెలుగుపై సాగించే పెత్తనాన్ని ఎత్తిచూపి ఎద్దేవా చేస్తారు. అలాగే 'ఇలాంటి తవ్వాయి వస్తే' కథతో కింది కులాలు మతాలు మారటం, గౌరవం కోసం, రక్షణకోసం ప్రయత్నించటం వివరిస్తారు. ఇటువంటి కథలతో పాటు మిగతా కథల్లో కనిపించే అంశాలు చూద్దాం... వైదిక బ్రాహ్మణ కుటుంబాల్లోని స్త్రీలు, రెడ్డి, వెలమ, క్షత్రియ స్త్రీలు కనిపిస్తారు. వీరితో చిన్నవాళ్ళ, పెద్దవాళ్ళు, దాసీలు, సంసారులు, వేశ్యలు, వితంతువులు, రాణివాసం వారు పలు తెరగులు. వీరి సమస్యలని

పలుకోణాల నుండి చిత్రించారు. ముఖ్యంగా స్త్రీల శ్రమకి గౌరవం లేకపోవడం, పురుషాధిపత్య సమాజంలో స్త్రీల పరిస్థితి కింది కులాలు అభ్యున్నతి, ప్రేమ వివాహాలు మనుషుల కోసం మతం, శాస్త్రాలు, దేవుళ్ళు ఉపయోగపడాలి గాని, వాటికోసం మనుషులు అన్నట్లు ఉండకూడదంటారు. మనిషికి గుణం ముఖ్యం గాని కులం కాదు అంటారు. ఇలా వీరు ఆనాడు లేవనెత్తిన పలు సమస్యల్లో కొన్ని లేవు. కొన్ని అట్లానే ఉన్నాయి. ముఖ్యంగా స్త్రీల విషయం.

ఇంటిపని, వంటపని, పిల్లల్ని కనడం, పెంపకం పూర్తిగా స్త్రీలచే అనే భావం నేటి సమాజంలో ఇంకా ఉంది. సాంకేతికంగా వచ్చిన అభివృద్ధి జరిగి అందుబాటులోకి వచ్చిన 'గ్రైండర్స్', 'మిక్సీలు', 'వాషింగ్‌మెషిన్', 'కిచెన్‌వేర్' ఇలాంటికి స్త్రీల పని భారాన్ని తగ్గిస్తున్నా పనిమాత్రం స్త్రీలదే. ఆధునిక కాలంలో ఉద్యోగ బాధ్యతలు చూసుకుంటూనే ఇంటిపని చూసుకోవాలి. శ్రీపాద ఆనాడే స్త్రీ పురుషుల సంబంధాలలోని అసమానతలు, స్త్రీల శ్రమ దోపిడిని చక్కగా క్రమబద్ధీకరించిన కుటుంబ వ్యవస్థలోని పురుషుల స్వార్థాన్ని, స్త్రీల స్వార్థాన్ని, స్త్రీలలో ఉండే రకరకాల మనస్తత్వాలు, అధికారం చెలాయించాలనే పురుషాధిపత్య భావజాలాన్ని చెప్పి స్త్రీలకు మేలు కలిగించే మార్గాన్ని సూచిస్తారు. ఇల్లాలు ఇంటిపని భారంగా భావించదు. పైగా తనవారికోసం తను పని చేసుకుంటున్నందుకు ఆనందం కూడా ఉంటుంది. అయితే ప్రేమగా, ఇష్టపూర్వకంగా స్వేచ్ఛగా పనిచేయడం వేరు. ఆ పనులు ఆమె, ఆడపిల్లలు తప్ప మగపిల్లలు, మగవాళ్ళు చేయడం నామోషి అనడం, అది ఆడవాళ్ళ పనే అనడం నిర్బంధం అవుతుంది. శ్రీపాదకథల్లో ఈ రెండురకాల పని అంటే పరాయికరణకు గురైన, గురికాని ఆడవాళ్ళ శ్రమకి మధ్య తేడాను చూపిస్తారు. ఆ కాలంలో వితంతువుల సమస్య తగ్గినా ఇంట్లో స్త్రీలకి తప్పటం లేదు. ఇటువంటి ఒకటి రెండు కథలని స్త్రీ సమస్యల నేపథ్యంలోంచి చూద్దాం.

**కొత్తచూపు** ఈ కథ పూర్తిగా కొత్త పద్ధతిలో నడిచింది. ఇంగ్లీషు చదువులు, ఆత్మరక్షణ విద్యలు, పెళ్ళి విషయంలో అమ్మాయికి స్వేచ్ఛ ఉండటం నలుగురులో స్వేచ్ఛగా తమ అభిప్రాయాలు చెప్పగలగడం ఈ కథలో చూస్తాం. నవంబరు 1948లో ఈ కథ అచ్చులో వచ్చింది. "ముదితల్ నేర్వరాని విద్యగలదే ముద్దార నేర్పించినన్" అని మన పెద్దలు చెప్పిన మాటకి లక్ష్యప్రాయంగా రాసిన కథా అనిపిస్తుంది. 'ఆకాశంలో సగం' అని మావో అన్నట్లు. స్త్రీలు అన్ని రంగాల్లో రాణించాలని ఆనాడు శ్రీపాద ఉద్దేశించి రాసిన కథ ఇది.

ఈ కథలో ప్రధాన పాత్ర 'అన్నపూర్ణ'. ఈమె రామశాస్త్రి, రాజేశ్వరిల ఏకైక కుమార్తె. తల్లిదండ్రులు ఈమెను ఆధునిక పద్ధతుల్లో పెంచారు. వైదిక కుటుంబాల్లో కట్టుబాట్లు దాటుకుని ముందుకు రావాలని పైకి కనిపించే వాస్తవం. కాని ఆడపిల్లలని తక్కువగా చూడకుండా వాళ్ళని చదివించాలి అని ఆనాటి సమాజానికి శాస్త్రిగారి సూచన. అందుకే పట్నంలో ఉంచి ఇంగ్లీషు చదివిస్తాడు. అలాగే వీరముష్టి సుబ్బయ్య దగ్గర అన్నపూర్ణకి 'సాముగరిడీలు' నేర్పిస్తారు. పురుషాధిపత్య సమాజంలో స్త్రీలు ఆత్మరక్షణ విద్యలు నేర్చుకోవడం చాలా అవసరం అని ఆనాడు వారు రాసిన విషయాలు నేడు స్పష్టంగా కనిపిస్తున్నాయి. ఊరంతా తనని చూసి నవ్వినా పట్టించుకోకుండా తన దగ్గర పెరిగే మగపిల్లలతో అన్నపూర్ణ చేత కుస్తీ చేయిస్తాడు.

పెళ్ళి విషయంలో మగపెళ్ళివారు కోరేకోరికలకు అంతు ఉండదు. ఏకపక్షంగా ఆడపెళ్ళివారిపై ఆధిపత్యం చెలాయిస్తుంటారు. పెళ్ళికూతురికైతే మాట్లాడే స్వేచ్ఛ తక్కువే. ఇటువంటి వాటి మీద తిరుగుబాటు చేస్తాడు. శ్రీపాద ఈ కథలో అన్నపూర్ణ చేత...." ఇప్పుడు వరయోగ్యత నిర్ణయించవలసినవారు.... మీ

వంటి తలపండిపోయిన వృద్ధులు కారు". తెనుగు కన్యలం మేమిప్పుడు చూసుకోవలసినవరయోగ్యత చక్కదనం కాదు, చదువూ కాదు. ఐశ్వర్యం కానేకాదు. ఇవన్నీ తెనుగు యువతిని బానిసనిచేశాయి. ఈ లక్షణాలున్న తెనుగు యువకులింత వరకూ చక్రవర్తులుగా చెలామణీ అయినారు, కాని అలాంటి వారిక వివాహానికి అర్హులుకారు". బతికినంతకాలమూ జీవితంలో స్త్రీలు తమతో సహకరించుకోవాలంటే యువకులిప్పుడు గడించుకోవలసిన యోగ్యతలు, శౌర్యం, బలపరాక్రమాలు, తెగబడి యుద్ధంచేసే ధైర్యం ..... ఇలా పెళ్ళిపెద్దల ముందు ధైర్యంగా మాట్లాడుతుంది. తానాశించినట్లు తయారైన కూతురిని చూసి రామశాస్త్రి గర్వపడతాడు. తల్లి పొంగిపోతుంది. కొడుకు ఉద్ధరించేవాడు. కూతురు పరాయిది అనే భావన పోయి ఆడపిల్లలని మగపిల్లలతో సమానంగా పెంచాలని సూచిస్తాడు. 'స్త్రీలు వంటింటి కుందేళ్ళు కాదు' అని సూటిగా చెప్తాడు. కచ్చితమైన జవాబ్దూ 1928లో రాసిన ఈ కథలో 'పూర్ణ' ప్రధాన పాత్ర. చిట్టెమ్మ, సీతారామయ్య, జానకిరామయ్యా ముఖ్యపాత్రలు. ఇందులో ప్రధాన అంశం. మనుషుల జీవితాలు బాగుపడటానికి శాస్త్రాలు, మతాలు, పనిచేయాలి గాని మనుషులు సుఖంగా లేకుండాజేసే ఈ ఆచారాలు, శాస్త్రాలు ఎందుకూ అని ప్రశ్నిస్తాడు.

మనుష్యులను అన్నివిధాల విడతీసిన శాస్త్రాలు యింకా లోకంలో యెక్కడేనా వున్నాయా?". ఈ కర్మ భూమిలో ఈ పుణ్యభూమిలో - సారం విరిగిపోయిన యీ చౌటిపర్రలో తప్ప మరెక్కడా లేవు". "బావా! ఇంకెందుకూ? వెధవలూ మళ్ళీ పెళ్ళాడితే పనికిరాని మతం వెధవలుంటే పనికొస్తుందా? వొకదారీ తెన్నులేని మతాన్ని లక్ష్యపెట్టడం యెందుకూ?....." అని..... నావంటి వాళ్ళంతా యీదుర్గతి దేవుడు కలిగించిందే అనుకుంటున్నారు గాని మనుష్యులు అందులోనూ మొగాళ్ళు - వేదశాస్త్రాలు చదువుకున్న బ్రాహ్మలు కలిగించిందని తెలుసుకున్నారంటే వాళ్ళవుసురు తగిలి యీ దేశంఅంతా వొక్కక్షణంలో బుగ్గయిపోతుంది....." అని హెచ్చరిస్తాడు.

అలాగే సాగర సంగం కథలో అంటరాని కులాలుగా చెప్పే మాలమాదిగల మధ్య ప్రేమపెళ్ళికి కులం అడ్డుగా నిలిస్తే ప్రేమ ముఖ్యం మనుషులు ముఖ్యం కులం కాదని పెళ్ళి జరిపిస్తాడు. అలాగే వెలమలు, రెడ్లు, క్షత్రియ బ్రాహ్మణ మొదలైన కులాల్లోనూ ప్రేమ పెళ్ళిళ్ళు జరిపిస్తారు.

వీరి కథల్లో స్త్రీ పాత్రలు చాలా ఉన్నతంగా, ఆదర్శంగా ఉంటాయి. వీరి మొదటి కథ "ఇరువుమొక్కచోటికేపోదము"లో వెంకమ్మ ప్రేమపాశములో బంగారమ్మ, ప్రణయ తపస్సులో సుబ్బమ్మ, ప్రణయభంగంలో సరసు, 'కన్యాకాలేయత్నాద్వరితా'లో రంగనాయికి, జానకి, అన్నపూర్ణకథలో ఉన్నతమైన స్త్రీపాత్రలుంటాయి. ఇది ఒక పార్శ్వమైతే ప్రధాన పురుష పాత్రలు స్త్రీల అభ్యున్నతికి తోడ్పాడునందించేవిగా ఉంటాయి.

వీరి కథల్లో బాగా ప్రాచుర్యం పొందిన కథలు చాలా ఉన్నాయి. అన్నింటిలోనూ స్త్రీల సమస్యలని చిత్రించారు. మచ్చుకి రెండు కథలని మాత్రం స్థూలంగా ప్రస్తావించాను. స్త్రీల అభ్యున్నతికికృషిచేసిన తొలితరం కథారచయితలోల వీరొకరు.

## ABSTRACT

This current study was undertaken to investigate the effects of exercise training on the antioxidant defense system in young and old rats. The activity of antioxidant defense system parameters namely superoxide dismutase (SOD), glutathione-s-transferase (GST), uric acid (UA), glucose 6 phosphate dehydrogenase (G6PDH), succinate dehydrogenase (SDH), and glutamate dehydrogenase (GDH) were assayed in the brain tissue. The activities of SOD, GST, G6PDH, SDH and GDH are decreased with advancement of aging. Where as UA level is increased in aged rats, than that of young rats. However with exercise training these parameters were increased. Exercise training to these rats reversed the contrary effects of aging in aged rats, which could be an important in alleviating the pathological consequences of aging. Based on the data obtained in this study, it is suggested that 2 months exercise training increases antioxidant defense enzymes, decreases oxidative damage and reduces the adverse effects of aging in the brain of rats. So, exercise is beneficial during aging process.

## INTRODUCTION

Aging has been defined as the sum of all changes produced with the passing of time, determining a decline in the morphological integrity and functional capacity of the endocrine, nervous and immune systems, together with a decrease in their ability to maintain homeostasis. Cell damage caused by free radicals appears to be a major contributor to aging and to degenerative diseases of aging such as cancer, cardiovascular disease, cataracts, immune system decline, and brain dysfunction[1,2]. Aging is associated with a progressive decline in muscle performance, characterized by decreased muscle strength and endurance capacity in both humans and animals[3]. Aging is

characterized by an increased production of ROS in tissues, which results in the decreament of antioxidant enzymes [4].

Exercise is recognized as an important activity for healthy life style and is recommended throughout life by scientists and clinicians[5]. Exercise training improves the physiological and functional capacity in the elderly peoples[6]. The benefits of regular physical exercise include reduce risk of cardiovascular disease, cancer, osteoporosis and diabetes[7]. It is well known that regular performed moderate exercise has many beneficial effects, whereas, acute exercise can produce significant damage in the tissue[8].

Animal tissues are constantly coping with high reactive oxygen species, such as super oxide anion, hydroxyl radicals, hydrogen peroxides and other radicals generating during numerous metabolic reactions[9]. The generation of small amount of free radicals appears to have an important biological function, but oxidative stress is caused by excess production of reactive oxygen species [10]. To protect the cell and organ system of the body against reactive oxygen species, mammal cells are well equipped with highly sophisticated and complex defense mechanisms known as antioxidant defense mechanism. Antioxidant defense systems protect cellular homeostasis from oxidative disruption by reactive molecules generated through the reduction of molecular oxygen. The efficient functionality of these mechanisms requires the concerted action of the individual systems. These defense systems also have to be in concert with the components responsible for the repair processes of oxidatively damaged molecules in order in the cell integrity [11].

So far, various age related changes have been investigated in antioxidant enzyme and oxidative enzyme capacity in rat tissues. However it must be stressed that these experimental results are inconsistent[12]. It is also unaware that exercise training could provide the protective effect to the aged brain. Hence, in this study, we determined the role of exercise training on antioxidant enzymes and oxidative enzymes in the brain tissue of rats.

## MATERIALS AND METHODS

### Animal care and maintenance

Wistar strain male albino rats of two different age groups, that is, young (3 months n=12) weighing 170±10 g and old (18 months n=12) weighing 240±10, were used in the present investigation. This study was approved by the Institutional Animal Ethics Committee (Regd. No. 438/01/a/CP CSEAI dt.17.07.2001; resolution number 9/IAEC/SYU/ 2001/dt. 04.03.2002). The rats in the 3-month age group were considered as "younger" and the 18-month age group were considered as "older" or adult rats as per the life span of Wistar strain. The rats were housed in

clean polypropylene cages, six rats per cage and maintained under hygienic conditions, temperature controlled room (27±2°C) with a photoperiod of 12-h light and 12-h dark cycle. The rats were fed with standard laboratory chow (Hindustan Lever Ltd, Mumbai, India) and water *ad libitum.*

**Grouping of animals**

Age matched rats were divided into 4 (Young and Old rats ) groups of six in each group and treated as follows: i) Normal Control, ii) Exercise training.

**Group I - Normal Control (NC) :** Six young rats were put on a six-channel, motor driven treadmill for 5 days / week for a period of 2 months and given 2 m/ mm exercise for 5 min for equivalent handling, and also the rats received normal (0.9%)saline orally via orogastric tube.

**Group II - Normal Control (NC) :** Six old rats were put on a six-channel, motor driven treadmill for 5 days / week for a period of 2 months and given 2 m/ mm exercise for 5 min for equivalent handling, and also the rats received normal (0.9%)saline orally via orogastric tube.

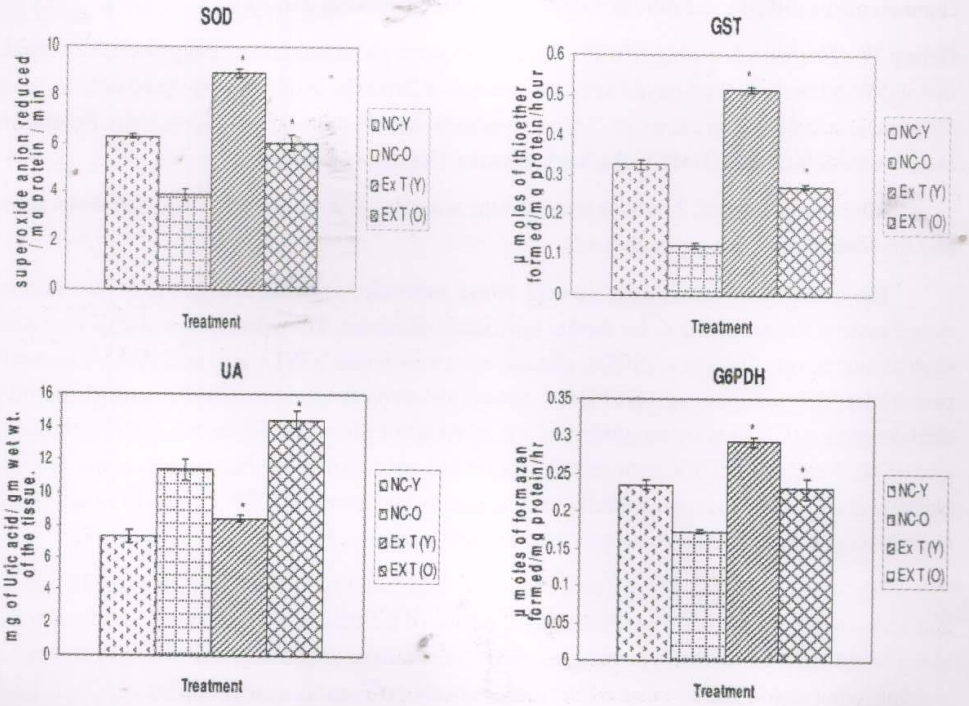
**Group III - Exercise Training (Ex T) :** Six young rats were given exercise training on a six-channel, motor driven treadmill for 5 days / week for a period of 2 months.

**Group IV - Exercise Training (Ex T) :** Six Old rats were given exercise training on a six-channel, motor driven treadmill for 5 days / week for a period of 2 months at the running speed of 23m / mm 30 mim at a constant gradient of 7.5%. Treadmill was custom-built at University Scientific Instrumentation Center (USIC)- Sri Venkateswara University Campus.

After completion of 2 months treatmentthe animals were sacrificed by cervical dislocation and the brain tissue was excised at 4.C.

The tissues are washed with ice-cold saline, immersed in liquid nitrogen and immediately stored in deep freezer at -80. C for further biochemicalanalysis. The selected antioxidant enzymes such as superoxide dismutase (SOD), glutathione s transferase (GST), uric acid (UA), glucose 6 phosphate dehydrogenase (G6PDH), succinate dehydrogenase (SDH) and glutamate dehydrogenase (GDH) were monitored by the methods of Misra and Fridovich, (1972), Habig *et al.*,(1974), Martinek (1970), Lohr and Waller (1965), as modified by Mastanaiah *et al.,* (1978), Nachlas *et al.,* (1960) as suggested by Prameelamma and Swami (1975) Lee and Lardy (1965) respectively. Where as total proteins was estimated by the method of Lowry *et al*, (1951).

The data has been analyzed by using SPSS (Version 13.5; SPSS Inc., Chicago, IL, USA) and M.S. Office, Excel Software for the significance of the main effects (factors), and treatments along with their interactions. The data has been compared using one way ANOVA with Dunnett's multiple comparison test and differences were considered significant at $p < 0.001$.



## Results

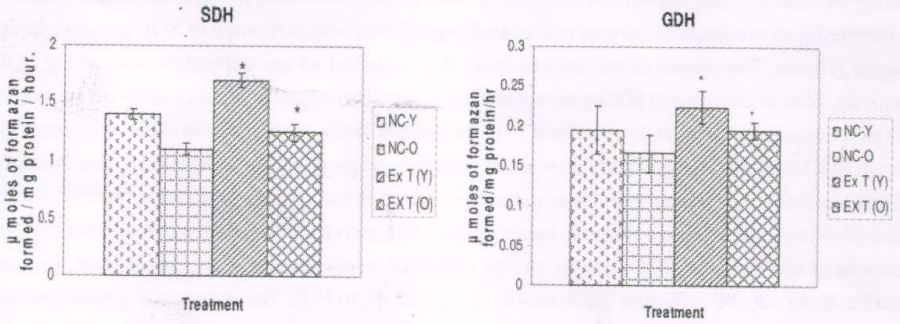


Figure 1 depicts the activities of SOD, GST, UA, G6PDH, SDH, and GDH. In aged rats these parameters activities were decreased than that of young rats, except UA level. However with exercise training all these parameters activities were increased.

In this investigation the activity of SOD observed as a foot marker of oxidative stress, was dropped with advancement of age and elevated with exercise training. Exercise induced elevation of SOD content even in old (56%) and Young (42%) animals promotes the antioxidant status brain.

Figure I shows that as age advances GST activity was decreased in brain tissue. But with exercise training GST activity is significantly increased in both age (Young 74 %, Old 82%) groups of brain tissue.

**Fig 1: Changes in SOD, GST, UA, G6PDH, SDH and GDH** activities in the brain tissue of Normal Control (NC), Exercised (Ex T) (23 m / min, 30 min/day, 5 days/week for 2 months), rats of two age groups. i,e Young (Y), and Old (O).

UA level was less in young animals compared to old animals in brain tissue. We report that significant elevation ($p<0.001$) in UA level due to exercise. The percent elevation of UA was more in old rats (26%), than of young rats (15%).

As result of age, the activity of G6PDH was decreased in brain compared to their young rats. In the present study a significant ($p<0.001$) augmentation of G6PDH activity in brain (24%) in young rats, and (32%) in old rats was observed with exercise training when compared to their respective normal controls.

SDH activity was greater in young rats, than that of old rats. We report that significant elevation ($p<0.001$) in SDH activity due to exercise. The percent elevation of SHD was more in (21%) in young rats. The same trend was also observed in old exercised rats (13%).

In this investigation the activity of GDH observed as a foot marker of oxidative stress, was dropped with advancement of age and elevated with exercise training. Exercise induced elevation of GDH content even in old (17%) and Young (14%) animals promote the antioxidant status brain. In the present study, the GDH activity in the brain tissue was decreased in old age rats than young rats.

**Discussion**

The effects of exercise on free radical production and the antioxidant system in the elderly have been widely investigated. However, it has not yet been studied how exercise affects the oxidant-antioxidant balance. We have therefore focused our attention on how the activities of antioxidant enzymes (SOD, GST, UA) and oxidative enzymes (G6PDH, SDH, GDH) in various tissues are affected in aged rats, which had performed treadmill exercise for two months.

Among various antioxidant enzymes, SOD is thought to be one of the major enzymes which protects against tissue damage caused by the potentially cytotoxic reactivities of radicals [13]. In this

study we reported that, age related decrease in SOD activity was observed in brain tissue, indicates either reduced synthesis of enzyme or elevated degradation or in activation of SOD enzyme during aging process. The results of the present study demonstrated an age dependent decrease in SOD activity. Similar decrease in SOD was reported by several investigators in mitochondria[14], in human skeletal muscle[15] and in rat myocardium [16]. In the present study, in response to exercise training the brain SOD exhibited a significant increase in both the age groups when compared to that controls. The increase in the enzyme activity as more pronounced in the younger age group. Several studies demonstrated that exercise training increase the SOD activity in heart, liver, lung and skeletal muscle of rat[17] because SOD activity can be increased with increase in $O_2 \cdot \hat{I}$ production. In most tissues there may be sufficient SOD activity to convert $O_2$ to $H_20_2$. Nevertheless, rigorous training is shown to increase SOD activity even in brain[18]. The observed increase in SOD activity in the brain of exercise-trained rats reflects the ability of this tissue to scavenge excess $O_2 \cdot \hat{I}$ in response to adaptation due to training. Sawada and Carlson reported that super oxide radical formation increases with age, therefore a decreased protection against toxic radical may have serious consequences for aging tissues[19]. Previously several scientists reported that an acute bout of exercise increases the SOD activity in various tissues including brain [20, 21].

Glutathione-s-transferase (GST) is a group of multifunctional proteins and has an important role in the detoxification of numerous xenobiotics [22]. The activity of GST was significantly decreased in the brain of older rats when compared to younger rats indicating the age dependent alterations in the activity of the enzyme. The increased accumulation of oxidative damage evident in the brain with age may be caused by a decline in cellular repair capacity or antioxidant status rather than increased oxidant production per se [23]. Ji & Fu reported that cellular antioxidant defense plays a more crucial role at advancing age[24]. The results of the present study showed an age dependent decline of the activity of GST. Similar age-dependent decrease in the activity levels of GST was reported by [25]. Several studies reported that exercise training significantly increased the antioxidant enzyme activities in the heart of mice and rats [26]. Sen *et al.* reported elevated activity levels of hepatic GST in the rat after exhaustive exercise[27]. Earlier reports on the skeletal muscle, hepatic and lung GST of rat showed similar induction in response to exercise training [28]. This induction of GST might be aimed at countering the oxidative stress that prevailed during exercise. The hyperoxic condition by the enhanced respiratory rate during exercise training might be the causative factor for the induction of GST with exercise training. The results of the present study showed elevated activity of brain GST with exercise training in both the age groups of rats, indicating the possible activation of the enzyme or its synthesis in response to exercise training, since GST is an inducible enzyme. Husain & Somani reported similar increase in the activity levels of GSTs in the plasma of rat with exercise training [29].

Uric acid function as a potential antioxidant has been recently emphasized. Its antioxidant property was first reported by [30]. Uric acid effective in quenching the hydroxyl and superoxide anion radicals. In this present study, uric acid levels were significantly increased in aged rats. In aged rats, exercise increases antioxidant enzymes in brain tissue [31]. An increased uric acid level with exercise training was reported by [32]. The mechanism of the exercise induced increase in uric acid content is thought to be the marked inhibition of renal clearance of urate by the lactate and b-hydroxy butyrate that accumulate during exercised training [33]. A high amount of uric acid level with exercise training suggests that free radical toxicity due to aging was countered effectively by uric acid, there by preventing the lipid peroxidation and tissue damage. Exercise training has the capacity to raise uric acid levels, which likely augments the antioxidative defense system, thereby protecting the brain tissue against oxidative-stressed condition during aging.

Glucose-6-phosphate dehydrogenase (G-6-PDH or G6PD) is the enzyme of the pentose phosphate pathway that is responsible for the generation of NADPH, which is required in many detoxifying oxygen derived free radicals [34]. In the present investigation the brain of older rats showed depleted activity of G-6-PDH suggesting decreased conversion of glucose-6-phosphate to 6-phospho-gluconate leading to reduced formation of NADPH in HMP shunt. A decrease in G-6-PDH activity in old rat brain could also be attributed to the reduced availability of NADP. The activity of G-6-PDH depends on SH groups in its active site. The decrease in sulfhydral groups, observed in the muscles of aging rats [35] supports the view that the activities of SH dependent enzymes including G-6-PDH are possibly decreased. A decrease in G-6-PDH activity affects RNA synthesis and nucleic acid metabolism, which is of vital importance for growth and regeneration. Exercise induced elevation of G-6-PDH activity was noticed in several studies [36]. In the present study G-6-PDH activity was increased on exercise training rats for the active participation of HMP pathway to overcome energy crisis and to generate reduced NADP for detoxification of free radicals in aged rat brain tissues. This increase was more pronounced in the younger rats when compared to older rats. The important function of HMP shunt is to produce NADPH which may act as an alternate source of energy to overcome energy crisis, which is prevailing in the cell systems due to altered citric acid cycle operation during physical stress. In other words the stepped up G-6-PDH activity may be interpreted, as a functional adaptation to meet the energy demands of the animal under exercise induced stress. The common feature of the tissue under stress conditions is a general elevation in the activities of NADP dependent dehydrogenases, and reduction in the activities of NAD dependent dehydrogenases. This is obvious, since one of the major functions of HMP shunt is to provide reduced NADP required for the detoxification of free radicals [37]. Kihlstrom reported an increase in the heart G-6-PDH activity during endurance training.

Succinate dehydrogenase (SDH) is a marker enzyme of mitochondria in the tissues. In this present study the specific activity of SDH was dramatically decreased with advancement of age. Similar age related decrease in SDH activity was reported by [38]. Age related decrease in the SDH activity was noticed in the brain tissue of rats reflects a general decline in oxidative potential of senescent tissues due to marked structural changes in mitochondria such as enlargement, matrix vacuolation and shortened cristae with the advancement of age as reported by [39]. The decrease in the SDH activity may also be due to diversion of TCA cycle intermediates such as a-ketoglutarate, for the conversion into glutamate and glutamine to counter the toxic effects of ammonia produced during aging there by depleting TCA cycle intermediates [40]. Where as with exercise training the SDH activity was increased in both age group rats. The increased SDH activity during exercise training indicates increased aerobic efficiency of the brain tissue. The present results are also attesting with the previous findings of [41, 42] who reported the significant increased levels of SDH activity with exercise in different tissues of both young and old rats. Stuewe *et al.,* reported that chronic exercise training induces many mitochondrial enzymes and enhanced mitochondrial proteins turnover which may also contribute to elevated SDH activity [43]. Gurumurhty et.al also reported the increased SDH activity in muscle and hepatic tissues respectively with response to endurance exercise training in both young and old albino rats. The increased activity of SDH in young rats with endurance exercise training program suggests increased mitochondrial oxidative potential and energy synthesis, utilization of carbohydrates and fats as substrates.

Glutamate dehydrogenase (GDH) is a homohexameric mitochondrial matrix enzyme that catalyses the reversible oxidative deamination of glutamate to a-ketoglutarate plus free ammonia using either NAD or NADP as a co-factor. The enzyme is expressed at high levels in liver, brain, pancreas and kidney but low in muscle. Aging is accompanied by a gradual deterioration of cell functions, mitochondrial dysfunctions and accumulation of protein damage have been proposed to contribute aging process [45]. As age advances, mitochondrial respiration also decreases in the tissues. In old age rats, due to lack of co-ordination among TCA cycle intermediate products the GDH activity may be decreased. Due to lack of sufficient availability of glutamate concentration at cellular levels the activity of glutamate dehydrogenase may also decreased in the tissues. In the present investigation, we reported that in exercise trained rats GDH activity was increased. This elevation of GDH activity indicates its contribution to enhanced a-ketoglutarate, which subsequently enter into TCA cycle. The increased GDH activity may be due to the sufficient availability of intracellular glutamate, which is released from ammonia and act as a substrate to the GDH. Glutamate dehydrogenase utilizes the NAD or NADP as a co-substrate to catalyze the reversible oxidative deamination of glutamate to a-ketoglutarate and free ammonia [46]. The elevation of GDH in the cells

help in supply of more amount of a-ketoglutarate to TCA cycle in order to compensate the energy crisis during exercise induced stress conditions. However with advancement of aging the GDH activity was decreased.

**ABSTRACT**
A study was undertaken to investigate the effect of Vitamin C on the toxicity of NaF in fishes. The fishes were divided into four groups and treatment was given for 30 days as per the experimental protocol. Antioxidant enzymes like Super oxide dismutase (SOD), catalase (CAT), ascorbic acid (AA), uric acid (UA) and thiobarbituric acid reactive substances (TBARSs) levels are estimated in liver tissue. Antioxidant enzymes decreased and TBARSs levels increased in NaF intoxicated fishes. However, these toxic effects of NaF were significantly reduced when the fishes were treated with the Vitamin C. This indicated that Vitamin C might play a role in reducing the toxic effect of NaF in fishes.

**KEYWORDS**: Antioxidant enzymes, Fishes, NaF, Vitamin C.

## INTRODUCTION

Fluoride in small doses has influence by inhibiting dental caries while in higher doses it causes dental and skeletal fluorosis (Shanthakumari *et al.*, 2004). Fluoride enter the body through drinking water, food, toothpaste and other dental products; drugs and fluoride dust and fumes from industries using fluoride containing salt and hydrofluoric acid (Shulman and Wells, 1997). Recent studies revealed that fluoride induces excessive production of oxygen free radicals, and might cause the depletion of antioxidant enzymes (Chlubek, 2003).Increased free radical generation and lipid peroxidation are proposed to mediate the toxic effects of fluoride on soft tissues (Rzeuski *et al.*, 1998).

Antioxidants are substances that are efficient to trap ROS and so maybe competent of decreasing oxidative damage. The use of antioxidants as therapeutic agents to treat diseases. The administration of antioxidant compounds have many protective effects. Exogenous sources of antioxidants are those that can be obtained from the diet. These can include Vitamin E (tocopherols), ascorbic acid (Vitamin C), carotenoids and flavonoids. In addition to dietary antioxidants, endogenous antioxidants also play a vital role in regulating ROS production and can be either enzymatic or non-enzymatic.

The present study was an attempt to evaluate the toxic effect of sodium fluoride and possible ameliorative role of Vitamin C in fishes.

## MATERIALS AND METHODS

### Animals

**Fish Acclimation**: Fishes were transported to laboratory under ordinary conditions. Fishes were divided into four groups, each containing ten fishes and placed in a fiber glass aquarium, size: 36cmx 18cm x 15cm containing ground water. Air pumps and filters were used to aerate the aquarium water by circulating it. All control and treated fish were fed with commercial pellet once a day. Water in aquaria was changed after every two days. Chemical analysis of water was done according to standard methods.

*Channa punctatus* ranging in length from 12±15cm and having a body weight of 30±35gm were obtained from the local fresh water resources and were maintained in large aquaria for 7 days to acclimatize them to the laboratory conditions. Chlorine free water was used which was changed at regular intervals. The values of some of the parameters of the water used were hardness 180ppm, pH 7.5±0.2, temperature 25±2c0.
The fishes were divided into 4 groups of 10 fishes in each group.
1. Normal Control (NC): Fishes are treated with normal ground water for 30 days.
2. NaF Control (NF C): Fishes are treated with NaF (100 ppm) for 30 days.
3. Vitamin C treatment (Vit c t): Fishes are treated with Vitamin C (100 ppm) for 30 days.

www.sciencejournal.in

4. NaF + Vitamin C (NF + Vit C): Fishes received Na F (100 ppm) and Vitamin (100 ppm) for 30 days.
The liver tissues are collected after the 30days of treatment.

**RESULTS**

Effect of Sodium Fluoride on hepatic antioxidant enzymes SOD, CAT, ascorbic acid and uric acid levels decreased in NaF intoxicated fishes. Administration of Vitamin C alone caused significant ($P < 0.05$) increase in the activities of SOD, CAT, ascorbic acid and uric acid levels compared to control rats. In addition, a significant recovery relating to SOD, CAT, ascorbic acid and uric acid was observed in response to the treatment with Vitamin C in NaF fishes. (Table 1).

**Table 1. Effect of Vitamin C on the antioxidant enzymes in NaF intoxicated fishes**

| | NC | NaF | Vit C | Na F + Vit C |
|---|---|---|---|---|
| SOD (Superoxideanion reduced/mg rotein/min ) | 14.06±1.612 | 8.02±1.214 | 15.86±2.418 | 12.84±1.82 |
| CAT (µm of hydrogen peroxide degraded /mg protein/min) | 28.02±2.14 | 14.62±1.48 | 32.04±0.32 | 22.14±2.86 |
| AA (mg ascorbic acid/g wet weight of the tissue) | 1.12±0.212 | 0.82±0.012 | 2.4±0.384 | 1.42±0.814 |
| UA (µm of uric acid/g wet weight of the tissue) | 1.6±0.10 | 1.02±0.036 | 1.8±0.246 | 1.4±0.028 |
| MDA (µm of malondialdehyde /gram) | 98.12±4.628 | 180.28±6.216 | 94.06±4.82 | 126.04±6.264 |

Our results indicated that the levels of thiobarbituric acid reactive substances(TBARSs) is significantly ($P < 0.05$) increased in liver of fishes treated with NaF (Table 1). Treatment with Vitamin C alone caused significant ($P < 0.05$) decrease in liver TBARS compared to control. In addition, Vitamin C supplementation in NaF fishes reduced the elevation of TBARS. (Table 1)

**DISCUSSION**

Fluorosis is a well-defined clinical entity characterized by toxic effects of high-fluoride intake on teeth, bones and soft tissues (Krishnamachari, 1976).

This is the first report on the effect of vitamin c in sodium fluoride intoxicated fishes. The present study exhibits the toxic effects of sodium fluoride on antioxidant enzymes in fishes. The present investigation also suggests sodium fluoride alters antioxidant enzymes, however Vitamin C supplementation protected the fishes from NaF intoxication. Hence, Vitamin C may be used as protective agent against many toxic substances in aquatic conditions.

SOD is an important antioxidant enzyme found in nearly all living cells exposed to oxygen. CAT is a very important enzyme in protecting the cell from oxidative damage by reactive oxygen species (ROS).Ascorbic acid is a potent water-soluble antioxidant enzyme involved with radical chain-breaking and regeneration of tocopherol from tocopheroxy radicals. Uric acid, a important antioxidant for humans, birds, reptiles, and some primate species, that scavenges singlet oxygen, peroxy radicals, and hydroxyl radicals and has been studied extensively in many physiological and pathological systems.

In the present study, SOD, CAT, AA and UA activities are decreased in Naf intoxicated fishes. It is proposed that there is an increased oxidative stress in Fluorosis and decreased in SOD and CAT in the red blood cells (RBC) of fluoride-in

 © 2018 DAMA International. All rights reserved. 

toxicated rats (Shivarajashankara *et al.*, 2001).In another study, decreased SOD and CAT activities in rat upon ingestion of sodium fluoride for 14 days were observed (Vani and Reddy, 2000). The decreased activities of SOD and CAT may be a response to increased production of hydrogen peroxide and superoxide by excessive production of free radicals. Many reports suggested that NaF supplementation causes excessive production of toxic free radicals which scavenges free radicals thus antioxidant enzymes came to rescue, hence these antioxidant enzymes activities decreased in NaF fishes (Liu et al., 2003). However Vitamin C treatment recovered all these antioxidant enzymes near normal levels.

Some studies suggest the use of antioxidants and antioxidant rich foods for the management of fluorosis (Susheela, 1999) and also for the beneficial effects of antioxidants as antidotes for fluoride toxicity (Chinoy *et al.*, 1994). Therefore, the purpose of the present study is to find out the ameliorating potential of Vitamin C on sodium fluoride-induced reactive oxygen species (ROS) and lipid peroxidation. Treatment with Vitamin C significantly increased SOD, CAT, AA and UA in NaF intoxicated fishes. The increased lipid peroxidation in NaF in fishes as found in the present study may be due to the inefficient anti-oxidant system. The elevated lipid peroxidation is responsible for the formation of lipid hydroperoxides in membrane and would result in damage of the membrane structure and inactivation of membrane bound enzymes. Elevated oxidative stress due to this imbalance leads to liver tissue injury through oxidized proteins and augmented levels of lipid peroxidation, as indicated by increased TBARS contenting NaF in the present study. Vitamin C treatment significantly reduces this enhanced lipid peroxidation. The anti-oxidant compounds and other pharmacological compounds of plants may inhibit the production of free radicals, and reduced the products of lipid peroxidation (Table 1).

## CONCLUSION

From the above study, we conclude that Vitamin C supplementation protected liver tissue in NaF intoxicated fishes. To the best of our knowledge this is the first reported data on the effect of Vitamin C in Na F fishes and also with reference to the antioxidant enzymes. However, further research is needed, for the better understanding of the mechanism of action of vitamin C by which it modulates anti-oxidant enzymes in toxicity condition.

**ABSTRACT**

The Phytochemical analysis of medicinal plants are gaining importance due the production of the new drugs from plants. The objective of the present research work was to investigate the presence of the phytochemical constituents and to study the bactericidal effect of *Ocimum sanctum* (OS). Phytochemical screening analyses was determined by using standard protocol methods. The antibacterial activities of OS were estimated by disc diffusion method against different bacterial strains. The results revealed that OS was found to be the predominant occurrence of phytochemicals like flavonoid, phenol, tannins, reducing sugar, glycosides, steroids and terpenoids, while starch resins, are absent. Ethanolic extract of the OS hold promises as a potential source of pharmaceutically important phytochemicals and also have strong antibacterial activity against Escherichia coli, Staphylococcus aureus and other strain than aqueous extract. Hence, the present investigation proves that O*cimum sanctum* can be applied as antimrobial agent against bacterial diseases.

Keywords: Phytochemical screening, Antibacterial screening, *Ocimum sanctum*

## INTRODUCTION

Medicinal plants have many potentially active phytochemicals which used to cure various ailments. These plants play beneficial role in healthcare system by protecting human beings from the adverse effects of diseases and other complications. [1]. Medicinal plants are the reservoirs of potentially useful chemical compounds which could serve as newer leads and clues for modern drug design [2]. Medicinal plants have been screened in many countries as antimicrobial agents and tissue protective drugs. The screening of plant extracts for antimicrobial activity has shown that plants are potential source of novel antimicrobial compounds [3].India is one of the oldest, richest and most diverse cultural traditions associated with the use of medicinal plants. During the last two decades, the pharmaceutical industry has made immense progress in pharmacological and chemical researches all over the world in an effort to discover new plant drugs. This leads to screening, isolation and estimation of compounds from many medicinal plants. *Ocimum sanctum* is one of important herb which is used in India. It has many pharmacological properties like antioxidant, antidiabetic, antiulcer, antinflammatory [4]. Hence, the present study was designed to screen the phytochemicals and antimicrobial activity of *Ocimum sanctum*.

## Materials and methods

### Collection of Plant Materials

The leaves of *Ocimum sanctum* were collected from Tirupati, A.P, India and identified by the Dr. Madhav Chetty, Department of Botany, SV University, Tirupati. Voucher specimen of *Ocimum sanctum* No 1183 was deposited in the Botany department.

### Chemicals and reagents

All chemicals used were of analytical grade and were purchased from Sigma–Aldrich, Merck and. All chemicals and reagents were used without further purification.

### Preparation of Plant Materials:

The sample of *O. sanctum* leaves was weighed on Shimadzu Electronic Balance. The stems were dried in an oven at 50-60ºC. The dried leaf are cooled at room temperature and weighed again on the same electronic balance. .

### Ethanolic extraction

100 grams of air-dried powder was taken in 1000 ml of ethanol in a conical flask, plugged with cotton wool and then kept for 24 hours. After 24 hours the supernatant was collected, this procedure was repeated thrice, until the residue turns to colure less.

The solvent was evaporated to make the final volume one fourth of the original volume with the help of rotavapour and the final metahnolic extract was stored at -10ºC.

**Aqueous extraction**

100 grams of air-dried powder was added to 1000 ml of water and soaked for 24 hours. It was then filtered through filter paper. The supernatant was collected, this procedure was repeated thrice, until the residue turns to colure less. The solvent was evaporated to make the final volume one fourth of the original volume with the help of rotavapour and the final aqueous extract was stored at -10ºC.

A portion of the leaf powder was subjected to phytochemical analysis, using standard chemical tests. Phytochemical screening of the crude extract was carried out employing standard methods and tests.

1. Test for Alkaloids (Wagner's reagent)

A fraction of extract was treated with 3-5drops of Wagner's reagent (1.27g of iodine and 2g of potassium iodide in 100ml of water) and observed for the formation of reddish brown precipitate (or) coloration.

2. Test for Terpenoids (Salkowski Test)

0.5 gram of each extract was added to 2 ml of chloroform. Concentrated sulphuric acid (3 ml) was carefully added to form a layer. A reddish brown colouration of the interface indicates the presence of terpenoids.

3. Test for Tannins

About 0.5 gram of the extract was boiled in 10 ml of water in a test tube and then filtered. A few drops of 0.1% ferric chloride was added and observed for brownish green or a blue-black coloration.

4. Test for Saponins (Foam test)

To 2ml of extract add to 6ml of water in a test tube. The mixture was shaken vigorously and observed for the formation of persistent foam that confirms the presence of saponins.

5. Test for Cardiac glycosides (Keller Kelliani's test)

5ml of each extract was treated with 2ml of glacial acetic acid in a test tube and a drop of ferric chloride solution was added to it. This was carefully underlayed with 1ml concentrated sulphuric acid. A brown ring at the interface indicated the presence of deoxysugar characteristic of cardiac glycosides. A violet ring may appear below the ring while in the acetic acid layer, a greenish ring may form.

6. Test for Phenols (Ferric chloride test)

A fraction of the extracts was treated with aqueous 5% ferric chloride and observed for formation of deep blue or black colour.

7. Test for reducing sugars (Fehling's test)

The extract (0.5 g in 5 ml of water) was added to boiling Fehling's solution (A and B) in a test tube. The solution was observed for a colour reaction.

8.Test for Flavonoids

To portion of the dissolved extract, a few drops of 10 % ferric chloride solution was added. A green or blue colour indicates the presence of phenolic nucleus.

9. Test For Resins

10 ml of petroleum ether extract was obtained in a test tube, the same amount of cupper acetate solution was added and the mixture was shaken vigorously and allowed to separate, a green colour indicates the presence of resins.

10. Sterols and Steroids (Salkowski's Test)

One ml of extract was treated with 2 ml of chloroform and equal amount of concentrated sulphuric acid was added, upper layer is turns to red indicates the presence of the sterols and steroids.

**Table 1: Phytochemicals analysis of *Ocimum sanctum***

**Collection of Text Organism**

Human pathogens culture of *Escherichia coli* (*E. coli*), *Staphylococcus aureus* (*S. aureus*), *Bacillus subtilis* and *Psudomonas aeruginosa* in this study were obtained from the Microbiology Laboratory of Sri Venkateswara University, Tirupati, Andhra Pradesh, India. All cultures were maintained in nutrient broth at 37ºC and maintained on nutrient agar slants at 4ºC.

**Determination of Zone of Inhibition**

The antibacterial activity studies are assessed by agar well diffusion method. Standard antibiotic streptomycin was used as positive control. Four bacterial strains were used for screening the antimicrobial activity of *Ocimum sanctum*. *Escherichia coli, Staphylococcus aureus, Bacillus subtilis* and *Pseudomonas aeroginosa* stock cultures were collected from department of Microbiology Sri Venkateswra University Tirupati, A.P, India. These organisms were cultured in nutrient agar medium prepared by autoclaving 2.5 gram nutrient agar in 100 ml of distilled water and incubated at 37ºC for 24h. Inoculate the testing microorganisms on agar plate by using inoculation wire loop. The discs were prepared by using sterilized what man (grade no.1) filter paper. The discs are rinse in different concentrations (10,20,30% w/v) of ethanolic and aqueous extracts of OS and those were placed on inoculated agar plates, then the plates were incubated at 37ºC for 24h. The tests were performed three times and the zones of inhibition were measured for by using a ruler and the results were recorded in mm.

**Results**

**Qualitative phytochemical screening**

In the present study, we investigated the phytochemical screening of *Ocimum sanctum* in ethanol and aqueous extract. The ethanolic extract of OS showed the presence of many phytochemicals. flavonoids, phenol, tannins, glycosides, terpenoids, steroids, alkaloids and absence of starch, anthraquinone, resins, and saponins. In the case of aqueous extract flavonoids, phenol, terpenoids, alkaloids, gcardiolycosides and absence of anthraquinone, resins, reducing sugars, tannins and saponins. (Table 1).

**Antimicrobial activity of *Ocimum sanctum***

The antimicrobial activity of ethanolic and aqueous extracts of OS was investigated by using agar diffusion method against selected human pathogens such as *Staphylococcus sp, Escherichia coli, Bacillus subtilis* and *Pseudomonas aeroginosa*. These four different pathogens have also tested with commercially available antibiotic like Streptomycin and results were indicated in Table 2. OS extracts used against the pathogenic organisms have showed varied degree of antimicrobial activity against the pathogens.

The result indicates that the ethanol leave extract showed more effective result than the aqueous extract with significant inhibition against *Pseudomonas aeroginosa* in well diffusion and poison plate. Thus, it was evident that the organic extracts were more effective than aqueous extract.

So, it is suggested that *Ocimum sanctum* may be recommended as antimicrobial agent against pathogens.

**Table 2: Antimicrobial Activity of Ocimum sanctum (Zone of inhibition in millimetres)**

| **Bacterial Species** | **Zone of Inhibition** (mm) | | | | | | | |

## Discussion

This study was conducted to investigate the phytochemical characteristics and antimicrobial activities of OS. Phytochemical constituents are secondary metabolites of plants which contribute significantly towards the biological activities of medicinal plants such as hypoglycemic, antidiabetic, antioxidant, antimicrobial, antiinflammatory, anticarcinogenic, antimalarial, anticholinergic, antileprosy activities etc. [5]. Phytochemical constituents such as tannins, flavonoids, alkaloids and several other compounds serve as defense mechanism against predation by many microorganism, insects and herbivores. The curative properties of medicinal plants are perhaps due to the presence of various secondary metabolites such as alkaloids, flavonoids, glycosides, phenols, saponins, steroids etc [6]. The preliminary phytochemical screening may be useful in the detection of the bioactive principles and subsequently may lead to the drug discovery and development of new drugs. Further, these tests facilitate their quantitative estimation and qualitative separation of pharmacologically active chemical compounds [7].The pharmacological properties of OS are able to determine the presence of flavonoids, alkaloids, steroids, triterpenes, glycosides, and tannins. The flavonoids were the common group of compounds found in all plants and play a major role in metabolism (Shirley 2001). The biological functions of flavanoids apart from its antioxidant properties include protection against allergies, inflammation, free radicals, platelet aggregation, microbes, ulcers, hepatoxins, viruses and tumors [8]. It also helps in managing diabetes induced oxidative stress. Flavonoids in OS act as antioxidant and free radical scavenger, which prevent oxidative cell damage [9,10].Alkaloids are secondary metabolites containing low molecular weight substances and show variety of biological functions. The alkaloids are used to design the anticancer and analgesic medicines [11]. Uses of specific photochemical presence in plants are an advantage to human being and it reduces the side effects of toxic substances formed by many metabolic reactions.Numerous studies have confirmed that steroids are responsible for cholesterol-reducing properties. Steroids also help in regulating the immune response. Steroids are present only in OS which is supposed to be of maximum medicinal value Steroids also help in regulating the immune response [12].Terpenoids exhibit various important pharmacological activities i.e., anti-inflammatory, anticancer, anti-malarial, inhibition of cholesterol synthesis, anti-viral and anti-bacterial activities [13]. Phenolic compounds are some of the mot widespread molecules among plant secondary metabolites, are known to act as natural antioxidants . Tannins have amazing stringent properties. They are known to hasten the healing of wounds and inflamed mucous membrane [14] Terpenoids have been found to be useful in the prevention and therapy of several diseases, including cancer. Terpenoids are also known to possess antimicrobial, antifungal, antiparasitic, antiviral, anti-allergenic, antispasmodic, antihyperglycemic, antiinflammatory and immunomodulatory properties [15]. In addition, terpenoids can be used as protective substances in storing agriculture products as they are known to have insecticidal properties as well [16]. Alkaloids are used as anaesthetic agents and are found in medicinal plants [17].Plant derived compounds received interest in the past few decades because of their potential antimicrobial activities. The phytochemicals of medicinal plants improve the health status of people and so it is used in pharmaceutical and nutraceutical products of commercial importance [18]. The results of antibacterial assay of OS extracts are presented in the table 2. OS contains unique constituents which differ from one extract to another, hence the type and extent of their medicinal property also differs. The presence of phytochemical components like alkaloid, terpenoids, tannin and steroids in ethanol extract may have good anti-inflammatory activities, antibacterial activity. The zone of inhibition increased with an increase in the concentration of the extracts in the well. The study revealed that ethanolic extract of OS is very effective against *Staphylococcus sp, Escherichia coli, Bacillus subtilis* and *Pseudomonas aeroginosa*. In nut shell, it can be concluded that the phytoconstituents of methanol extracts of OS can be used as antimicrobial agent. Antimicrobial activity of OS in different extract was shown in Table 2 and compared with different concentrations. The ethanolic extract showed highest antibacterial activity than aqueous extract. Ethanolic extract of OS worked against pathogenic bacteria responsible for common infections of skin, urinary, and gastrointestinal tracts. OS contains alkaloids, which are responsible for the strong antibacterial activities. The antimicrobial activity of OS may be due to the presence of many phytochemicals.

## Conclusion

The present study clearly indicates that *Ocimum sanctum* have many phytochemical constituents. The antimicrobial efficacy of *Ocimum sanctum* leaves indicates that the plant possess potent antimicrobial properties as well. As *Ocimum* is widespread in India, it can be recommended as an easily available and renewal source of antimicrobial agent instead of synthetic chemicals. It is quit safer to use as an herbal medicine as compare to chemically synthesized drug. The presence of many bioactive compounds in high concentration justifies that the OS can be used for various ailments by traditional practitioners. However, isolation of individual phytochemical constituents and subjecting it to pharmacological activity will definitely give fruitful results.

## ABSTRACT

Corona Virus Disease – 19 (COVID-19) that appeared first in December 2019 has become a pandemic within a short span of time. It is posing many questions to the scientific community, challenging food and health security. As on April 3, 2020 the number of cases approached one million worldwide. There have been massive thermal screening, quarantines, social distancing and lockdowns world over. While there is spread of many falsifications around corona virus infections, scientists have been engaged in research to find out a solution to control the pandemic, prevent the spread and treat the affected successfully. Intensive research is needed to elucidate the transmission routes and pathogenic mechanism of novel emerging corona virus diseases. It is also required to elucidate the possible drug targets to develop effective preventive and therapeutic measures. In this backdrop, the present paper reviews the available literature, with emphasis on virus entry in to the host and possible development of effective therapies using manipulation of receptor proteins as first step prevention.

Key words: COIVD-19; Pandemic; Entry into host; Receptors.

**Introduction:**

Corona viruses affect mammals and birds. These viruses cause respiratory tract infections in human beings, which range from symptoms of cold to SARS, MERS. Symptoms in other species vary. As against many viruses, development of a vaccine has been difficult.Corona viruses are spherical, large and pleomorphic having a diameter around 120nm. The envelop consists of a lipid bilayer where in the structural proteins are anchored. These include the membrane, envelop and spike proteins. The viral spike peplomers, which are surface proteins give its characteristic ‘crown’ like appearance, hence the name ‘corona’ virus (Image 1). Subsets of corona viruses are found to have shorter projections that function as Haemaglutinin Esterase (HE).

The nucleocapsid present inside the envelop is formed by copies of nucleocapsid protein which are bound to the positive sense ssRNA genome. The virus, when it is outside the host,is protected by envelop, membrane protein and nucleocapsid. SARS-CoV-2, responsible for COVID-19 pandemic, also has mushroom shaped protein spikes which render the virus the ability to bind and fuse to human cells, gaining entry into the host.

Four of the seven strains of human coronaviruses studied are known to produce the generally mild symptoms of the common cold:

1. Human corona virusOC43 (HCoV-OC43)
2. Human corona virusHKU1
3. Human corona virusNL63 (HCoV-NL63, New Haven coronavirus)
4. Human corona virus229E (HCoV-229E)

Three other strains produce severe symptoms, which include

1. Middle East respiratory syndrome-related corona virus (MERS-CoV), previously known as *novel coronavirus2012* and *HCoV-EMC*
2. Severe acute respiratory syndrome corona virus (SARS-CoV or "SARS-classic")
3. Severe acute respiratory syndrome corona virus2 (SARS-CoV-2), previously known as 2019-nCoV or "novel coronavirus2019"

The coronaviruses HCoV-229E, -NL63, -OC43, and -HKU1 continually circulate in the human population and cause respiratory infections in adults and children world-wide.

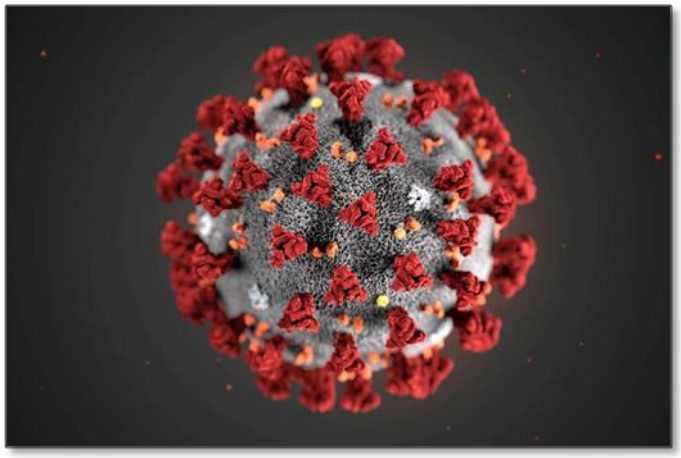

Image 1: The ultrastructural morphology exhibited by the SARS-CoV-2
(Center for Disease Control and Prevention on January 29, 2020)

**Infection of a coronavirus**

When the viral spike glycoprotein binds its complementary host cell receptor, infection occurs. Once attached, host cell protease cleaves the receptor attached spike-protein. Virus enters the host cell by endocytosis or fusion of viral envelop with host cell membrane. Availability of host cell protease, cleavage and activation determine the entry of virus into the host cell. Viral genome enters the host cell cytoplasm once the virus particle is uncoated immediately after entry. The corona virus RNA genome attaches to host ribosome with a high degree of specificity, which is due to the presence of a 3' poly adenylated tail and 5' methylated cap. The initial overlapping open reading frame of the virus genome is translated to form a long polypeptide chain, which has its own protease sequence to cleave it into multiple non-structural proteins.

**Human to human transmission**

The issue of concern about corona viruses is their ability to get transmitted from human to human individuals. The transmission occurs among close contact by droplet infection. affected people transmit during incubation period. The infectivity, tissue tropism and species range of the corona virus is largely dependent on the interaction of spike proteins with complementary host cell receptors. For example, SARS corona virus infection takes place by attachment to angiotensin converting enzyme 2 (ACE2) receptor.

**Coronavirusdisease 2019 (COVID-19)**

A pneumonia outbreak was reported in December 2019 in Wuhan City, Hubei Province, China. On 31 December 2019, after ruling out a number of etiological agents including SARS Corona Virus & MERS Corona Virus, the outbreak was traced to a novel strain of coronavirus,which was given the interim name 2019-nCoV by WHO.Genome analysis reveals that 2019-nCoV belongs to *Sarbecovirus* subgenus, *Betacoronavirus* genus of the subfamily *Orthocoronavirinae* in the family *Coronaviridae* of the suborder *cornidovirineae* of the order *Nidovirales.*It was later renamed as SARS-CoV-2 by the International Committee on Taxonomy of Viruses.The outbreak was declared a Public Health Emergency of International Concern on 30 January 2020. On 11 February 2020, WHO announced a name for the new coronavirus disease - COVID-19.

As of 03 April 2020, there have been at least 46764confirmed deaths and more than 932166 confirmed casesworldwide and the epidemic curve is on steep rise (Image 2).The Wuhan strain of Corona Virus is identified to have approximately 70% genetic similarity to the SARS-CoV. The virus has a 96% similarity to a bat coronavirus, so it is widely suspected to originate from bats as well.

Image 2: The COVID-19 pandemic as on 03.04.2020 (courtesy: WHO dashboard)

**The viral capsid and viral entry into the host:**

Viral capsids are generally stable to protect the genome inside and play different roles in the host-virion interactions. Envelop- associated proteins play crucial role in binding to receptors, membrane fusion, uncoating and receptor modification, all of which are vital for virus replication. Studies on fusion proteins reveal their importance in viral entry and release. Priming of viruses is a very important aspect, which should be probed into to identify potential drug targets. Priming, which involves conformational changes in surface proteins, facilitates viral uptake and infection of target cells. Release of viral genome into the cytoplasm of the host cell is one crucial area where scientific intervention can lead to discovery of potential therapeutic agents. For example, priming of influenza viruses involves endosome membrane disruption based on activation of hemagglutinin molecule. Inhibition of enzyme cascade may prove efficient therapy for prevention of virus infection and infestation.

Virus-host relationship may form a crucial area for scientific studies because virion attachment and entry into the host cell is the most important stage for virus multiplication. Viral envelops act as fusion machines to facilitate viral entry into host cells. For example, fusion of

influenza virus depends on consecutive binding of gp120 to CD4 and the chemokine receptors. The fusogenic domain is in gp41 and the fusion peptide is formed at the nacent amino peptide formed by cleavage of gp160 precursor. Premature triggering of the fusion peptide will result in an inactive virus. Crystallized gp41 complex shows conspicuous structural homology with the influenza hemagglutinin. It is noteworthy that the fusogenic confirmation of influenza hemagglutinin is induced by low pH. Such subtle areas may form crucial points of research to combat infections.

**COVID-19 entry into the host**

Studies revealed that the spike protein of the SARS-CoV-2 that causes COVID-19 has a good affinity (10-20 times to that of SARS virus) and binds to the host cell receptor known as angiotensin -converting enzyme 2 (ACE2) and this serves as the entry point into human cells. When compared to SAARS corona virus, the novel corona virus has high human-to-human transmissibility because of this higher affinity. Studies to employ SARS specific antibodies to prevent novel corona virus infection did not yield results. It is also revealed that the spike protein has 98% sequence similarity to that of bat corona virus.

Corona viruses have the largest genomes of all RNA viruses. These comprise of cis-acting RNA elements which warrant the replication of viral RNA. These cis-acting elements form a minor fraction of the total viral genome. RNA secondary structures of these cis-acting regions are well-understood. But, how the cis-acting structures and sequences interact is not yet understood. Infectious corona virus assembly selection of viral genomic RNA from a pool of non-viral and viral RNA present in the cell. Studies revealed that seven to ten viral mRNAs are synthesized in infected cells and the full-length genomic RNA alone is packaged into corona virus particles. There are studies which revealed the involvement of cis-acting and trans-acting viral factors in encapsulation and packaging. The molecular mechanisms of genome selection and packaging will form a critical area where in scientists can develop anti-viral agents for diagnostics and therapeutics. Also, understanding the atomic level structure of the novel corona virus – 2019 spike protein may augment development of potent vaccines.

**Discussion and conclusion:**

The SARS-Sprotein is a type I transmembrane protein, which comprises 1,255 aminoacids and contains 23 consensus signals for N-linked glycosylation. S protein is synthesized in the secretory pathway of infected cells.It contains an N-terminal signal sequence, which mediates import of the nascent protein into the endoplasmic reticulum, where the protein is folded and modifiedwith mannose-rich carbohydrates. Upon transport of the protein into the Golgi apparatus, most, if not all, of the high-mannose carbohydrates are processed into complex glycans. A novel dibasic ER retrieval motif in the cytoplasmic tail of SARS-S promotes accumulation of the S protein at the ER–Golgi intermediate compartment and the Golgi region the sites where progeny particles are assembled. Formation and budding of new particles are driven by the membrane protein (M), the envelope protein (E) and the nucleocapsid protein (N);interactions with the M protein might facilitate S protein incorporation into particles.The domain organization of SARS-S resembles that of several well-characterized viral membrane proteins, such as influenza virus hemagglutinin (HA) and human immunodeficiency virus (HIV) envelope protein (Env). These proteins employ comparable strategies to facilitate fusion of viral and host cell membranes and are termed class I fusion proteins.They are distinguished from class II fusion proteins, found, forexample, on flavi- and alphaviruses, by their distinct spatial organization and theparticular configuration of the functional elements required for fusion with targetcells: class I fusion proteins are inserted perpendicular to the viral membrane andcontain an N-terminal surface unit (SU) and a C-terminal transmembrane unit(TM). The globular SU interacts with cellular receptors, while the TM promotes. The position of the S protein open reading frame in the SARS-CoV genome is indicated in the upper panel. Coronavirus S proteins exhibit a domain organization characteristic for class Ifusion proteins. A signal peptide is located at the N-terminus and mediates import of the nascent protein into the secretory pathway of infected cells. The surface unit S1 contains a receptor binding domain (RBD), which allows engagement of cellular receptors for infectious entry. The transmembrane unit (S2) harbors functional elements pivotal to membrane fusion: a fusion peptide, two helical regions, and a

transmembrane domain. Proteolytic cleavage into the S1 and S2 subunits by host-cell proteases is formed.

The cellular entry of SARS-CoV-2 is a multistep process which involves the formation of several transient intermediates. All structures participating in the entry cascade are potential targets for inhibitors and the feasibility of several approaches to prevent entry. The S protein can also be targeted by lectins, which bind glycans on the S protein and thereby block viral entry In summary, the approaches described above, particularly combinations thereof, should allow development of compounds suitable for effectively preventing or combating future outbreaks of SARS-CoV-2.

# Trends in India's trade with Vietnam: An Empirical Analysis

**VENKATA PRASAD A* and D. KRISHNAMOORTHY****

*Lecturer in Economics, PRR & VS Govt. Degree College, Vidavalur, SPSR Nellore Dt.A.P. E mail: analaprasad2002@gmail.com
**Professor, Department of Economics, Sri Venkateswara University, Tirupati – 517 502, E mail:dkmoorthy2010@gmail.com

**Abstract**

*India and Vietnam share close to half a century of relations with the establishment of formal diplomatic ties that began in 1972 between India and the then-North Vietnam. The relations were derived from common historical linkages as colonies of Western powers striving to achieve independence. Bilateral ties between India and Vietnam have got strengthened in recent years with a focus on regional security issues and trade. The adoption of the 'Look East Policy', imbued with the economic element, marked an important turning point in India-Vietnam economic relations. Vietnam has played an important role in India's "Act East" policy, which was enunciated as an upgrading of the earlier 'Look East Policy' and also she has been a crucial partner in sub-regional, regional and multilateral forums. The need for economic development increased the importance of bilateral economic and commercial linkages between both the countries. These efforts received fillip from regional arrangements, as for example, ASEAN-India cooperation and Mekong - Ganga Cooperation. India is Vietnam's fifth largest trading partner in ASEAN; Vietnam holds the 19th position worldwide for India, both the countries made conscious efforts to expand the areas of economic cooperation and to increase the volume of trade and investment. India's total trade comprising exports and imports skyrocketed from the abysmal level of US $0.24 billion to the magnificent level of US $12.27 billion between the years 2001 and 2017. India and Vietnam will explore "substantive and practical measures" to achieve the bilateral trade target of $15 billion by 2020. Currently, India has 182 investment projects worth US $816 million in Vietnam, while Vietnamese businesses have a mere seven projects worth some US $6 million in India. The present paper reviews the performance of India's merchandise trade with Vietnam during 2000-01 to 2015-16 on the basis of the data released by the Ministry of Commerce and Industry, Government of India.*

*(302 words)*

**KEY WORDS:** ASEAN, Trade, Growth Rates, Commodity and Act East Policy

Several regional economic groups have emerged in different parts of the world particularly after 1950s. One such regional groups that has made rapid strides in terms of degree of economic integration and geographical coverage is "Association of South East Asian Nations" (ASEAN) among the countries of South East Asia. The Association of Southeast Asian Nations, or ASEAN, was established on 8th August 1967 in Bangkok, the capital of Thailand, with the signing of the ASEAN Declaration (Bangkok Declaration) by the founding members of ASEAN, namely Indonesia, Malaysia, Philippines, Singapore and Thailand. Brunei Darussalam then joined the Association on 8th January, 1984, Vietnam on 28th July 1995, Lao PDR and Myanmar on 23rdJuly,1997 and Cambodia on 30th April 1999. The ten member states of ASEAN hope that the regional co-operation among these members could help in exploiting the existing resources in the region fully. ASEAN is a unique example for regional co-operation and development. It is most successful inter-governmental organization in the developing world today. In the words of Kofi Annan, former Secretary General, UNO, ***"Today, ASEAN is not only a well-functioning, indispensable reality in the region, it is a real force to be reckoned with far beyond the region. It is also a trusted partner of United Nations in the field of development".***

India's relations with Vietnam are marked by growing economic and commercial engagement. India is now among the top ten trading partners of Vietnam. In recent times, political contacts have strengthened as reflected in several high level visits by leaders from both sides. Trade and economic linkages continue to grow. India's thrust under the 'Look East' policy combined with Vietnam's growing engagement within the region and with India has paid rich dividends. Vietnam is an important regional partner in South East Asia. India and Vietnam closely cooperate in various regional forums such as ASEAN, East Asia Summit, Mekong – Ganga Cooperation, Asia Europe Meeting (ASEM) besides UN and WTO.

Trade and other Areas along with defence and strategic ties, India has attempted to boost economic relations with Vietnam. Sri.NarendraModi's policy navigation from "Look East" to "Act East", which essentially aims to strengthen ties with the extended neighborhood of the Asia Pacific region and to expand ties between India and Vietnam to the level of "Comprehensive Strategic Partnership", makes Vietnam extremely critical in India's eastward outreach. Vietnam on its part has actively supported the Act East Policy as it facilitates India's larger role in the region. Also, Vietnam is ASEAN's Coordinator for ASEAN-India Dialogue Relations from 2015 to 2018, which can be utilised to further increase the cooperation. India is now among Vietnam's top ten trading

partners and during Sri. NarendraModi's 2016, which is expected to further boost bilateral trade between them. India-Vietnam economic ties date back to 1978 when both countries signed.

The two countries also expanded cooperation in areas such as space exploration and cyber security. New Delhi and Hanoi signed the Inter Governmental Framework Agreement for the exploration of outer space for peaceful purposes, and agreed to conclude the Implementing arrangement between the Indian Space Research Organisation and the Vietnam Ministry of Natural Resources and Environment on the establishment of a Tracking and Data Reception Station and a Data Processing Facility in Vietnam under the India-ASEAN Space Cooperation. A Memorandum of Understanding on cyber security was also signed between Vietnam's Ministry of Public Security and India's Ministry of Electronics and Information Technology; and the two countries also facilitated the transfer of equipment to the Indian-funded Indira Gandhi High-Tech Crime Laboratory. India has also established a satellite tracking facility in Ho Chi Minh City. Although termed a civilian facility, it could provide strategic benefits such as the tracking of Chinese movement in the sea, in case of a threat. It has been planned and implemented by the Indian Space Research Organization. Conclusion Collaborating on regional security, defence, and trade engagements, India and Vietnam have managed to build a strong partnership over the last few years. Given their mutual convergence, it is likely that this relationship will only grow stronger. There remains much to do, for instance India can help Vietnam is also a prospective market for India's defence exports, which still remains under-exploited. Beyond that, there is significant scope to explore in the economic realm on areas such as energy, mineral exploration, agro-processing, healthcare, IT, and education, among others, which will help to boost existing ties. Cultural and people-to-people exchanges need to be strengthened further as there is significant goodwill that can be leveraged by the two states. Overall, this is a relationship that is poised to take off in the coming years, led by political leaderships in the two countries determined to make this relationship truly strategic in orientation.

**India's Trade with Vietnam:**

Bilateral trade between India and Vietnam has seen continuous growth over the past few years. India is now among the top ten trading partners of Vietnam. Over the past 16 years there has been a steady increase in the trade volume between India and Vietnam. Eventually it crossed the 10,000cr. Mark in the year 2009-10. This is a major achievement, in light of the fact that one decade ago; in 2000-01 the total trade was Rs. 1088.64 cr. In the last five years there has been a continuous growth in the bilateral trade.

Vietnam is ASEAN country with which India has favorable trade balance. The relevant details are furnished in Table -1.

**Table-1: India's Exports to and Imports from Vietnam and World** (Rs in crores)

| Year | Exports | Imports | Exports to World | Imports from World | 2 as %age of 4 | 3 as %age of 5 | Balance of Trade | Trade Balance as % of total trade |

Source: Website: http://commerce.nic.in/eidb/Default.asp (from 2000-01 to 2015-16)

It could be seen from the table that India's exports to Vietnam soared from Rs. 1,032.02crores to Rs. 34,616.91crores registering a magnificent 33.54 fold increase between 2000-01 and 2015-16. India's imports from this country, on the other hand, a skyrocketed by 296 times from Rs. 56.62 crores to Rs. 16,763.11crores. Thus both in magnitude and growth, the performance of imports from Vietnam were higher than that of exports. The same conclusion is reiterated by the ratio analysis. As could be seen from the table, India's exports to Vietnam as a proportion of her total global exports put up a spurt from 0.12 per cent in 2000-01 to 2.02 per cent in 2015-16. On the other hand, India's imports from Vietnam as a proportion of her total global imports rose sharply from 0.36 per cent to 0.67 per cent amidst wide fluctuations. In view of rising trends in both exports and imports both in absolute and relative terms, India had a comfortable position on her balance of trade. The India's positive trade balance with Vietnam

notched up from Rs.975.4crores to Rs. 17,853.8 crores in absolute terms but in relative terms the ratio decelerated from 89.60 per cent to 34.75 per cent during the study period in view of higher growth rates of imports as compared to exports.

Thus, both in magnitude and growth, the performance of imports from Vietnam was higher than that of exports. The same conclusion is reiterated by the ratio analysis. In view of relatively higher level of exports as compared to imports in absolute and relative terms, India had been in a comfortable position on her balance of trade. The India's positive trade balance with Vietnam notched up from Rs.975.4crores to Rs. 17,853.8 crores in absolute terms but declined from 89.60 per cent to 34.75 per cent in relative terms during the study period. The analysis of growth rates of India's trade with Vietnam as presented in Table.1A revealed excellent performance in both exports and imports. India's imports from this country grew by robust 51.22 per cent as compared to exports that put up a handsome 29.84 per cent growth per annum during the period under study. Both these growth rates were statistically significant at one per cent probability levels as confirmed by the computed 't' test statistics for exports (38.25) and imports (27.99) that were higher than the theoretical 't' test statistic value of 3.250. Also exports had a lower SEE of b value (0.007) and higher $R^2$ value (0.99) as compared to the corresponding values of 0.015 and 0.98 for imports.

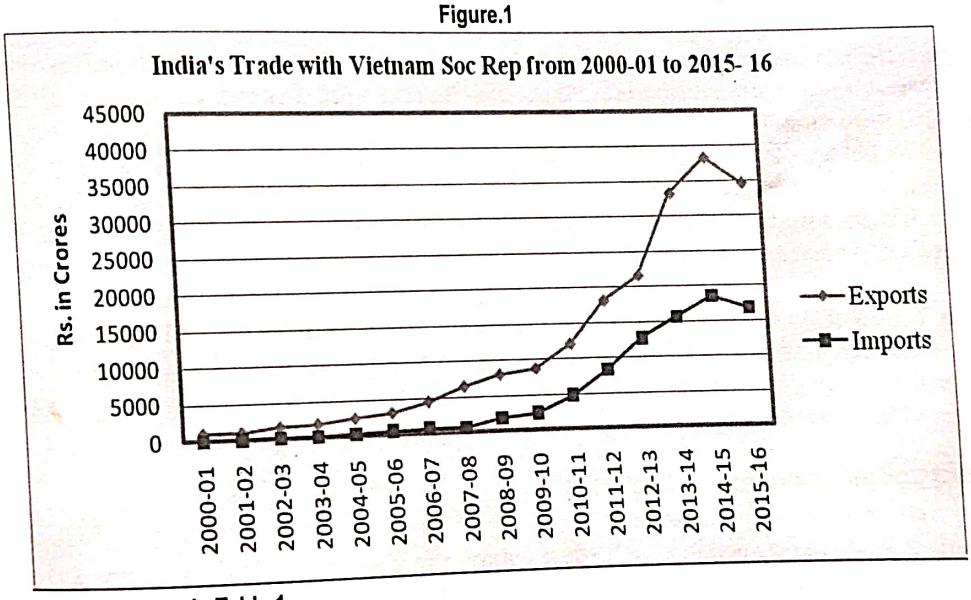

**Table.1A: Growth of India's Trade with Vietnam Soc. Rep., during 2000-01 to 2015-16**

| Variable | CAGR% | $R^2$ | SEE of b-value | t-value |
|---|---|---|---|---|
| Exports | 29.84 | 0.99 | 0.007 | 38.25 |
| Imports | 51.22 | 0.98 | 0.015 | 27.99 |

Source: Table.1

Thus India's exports to Vietnam performed well as compared to her imports from Vietnam in several respects. Figure.1 highlights the excellent performance India's trade with Vietnam in terms of line charts.

**Figure.1**

**Source: Computed for data in Table.1**

## GROWTHRATES OF MAJOR COMMODITY GROUPS OF INDIA'S EXPORTS TO VIETNAM

From the discussion of India's trade with Vietnam in chapter five, it was inferred that Vietnam is one of the most important and emerging India's trade partner within ASEAN region because India's exports to Vietnam grew by reliable and splendid 29.84 per cent and that India's imports from Vietnam surged by dependable and marvelous 51.22 per cent per annum during the period 2000-01 and 2015-16. India has also been enjoying positive trade balance with her trade with Vietnam. Given the scenario of overall trade, an attempt is made here to further probe to analyse the growth pattern of India's top 10 exports and imports items in her trade with Vietnam and relative shares of top ten commodity groups. Table.2 incorporates the necessary information on the growth rates, mean, standard deviation and coefficient of variation relating to India's exports to Vietnam.

**Table.2: Growth Rates of Top – 10 Commodities of India's Exports to Vietnam Soc Rep During the period from 2000-01to 2015-16**

| S. No | HS Code | Commodity | CAGR% | $R^2$ | t-cal value | Mean (Rs in crores) | SD (Rs in crores) | CV % |
|---|---|---|---|---|---|---|---|---|
| 1 | 23 | Residues and waste from the food industries; prepared animal fodder | 9.56 | 0.27 | 2.31 | 70.39 | 754.89 | 59.42 |
| 2 | 30 | Pharmaceutical products | 15.12 | 0.97 | 24.03 | 451.00 | 301.41 | 66.83 |
| 3 | 39 | Plastic and Articles Thereof | 12.33 | 0.76 | 6.70 | 383.52 | 248.68 | 64.84 |
| 4 | 84 | Nuclear reactors, boilers, machinery and mechanical appliances; parts thereof. | 28.67 | 0.86 | 9.65 | 375.10 | 415.09 | 110.66 |
| 5 | 40 | Rubber and Articles Thereof | 12.20 | 0.60 | 5.20 | 109.52 | 71.57 | 65.34 |
| 6 | 72 | Iron and Steel | 17.67 | 0.62 | 4.84 | 459.12 | 537.80 | 117.13 |
| 7 | 38 | Miscellaneous chemical products | 16.44 | 0.85 | 8.94 | 236.64 | 152.09 | 64.27 |
| 8 | 29 | Organic Chemicals | 16.07 | 0.94 | 15.40 | 248.98 | 161.94 | 65.04 |
| 9 | 3 | Fish and Crustaceans, Molluscs and other Aquatic invertebrates | 42.76 | 0.76 | 6.65 | 1580.01 | 2420.13 | 153.17 |
| 10 | 52 | Cotton | 40.59 | 0.93 | 14.33 | 653.53 | 821.42 | 125.68 |

Source: http://commerce.gov.in/EIDB.aspx

It is observed from the table that out of the top ten export commodity groups listed in the table, Fish and Crustaceans etc., (HS Code: 03) registered the highest growth rate of 42.76 per cent, closely followed by Cotton (HS Code: 52) with a growth rate of 40.59 per cent. The growth rates of these commodity groups were statistically significant at one per cent probability level. Next to these two commodity groups, the high tech commodity group viz., Nuclear Reactors, Boilers etc., (HS Code: 84) registered the highest growth rate of 28.67 per cent followed by Iron and Steel (HS Code:72) with a growth rate of 17.67 per cent.

The high growth rate of all the above four commodity groups was also associated with high levels fluctuations in terms of Coefficient of Variation ranging from 111 per cent to 153 per cent. The other export commodity groups that have registered double digit growth rates during the study period were Miscellaneous Chemical products (HS Code: 38) with a growth rate of 16.44 per cent, Organic Chemicals (HS Code: 29) with a growth rate of 16.07 per cent, Plastic and articles thereof (HS Code: 39) with a growth rate of 12.33 per cent, Rubber and articles thereof (HS Code: 40) with a growth rate of 12.20 per cent.Thus, out of 10 commodity groups, the only commodity group that has registered the single digit statistically insignificant growth of 9.56 per cent was the commodity group Residues and wastes from the food industries etc., (HS Code: 23).

The $R^2$ value of this commodity group was also very low. The commodities that have registered the growth rates between 10 per cent and 20 per cent, by and large, were subjected to relatively less degree of fluctuations in terms of coefficient of variation. The mean values of top 10 export commodity groups from India to Vietnam varied between a low of Rs.70.39 crores to Rs.1580 crores during the period under consideration.

**GROWTHRATES OF MAJOR COMMODITY GROUPS OF INDIA'S IMPORTS FROM VIETNAM**

The growth rates of India's imports from Vietnam during the period from 2000-01 to 2015-16 along with $R^2$ values, computed t-values, mean, standard deviation, coefficient of variation are furnished in Table.3. A cursory glance at the table indicates that when compared to the export growth rates, the import growth rates from Vietnam were relatively high. Among the listed top 10 import commodity groups, the Hi-tech commodity group viz., Electrical Machinery and Equipment etc., (HS Code: 85) registered the reliable and fabulous growth of 71.30 per cent per annum followed by Rubber and articles thereof (HS Code: 40) with a tremendous growth rate of 56.58 per cent, Footwear, Gaiters etc., (HS Code: 64) with a magnificent growth rate of 45.60 per cent, Plastic and articles thereof with an amazing growth rate of 40.66 per cent. It is important to note that the $R^2$ and computed t-values of all these commodity groups were all very high indicating the dependable and sustainable growth of these commodity groups in the future.

At the other extreme, the commodity group Lac, Gums, Resins etc., (HS Code: 13) exhibited negative growth of -18.21 per cent during the period under consideration. Though another commodity group Other Base metals, cermets etc., (HS Code: 81) registered reasonably higher growth rate of 18.26 per cent per annum, the growth was not statistically significant and also the $R^2$ value was very low. The mean value of India's top ten commodity groups from Vietnam varied between a low of Rs.4.29 crores in the case of Lac, Gums etc., and a high of Rs.2047.67 crores in the case of Electrical machinery etc. It should, however, be noted that

the fluctuations in the quantum of imports from the country were very high and were above 100 per cent indicating that the standard deviation values of the commodity groups were higher than the corresponding mean values. This implies that there are wide fluctuations in the year to year India's imports from Vietnam. Nevertheless, the growth rates of imports of all the commodity groups from Vietnam were statistically significant at one per cent probability level except in the case of one commodity group viz., Other Base metals etc. (HS Code: 81).

**Table.3 : Growth Rates of Top – 10 Commodities of India's Imports from Vietnam Soc Rep During 2000-01 to 2015-16**

| S. No | HS Code | Commodity | CGR% | $R^2$ | t-cal value | Mean (Rs in crores) | SD (Rs in crores) | CV % |
|---|---|---|---|---|---|---|---|---|

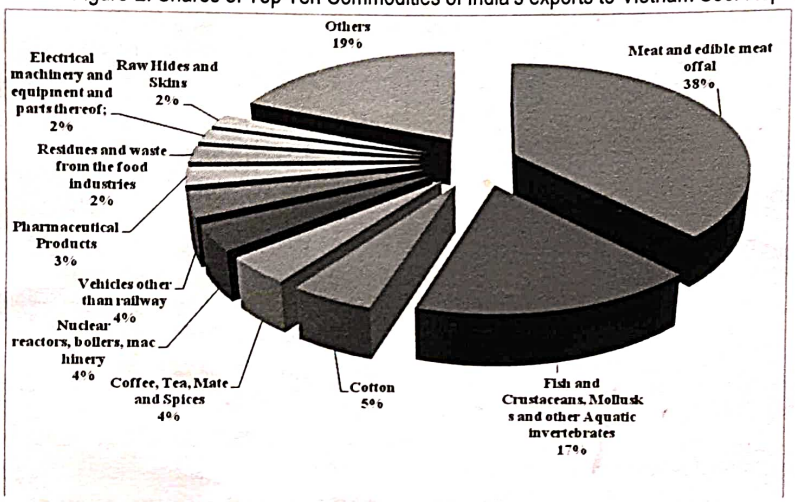
**SHARES OF TOP 10 EXPORT COMMODITIES TO VIETNAM**

Having discussed the growth of India's top 10 export and import commodity groups from Vietnam, an attempt is made to analyse their relative shares in total exports and imports. Table.4 incorporates the information on the shares of top ten export commodity groups in India's exports to Vietnam during the period from 2000-01 to 2015-16.

**Table.4: Shares of Top Ten Commodities in India's Exports to the Vietnam Soc Rep**



| S. No. | HS Code | Commodity | % Share in 2000-01 | Rank | % Share in 2015-16 | Rank |
|---|---|---|---|---|---|---|
| 1 | 23 | **Residues and waste from the food industries; prepared animal fodder** | **18.11** | **1** | **2.54** | **8** |

| 10 | 52 | **Cotton** | **3.19** | **10** | **4.99** | **3** |
| | | Total | 85.26 | – | 37.3 | – |

Source: Computed for the data obtained from, commerce.nic.in/eidb/ecom.asp

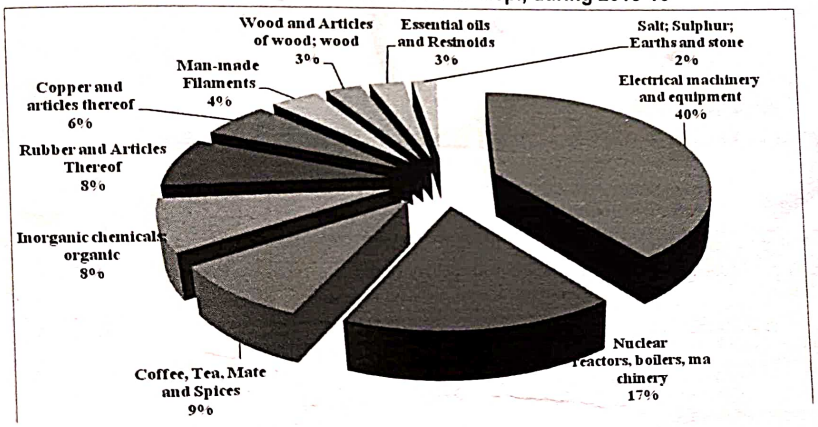
It could be seen from the table that the top 10 India's export commodity groups to Vietnam accounted for an overwhelming proportion of 85.26 per cent of India's exports to Vietnam in the year 2000-01.However, over the years there has been marked change in the commodity composition of India's exports to Vietnam. As could be observed from the table in the year 2015-16, the top listed commodities in the table could account for only 37.3 per cent of total exports to the country. Except two commodity groups

viz., Fish and Crustaceans etc., (HS Code: 03) and Cotton (HS Code: 52), all other commodity groups have lost their shares drastically over the period of time. While the former commodity group could increase its share dramatically from 4.52 per cent to 16.76 per cent and rank from 9th to 2nd, the latter commodity group could marginally gain its share from 3.19 per cent to 4.99 per cent and rank from 10th to 3rd between the years 2000-01 and 2015-16. Three other notable commodities, that have retained their ranking within the top 10 even after losing their export shares, were Residues and wastes from the food etc., (HS Code: 23 which has lost its share from 18.11 per cent to 2.54 per cent and the rank from 1st to 8th), Pharmaceutical Products (HS Code: 30) which has lost its share from 14.87 per cent to 2.76 per cent and rank from 2nd to 7th and Nuclear Reactors, boilers etc., (HS Code: 84) which has lost its share from 8.03 per cent to 3.90 per cent and rank from 4 to 5). *The fall in the importance of India's hi-tech export products like Nuclear Reactors, boilers etc., (HS Code: 84) and Pharmaceutical Products (HS Code: 30) is a cause for concern.* Thus out of the top 10 export commodities five commodities slipped out of the top ten-list and in their place new commodity groups have entered. **Appendix Table-1** provides the details of the new commodity groups that have entered into India's export basket to Vietnam and their relative shares. These 10 commodity groups constituted about 81 per cent of the total exports shipped to Vietnam in the year 2015-16. The structure India's exports to Vietnam in the year 2015-16 are vividly represented in the form of Pie Diagram in Figure-2.

Figure-2: Shares of Top Ten Commodities of India's exports to Vietnam Soc. Rep. during 2015-16

## SHARES OF TOP - 10 IMPORT COMMODITIES FROM VIETNAM

The analysis of growth of India's imports from Vietnam in the earlier section indicated that all the commodities except one commodity group registered positive and high rates of growth. What is the effect of the growth rates on the relative shares of these commodity groups over the period of time? Table.5 provides the information on the relative shares of top ten India's import commodities from Vietnam during two years viz., 2000-01 and 2015-16.As could be observed from the table, out the top commodities two commodity groups viz., Electrical machinery and Equipment etc., (HS Code: 85) and Rubber and articles thereof (HS Code: 40) that have registered the highest and the second highest growth rates during the period 2000-01 and 2015-16 have markedly improved their relative shares respectively from 9.89 per cent to 31.40 per cent and from 5.43 per cent to 6.11 per cent.



These two commodity groups occupied the first and fifth ranks respectively in the year 2015-16. In view of enormous rise in the relative share of the first commodity group, viz., Electrical machinery and Equipment etc., (HS Code: 85) from about 9 per cent to 31 per cent, the relative shares of other commodity groups have dwindled over the years even though they have achieved higher rates of growth. It is matter of appreciation to note that India has been importing essential manufactured commodities like electrical machinery and equipment, Rubber and articles thereof from Vietnam. On the other hand, India has been curtailing the imports of primary products such as coffee, Tea, mate etc., (HS Code: 09) whose share has fallen drastically from 34.54 per cent to 6.94 per cent, lac, Gums, Resins etc., (HS Code: 13), whose share has also decelerated sharply from 14.46 per cent to 0.02 percent, Miscellaneous Chemical products (HS code: 38) whose share has decelerated from 3.54 per cent to 0.74 per cent), plastic and articles thereof (HS Code: 39) whose share has come down from 8.42 per cent to 1.67 per cent, Essential Oils and Resinoids etc., (HS code: 33) whose share declined from 5.71 per cent to 2.37 per cent and Organic Chemicals (HS Code: 29) which has lost its share from 1.88 per cent to 0.21 per cent.

**Table.5:** Shares of Top Ten Commodities in India's Imports from Vietnam Soc. Rep

| S. No. | HS Code | Commodity | % Share in 2000-01 | Rank | % Share in 2015-16 | Rank |
|---|---|---|---|---|---|---|
| 1 | 9 | Coffee, Tea, Mate and Spices | 34.54 | 1 | 6.94 | 3 |
| 2 | 13 | Lac; Gums, Resins and other vegetable saps and extracts | 14.46 | 2 | 0.02 | 61 |
| 3 | 85 | Electrical machinery and equipment and parts thereof; sound recorders and reproducers, television image and sound recorders and reproducers, and parts. | 9.89 | 3 | 31.40 | 1 |
| 4 | 39 | Plastics and articles thereof | 8.42 | 4 | 1.67 | 12 |
| 5 | 33 | Essential oils and Resinoids; perfumery, cosmetic or Toilet preparations | 5.71 | 5 | 2.37 | 9 |
| 6 | 40 | Rubber and Articles Thereof | 5.43 | 6 | 6.11 | 5 |
| 7 | 81 | Other Base Metals; Cermets; Articles Thereof. | 3.94 | 7 | 0.01 | 67 |
| 8 | 38 | Miscellaneous chemical products | 3.54 | 8 | 0.74 | 20 |
| 9 | 64 | Footwear, Gaiters and the like; parts of such Articles | 1.92 | 9 | 1.66 | 13 |
| 10 | 29 | Organic Chemicals | 1.88 | 10 | 0.21 | 35 |
| | | Total Share | 89.74 | – | 51.13 | – |

Source: Computed for the data obtained from, commerce.nic.in/eidb/ecom.asp accessed on 08.06.2017

**Figure-3: Shares of Top Ten Commodities of India's Imports from Vietnam Soc Rep., during 2015-16**

All these commodity groups together accounted for only 51.13 per cent of total imports from Vietnam in the year 2015-16. This implies that other new commodity groups have entered in to India's import commodity basket and thereby India's imports structure has been more diversified in the year 2015-16 as compared to the year 2000-01. The details of new and diversified India's import basket from Vietnam in the year 2015-16 are furnished in the **Appendix Table-II**. At the same time, the details of India's import structure from Vietnam in the year 2015-16 are furnished in the form of Pie Diagram in Figure-3.

**Conclusion:**

India's has been initiating economic liberalisation since 1991 and Vietnamsince 1986. The economic reforms initiated by DoiMoiin Vietnam had created massive opportunities for commercial exchanges and cooperation in such areas as agriculture processing and technology and knowledge-based industries such as IT, biotechnology, oceanography and Space. Vietnam is focussing its attention on restructuring its economy by enhancing science and technology adoption where India can help Vietnam to a great extent. India's exports to Vietnam increased by 30 per cent whereas her imports from Vietnam rose by 51 per cent during 2000-01and 2015-16. The share of Vietnam in India's total exports to world varied from 1.11 per cent to 2.02 per cent and the share of imports from the country as a proportion of India's total imports ranged between a low of 0.14 per cent and 0.67 per cent during 2000-01and 2015-16. India has all along been getting positive trade balance with Vietnam in view of higher exports and relatively lower imports.Finally, both the countries need to understand their strengths and opportunities in their bilateral economic relations and

act accordingly. In a short period of time, it will be impossible for Vietnam to bridge the trade balance, which is currently in India's favour. Vietnam's attention therefore, must be focused on attracting investment from India, which Vietnam needs, to fuel its growing economy. At the same time, India in its endeavour to become a global economic player needs to strengthen its economic relations with Vietnam through increased interaction with physical, commercial, investment, and trade linkages to venture into the larger Asia-Pacific.

**ABSTRACT:** Pantoprazole belongs to benzimidazole group. It is a proton pump inhibitor, used for the treatment of gastric and duodenum ulcers. It undergoes degradation in acid medium of the stomach, can be coated with enteric coating polymer that will safely deliver the drug in the small intestine. A simple dissolution test method for Pantoprazole pellets dosage forms has been proposed and HPLC analytical method was developed for the measurement of Pantoprazole pellets dosage forms with Detector .The chromatographic system consists of 4.0mm x 12.5CM, 5µ Packing L7 column, an gradient mobile phase of 340 ml of Acetonitrile+660ml phosphate buffer. The flow rate is 1ml /minute and elute is tested at 280nm.The pantoprazole was eluted 4.569min with no interfering peak from additives used for preparation dosage forms. The method was linear over the range of 10-125µg/ml pantoprazole. The dissolution test was conducted in 6.8 phosphate buffer, 900ml with paddle RPM at 100.Dissolution was found to be NTL 75% in 45 minutes. The proposed method was applied successfully for the measurement of Pantoprozole content in pellets dosage forms

Key words: Dissolution tester, HPLC, Pantoprazole Pellets dosage forms, RPM, Mobile phase

1. INTRODUCTION: IUPAC name of pantoprazole is "6-(difluoromethoxy)-2-[(3,4-dimethoxypyridin-2-yl)methylsulfinyl]-1H-benzimidazole".It is a substituted benzimidazole specified for the short-term treatment (up to 16 weeks) in the healing and symptomatic relief of erosive esophagitis. Pantoprazole is a proton pump inhibitor (PPI) that suppresses the final step in gastric acid production[1], it is due to lipophilic weak base that crosses the parietal cell membrane and enters the acidic parietal cell canaliculus where it becomes protonated, producing the active metabolite sulphenamide, which forms an irreversible covalent bond with two sites of the H+/K+-ATPase enzyme located on the gastric parietal cell, thereby inhibiting both basal and stimulated gastric acid production[2].

**Structure of Pantoprazole:**

2. Materials and Methods:

2.1 Instruments: Dissolution tester make Electrolab India (p)L.t.d, High performance liquid chromatograph shimadzu 2010 Rheoodyne injector with 100µl loop.L.C solutions computer based software is used.

2.2.Chemicals: Working standard pantoprazole procured from M/S Angels Pharma India Private Limited, Acetonitrile, HPLC grade(make E-Merck) ,Methylene chloride, Methanol (HPLC GRADE), Ammonia, Isopropyl alcohol(HPLC GRADE), Ethanol AR, Disodium tetraborate AR, Dibasic Sodium phosphate AR, Hydrochloric acid AR, Sodium Hydroxide AR, Monobasic sodium phosphate AR, Potassium dihydrogen orthophosphate and purified water.

2.3. Drug release

Acid resistance stage:

| | |
|---|---|
| Medium | : 0.1 N Hydrochloric acid; 500mL |
| Apparatus | : USP-II |
| Rpm | :100 |
| Time | : 2 hours |

Buffer stage

| | |
|---|---|
| Medium | : 6.8 phosphate buffer, 900ml |
| Apparatus | : USP-II |
| Rpm | : 100 |
| Time | : 30min. |

2.4**Requirements:**

**Instruments:** A suitable High Performance Liquid Chromatography consisting of a pump, a UV-VIS detector, sample injector, controller and integrator or equivalent software. The system is equipped with 4.6mm x 250mm, Inertsil ODS 3V or Equivalent. Dissolution apparatus, pH meter

**Reagents;** Methylene chloride, Methanol (HLC GRADE), Ammonia, Isopropyl alcohol(HLC GRADE), Ethanol AR, Disodium tetra borate AR, Dibasic Sodium phosphate AR, Hydrochloric acid AR, Sodium Hydroxide AR, Monobasic sodium phosphate AR, Acetonitrile (HLC GRADE), Potassium di hydrogen orthophosphate and purified water.

2.5 Solution Preparation:

Preparation of 0.01M of Disodium borate:
Weigh about 3.84g of Disodium tetraborate and make up to 100mL using wate, mix well.
0.1NHCI Preparation:
Take about 8.5ml of Hydrochloric acid and make up to 1000ml using water, mix well.

2N HCI Preparation:
Take about 17.0ml of Hydrochloric acid and make up to 100ml using water, mix well

2N NaOH Preparation
Weigh about 8.0g of NaOH and make up to 100ml using water, mix well.

pH 10.4 Buffer preparation:
0.235 M Dibasic sodium phosphate-Dissolve 33.36g of anhydrous sodium phosphate in 100ml of water. And adjust with 2N sodium Hydroxide to pH of 10 .4 ± 0.1

pH 6.8 Phosphate buffer preparation:
Add 400ml of 0.1N hydrochloric acid to 320 ml of pH 10.4, 0.235 M Dibasic sodium phosphate and adjust with 2N Hydrochloric acid or 2N sodium hydroxide, if necessary, to a pH of 6.8±0.05. Dilute 250ml of this solution with water to 1000ml.

pH 7.6 Phosphate Buffer preparation:
Dissolve 0.178g of monobasic sodium phosphate and 4.49g of dibasic sodium phosphate in 1000ml of water. Adjust with 2N Hydrochloric acid or 2N sodium hydroxide, if necessary, to a pH 7.6±0.1. Dilute 250ml of this solution with water to 1000ml.
Mobile phase preparation:
Transfer 340 ml of Acetonitrile to a 1000ml volumetric flask, dilute with pH 7.6 phosphate buffer to volume, and pass through a membrane filter having a 0.5um or finer porosity,. Make adjustments.
Diluents:-
Dissolve 7.6g of sodium borate dehydrates in about 800ml of water. Add 1.0g of edentate Disodium, and adjust with 50% sodium hydroxide solution to a pH of 11.0±0.1. Transfer the solution to a 2000ml volumetric flask, add 400ml of dehydrated alcohol, and dilute with water to volume.

Solution A- Prepare a filtered and degassed solution of 6.0g of glycogen in 1500ml of water. Adjust with 50% sodium hydroxide solution to a pH of 9.0, and dilute water to 2000ml.

Solution B- Use a filtered and degassed mixture of acetonitrile and methanol(85:15)

Mobile phase – Use variable mixture of solution A and solution B as directed for chromatographic system. Make adjustments if necessary.

3.0 Acid Stage Dissolution solutions preparation:

Standard solution:
Accurately weigh about 50 mg of Pantoprazole WS, in to a 250ml volumetric flask, dissolve in 50 ml of alcohol, dilute with 0.01M sodium borate solution to volume and mix. Transfer 10.0ml of this solution into a 100ml volumetric flask, add 20ml of alcohol, dilute with 0.01M sodium borate solution to volume and mix well.

Test solution:
Transfer 500ml 0.1N HCI solution in dissolution jar maintains the temp. $37.0^0C \pm 0.5^0C$ and accurately weigh 235.0mg of sample (pellets) transfer in to the jar. Start the dissolutions system. After 2 hours, filter the dissolution medium containing the pellets on the sieve, and rinse them aperture of not more than 0.2mm. after 2 hrs collect the pellets on the sieve, and rinse them with water.
Using approximately 60ml of 0.01M sodium borate solution, carefully transfer the pellets quantitatively to a 100ml volumetric flask. Sonicate for about 20minutes until the pellets are broken up. Add 20ml of alcohol to the flask, dilute with 0.01M sodium borate solution to volume, and mix. Dilute the an appropriate amount of this solution with 0.01M sodium borate at about 3000rpm for 5 minutes. Final Concentration 10µg/ml.

4.0 Buffer stage:
Medium: pH 6.8 phosphate buffer, 900ml
Proceed as directed for acid resistance stage with a new set of pellets from the same batch. After 2 hours, add 400 ml of 0.235M dibasic sodium phosphate to the 500ml of 0.1N hydrochloric acid medium in the vessel. Adjust, if necessary, with 2 N hydrochloric acid or 2 N sodium hydroxide to a pH 6.8 ±0.05.

ApparatusUSP-II : 100rpm
At the end of 30 minutes, determine the amount of Pantoprazole dissolved in pH 6.8 phosphate buffer by employing the following method.

Dissolution Calculation:

$$\frac{\text{Sample area}}{\text{Std area}} \times \frac{\text{std dilution}}{\text{sample dilution}} \times \frac{100}{Assay} \times \text{Stand purity} = \text{---------}\%$$

5.0. Chromatographic parameters:

| | |
|---|---|
| Column | : 4.0mm x 12.5CM, 5 µ Packing L7 |
| Detector | : UV-Vis Detector |
| Wave length | : 280nm |
| Flow rate | : 1.0ml/minute |
| Injection volume | : 20 µL |
| Run time | : 12 minutes |

| Time (Minutes) | solution A % | solution B % | Elution |
|---|---|---|---|
| 0-20 | 88-40 | 12-60 | linear gradient |
| 20-21 | 40-88 | 60-12 | linear gradient |
| 21-25 | 88 | 12 | isocratic |

System suitability:

Inject blank and record the chromatogram. Examine the chromatogram for any extraneous peaks. There should be no interference from the blank at the retention time of analyte peak. Inject standard solution five times and calculate the relative standard deviation (RSD) for area of the analyte peak. The relative standard deviation for five injections of Pantoprazole should not be more than 2.0%.

Separately: Inject equal volume (about 20µL) of the standard preparation and the test preparation into the chromatograph, record the chromatograms, and measure the peak area response. Calculate the quantity, in mg of Pantoprazole by the given formula

Dissolution Calculation:

$$\frac{\text{sample area}}{\text{Std area}} \times \frac{\text{std Dilution}}{\text{sample dilution}} \times \frac{100}{\text{Assay}} \times \text{std purity} = _____\%$$

6. Assay:

6.1 Requirements:

Instrument: A suitable high performance Liquid chromatograph consisting of a pump, a UV-VIS detector, sample injector, controller and integrator or equivalent software. The system is equipped with 4.6mm x 250mm, inertsil ODS 3V or Equivalent, Dissolution apparatus and pH Meter.

Reagents: Methanol (HPLC GRADE), Phosphorouspentixide, ammonia, hydrochloric acid AR, sodium hydroxide AR, Monobasic sodiumphospahte, Acetonitrile, (HPLC GRADE) and purified water.

6.2 pH 7.6 Phosphate Buffer preparation:
Dissolve 0.718g of monobasic sodium phosphate and 4.49g of dibasic sodium phosphate in 1000ml of water. Adjust with 2N Hydrochloric acid or 2N sodium hydroxide, if necessary, to a pH of 7.6$\pm$ 0.1. Dilute 250ml of this solution with water to 100ml.

6.3 Mobile phase preparation:
Transfer 340ml of acetonitrile to a 1000ml volumetric flask, dilute with pH 7.6 phosphate buffer to volume, and pass through a membrane filter having a 0.5um or finer porosity. Make adjustments.

Diluent: Dissolve 7.6 g of sodium borate dehydrates in about 800ml of water. Add 1.0g of edentate Disodium, and adjust with 50% sodium hydroxide solution to a pH of 11.0$\pm$0.1. Transfer the solution to a 2000ml volumetric flask, add 400ml of dehydrated alcohol, and dilute with water to volume.

Blank solution: Take mobile phase as blank.

6.4 Chromatographic parameters:

Column : 4.0mm x 12.5CM, 5µ Packing L7
Detector : UV-Vis Detector
Wave length : 280nm
Flow rate : 1.0ml/minute
Injection volume : 20µL
Run time : 12 minutes

Procedure:

| Time (Minutes) | solution A % | solution B % | Elution |
|---|---|---|---|
| 0-20 | 88-40 | 12-60 | Linear gradient |
| 20-21 | 40-88 | 60-12 | Linear gradient |
| 21-25 | 88 | 12 | isocratic |

Standard preparation- Dissolve, by sonicating an accurately weighed quantity of Pantoprazole WS in diluent, and quantitatively, and stepwise if necessary, with diluents to obtain a solution having known concentration of about 0.2mg per mL.

Sample preparation- Weigh and mix the contents, Transfer an accurately weighed portion of the mixture about 235mg of Pantoprazole, to a 100mL volumetric flask, add about 50ml of membrane filter having 0.45µm of fine porosity. (Note – Bubbles may form just before bringing the solution to volume. Add a few drops dehydrated alcohol to dissipate the bubbles if the persist for more than few minutes.)

Blank solution: Take mobile phase as blank.

Procedure:
Separately inject equal volume (about 20µl) of the standard preparation and the test preparation into the chromatograph, record the chromatograph, and measure the peak area responses. Calculate the quantity, in mg of Pantoprazole by the given formula

$$\text{Assay calculation: } \frac{\text{sample area}}{\text{Std area}} \times \frac{\text{standard dilution}}{\text{sample dilution}} \times \text{std purity} = _____\%$$

**Recovery studies:** To study the linearity, accuracy and precision of proposed method, recovery experiments were carried out known quantities of standard at two different levels were added to the pre analyzed sample, the recovery was estimated to be more than 99%.

**Conclusion:** The proposed method is simple rapid and no where involves use of complicated sample preparation. High percentage of recovery shows that the method is free from interference of the excipients used in the semi formulations. Therefore method can be useful in routine quality control analysis.

## *Abstract*

The present work demonstrates the use of coffee husk extract as a fuel (otherwise an agro waste) for the synthesis of nano zinc oxide (ZnO) by one step solution combustion synthesis. We also show the comparative studies of coffee husk extract (green fuel) derived nano ZnO (CHZnO) and sugar (chemical fuel) derived nano ZnO (SZnO) as an adsorbent for Congo red dye removal. Synthesized ZnO nanoparticles were characterized using XRD, SEM, TEM, FTIR, and BET. The adsorption characteristics were investigated with respect to changes in pH, temperature, initial dye concentration, adsorbent dose and contact time. CHZnO exhibited higher adsorption capacity (76 mg/g) compared to SZnO (56 mg/g). The equilibrium adsorption data were analyzed using various isotherm models (Langmuir, Freundlich, Temkin, and Dubinin-Radushkevith) and thermodynamic parameters. Among the models studied, Langmuir isotherm fitted well with experimental equilibrium data ($R^2$>0.99). Adsorption kinetics was found to follow pseudo-second order with the highest $R^2$ value. Intraparticle or pore diffusion was the major rate controlling step in the adsorption process. The present study demonstrates the potential application of agro-based bio-waste as a novel fuel in the synthesis of nanomaterials for use as efficient adsorbents in water treatment.

Keywords: Coffee husk extract, nano ZnO, Adsorption, Congo Red, Intraparticle diffusion

## *Introduction*

Textile industry ranks first in the usage of dyes for colouration of fibres. However, low levels of dye-fibre fixation results in more than 50% of dyes being lost in the effluent stream of these industries [1]. The complex aromatic structure of dyes resists them from aerobic digestion. This increases the problem of degradation and poses severe problems to the aquatic life, food web and causes damage to the aesthetic nature of the environment [2,3]. Most of the dyes may be carcinogenic, mutagenic or teratogenic, cause allergic dermatitis, skin irritation etc. and pose a serious threat to human health. To control the negative effects of dyes on the living system and water quality, it is necessary to completely remove or minimize the concentration of dyes to permissible limits prior to their discharge [4,5].

Several physical, chemical, and microbial methods like adsorption, coagulation, flocculation, biodegradation, chemical oxidation, reverse osmosis, membrane filtration, electrochemical methods etc. have been reported for the removal of dyes in the effluent [4,6,15,7–14]. However, due to the complexity of the dye-containing wastewater stream, there is no single technique capable of providing complete remediation for such streams [16]. Among the various methods, adsorption process has been found to be superior in terms of its effectiveness, flexibility, simplicity, and ease of operation. Adsorption also removes the dye molecule as a whole and leaves no harmful fragments in the effluents [11,17]. Adsorptive removal of pollutants from wastewater has been extensively studied using activated carbon, zeolites, biomaterials, polymers etc. However, owing to factors like low efficiency, high cost, recycling difficulty and lower adsorption rates of various adsorbents used, it is crucial to develop more efficient and cost-effective adsorbents for removal of pollutants from wastewater in industrial scale [18,19]. Metal and metal oxide nanoparticles, due to their small size, larger surface area, high adsorption efficiency, and other multifunctional properties, have gained great attention over conventional adsorbents in decontamination of wastewater [16,20,21]. Among numerous metal oxides used, ease of large-scale synthesis with economic viability has made zinc oxide nanoparticles ideal adsorbent in water decontamination applications [22]. Extensive literature is available on the utilisation of ZnO nanoparticles as a photocatalyst for removal of organic pollutants, however, its use as adsorbant is limited [12,23–29]. Adsorptive removal of Acid Black 210 [30], Reactive black 8 [31], Remazol Brilliant Blue R[30,32], Victoria Blue B [21], Congo red [19,22,33], Brilliant green [33], Ionic dyes [34], Methyl orange [35], Methylene blue [35,36], Rhodamine 6G [35], Rhodamine B [37], acid orange 7 [37], RuN3 [38], malachite

Accepted Manuscript

green [22] dyes using zinc oxide nanoparticles synthesised by different routes have been reported.

Among the various routes of nanoparticle synthesis, solution combustion method is a simple one-step process that requires lesser time and energy [39–41]. This method also yields homogenous and crystalline oxide products of high purity. Fuel used in the solution combustion synthesis is important among various experimental parameters because it has a tremendous effect on the exothermicity and amount of gases that evolve during the auto-combustion process. These parameters have significant effect on morphology, phase and particle size of the oxide products [42,43]. From the recent reports, it is evident that most commonly used fuels for combustion synthesis are carbohydrates and amines that have the capability of chelating with metal ions of desired metal oxides [39]. In spite of various reports on the use of different chemicals as fuels, use of eco-friendly, bio-derivative extracts as fuels are limited. The main objective of this research is therefore, to utilize extract of coffee husk, an agro waste generated during dry processing of coffee beans, as a sustainable fuel for the synthesis of ZnO nanomaterial (CHZnO) through solution combustion method. Coffee husk extract could play an important role as fuel because it is rich in biomolecules such as carbohydrates (58-85%), proteins (8-11 %), polyphenols, tannins etc. [44]. Some of these biomolecules contain amine groups which possess good chelating properties and helps in combustion [45]. The use of coffee husk extract as novel fuel for the synthesis of metal oxides could be a greater contribution to the field of nanomaterial synthesisand opens up a new avenue in the utilization of bio-waste as one of the reactants (fuel) for nanomaterial synthesis.

In the present study, adsorption efficiency for removal of Congo red using green-fuel derived CHZnO was compared with chemical-fuel derived SZnO. Effect of process parameters such as adsorbent dose, solution pH, initial dye concentration, temperature and time were studied in batch mode. The equilibrium adsorption data were analyzed with various kinetic and thermodynamic models and experimental data were modelled with various isotherms to understand the mechanism of Congo red adsorption on ZnO nanoparticles.

## Materials and Methods

### *Materials*

Zinc nitrate hexahydrate ($Zn(NO_3)_2.6H_2O$, 99 % purity) and Congo red ($C_{32}H_{22}N_6Na_2O_6S_2$, $\lambda_{max}$-497 nm, Figure) were procured from S D Fine-Chem Limited, Mumbai. All chemicals were of

Accepted Manuscript

analytical grade and used without further purification. Coffee husk was collected from Allana Coffee Curing Works, Hassan (13.0753° N, 76.1784° E), India. Double distilled water was used throughout the experiments. The structure of Congo red is given in Figure S1.

***Preparation of Coffee Husk extract***

Coffee husk was manually cleaned to remove foreign materials and dried in hot air oven at 40 ºC till a constant mass was achieved. Dried coffee husk was ground in a domestic mixer and powdered. 15 g of powder was boiled in 250 ml of water for 1 h with reflux arrangement. The extract was filtered to remove the residues and refrigerated for further experiments.

***Synthesis of ZnO nanoparticles***

To study the effect of fuel on morphology and adsorption capacity of nanoparticles, zinc oxide was prepared using coffee husk extract as green fuel and sugar as chemical fuel. For coffee husk extract mediated synthesis of ZnO, 2.97 g zinc nitrate hexahydrate was dissolved in 10 ml of coffee husk extract and diluted with 10 ml of double distilled water. The resulting redox mixture was stirred for 1 h using a magnetic stirrer to obtain a homogeneous solution. This mixture was kept in a preheated muffle furnace at 500±10 ºC. The reaction mixture underwent thermal dehydration followed by flame type combustion with the evolution of a large amount of gases. Milky white fluffy mass of nanocrystalline ZnO nanoparticles was obtained. The experiment was repeated for different volumes of coffee husk extract (20, 30, 40, 50 ml and 60 ml) to optimize the fuel quantity. The same protocol was used for chemical fuel mediated synthesis of ZnO nanoparticles using a stoichiometric ratio of zinc nitrate hexahydrate and sugar. The obtained ZnO nanoparticles using coffee husk extract and sugar were named as CHZnO and SZnO respectively.

***Characterization of ZnO Nanoparticles***

Powder X-ray diffraction (XRD) characterization of the ZnO nanoparticles was carried out using (Rigaku's, Smartlabs, Japan) rotating anode Cu Kα (1.5406 Å). The accelerating voltage and current were 30 kV and 40 mA respectively. The XRD patterns were collected in the 2θ range 10° to 70° with a step size of 0.02°. Scanning electron micrographs (SEM) were recorded to investigate the surface morphology using JEOL (JSM-840A) instrument. TEM analysis was

Accepted Manuscript

performed using JEOL JEM-301 machine operated at 200 kV. The surface area and porosity of the adsorbent were determined using a MicrotracBEL, Japan, Automatic specific surface area/pore size distribution measurement. The FTIR spectroscopic studies of the adsorbent have been carried out on a Perkin Elmer spectrometer (Spectrum 1000) with KBr pellets.

***Determination of Zero Point Charge***

The zero-point charge of the adsorbent was determined by solid addition method described elsewhere [38,39]. A Series of 50 ml 0.01 N NaCl solution was taken in 250 ml conical flask and solution pH was adjusted between 2 and 12 using 0.01 N NaOH and 0.01 N HCl. 0.01 g of ZnO nanoparticles was added to these solutions and kept in an orbital shaker at 150 rpm to equilibrate for 48 h. Final pH of the solution after 48 h was measured and the zero-point charge was obtained from the plot of the change in pH (final pH – initial pH) Vs initial pH.

***Batch Adsorption studies***

To assess the performance of the adsorbent, batch mode of adsorption experiments was conducted in 250 ml conical flasks with 50 ml of Congo red solution agitated at 150 rpm in an orbital shaker. Effect of adsorbent dosage (5-50 mg), pH (6-12), initial dye concentration (100-800 mg/L), temperature (30-60 $^{o}$C) and time (5-120 min) were systematically investigated. Initial pH was adjusted using sodium hydroxide (0.1 N) or hydrochloric acid (0.1 N). Post-interaction, solutions were centrifuged at 15000 rpm for 5 min to remove the adsorbent. The absorbance of the supernatant solution was recorded at 497 nm wavelength. The dye removal efficiency, equilibrium capacity of adsorption ($q_e$) and adsorption capacity at time t ($q_t$) are calculated using equations,

$$\text{Dye removal efficiency (\%)} = \frac{100\,(C_i - C_e)}{C_i} \quad \text{or} \quad \frac{100\,(C_i - C_t)}{C_i} \qquad \text{Equation (1)}$$

$$q_e = \frac{(C_0 - C_e)\,V}{m}, \text{ mg/g} \qquad \text{Equation (2)}$$

$$q_t = \frac{(C_0 - C_t)\,V}{m}, \text{ mg/g} \qquad \text{Equation (3)}$$

where $C_i$ is the initial dye concentration (mg/L), $C_e$ or $C_t$ is dye concentration left in solution after equilibrium or kinetic time, $V$ is the volume of dye solution (L) and $m$ is the mass of adsorbent (g).

Accepted Manuscript

### *Statistical Analysis*

Adsorption experiments were carried out in duplicates and average values were used for modelling of isotherm and kinetics data. Linear regression analysis of models was performed in Microsoft Excel® 2016 and the suitable models were selected based on the values of the coefficient of correlation ($R^2$) calculated using the following expression,

$$R^2 = \frac{\sum(q_{e,pre,i} - q_{e,exp,avg})^2}{\sum(q_{e,pre,i} - q_{e,exp,avg})^2 - \sum(q_{e,pre,i} - q_{e,exp,i})^2} \quad \text{Equation (4)}$$

where $q_{e,exp,i}$ and $q_{e,pre,i}$ are experimentally measured and model predicted adsorbate solid phase concentration on adsorbent at any observation i respectively. $q_{e,exp,avg}$ is average of experimentally measured observations and N is the number of observations [46].

## Results and Discussion

### *Characteristics of ZnO Nanoparticles*

XRD patterns of nano ZnO prepared with different volumes (10-60 ml) of coffee husk extract fuel are shown in Figure 1. XRD pattern of all the samples prepared indicated pure ZnO with hexagonal structure without any impurity phases within the concentration range of the fuel studied. All the diffraction planes can be readily indexed to standard data (JCPDS: 72-0627) [47]. However, the XRD diffraction peaks showed differences in peak height and width for samples prepared with the varying concentration of coffee husk extract fuel. With an increase in the volume of fuel, the peak width is found to increase and the intensity of diffraction peaks are significantly reduced. This might be attributed to reduced exothermicity when excess fuel is used due to the fact that part of energy during combustion is used up for oxidation of carbon moiety present in the fuel [43]. From the XRD pattern, it is evident that beyond 30 ml of fuel, there is a significant decrease in the crystallinity of the ZnO nanoparticles. On the other hand, when the volume of coffee husk extract is < 30 ml, the diffraction patterns show broad peaks with relatively less intensity. This suggests that when the fuel volume is < 30 ml, the crystallinity of the ZnO obtained is not sufficient enough due to fuel deficient conditions. 30 ml of coffee husk extract fuel which resulted in nano ZnO with appreciable crystallinity, is therefore chosen as the optimised concentration of fuel. Further, XRD pattern of ZnO prepared with sugar as fuel is shown in Figure 2. which indicates wurtzite structure ZnO particles devoid of

Accepted Manuscript

impurities. It is worth noticing that the crystallinity of the ZnO prepared with sugar as fuel is found to be significantly higher than that with coffee husk extract fuel. This might be due to higher exothermic nature of the reaction when sugar is used as fuel resulting in a better crystalline product. To evaluate the average crystallite size of the samples, Scherrer's peak broadening method was employed using Scherrer equation [48,49]. The average crystallite size for CHZnO and SZnO was found to be 12 nm and 24 nm respectively.

Scanning electron microscopic images of CHZnO and SZnO is shown in Figure 3 (a) and (b) respectively. From the micrographs, it is evident that SZnO nanoparticles showed well-formed particles with a varying size and the agglomeration of the particles resulted in the formation of interconnected particle clusters. Discontinuous nature of agglomerated particles resulted in the creation of voids in the structure. On the other hand, the surface morphology of the CHZnO has clusters of agglomerated mass and individual particles are not clearly distinguishable. The extent of agglomeration is found to be greater in CHZnOcompared to SZnO. It is worth noticing that in CHZnO varying sizes of agglomerated clusters are formed on flaky type morphology.. The difference in the size of agglomerated clusters can be attributed to the uneven distribution of heat during combustion reaction [50] and higher agglomeration in the coffee husk extract derived samples might be due to smaller particle size compared to that of sugar derived samples.

Transmission electron microscopy (TEM) of ZnO nanoparticles prepared by coffee husk extract and sugar as fuels is shown in Figure 4 (a) and (b) respectively. Figure 4(a) indicates predominantly spherical particles with a few irregular shaped particles. The size of the particles is found to be varying between 10 and 40 nm in diameter. However, TEM micrographs of CHZnO coffee husk extract derived ZnO nanoparticles (Figure 4 b) shows that all the particles are near spherical in nature with average size ~15 nm. The extent of agglomeration in CHZnO is found to be greater than that of SZnO. The obtained TEM result is consistent with SEM analysis and the reason for higher agglomeration might be due to smaller particles that readily agglomerate in order to reduce the higher surface energy.

Among the many important characterizations for nanopowders, specific surface area (SSA) is essential for evaluating the applicability for various engineering applications. It is well established and recorded fact that SSA ($m^2/g$) of powder samples depends on various other parameters such as size, morphology, size distribution, and synthesis methodology. In addition to this, porosity is also one crucial factor that significantly affects the SSA. It is well-known fact

Accepted Manuscript

that solution combustion derived products possess high porosity due to the liberation of gaseous byproducts during the exothermic reaction [45]. Further, the heat generated during exothermic combustion reaction is sufficient enough for the nucleus formation but too short for the grain growth. This will lead to the formation of particles in the nano-regime and hence higher surface area for combustion derived products [42]. The surface area and pore size distribution of the samples CHZnO and SZnO are evaluated from $N_2$ adsorption-desorption isotherms and are given in Figure 5(a) and (b) respectively. The BET surface areas of CHZnO and SZnO are found to be 38 and 29 $m^2/g$ respectively. The reduced surface area for SZnO can be attributed to the reduced particle size compare to that of CHZnO, which is also evident from TEM analysis. The reasons for variation in particle size are discussed in PXRD and TEM sections. The pore size distribution is calculated using the Barrett–Joyner–Halenda (BJH) model and indicates that pore size distribution is in the range of 10 - 30 nm with a maximum at about 11 nm.

***Effect of Adsorbent dosage***

The effect of adsorbent dosage on the removal of Congo red dye using zinc oxide nanoparticles was studied with an initial dye concentration of 20 mg/L at neutral pH and the results obtained are shown in Figure 6. With an increase in adsorbent dosage, the percentage dye removal is found to increase. Percent removal of dye was 32 % with 0.1 g/L of CHZnO and reached a maximum of 96 % at 0.7 g/L dosage. In contrast, use of SZnO as adsorbent showed 26 % (minimum) and 83 % (maximum) removal when the dosage was 0.1 and 0.9 g/L respectively. The increase in dye removal efficiency with dosage can be attributed to the increase in adsorption sites. The greater adsorption capacity of CHZnO compared to SZnO can be attributed to smaller particle size and larger surface area of CHZnO compared to SZnO which are evident from TEM and BET surface area results (Figure 4 and 5).

***Effect of pH***

Adsorption of pollutants on to solid particles greatly depends on the solution pH, which significantly influences absorbent surface charge and ionization degree of pollutants [51,52]. The effect of pH on Congo red adsorption on ZnO nanoparticles was studied in the pH range 6 and 10.5 (Figure 7). The studies were not carried below pH 6 because of shift in $\lambda_{max}$ of the dye.

Accepted Manuscript

The dye removal efficiency of CHZnO nanoparticles varied from 83 % to 78 % in the pH range 6 to 8, and decreased significantly beyond pH 8. The dye removal efficiency of SZnO nanoparticles also decreased significantly beyond pH 7. The experimentally determined zero-point charge for CHZnO and SZnO is pH 7.55 and pH 7.35 respectively (Figure 8). At pH above the zero-point charge, adsorbent surface acquires a negative charge and develops a repulsive force against anionic Congo red dye resulting in decreased removal efficiency. Based on the pH experiments the optimum pH for dye removal was considered to be pH 7 and further experiments are carried out at this pH.

***Adsorption Isotherms***

It is important to develop a correlation for the equilibrium data to optimize the design of adsorption system. The interaction between adsorbate and adsorbent can be better explained using equilibrium adsorption isotherm. Experimental equilibrium data were fitted with four isotherms namely Langmuir, Freundlich, Temkin and Dubinin-Radushkevitch isotherms and the equations for these models are presented below (Equation 5-11):

Langmuir Isotherm:

$$q_e = \frac{q_{max} K_L C_e}{1 + K_L C_e} \quad \text{Equation (5)}$$

$$R_L = \frac{1}{(1 + K_L C_0)} \quad \text{Equation (6)}$$

Freundlich Isotherm:

$$q_e = K_f C_e^{1/n} \quad \text{Equation (7)}$$

Temkin Isotherm:

$$q_e = \frac{RT}{b_T} \ln(K_T C_e) \quad \text{Equation (8)}$$

.

Dubinin-Radushkevitch Isotherm:

$$q_e = q_{DR} e^{-K_{DR}\varepsilon^2} \quad \text{Equation (9)}$$

$$\varepsilon = RT \ln\left(1 + \frac{1}{C_e}\right) \quad \text{Equation (10)}$$

$$E = \frac{1}{\sqrt{2K_{DR}}} \quad \text{Equation (11)}$$

where $q_{max}$ (mg/g) is maximum saturated monolayer adsorption capacity; $K_L$ (L/mg), Langmuir constant related to the affinity between adsorbent and adsorbate; $R_L$ (Dimensionless), separation factor; $K_f$ (mg/g) (L/mg), Freundlich constant; n, Freundlich intensity parameter; $K_T$ (L/mg), equilibrium binding constant; $b_T$( J/mol), Temkin isotherm constant related to the heat of sorption; $q_{DR}$ (mg/g), adsorption capacity; $K_{DR}$ ($mol^2/kJ^2$), constant related to sorption energy; ε,

Accepted Manuscript

Polanyi potential; R (kJ $K^{-1}$ $mol^{-1}$), gas constant (8.314 $\times 10^{-3}$); T (K), absolute temperature; E (kJ/mol), mean adsorption energy.

Model constants and $R^2$ values of selected isotherms are given in Table 1. According to the results obtained, the Langmuir isotherm model has the highest $R^2$ value and fitted best with experimental equilibrium data obtained for both the adsorbents in the temperature range studied (30 to 60 $^oC$). Langmuir isotherm model explains the formation of monolayer adsorption of adsorbate molecules on the surface of the adsorbent with the absence of lateral interaction or steric hindrance between adsorbate molecules [46]. The obtained results indicated a decrease in the maximum adsorption capacity, $q_{max}$, which could be attributed to the exothermic nature of adsorption process. Langmuir constant, $K_L$, also decreased with increase in temperature indicating that affinity between adsorbate and adsorbent deceased with an increase in temperature. The maximum adsorption capacity of Congo red on CHZnO and SZnO was found to be 77 and 52 mg/g respectively. The adsorption capacities of CHZnO and SZnO are compared with the other adsorbents reported in literature and tabulated in Table 2. As evident from Table 2, CHZnO is a promising adsorbent for removal of Congo red from wastewater compared to the other reported nanomaterial-based adsorbents.

The predicted $q_{max}$ values obtained from the Langmuir model are closer to the experimental values compared to the $q_{max}$ predicted by other isotherm models. In addition to the Langmuir constant ($K_L$), favourability of adsorption process was also identified using the separation factor, $R_L$ [61]. This separation factor signifies the nature of adsorption process depending on the values of $R_L$. $R_L>1$, $R_L=1$, $0<R_L<1$ and $R_L=0$ indicate to unfavourable, linear, favourable and irreversible adsorption process respectively. Effect of temperature and concentration on $R_L$ values are depicted in Figure 9 (a) and (b). In the present study $R_L$ values are found to be in the range $0<R_L<1$ indicating that the adsorption process is favourable.

***Adsorption Kinetics and Mechanism of adsorption***

In general any adsorption process involves three important steps: (a) transfer of adsorbate molecules from bulk phase to adsorbent surface - film diffusion or external diffusion (b) movement of adsorbate molecules from outer surface of adsorbent to the pores - intraparticle or pore diffusion (c) attachment of adsorbate molecule to the adsorption site [62]. Film diffusion and pore diffusion are transport steps that lead to the adsorption process and the last step is the reaction step where adsorbate molecules bind to the adsorptive sites. In the adsorption process, the reaction step is rapid compared to transport steps. So it is critical to evaluate the kinetic

Accepted Manuscript

parameters to understand the performance of adsorbent and estimate the rate-limiting step in the process [63]. Two reaction models and two diffusion based models were employed to study the kinetics of Congo red adsorption on ZnO nano-adsorbents. The details of the selected models are presented below:

**Pseudo First Order**

$$q_t = q_e\left(1 - e^{-k_1 t}\right) \quad \text{Equation (12)}$$

**Pseudo Second Order**

$$q_t = \frac{q_e^2\, k_2\, t}{1 + k_2\, q_e\, t} \quad \text{Equation (13)}$$

**Weber-Morris Intra-particle Diffusion**

$$q_t = k_d\, t^{1/2} + C \quad \text{Equation (14)}$$

**Bangham**

$$\log\left\{\log\left(\frac{C_o}{C_o - q_t\, m}\right)\right\} = \log\left(\frac{k_o\, m}{2{,}303\, V}\right) + \propto \log(t) \quad \text{Equation (15)}$$

where qe (mg/g) is adsorption capacity at equilibrium; qt (mg/g), adsorption capacity or concentration of solute in a solid phase at time t (min); $k_1$ ($min^{-1}$), pseudo first-order rate constant; $k_2$ (g/mg. min), pseudo-second-order rate constant; $k_d$ (mg/g x $t^{1/2}$), intraparticle rate constant; C (mg/g), constant associated with the thickness of the boundary layer; $C_o$ (mg), amount of initial adsorbate in the liquid phase; m (g), amount of adsorbent; V(L) is the volume of solution used in the batch adsorption; $k_0$ (L $g^{-1}$) and α (<1) are the Bangham's equation parameters [62,64].

The kinetic model parameters and $R^2$ values obtained at various concentrations are summarised in Table 3. Based on the $R^2$ values, pseudo-second-order model fitted well with experimental kinetic data indicating Congo red adsorption on nano ZnO follows the pseudo-second-order model. Further, this is also supported by the values of $q_e$ that are found to be closer to the experimental values. It is worth noticing that with an increase in dye concentration from 20 to 60 mg/L, adsorption capacities for CHZnO and SZnO were found to increase by a factor ~48 % and ~53 % respectively (Figure 10 (a) and (b)).

Mere reaction models are not sufficient to identify the diffusion mechanism during the adsorption process. Therefore, Weber-Morris intraparticle diffusion and Bangham diffusion models were employed to explain the diffusion rate-limiting step [65]. From Table 3, it can be

Accepted Manuscript

noted that the value of intercept C of Weber-Morris model is found to be away from zero indicating that this model is not suitable to predict the rate-limiting step. Further, if intraparticle diffusion is the only rate-limiting step in adsorption has been confirmed by Bangham model. Higher correlation of desired linear fit in the double logarithmic plot shows that intraparticle diffusion is the rate-limiting step in the adsorption of Congo red on ZnO nanoparticles [66]. From the obtained experimental results, it is also observed that the diffusion rate increased with increase in concentration. An increase in initial concentration will produce a higher concentration gradient which will eventually cause faster diffusion and quicker adsorption (Ofomaja, 2010). Thus one may infer that intraparticle diffusion is the significant rate-limiting step in the adsorption of Congo red on nano ZnO.

***Thermodynamic Studies***

Development of efficient batch adsorption process for removal of pollutants from aqueous solution is significantly reliant on various thermodynamic parameters such as Gibbs free energy ($\Delta G$), enthalpy change ($\Delta H$), entropy change ($\Delta S$), isosteric heat of adsorption ($\Delta H_X$), mean free energy per molecule of adsorbate ($E_d$) etc. These parameters are also critical in predicting the nature of adsorption; either physisorption or chemisorption [59]. Thermodynamic parameters were computed using the following equations:

$$\Delta G^0 = -RT \ln K_c \qquad \text{Equation (16)}$$

where R is a universal gas constant (8.314 x $10^{-3}$ kJ $mol^{-1}$ $K^{-1}$) and $K_c$ is dimensionless equilibrium constant derived from Langmuir coefficient $K_L$ using Equation 17.

$$K_C = M_w \times 55.5 \times 1000 \times K_L \qquad \text{Equation (17)}$$

Where $M_W$ is molecular weight of Congo red (696 g/mol), factor 55.5 is the number of moles of pure water per litre[67,68].

The relationship between $\Delta G^o$, $\Delta H^o$ and $\Delta S^o$ is described as follows:

$$\Delta G^o = \Delta H^o - T\Delta S^o \qquad \text{Equation (18)}$$

Substituting Equation (16) in Equation (18) one can obtain well know van't Hoff equation given in Equation (3)

$$\ln K_c = \frac{-\Delta H^o}{R}\frac{1}{T} + \frac{\Delta S^o}{R} \qquad \text{Equation (19)}$$

Accepted Manuscript

The values of $\Delta H^o$ and $\Delta S^o$ are determined using the plot of $\ln K_C$ Vs 1/T. Thermodynamic parameters calculated for both the adsorbents are tabulated in Table 4. A negative value of $\Delta G$ confirms that adsorption of Congo red on ZnO nanoparticles is a spontaneous and feasible process. A negative value of $\Delta H$ confirms the adsorption process is exothermic and indicates that adsorption efficiency of the adsorbent decreases with increase in temperature. The values of $\Delta H$ in the range of -20 to 0 kJ/mol infer that hydrogen bonding forces may play a vital role in the adsorption of Congo red on ZnO nanoparticles [69]. The magnitude of the $\Delta H$ value indicates that adsorption of Congo red dye on ZnO nanoparticles is physical in nature [70].

Isosteric heat of adsorption is another important thermodynamic parameter used to characterize and optimize the adsorption process. It is also a crucial parameter in the design of adsorption separation process and provides insights into the surface energy heterogeneity of adsorbent. The isosteric heat of adsorption at constant surface coverage is calculated using an integrated form of Clausius–Clapeyron equation given below:

$$\ln C_e = -\left(\frac{\Delta H_X}{R}\right)\frac{1}{T} + C \qquad \text{Equation (20)}$$

where C is the constant.

From Table 5, it is found that $\Delta H_X$ values for both the adsorbents at various temperatures are below 80 kJ/mol and is attributed to the occurrence of physisorption process [71]. The decrease in $\Delta H_X$ values at higher solution concentration indicates that ZnO nanoparticles have energetically heterogeneous surfaces. In contrast, a constant value of the heat of adsorption is attained in the adsorbents which have homogenous surfaces [70,72]. From Table 5 it is evident that at low adsorbent concentrations, heat of adsorption values are found to be higher but when the adsorbent concentrations are higher these values are found to be lower. This can be explained based on the adsorbate-adsorbent interactions. These interactions results in high adsorption heat values whereas the interaction between adsorbate and adsorbate molecules leads to lower values of heat of adsorption [71].

## Stability Studies of Adsorbents

Stability of the adsorbents after use in adsorption experiments are significant in order to utilise them for real time applications. To evaluate the stability of the ZnO adsorbent after adsorption the samples were characterized by XRD, FTIR and EDAX techniques. From the XRD results it

Accepted Manuscript

is evident that there is no significant variation in the diffraction pattern before and after adsorption experiments for CHZnO (Figure S2). All the diffraction peaks and peak positions are unaltered after the adsorption experiments. Therefore, it can be inferred that ZnO adsorbent after adsorption experiment is found to be stable. Further, FTIR spectra recorded for both CHZnO and SZnO showed characteristic Zn-O peak ~447 $cm^{-1}$ (Figure S3 and S4). It can be noticed that the characteristic Zn-O bond stretching band is unaltered even after adsorption experiments. This clearly indicates that adsorbent is stable even after adsorption experiments. Similarly, EDAX analysis also showed that except for the additional C peak (due to Congo red adsorption) the other elemental composition remains same (Figure S5).

## Conclusion

In summary, the influence of green and chemical fuel on adsorptive characteristics of solution combustion derived nano ZnO for Congo red as a model pollutant was demonstrated. ZnO nanoparticles synthesized using coffee husk extract (CHZnO) showed smaller particles size compared to that synthesized with sugar (chemical fuel) (SZnO). Adsorption studies clearly demonstrated that pH, adsorbent dose, initial dye concentration, temperature and time have a significant effect on dye removal. CHZnO showed higher adsorption efficiency with adsorption capacity ~ 77 mg/g. Langmuir isotherm model regressed well with experimental equilibrium data for both the adsorbents in the temperature range studied. Separation factor ($R_L$) calculated to be in the range $0<R_L<1$ indicates favourability of the adsorption process. Hydrogen bonding forces might play a vital role in the adsorption of Congo red on ZnO nanoparticles since the values of $\Delta H$ was in the range of -20 to 0 kJ/mol. Modelling of experimental data with various diffusion based kinetic models to understand the mechanism of adsorption indicated that intraparticle or pore diffusion was the major rate controlling step. This study demonstrates the promising application of agro-based bio-waste as fuel in combustion synthesis for the preparation of efficient adsorbents for water treatment.

# A NOVEL APPROACH TOWARDS GREEN SYNTHESIS OF ZINC NANO PARTICLES FROM *GUAZUMA ULMIFOLIA* (LAM) FOR THEIR ANTI OXIDANT ACTIVITY STUDY

**Nannapaneni U. R.[a]* and Rayapati S. R.[b]**

(Received 24 September 2018) (Accepted 02January 2019)

**ABSTRACT**

Here we report a novel biological approach for the formation of zinc nanoparticles using *Guazuma ulmifolia* (Lam) leaves. Zinc acetate was reduced with aqueous solution of *Guazuma ulmifolia* leave extracts. X-Ray diffraction (XRD) pattern reveals the formation of zinc nanoparticles, which shows crystallinity. Scanning electron microscopy (SEM) suggested particles size in the range of 46-96nm and spherical shape. UV absorption studies of zinc nano particles showed absorbance at 698nm and FT-IR studies of zinc nanoparticles confirmed the presence of bio active phyto-constituents in the formed nano particles. The DPPH free radical inhibition study confirmed that the synthesized zinc nano particles have potential radical inhibiting activity.

***Keywords***: *Guazuma ulmifolia*, zinc nanoparticles, FT-IR, XRD, SEM, DPPH radical scavenging activity

## INTRODUCTION

It has been demonstrated that many biological systems, including plants algae[1], diatoms[2], bacteria[3], yeast[4], fungi[5], and human cells[6] can transform inorganic metal ions into metal nanoparticles. The advantages of using plant and plant-derived materials for biosynthesis of metal nanoparticles have interested researchers to investigate mechanisms of metal ions uptake and bioreduction by plants, and to understand the possible mechanism of metal nanoparticle formation in plants. Among all other biological synthesis methods, plants and plant extracts appear to be the best options because of cost efficiency, low cost a of cultivation, short production time, safety and low maintenance requirement. In this connection, the present paper deals with the eco-friendly synthesis of zinc nanoparticles by *Guazuma ulmifolia* plant extract.

*Guazuma ulmifolia* (Lam), a West Indian Elm is a medium-sized tree and has been cultivated in India and Sri Lanka for over 100 years, and often planted as shade and ornamental tree elsewhere in the tropics. It is also found in the Caribbean, Mexico, Central America and Colombia, Ecuador, Peru, Bolivia, Paraguay, Argentina, and Brazil[7]. The tree produces small, whitish-cream flowers during the dry season. These develop into odd, woody fruits which look similar to the true Rudraksh, used as beads in *rudraaksh maala* worn by sadhus and saints. Usually, leaves are alternate, in flat plane along long branches, upper side dark green, underside light green-blue. The plant has a long history of herbal use, and is much used in modern herbal medicine in South America. The plant is antibacterial, anti-inflammatory, antifungal, antitussive, antiviral, astringent, blood purifier, cardiac, diaphoretic, digestive, diuretic, febrifuge, haemostatic, hypotensive, oxytocic and vulnerary. Various studies using leaf and bark extracts have clinically demonstrated remarkable antibacterial activity against several disease-causing pathogens, including *Bacillus, Staphylococcus, Streptococcus, E. coli, and Neisseria gonorrhea.* The bark is a rich source of tannins and antioxidant chemicals called proanthocyanidins. In particular, procyanidin B-2 has been shown in various studies to help promote hair growth and alleviate baldness[8].

The plant *G. ulmifolia* is having tremendous medicinal activity and there is no manuscript reported for the synthesis of nano particles using *G. ulmifolia*. Hence, the present work describes the synthesis and DPPH free radical activity study of zinc nano particles using *G. ulmifolia* leaves.

## MATERIAL AND METHODS

### Collection of Plant Material

Fresh leaves of the plant *G. ulmifolia* were collected in the coastal area near Machilipatnam port, Andhra Pradesh, India.

[a] Department of Freshman Engineering, Prasad V. Potluri Siddhartha Institute Technology, Kanuru, Vijayawada - 520007 Andhra Pradesh, India

[b] Department of Chemistry, Bapatla College of Arts and Science, Bapatla - 522101, Guntur, Telangana, India

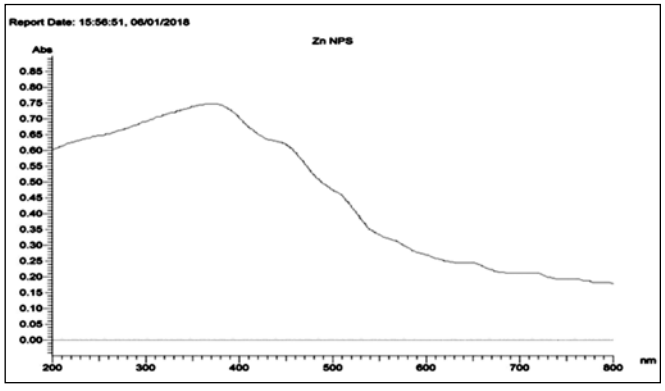

**Fig. 3: UV- visible absorption spectra of synthesized zinc nano particles**

## Collection of the extracts

Collected plant parts were cleaned with water absorbent paper (wet filter paper). Then, it was cut into small pieces, dispensed in 100 mL of sterile distilled water and boiled for one hour at 80$^0$C. Then the extract was collected in separate conical flasks by standard filtration method.

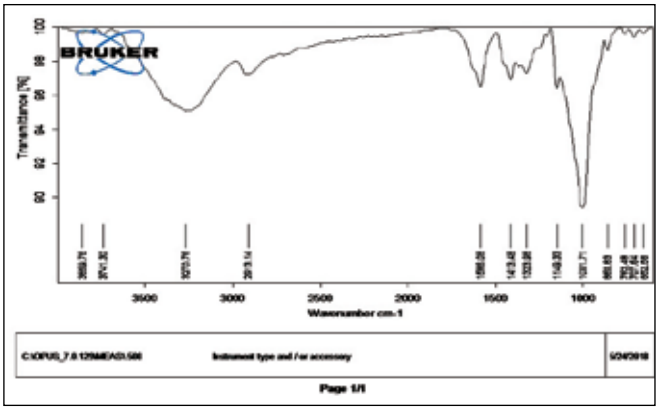

**Fig. 4: FT IR spectrum of synthesized zinc nano particles**

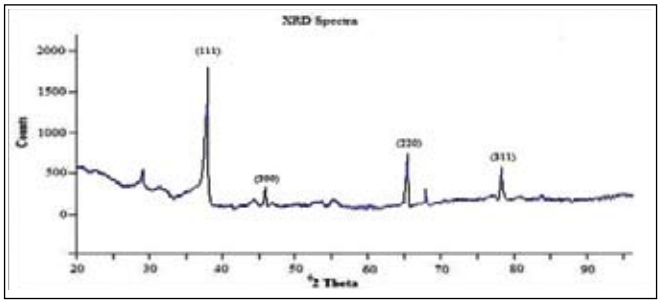

**Fig. 5: XRD spectrum of synthesized zinc nano particles**

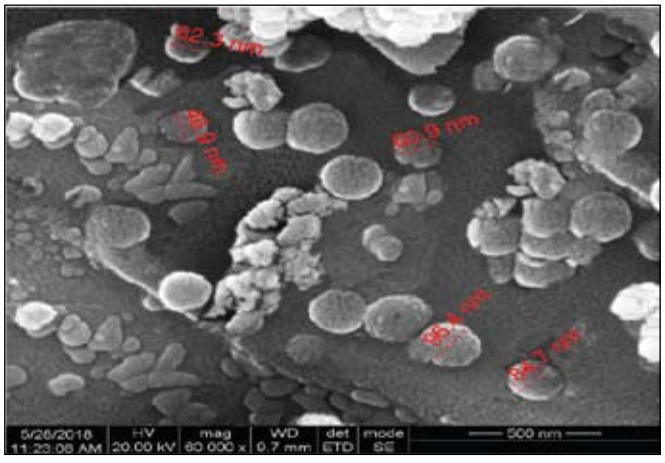

**Fig. 6: Scanning electron microscopy image of synthesized zinc nano particles**

## Preparation of extract

Different parts of the plant like leaves, stem, root, flower and whole plant were used for the synthesis of zinc nano particles. 10 g of different parts of plant powder was dissolved in 100 mL of distilled water separately and boiled under constant stirring using a magnetic stirrer for around 3 h. After cooling, the extract was centrifuged

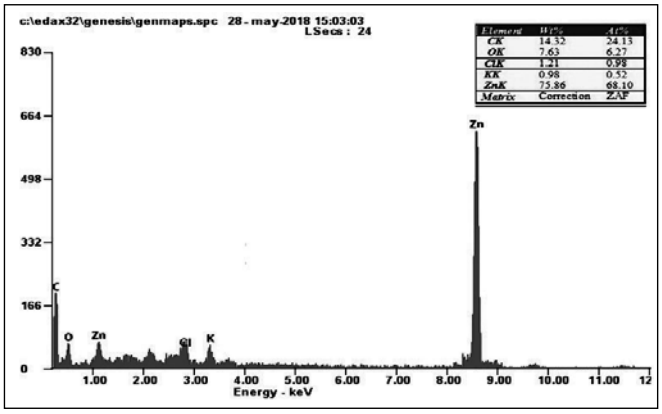

**Fig. 7: EDS of synthesized zinc nano particles**

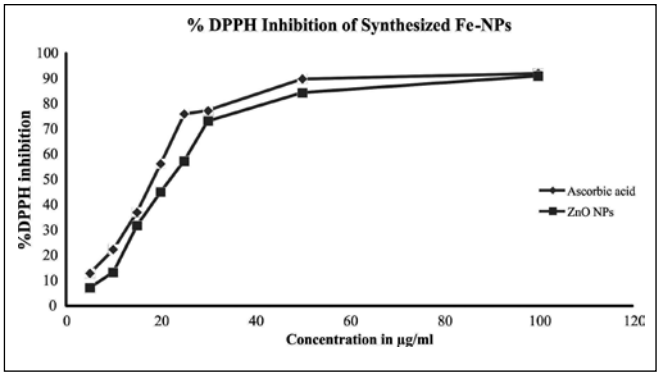

**Fig. 8: DPPH free radical scavenging activity study results**

twice for 10 min to get clear extracts. All the extracts were preserved in air tight container and were used for the synthesis of zinc nano particles.

## Green synthesis of zinc oxide nanoparticles

15 mL of selected plant part extract of *Guazuma ulmifolia* was added to 2.195 g of zinc acetate dihydrate dissolved in 35 mL of distilled water. The reaction mixture was kept on magnetic stirrer for 6h. After 6h, 2 M NaOH (4 g of NaOH pellet in 50 mL of Milli-Q water) was added to the solution and it was placed in incubator at 60°C with magnetic stirring overnight then it was centrifuged at 14,000 rpm for 15 min. Precipitate was subjected to washing with alcohol and distilled water three times each. Precipitate was dried in an incubator at 40–50 °C and fine powder was prepared with the help of ceramic pestle and mortar. The same procedure was fallowed for the synthesis of zinc nano particles using different parts of plant *G. ulmifolia*. The nanoparticles that produced high yield were considered for further characterization and biological activity study.

| Yield of nano particles | | 26.5mg | 15.7mg | 11.8mg | 9.1mg | 19.2mg |

X-ray diffraction (XRD) techniques. The UV absorption of synthesized zinc nano particles was studied in the range of 500-200 nm. The UV absorption was recorded using Techomp (UV-2301) and the absorption values were re-plotted using UV solution software 2. Fourier transform infrared (FTIR) spectroscopy was studied for determining the functional groups involved in the synthesized ZeNPs on Perkin Elmer FTIR Spectrophotometer with attenuated total reflectance technique. Energy dispersive spectrometer (EDS) conforms the purity of zinc nano particles. Field emission electron microscopy (LEO 1420 VP Compact variable pressure Digital SEM manufactured by Leo Electron Microscopy Ltd) was used for determining the size, shape of the synthesized ZeNPs. X-ray diffraction (Bruker-D4 ENDEAVOR XRD instrument) was used for determining the atomic and molecular structure of a nano crystal.

### DPPH free radical scavenging activity of synthesized zinc nano particles

*In vitro* antioxidant activity was studied by testing the scavenging capacities on 2,2-diphenyl-1- picrylhydrazyl (DPPH) free radical. The nanoparticle solution was lyophilized and converted to a powder, the concentration of the stock solution was 1 mg/mL. Various concentrations of the stock solutions (concentrations of 5-100µg/mL) were mixed with 0.25 mM DPPH in ethanol, to produce a final DPPH concentration of 0.1 mM. The mixture was vigorously shaken and left to stand for 20 min in the dark and its absorbance was measured at 517 nm. Ascorbic acid was used as the standard. The radical-scavenging activities of samples, expressed as percentage inhibition of DPPH, were calculated according to the formula i.e.,

$$\text{Inhibition percentage} = \frac{(\text{Absorbance of control} - \text{Absorbance of sample})}{\text{Absorbance of control}} \times 100$$

## RESULTS AND DISCUSSION

Different parts of *G. ulmifolia* plant extracts were employed for the green synthesis of zinc nanoparticles. The color formed during the addition of different parts of plant extract and zinc metal solution was noted. The color of the zinc acetate and plant extract mixture was gradually changed from light yellow to dark brown, indicating the formation of zinc nanoparticles. The color formed in the metal of leaf extract as green reducing agent produces high yield with less time of 6h. The formation of nano particles in the presence of other plant medicated synthesis show less color change and very less yield was observed, confirming that the formation of nano particles was high in the presence of leaf extract of *G. ulmifolia* as reducing agent. The color changes and the yields of nano particle formation are given in Table I. The nano particles formed using leaf extract produces a very high amount of 26.5mg of nano particles where as flower extract produces a very less amount of 9.1mg. The synthesis of zinc nano particles process is given in Fig. 2. The nano particles formed using leaf extract of *G. ulmifolia* as reducing agent was found to produce high amount of nano particles in less time and hence further studies were carried using nano particles formed using leaf extract of *G. ulmifolia*.

The UV absorption nature of the synthesized nano particles was studied using UV visible spectrophotometer. At a temperature of 35°C, the formation of the nanoparticles was observed with a characteristic plasmon band at 368 nm, which appeared at 30 min reaction time (Fig. 3). No change in absorbance was observed after 6h, indicating the complete conversion of $Zn^{++}$ to Zn. FTIR spectroscopy was employed to determine the possible bimolecular and functional groups involved in reduction, capping and efficient stabilization of newly synthesized zinc nanoparticles. The FTIR spectrum of zinc nano particles are presented in Fig. 4. In the FTIR spectrum of synthesized zinc nano particles, some pronounced absorbance was recorded in the area between 4000 and 500 $cm^{-1}$. Strong band at 1149 $cm^{-1}$, 3741 $cm^{-1}$ and 3270 $cm^{-1}$ confirms the C-O stretch, O-H stretch and H-bonded O-H group in alcoholic compounds confirms the alcoholic compounds in the nano particles. The aromatic carbon=carbon stretching vibration was observed at 1586 $cm^{-1}$ confirms that aromatic alcoholic compounds are involved in the formation of zinc nano particles. The precipitation stage during the reduction process usually involves fast chemical reactions and nucleation kinetics, thus the type of reducer is a significant factor in the particle size distribution of the product. The results previously reported indicated that flavonoids, phenolic compounds and terpenoids may be held responsible for efficient capping and stabilization of obtained nano particles. The X-ray diffraction analyses were carried out to determine the known phase of the zinc nanoparticles. Fig. 5 demonstrates the XRD pattern of the dried synthesized zinc nanoparticles by the *G.ulmifolia* leaf extract. The spectrum exhibited four distinct separate peaks at $2\theta$ of 35.6, 46.2, 65.1 and 79.7 that could be indexed to (111) (200), (220), (311) and (222) planes, respectively. The diffraction peaks data obtained were in accordance with the reports of FCC structure. The mean grain crystalline size of green synthesized zinc oxide nano particles was calculated by employing Debye–Scherrer formula. The average grain crystalline size of zinc nano

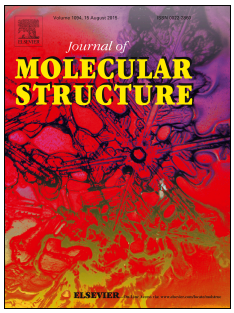
particles was estimated to be approximately 70.2nm. A small number of unassigned peaks were also recorded that might be due to the crystallization of bioorganic phases present in *G. ulmifolia* leaf extract on the surface of the zinc nanoparticles.

SEM technique was employed to determine the surface morphology and the topography of synthesized zinc nanoparticles. Fig. 6 shows the size of zinc nanoparticles from 46-96nm, with an average size 70.2nm. SEM image exhibited that the biosynthesized zinc nanoparticles were mostly circular shape. The circular particles were found to be less in size than the irregular particles.

The EDS profile (Fig. 7) shows a strong zinc signal at 8.6eV. The graph also shows the presence of carbon (C), oxygen (O), chloride (Cl) and potassium (K) in the EDS picture of zinc nanoparticles. It has been reported that nanoparticles synthesized using plant extracts are surrounded by a thin layer of some capping organic material from the plant extract and are, thus, stable in solution up to 4 weeks after synthesis. This is another advantage of nanoparticles synthesized using plant extracts over those synthesized using chemical methods.

### Anti-oxidant activity by DPPH method

The antioxidant activity of the synthesized zinc nano particles and ascorbic acid were evaluated using DPPH scavenging assay. The IC50 values of extract, standard and synthesized zinc nano particles are reported in Table II. It can be inferred from the data that synthesized zinc nano particles displayed similar antioxidant activity in comparison to standard ascorbic acid. There was a dose dependent increase in the percentage inhibition (% inhibition) of extracts and synthesized zinc nano particles. DPPH free radical scavenging assay of the synthesized zinc nano particles when compared with the standard ascorbic acid showed promising activity (Fig. 8). It was found that at a concentration of 5-100µg/mL, the bio-conjugated zinc nano particles exhibited better free radical scavenging activity with reference to drug ascorbic acid. These results suggest that at concentrations of 30µg/mL, the synthesized zinc nano particles may serve as potent radical scavengers. All these results suggest that intercalation of bio extracts with zinc nanoparticles can serve as promising antiradical agents.



## CONCLUSION

The present work reports the facile, convenient and eco-friendly, *G. ulmifolia* leaves extract mediated green synthesis of bio-conjugated zinc nanoparticles. The characterization with UV–Vis spectroscopy, FT-IR, SEM and EDS analysis authenticate the formation of target zinc nanoparticles. Characterization analysis depicts the stabilization of synthesized zinc nanoparticles by the capping organic materials thereby preventing their agglomeration. The synthesized zinc nanoparticles exhibited promising ability to diffuse the toxic free radicals and can be used as a possible food additive or in nutraceutical and biopharmaceutical industries. It could be concluded that *G. ulmifolia* leaves mediated zinc nano particles can be used efficiently in the production of potential antioxidant and antibacterial zinc nano particles for commercial application.

**Abstract**

In the present study, the title compound 1,7-bis(4-bromophenyl)heptane-1,7-dione (BBPHD) was synthesized according to the procedure described in literature, and its solid state crystal structure was characterised by the single crystal x-ray diffraction study. The complete crystallographic information has been reported in the present work. Physicochemical characterization by various spectral tools such as FT-IR, FT-Raman, $^{1}$H-NMR, $^{13}$C-NMR and UV-visible, have been performed as well and these results have been correlated with the theoretical data. The ground state geometrical optimization of the title compound has been performed using the DFT/B3LYP/6-311++G(d,p) level of theory in gas phase. Extracted molecular structure obtained by x-ray difractometry has been used as the starting molecular structure for geometrical optimizations. Computationally obtained structural and geometric parameters are in good

agreement with the experimentally obtained values. The experimental FT-IR and FT-Raman spectral data were compared with the theoretical spectral data and the complete assignment of vibrational wave numbers has been done on the basis of potential energy distribution (PED). In addition, reactive properties have been addressed on the basis of frontier molecular orbital analysis, global chemical reactivity descriptors, natural bond order (NBO) analysis, nonlinear optical (NLO) properties, molecular electrostatic potential (MEP) and average local ionization energy (ALIE) surfaces. Molecular dynamics (MD) simulations have been used in order to study the influence of water to the title compound. The docked ligand forms a stable complex with feruloyl esterase inhibitor and could be considered as a lead compound for the development of new antioxidant drug.

**Key words:** DFT; Hirshfeld surfaces; ALIE; RDF; Molecular docking.

## 1. Introduction

Owing to their abundance in natural products and pharmacologically active compounds, the significance of halogenated compounds is increasing [1-3]. This class of molecules has been successfully applied for the development of paints, dyes, adhesives, flame retardants, imaging agents in medical diagnosis, hydraulic and heat transfer fluids, refrigerants, solvents and in materials science [4-6]. Halogenated aromatic organic substrates are of great importance for the organic chemistry transformations, especially in the area of cross-coupling chemical reactions [7]. Although the halogenation is frequently followed by toxic chemicals, this procedure is highly developed and frequently used. There are number of advantages when it comes to the employment of halogens for the development of new molecules. For example, the introduction of carbon-halogen bond increases the thermal and oxidative stability, which leads to the lower sensitivity towards the oxidation by the liver P450 detoxification [6]. The same group of authors also indicates that carbon halogen bond increases the biological membrane permeability. Halogenated compounds are especially important in the area of agriculture and halogenation proved to be an important tool for development of efficient agricultural products. Jeschke [8] reports the information that since 2010, 96%of launched agricultural products, including herbicides, fungicides, insecticides/acaricides and nematicides, are containing halogen atoms. Positive effects of halogen atoms and halogen-containing groups are owed to steric and electronic effects [9], polarity of carbon-halogen bond [10] and pKa values effects [8]. One of the most important parameters in terms of pharmacokinetics, molecular lipophilicity, turned out to be adjustable by the substitution with halogen atoms [11]. Recently, Chen et al. [12] reported specific

nematic liquid crystal (LC) whose synthesis is based on the title compound (BBPHD). Taking into account the importance of their work, and importance of BBPHD for the synthesis of some other new specific nematic liquid crystals, we have decided to study BBPHD in details by spectroscopic and computational approaches. Density functional theory (DFT) represents irreplaceable tool for performing efficient and inexpensive computational studies in many areas [13-16]. DFT calculations with the hybrid exchange correlation functional B3LYP (Becke's three parameter (B3) exchange in conjunction with the Lee-Yang-Parr's (LYP) correlation functional) are of particular significance for studying systems comprising of extensive electron conjugation and/or electron lone pairs [17-20]. These structures have been the subject of many experimental and theoretical studies, especially when it comes to understandings of their structure, molecular properties and reaction mechanisms. Computational molecular modelling based on DFT calculations has become practically indispensable tool for evaluation and prediction of various properties of molecules and structures [21, 22], while in this work DFT calculations have been used in order to address global and local reactivity descriptors, including frontier molecular orbitals, MEP and ALIE surfaces and Fukui functions. DFT calculations were also used for confirmation of spectroscopic characterization and elucidation of vibrational specificities. Natural bond orbital (NBO) analysis has also been performed. Because newly synthetized molecules such as BBPHD might find place in the new pharmaceutical products, it is quite possible that they might end up in different water resources [23-27]. The introduction of halogen atoms also increases the persistency of compounds in environment, and in the same time hardening their degradation. This motivated us to also computationally study the degradation properties by calculation of bond dissociation energies for hydrogen abstraction (H-BDE) and stability in water by molecular dynamics (MD) simulations, another very important component of molecular modelling. Solid state crystal structure of BBPHD is elucidated by the single crystal X-ray diffraction studies, while contribution and quantification of various intermolecular interactions in crystal structure has been determined by the Hirshfeld surface analysis.

## 2. Material and methods

### 2.1. General remarks

The synthesis of BBPHD was carried according to the procedure reported in paper by Chen et al. [12]. Colourless prism like suitable crystals used for the structure determination was obtained by slow evaporation of ethanol at ambient temperature. FT-IR spectrum (Fig.S1-

supporting information) of title compound was recorded using the KBr pellets in the range of 4000-600 $cm^{-1}$ region, with the ATR module ALPHA-T Bruker FT-IR spectrophotometer. FT-Raman spectrum (Fig.S2-supporting information) of the title compound was recorded by Bruker RFS 100/s (Germany) using the Nd:YAG laser source, excitation wavelength of 1064 nm and spectral resolution of 2 $cm^{-1}$. $^{1}H$ and $^{13}C$-NMR spectra of the title compound was recorded (in ppm) on Bruker 400MHz spectrometer in $CDCl_3$ as solvent and TMS as internal standard.

**2.2. Data Collection and refinement details**

A suitable prism like crystal was selected and mounted on a Bruker APEX-II CCD diffractometer using the graphite monochromated MoKa ($\lambda$ = 0.71073 Å) radiation and detector (CCD). The crystal was kept at 296(2) K during data collection. The structure was solved using the Olex2 software [28] employing the olex2.solve [29] structure solution program and using the Charge Flipping. The structure was refined with the ShelXL [30] refinement package using the Least Squares minimization. All of the non-hydrogen atoms were revealed in the first difference Fourier map itself and were refined anisotropically. All of the hydrogen atoms were positioned geometrically, with C-H = 0.96 Å for methyl H, C-H = 0.93 Å for aromatic H, and refined using the riding model with $U_{iso}(H) = 1.5U_{eq}(C)$ for methyl hydrogens and $U_{iso}(H) = 1.2U_{eq}(C)$ for aromatic hydrogens. The nitrogen bound hydrogen atom was located in a difference map and was refined isotropically with the bond length restraint of N-H = 0.86(2) Å. All of the geometrical calculations were carried out using the program PLATON [31] within the WinGXsuite [32]. The molecular and packing diagrams were generated using the MERCURY program [33].

**2.3. Computational details**

Molecular structure of BBPHD is extracted from the X-ray structure for computational studies. The molecular geometry optimization, vibrational analysis, frontier orbital analysis (HOMO-LUMO), MEP, surface analysis and Mullikan atomic charges were calculated at DFT/6-311G++(d,p)(5D, 7F) level using Gaussian 09 program package [34]. The assignment and PED analysis of wave number were performed by GaussView5.0 program [35] and GAR2PED software package [36]. For better agreement of calculated wavenumber numbers with experimental values, the wave numbers were scaled by the scaling factor of 0.9613 [37]. Schrödinger Materials Science Suite 2017-3 [38] was also used for computational study of global and local reactive properties of the newly synthetized BBPHD molecule. Particularly, Jaguar 9.7

program [39] has been used for DFT calculations, combined with Desmond program [40-43] for simulations based on molecular dynamics. Computational study based on DFT approach with SMSS has been also done with Becke-Lee, Parr i Yang (B3LYP) [44] exchange-correlation functional with 6-311++G(d,p), 6-31+G(d,p) and 6-311G(d,p) basis sets, in order to respectively obtain ALIE, Fukui functions and bond dissociation energies (BDE). Molecular dynamics simulation has been done with OPLS3 force field [40, 45-47], with simulation time of 10 ns, temperature of 300 K, pressure of 1.0325 bar and cut off radius of 12 Å. System was of isothermal–isobaric (NPT) ensemble class, while the simple point charge (SPC) solvent model [48] was chosen for the modelling of solvent properties. A single BBPHD molecule was placed into the cubic box with approximately 3000 water molecules. Analysis of electron density between atoms has been performed according to the works of Johnson et al. [49, 50], in order to identify formation of intra-molecular non-covalent interactions. Maestro GUI [51] was used for the preparation of input files and analysis of results when Schrödinger Materials Science Suite 2017-3 was employed.

### 2.4 Conformational Analysis

The solid structure of the title compound has been determined, by the X-ray diffraction spectroscopic technique, to be planar with $C_s$ symmetry, but it can be considered as near-$C_{2v}$ as well. Such configuration allows more efficient packing and facilitates the intermolecular interaction between the molecular layers. Very interestingly, the optimized strict $C_{2v}$ structure was verified to be a minimum with all computed frequencies being positive. The two carbonyl groups prefer to point away from the skeleton of the molecule to maintain up to a 6 kcal/mol more stable configuration than when one of them would eclipse any of the $CH_2$ units. Nevertheless, detailed conformational analysis revealed that other possible non-planar (*np*) forms can possibly exist, and their calculated energies are expected to be very comparable with the experimentally reported one. Understanding these conformations is of great importance, as the molecular structure in the crystalline packing could be sensitive to several parameters such as temperature and pressure. To explore the possible stable forms beside the one determined experimentally, detailed conformational analysis at the B3LYP/6-311++G(d,p) has been performed. The internal rotations about the C2-C3, C3-C4 and C5-C6 (Fig.S3-supporting information) were calculated and show three possible non-planar forms (*np*-1, *np*-2 and *np*-3, respectively) within a stability range of less than 1 kcal/mol compared to the $C_s$ form. The large-

amplitude rotation about these bonds exhibits a barrier in a range of 2-3 kcal/mol in the non-condensed phase, indicating the feasibility of the formation of other packing pattern when harsh conditions are applied.

### 2.5. Hirshfeld surfaces

We examined molecular surfaces, packing of molecules in their crystal structure, highlighting the contribution of significant inter molecular interactions between molecules that are responsible for the molecular arrangement in the crystalline state through Hirshfeld surface analysis. Hirshfeld surfaces [52-54] and the related 2D finger print plots (FP) [55-57] are unique for any crystal structure and provide a quantitative measure of the intermolecular interactions on the surface [52, 58]. The Hirshfeld surface analysis and finger print plots of BBPHD was generated by using Crystal Explorer 3.0 software [59] which accepts structure input file in the CIF format. The surfaces are mapped using a fixed colour scale red, white and blue, where red highlights contacts shorter than the sum of van der Waals (vdW) radii which is represented by negative sign values of $d_{norm}$, white for contacts around vdW separation with $d_{norm}$ values equal to zero, and blue for contacts longer than vdW sum with positive sign $d_{norm}$ values.

## 3. Result and discussions

### 3.1. Crystal structure analysis

The title compound crystallizes in orthorhombic space group *Abm2*, with the following unit cell parameters: $a$ = 7.1227(11) Å, $b$ = 42.536(4) Å, $c$ = 5.8126(6) Å and Z = 4. The molecule exhibits crystallographic inversion symmetry located at the C10 carbon atom and there is half-molecule in the asymmetric unit. The molecule is almost planar with root mean squared deviation of all atoms (excluding H-atoms) being 0.076Å. The crystal structure features C2-H2…$\pi_{aryl}$ and C5-H5…$\pi_{aryl}$ interactions, forming a three dimensional grid like architecture. The packing of molecules in the crystal lattice is shown in Fig.S4 (supporting information). The crystallographic data and refinement parameters are summarized in Table 1.

### 3.2. Hirshfeld surfaces

3D Hirshfeld surfaces and 2D finger print analysis illustrations of the title compound (BBPHD) are shown in Fig.5 (supporting information), where surfaces have been mapped over $d_{norm}$ and shape index -1.0-1.0 Å. A red spot close to the H2 hydrogen atom on the $d_{norm}$ surface and the centroid of the aromatic ring arises as a result of C2-H2…$\pi_{aryl}$ interactions present in the crystal. Similarly, a faint red spot close to H5 atom on the $d_{norm}$ surface is due to weak C5-

H5…$\pi_{aryl}$ interactions (Fig.S5a). The dark red spots close to the centroid of the two aromatic rings in the shape index is a result of the two C-H…$\pi_{aryl}$ interactions. The two C-H…$\pi_{aryl}$ interactions are mapped over the $d_{norm}$ surface to support the presence of these interactions (Fig. S5b). The relative contribution of different interactions to the Hirshfeld surface was calculated for BBPHD. It is evident from Fig.S5(c) that the H···H contacts account for about 34.7% of the total Hirshfeld surface area; the remaining contribution was mostly due to C···H (25.8%), O···H (12.4%), Br···H (15.0%), Br···Br (9.3%) interactions and only minor contribution from other interactions.

**3.3. Geometrical parameters**

In the present case the experimental C-C bond lengths are in the range of 1.4104-1.3785 Å and the calculated C-C bond lengths are in the range of 1.4057-1.3727 Å [60]. For the title compound, the C-Br bond length is 1.9237 Å (DFT) and 1.9055 Å (XRD), which is in agreement with the literature data [61]. The C=O bond length (1.1988) agrees with the reported literature values [60]. At C8 position, the bond angles (/DFTXRD) are C3-C8-C9 = 123.5/123.7°, C3-C8-Br1 =119.1/119.2° and C9-C8-Br1 = 117.3/117.1° and the asymmetry in angles is due to the electronegative bromine atom.

**3.4. IR and Raman spectra**

Table 2 contains the wavenumbers (calculated and observed) with vibrational assignments, while the atom labelling is provided in Fig.1. Phenyl rings at C5 and C27 are designated as PhI and PhII, respectively. The carbonyl stretching C=O vibrations [62-64] appear at 1668 $cm^{-1}$ (IR), 1680 $cm^{-1}$ (Raman) and theoretically at 1679 and 1678 $cm^{-1}$. The bands observed at 679, 662 $cm^{-1}$ (IR), 658, 551 $cm^{-1}$ (Raman) and at 678, 667, 553 $cm^{-1}$ (DFT) are assigned as C=O deformation modes [62]. The phenyl C-H stretching modes are assigned at 3081, 3062 $cm^{-1}$ (spectrum), 3079, 3059 $cm^{-1}$ (Raman) and in the range 3082-3064 $cm^{-1}$ based on DFT calculations [62, 65]. The ring stretching modes of the phenyl ring are assigned in the range 1558-1269 $cm^{-1}$ theoretically. The bands observed at 1570, 1530, 1450, 1374 $cm^{-1}$ (IR) and at 1565, 1279 $cm^{-1}$ (Raman) are assigned as the phenyl ring stretching modes. The band at 1042 $cm^{-1}$ (IR), 1042 $cm^{-1}$ (Raman) and 1040 $cm^{-1}$ (DFT) is assigned as the ring breathing mode of the para substituted phenyl ring [65], which is in agreement with the reported values at 1062 $cm^{-1}$ (IR) and 1061 $cm^{-1}$ (DFT) [66]. The in-plane and out-of-plane CH deformations are assigned theoretically in the range 1276-1087 $cm^{-1}$ and 965-788 $cm^{-1}$, respectively. Experimentally, these

modes are assigned at 1156, 1087 $cm^{-1}$ (IR), 1279, 1088 $cm^{-1}$ (Raman) and 963, 815, 801 $cm^{-1}$ (IR), 968, 818, 798 $cm^{-1}$ (Raman). The $CH_2$ stretching modes are assigned in the range 2965-2865 $cm^{-1}$ in IR spectrum, 2965-2877 $cm^{-1}$ in Raman spectrum and in the range of 2962-2873 $cm^{-1}$based on DFT calculations [62,67]. The $CH_2$ bending modes are observed in the ranges 1450-759 $cm^{-1}$ in the IR spectrum and 1440-738 $cm^{-1}$ in the Raman spectrum. According to the DFT calculations, these modes are in the range of 1453-706 $cm^{-1}$. The C-C stretching modes are assigned in the range 1173-780 $cm^{-1}$computationally. Bromine compounds [62] absorb strongly in the region of 635±85 $cm^{-1}$, due to the CBr stretching vibration and in the present case, bands at 615 $cm^{-1}$ (IR), 624 $cm^{-1}$ (Raman) and 616 $cm^{-1}$ (DFT) are assigned to this mode. Varghese et al. [68] reported the CBr stretching mode at 632 $cm^{-1}$ theoretically.

**3.5. NMR spectra analysis**

Chemical shift ($^{1}H$ and $^{13}C$) values of the investigated molecules have been computed with GIAO/B3LYP method [69] and compared with experimental values (Table S1-supporting information). The chemical shift values of $^{1}H$-NMR spectrum of title compound show two ranges; first one is consequence of the chemical shift of aliphatic C-H protons, which occurred in the range of 1.39-2.95/1.29-3.02 ppm (experimental/theoretical). The chemical shift of hydrogen atom attached to carbon near to the carbonyl group is higher than expected. H21, H22, H40 and H41 resonate at high frequency 2.95/3.02 (experimental/DFT), due to influence of carbonyl groups. Second one, around 7.60-7.81/7.69-8.06 (experimental/theoretical) ppm, occurred due to the aromatic protons. Chemical shift values of $^{13}C$-NMR for aromatic carbon atoms in general have values higher than 100 ppm [70,71]. Computational and experimental $^{13}C$ NMR values of carbon atoms of methylene groups of aliphatic chain are in good agreement as well: C17, C36 (24.02/27.40), C13 (28.97/32.69) and C20, C39 (38.37/42.69) ppm (experimental values/computational values). The chemical shift value at 199.26/205.26 ppm (experimental/computational) is assigned to the carbonyl carbon atoms C2 and C24. Signals observed in range of the 128.26-135.82/134.04-153.80 ppm (experimental/computational) correspond to carbon atoms of phenyl rings. From above result shows, the theoretical chemical shifts are good in agreement with experimental findings.

**3.6. Electronic properties and frontier molecular orbital analysis**

Chemical reactivity and kinetic stability of molecules depend upon the energy gap between HOMO and LUMO orbitals. These molecular orbitals are often known as frontier

molecular orbitals (FMOs). Based on the energy gap between frontier orbitals, molecules are frequently classified into soft and hard molecules. Energy gap between frontier orbitals is a critical parameter for prediction of the biological activity and transport properties. Frontier molecular orbitals have been visualized in Fig.S6 (supporting information). It can be seen that HOMO (MO109) is localized mainly at the carbonyl group and partially at the aliphatic chain, while LUMO (MO110) is localized mainly at the benzene ring and partially at the carbonyl group. Based on the HOMO to LUMO transitions, it can be concluded that the transfer of electron cloud occurs mainly from carbonyl group to benzene ring. In the present case, the calculated energy values of HOMO and LUMO are -7.20 eV and -2.16 eV, respectively and the energy gap between HOMO and LUMO is 5.04 eV. The higher the energy gap between HOMO-LUMO is, the harder the molecule is. In order to understand the chemical reactivity of title compound, global reactivity parameters were evaluated by DFT method. Single point calculation was carried out at DFT/6-311++G(d,p) level of theory. Vertical ionization potential (IP) and vertical electron affinity (EA) parameters have been calculated. These parameters were defined according to the following equations:

$$IP = E_{n-1(\text{cation})} - E_{N(\text{neutral})},$$

$$EA = E_{N(\text{neutrail})} - E_{N+1(\text{anion})},$$

where $E_{N+1(\text{anion})}$, $E_{N(\text{neutral})}$ and $E_{N-1(\text{cation})}$ are total energies of anion, neutral and cation forms of investigated molecule, respectively [72, 73]. These parameters were used in order to calculate the values of global reactivity descriptor, summarized in Table S2 of the Supplementary Materials. TD-DFT calculations have been performed at B3LYP/6-311++G(d,p) level of theory, while theoretical UV transitions have been characterized by vertical excitation energies, wavelength and oscillator strength. These results are summarized in Table S3 of the Supplementary Materials. The UV spectrum of the title compound (Fig.S7-supporting information) is characterized by electronic absorption band located at 268 nm, which is the consequence of the transitions: HOMO-1→LUMO and HOMO→LUMO+1(π-π transition).

### 3.7. Nonlinear optical properties

With regards to optoelectronic applications [74], the NLO active materials receive significant attention. Some of the properties that are important for optoelectronic applications can be obtained by DFT calculations and these include dipole moment, polarizability, first and

second hyperpolarizabilities. Respectively, these parameters have been calculated to be 4.102 Debye, $4.149\times10^{-23}$ esu, $6.227\times10^{-30}$ esu and $-71.736\times10^{-37}$ esu. It is interesting to notice that the first hyperpolarizability of the title compound is 31.98 times higher than in the case of urea, revealing possibility of the title compound to possess representative NLO properties, comparable with similar derivatives [75].

### 3.8. Molecular electrostatic potential

Analysis of charge distribution by mapping of MEP to the electron density surface is valuable approach in molecular modelling, when it comes to the biological recognition, hydrogen bonding interactions and visualization of reactive molecular sites [76, 77]. Optimized molecular structure was used for the generation of 3D MEP and 2D counter surfaces plots with rainbow colour scheme (electron reach regions are represented with red colour, while electron poor regions are represented with blue colour). For the title compound MEP took values from– 5.56a.u. (red) to 5.56a.u. (blue). MEP and surface analysis diagram of title compound, Fig.2, show that negative regions are mainly localized over oxygen atoms of the carbonyl groups, indicating the most sensitive sites towards the electrophilic attacks. On the other side, the maximal positive regions are localized over hydrogen atom of the aliphatic chain as well as phenyl rings, indicating sensitivity towards the nucleophilic attacks.

### 3.9. Natural Bond Orbital analysis

Natural bond orbital (NBO) calculations were performed using NBO 3.1 program [78] as incorporatedin the Gaussian09 package. In this case the DFT/SDD level of theory was used in order to understand various second-order interactions, principal interaction summarized in Tables S4 and S5 (supplementary materials). The strong intermolecular hyper conjugative interactions are: $C_2$-$C_5$ from $O_{16}$ of $n_2(O_{16}) \rightarrow \sigma^*(C_2\text{-}C_5)$ which increases the electron density 0.06345e that weakens the respective bond $C_2$-$C_5$ leading stabilization of 16.61 kJ/mol; $C_2$-$C_{20}$ from $O_{16}$ of $n_2(O_{16})\rightarrow\sigma^*(C_2\text{-}C_{20})$ which increases the electron density 0.05561e that weakens the respective bond $C_2$-$C_{20}$ leading stabilization of 17.56 kJ/mol; $C_{24}$-$C_{27}$ from $O_{35}$ of $n_2(O_{35})\rightarrow\sigma^*(C_{24}\text{-}C_{27})$ which increases the electron density 0.06345e that weakens the respective bond $C_{24}$-$C_{27}$ leading stabilization of 16.61 kJ/mol; and $C_{24}$-$C_{39}$ from $O_{35}$ of $n_2(O_{35})\rightarrow\sigma^*(C_{24}\text{-}C_{39})$ which increases the electron density 0.05561e that weakens the respective bond $C_{24}$-$C_{39}$ leading stabilization of 17.56 kJ/mol. The orbital with low occupation number are high energies are $n_2(O_{16})$, $n_2(O_{35})$ with energies -0.27360, -0.27360a.u. and considerable p-characters100,

99.99% and low occupation numbers 1.90859, 1.90859 while the orbital with high occupation numbers and low energies are: $n_1(O_{16})$, $n_1(O_{35})$ -0.68914, -0.68914a.u. and p-characters, 61.77, 61.77 and occupation numbers 1.97457, 1.97457. Thus, a very close to pure p-type lone pair orbital participates in the electron donation to the $\sigma^*(C_2\text{-}C_5)$ orbital for $n_2(O_{16}) \rightarrow \sigma^*(C_2\text{-}C_5)$, $\sigma^*(C_2\text{-}C_{20})$ orbital for $n_2(O_{16}) \rightarrow \sigma^*(C_2\text{-}C_{20})$, $\sigma^*(C_{24}\text{-}C_{27})$ orbital for $n_2(O_{35}) \rightarrow \sigma^*(C_{24}\text{-}C_{27})$, $\sigma^*(C_{24}\text{-}C_{39})$) orbital for $n_2(O_{35}) \rightarrow \sigma^*(C_{24}\text{-}C_{39})$ interactions in the title compound.

### 3.10. ALIE and MEP surface, Fukui functions and non-covalent interactions

Aside of the MEP surface, in this work ALIE values were mapped to the electron density surface in order to identify the molecule sites where electrons are least tightly bound. This enabled us to detect molecule sites that are the most sensitive towards the electrophilic attacks (Fig.3) [79-82]. The analysis of electron density between atoms revealed that the intra-molecular non-covalent interactions in the case of BBPHD molecule didn't form. The lowest ALIE values in the case of BBPHD molecule were calculated in the near vicinity of bromine atoms, with corresponding values of ~205 kcal/mol. On the other side, the highest ALIE values were calculated in the near vicinity of all hydrogen atoms with the corresponding values of ~342 kcal/mol. Additional insights into the local reactive properties of BBPHD molecule were obtained thanks to the calculation of Fukui functions, which are in the case of Jaguar program for DFT calculations obtained by the finite difference approach according to the following equations:

$$f^{+} = \frac{\left(\rho^{N+\delta}(r) - \rho^{N}(r)\right)}{\delta}, \qquad (1)$$

$$f^{-} = \frac{\left(\rho^{N-\delta}(r) - \rho^{N}(r)\right)}{\delta}, \qquad (2)$$

where $N$ represents the number of electrons in reference state of the molecule, while $\delta$ is fraction of electron which default value is set to be 0.01 [83]. After mapping of the values of the Fukui functions to the electron density surface the following corresponding surfaces have been obtained, Fig.4. In general Fukui functions track the changes in electron densities which are consequence of change in the overall charge of the observed molecule. The change in overall molecular charge influences the values of electron density at the molecular surface. By tracking of these changes in electron density, Fukui functions allow detection of molecule sites with electrophilic and nucleophilic properties. In this regard, purple colour for Fukui $f^{+}$ function in

Fig.4a is positive colour and indicates sites with increased electron density after the addition of charge. In Fig.4a it can be seen that blue-to-purple colour is located in the near vicinity of carbon atoms connected with oxygen atoms, which marks them as an electrophilic ones. On the other side, red colour for Fukui $f^-$ function is a negative colour and indicates sites with decreased electron density after the removal of charge. Inspection of Fig.4b indicates that the red colour is located in the central part of the molecule, marking this area as nucleophilic.

### 3.11. Sensitivity towards autoxidation and water

Taking into account the negative environmental impact of the pharmaceuticals, in this work we have also studied the sensitivity of BBPHD molecule towards the autoxidation mechanism [24, 84]. Oxidation mechanism represents one of the most important pathways for degradation of pharmaceuticals [85-88]. Thanks to the correlation between bond dissociation energies for hydrogen abstraction (H-BDE) and sensitivity towards the autoxidation mechanism, computational molecular modelling techniques can be used for determination of the molecule sites where degradation could start [89-95]. Fig.5 contains information about the H-BDE values. According to the results presented in Fig.5, for BBPHD molecule it can be concluded that it is highly stable towards the autoxidation mechanism, since there are no H-BDE values in the region between 70 and 90 kcal/mol [96, 97]. In the same time the lowest BDE value has been calculated for bromine atoms indicating that degradation could start by detaching of these atoms. Sensitivity towards water molecules was investigated by molecular dynamics simulation. The information on the obtained trajectories were used in order to calculate Radial Distribution Functions (RDF) for all atoms of the BBPHD molecule, with the goal to identify atoms with the most important interactions with water. RDFs were calculated with respect to the distance between the observed atom of the BBPHD molecule and oxygen atom of the water molecule. Representative RDFs have been presented in Fig.6. According to the results provided in Fig.6 it can be seen that BBPHD molecule has significant stability in water, as there are no hydrogen atoms with sharp g(r) curves located at distances below 2 Å. The highest g(r) value was calculated for bromine atoms, however their maximal g(r) values are located at distance of around 3.5 Å. On the other side, maximal g(r) values carbon atoms C16 and C35 are located at the distances lower than in case of the bromine atoms, but their maximal g(r) values are much lower. Maximal g(r) values of the carbon atoms C8 and C30 are somewhere between bromine

atoms at carbon atoms C16 and C35, however their peaks are located at high distances of over 4.5 Å.

### 3.12. Molecular docking

Based on the molecular structure, PASS (Prediction of Activity Spectra) [98] online tool for prediction of different types of activities has been applied. According to the results of PASS analysis, which have been summarized in Table 3, the title compound could serve as feruloyl esterase inhibitor, with probability to be active (Pa) value of 0.936. Antioxidants are necessary to control degenerative reactions produced by reactive oxygen and nitrogen species. These species are involved in several ailments including cancer and heart diseases. Several literatures suggest that heptane derivatives show promising antioxidant activities [99, 100]. Ferulic acid is the most abundant hydroxycinnamic acid in the plant world and is one of the most promising sources of antioxidants [101]. Feruloyl esterase is a class of enzymes used in biocatalysis for refinement of hydroxycinnamic acids. These compounds have shown to have antioxidant and antibacterial properties, FAEs and their hydrolytic or transesterification products are of great interest for various biotechnological applications, in particular as modified natural antioxidants or food flavour precursors [102].It prevents low-density lipoprotein from oxidation, exhibits inhibitory effects on tumour promotion [103] and protects against certain chronic diseases such as coronary heart disease and some cancers [104, 105]. Therefore the feruloyl esterase inhibitor is used as a target for docking study. High resolution crystal structure of feruloyl esterase inhibitor was downloaded from the RSCB protein data bank website with PDB ID: 1UWC. All molecular docking calculations were performed on Auto Dock-Vina software [106] and as reported in literature [74, 107]. The ligand binds at the active site of the substrate by weak non-covalent interactions and these interactions are depicted in Fig.S8 (supporting information). Amino acids forms strong hydrophobic interaction with the ligand. The docked ligand forms a stable complex with feruloyl esterase inhibitor (Fig.S9-supporting information) and got a binding affinity value of -5.7 kcal/mol (Table 4). Thus the title compound can be a lead compound for developing new antioxidant drug.

## 4. Conclusion

The title compound, 1,7-bis(4-bromophenyl)heptane-1,7-dione was characterized by single crystal XRD, FT-IR, FT-Raman as well as NMR spectroscopic studies. Within the framework of DFT, the vibrational wavenumbers are theoretically predicted and compared with

experimental wavenumbers. Conformation analysis shows that the two carbonyl groups prefer to point away from the skeleton of the molecule to maintain up to a 6 kcal/mol more stable configuration than when one of them would eclipse any of the $CH_2$ units. MEP plot showed that the negative regions are mainly localized over the oxygen atoms of the carbonyl groups while the maximal positive regions are localized over the hydrogen atom of the aliphatic chain as well as phenyl rings. The first hyperpolarizability of the title compound is 31.98 times that of urea. ALIE surfaces revealed that the near vicinity of bromine atoms could be the most sensitive parts of the BBPHD molecule in terms of electrophilic attacks. Additionally, Fukui functions revealed that the central part of BBPHD molecule could be considered as important reactive center when charge is added or removed. The values of H-BDE indicate that BBPHD molecule is highly stable towards the autoxidation mechanism, while the remaining BDE values indicate that degradation process might start with detaching of bromine atoms. Molecular dynamics study indicated that BBPHD molecule is highly stable in water as well, since there are no hydrogen atoms with significant interactions with water molecules. PASS analysis predicts feruloyl esterase inhibitor activity for the title compound and the docking studies suggest that the title compound can be a lead compound for developing new antioxidant drug.

**Acknowledgment**

The authors are highly thankful to the UGC for financial assistance. The authors are grateful to Prof. K. Saraswathi, Department of Chemistry, S.V. University, Tirupati, for her constant support and encouragement.Part of this work has been performed thanks to the support received from Schrödinger Inc. Part of this study was conducted within the project funded by the Ministry of Education, Science and Technological Development of Serbia, grant III41017.

**Supplementary Material**

The cif file of the title compound have been assigned CCDC number1577497and can be obtained free of cost on application to CCDC 12 Union Road, Cambridge CB21 EZ, UK. (Fax: (+44) 1223 336-033: e-mail: data_request@ccdc.cam.ac.uk).

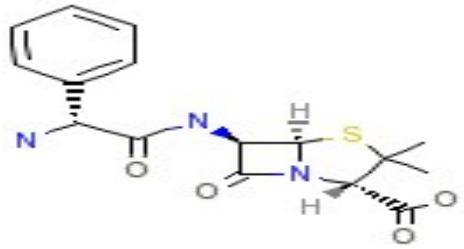
# DISSOLUTION TEST METHOD BY HPLC FOR ROSICILLION 250 MG CAPLETS

**Srinivasa Rao. T*[1], Srinivas rao.Rayapati [2], B.C.K Reddy[3], G.Maniteja[4]**



1* Associate professor K.G Reddy college of engineering and technology Hyderbad,2 Professor Bapatla college of arts and science Bapatla, 3.R&D manager SB Organics Hyderabad.4.Research scholar JJT university.

ABSTRACT: Roscillin is uses full to treat urinary tract, pneumonia, respiratory track infections. It is a Pencillin derivative, used for infections of the stomach or intestines. It is an antibiotic and used to fight bacterial infections. Roscillin 250 MG Capsule is less toxic than other antibiotics. Side effects are rare and hardly occur. They include nausea, vomiting, high level of eosinophils, skin rashes, swelling of tongue and diarrhea. Serious but rare side effects include dark urine, abdominal pain, jaundice, easy bruising or bleeding, persistent sore throat or fever. Dissolution test method by HPLC analysis is proposed for ROSICILLION pharmaceutical dosage forms, maximum absorbance is found at 220 nm, The proposed method is validated according to ICH guidelines, it is very simple and convenient.

Important words: Roscillin API, Antibiotic, Penicillin, urinary tract, HPLC, Absorbance, ICH

INTRODUCTION: Roscillin pharmaceutical dosage form is used to care for a mixture of environment caused by bacterial infections of the body parts, instance lungs, heart, brain and urinary tract. It supposed to be used on vacant stomach for improved absorption. Dissolution test method for Roscilin dosage forms by High performance liquid chromatography is proposed, it's maximum absorbance found to be at 220nm, structure of API and chromatographic conditions as follows

Structure of Roscillin:

Chromatographic conditions: By HPLC

Column: Bond a pack C18

Wave length: 220 nm

Retention time (RT) :4.2 minutes

Injection volume: 20µl

Rate of flow: 2.0 ml/min

Temperature of the Oven: 30 ˚C temp.

Preparation of Mobile Phase:

Preparation of Buffer: 1.36 g of $KH_2PO_4$ and one ml 1N Acetic acid suspended in 1000ml of $H_20$

**Mobile phase:** Buffer and $CH_3CN$ are mixed in the ratio of 92:8 degassed using sonicators

Dissolution: After 45 minutes not less than 70%

Medium: 900 ml, water

Type: USP –I (Basket)

RPM: 100

Temperature: 37±0.5◦C

Preparation of Standard: 50 mg of Roscillin working standard make up to 200ml dilute with water

**Preparation of sample:** Assemble the apparatus. According to individual monograph keep the stated volume of dissolution medium in the vessel of apparatus and maintain the dissolution medium temperature to 37 ±0.5°C, remove the thermometer. Keep the six test sample equivalent to 250mg of Roscillin in the dissolution apparatus, taking care to keep out air bubbles from the surface of dosage-form unit, and instantaneously operate the dissolution equipment at the rate specified in the monograph. within the time period specified, take out a 10ml of sample from a zone middle between the surface of dissolution medium and the top of rotation basket , not less than 1cm from the top of the rotation Basket, not less than 1cm from the vessel wall. Calculate the amount of Roscillin dissolved using the subsequent process.

Process: Separately inject 20µl blank , Mobile phase Five injections, standard preparation and sample preparation in to the chromate graphic system and trace the chromatograms, evaluate the peak responses.

System suitability evolution: Efficiency of the column for the Roscillin is determined from the standard preparation should not less than 2000 theoretical plates and for the same peaks the tailing factor should not be greater than two..

The Relative standard deviation of 5 repeat injections of Roscillin standard preparation should not be greater than 2.0

The Roscillin retention time is 4.2 minutes.

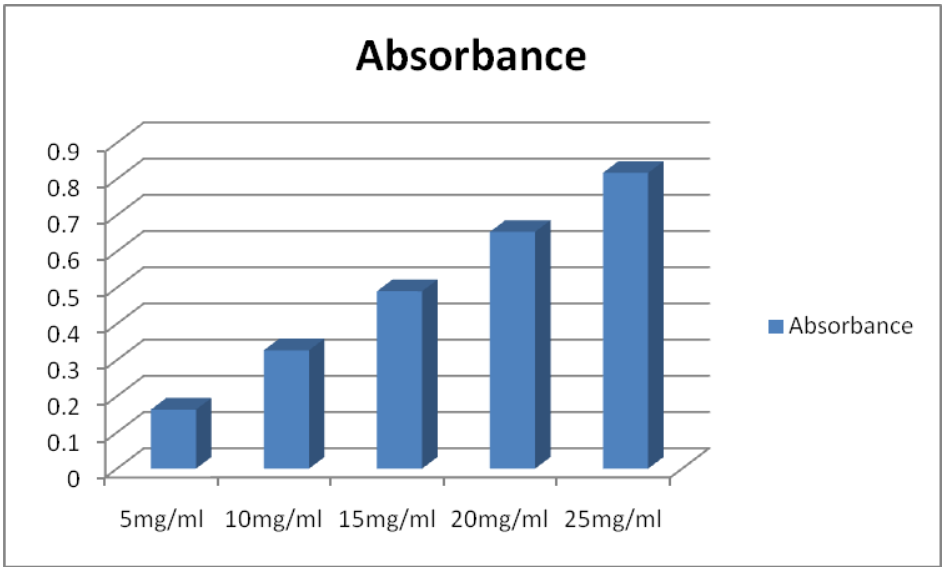
Calculation: Calculate percentage (%) amount of Roscillin released from the caplets at respective time point by using the following formula.

$$\frac{At}{As} \times \frac{WS}{200} \times \frac{900}{Wt} \times \frac{P}{100} \times \frac{100}{lable\ claim} = \text{----------}\%$$

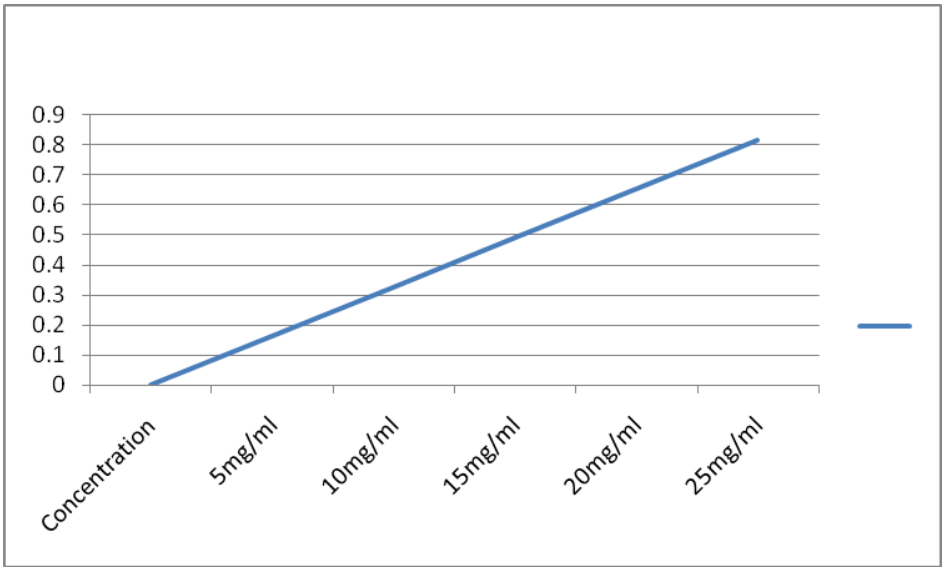
At=Roscillin peak area in the sample solution chromatogram.

AS=Roscillin peak area in the standard solution chromatogram.

WS= Roscillin working standard weight.



Wt= Roscillin test sample weight.



| Formulation | Medium | Bowls NO | Releasing profile | Average | limit | S.D | RSD |
|---|---|---|---|---|---|---|---|
| Capsulate | 900 ml water | 1,2,3,4,5,and 6 | 76.1%,75.9%, 76.3%,76.7%, 76.6%,and 76.5% | 76.35 % | NLT 70% | 0.3082 | 0.403 |

**Revitalization study:** Revitalization experiments were did for to study the linearity, accuracy and precision of proposed method. At two different levels known quantities were added to the sample and analyzed ,the revitalization was estimated to be greater than 99%

Out come and conversation of Linearity: Roscillin linearity is established by scheming a diagram of standard solution absorbance versus concentration. The linearity is found to be between 5-25mg/ml

| S.NO | Concentration of the standard solution | OD values |
|---|---|---|
| 1 | 5mg/ml | 0.163 |
| 2 | 10mg/ml | 0.327 |
| 3. | 15mg/ml | 0.490 |
| 4 | 20mg/ml | 0.654 |
| 5. | 25mg/ml | 0.817 |

The repeatability and consistency of the method has been verified by performing revitalization studies , showed good out put..

Final conclusion: The projected process is free from interference of the additives added in the formulations of Roscillin .It is very easy, fast and no where involves use of complicated sample preparation. High percentage of recovery and validation parameters be evidence for that the method is reliable and acceptable. Therefore the method can be useful in routine quality control analysis.

## Abstract

Koundinya wild life Sanctuary in Chittoor district, Andhra Pradesh located in the 12° 39'-13° 10' N and 78° 29'-78°.52' E falls in the hill ranges of the Eastern Ghats, a broken and discontinuous line of mountains in peninsular India. Koundinya wildlife Sanctuary is linear in Shape, running ca.70 km north to south. The breath varies from 1 to 15 km. It occupies 357km2.It has a periphery of about 224km with 53 fringe and 8 enclosure villages and is bordered by reserve forest of Andhra Pradesh or Tamil Nadu. The Sanctuary comes under two ranges: Palamaner in the north and Kuppam in the South. Palamaner range has four blocks: Tekumanda, Musalimadugu, Mordana and Nelipatla. The Kuppam range has six blocks: Naikaneri, Peddanaikdurg, Charagallu, Peddur Extension, Peddur and Kangundi. The main water resourses in the Sanctuary consists of the River Palar, its tributaries the Mallatar (or Kaigal) and Koundinya, from which the Sanctuary gets its name. The vegetation comprises predominantly of Southern Tropical Dry Mixed Deciduous (Champion and Seth 1968) with trees of *Hardiwikia binata Chloroxylon swietenia, Albizia amara, Boswellia serrata, Anogeissus latifolia ,Pterocarpus santalinus, Shorea spp, Diospyros spp and Ficus spp.* The vegetation varies widely in different areas as result of terrain soil, impact of graging, fires, woodcutting.

## INTRODUCTION

The term Protected area is commonly used to describe areas of Ecological and Biological importance. The area which is to be declared as Protected area have the great floral and faunal significance and needs to be conserve an ecological system and needs to be protected. An area which is having some floral or fauna species of great significance must be declared as protected area.

Protected area is classified into four types. These are 1. National Parks, 2. Sanctuaries, 3. Conservation reserves, and 4. Community Reserves. The area, which is having adequate ecological, faunal, floral, Geomorphological, natural, or Zoological significance has described as National Park. The main purpose of the national park is to protect, propagate or develop wildlife and its environment, but the any rights are not allowed inside the living people.

The area which is declared as the sanctuary having ecological, faunal, floral, geo morphological, natural or Zoological significance and to protect, propagate, develop the wild life and its environment but some certain rights were allowed the people living inside the sanctuary.

The areas which links the one protected area to the another is declared as Conservation Reserves. The Conservation Reserves are declared by the State Government. The main purpose of the conservation reserves is to protect landscapes, seascapes, floral and their habitat. The Conservation Reserves are declared by the State Government.

An area where an individual or a community has voluntary conserve the wildlife and its habitat is

declared as community reserves. The main purpose of the community reserves is protecting fauna, flora, and traditional and cultural values. These were also declared by the State Government.

Globally there are more than 161000 protected areas of October 2010 with covering 236 countries and territories throughout the world. (IUCN, World data base on protected areas). The total geographical area of India is 32, 87,590 $km^2$ of which the total forest cover is 6, 97,898 $km^2$ cover 21.23% geographical area of India. There are 17 mega diverse countries in the world of which India is also one among them. India is having only 2.4% of the world's land area, 16.7% human population of the world and 18% livestock.

India harbors a rich wildlife variety and have 730 protected areas of which 103 National Parks, 535 Wildlife sanctuaries, 66 Community reserves,26 conservation reserves covering an area of 160896.51 $Km^2$ covering 4.88 % geographical area of the India. Andhra Pradesh has 1National Park, 13 wildlife sanctuaries and 2 Zoo parks are extended over 9076.82 $Km^2$. (4.57% of the total geographical area). The Eastern Ghats is located between $77^0 22'$ and $85^0$ 20' East longitudes and $11^0 22'$ North latitudes in the tropical region. In Andhra Pradesh, the hilly region in the district of Vizayanagaram, Vishakapatnam, Srikakulam, East Godavari, Krishna, Guntur, Prakasam, Nellore, Kurnool, Anantapuram, Chittor and Kadapa forms the Eastern Ghats. The Northern portion includes the Godavari, Sileru-Machkund Basin and covers the district of Srikakulam, Vijayanagaram, Vishakapatnam, East Godavari and West Godavari. The Southern Eastern Ghats portion covers the districts of Guntur, Prakasam, Nellore, Kurnool, (Veligondas, Palakondas, Nallamalias, Erramalias etc) and extend also into adjoining Kadapa and Chittor districts of Seshachalams. Andhra Pradesh has 1 National Park, 13 wildlife sanctuaries and 2 Zoo parks of which one National Park and Six Wildlife Sanctuaries are in the Eastern Ghats and Four Wildlife Sanctuaries are located along the East Coast. Koundinya wildlife Sanctuary in Chittoor district, Andhra Pradesh is one among the 13 wildlife sanctuaries present in Andhra Pradesh.

## MATERIALS AND METHODS

The study was carried out during July 2019 – March 2020 Plant specimens were collected and identified after studying all characters with the help of standard local flora and the relevant literature available on the internet (www.Googlescholar) the indigenous knowledge of local primitive communities like Yanadies, Yerukula and Loddy etc. The indigenous knowledge of these primitive communities through personal interviews is utilized in the identification of the key flora of the study area. Herbarium was prepared by the standard methods. The entire area of the sacred grove is thoroughly studied by repeated visits in different seasons of the year 2019–2020 covering pre-monsoon, monsoon, and post-monsoon seasons. It helps in observing the different developmental stages of medicinal plant species like vegetative, flowering, and fruiting stages. The plant specimens were collected, identified with the help of Flora of Presidency of Madras Gamble, 1967 and Genera Platarum of Bentham and Hooker 1897. During the field work, the specimens collected for the preparation of herbarium were processed in accordance with the methodology adopted by Jain and Rao 1977. The plant species are given in alphabetical sequence with other details such as botanical name, vernacular name, family, habit in Table 1.

### Identification of plants

The plant species were collected from the forest with the help of practitioners and identified using the Gamble, J.S. 1915-36. Flora of Presidency of Madras, and local floras as well as through comparison with identified specimens deposited in the herbarium of Nedurumalli Bala Krishna Reddy medicinal plant research center Department of Botany Vidyanagar.

## RESULTS AND DISCUSSION

## CONCLUSION

Nearly 149 species belonging to 50 families were recorded. Out of 149 plant species herbs 19;Shrubs 19;Trees 104 ;Climbers 04.Fabaceae occupies first place with 18 species; Euphorbiaceous occupies second place with 10 species; Rubiaceae occupies third place with 08 species; Anacardiaceae, Moraceae and Verbanaceae occupies fourth place with 06 species, Rutaceae and Combretaceae occupies fifth place with 05species.

# A Facile Approach to 3,4-Oxepino-Fused Tricyclic Indoles from MBH-Acetates of Acetylenic Aldehydes *via* Successive Allylic Substitution/Intramolecular [3+2] Annulation†

Chada Raji Reddy[+],*[a, b] Puppala Sathish,[a, b] and Reddi Rani Valleti[a]

Herein, we present our findings on the synthesis of 3,4-oxepino-fused indoles by a two-step reaction sequence involving an initial allylic substitution followed by Rh(III)-catalyzed intramolecular [3+2] annulation *via* C–H activation starting from Morita-Baylis-Hillman (MBH) acetates of acetylenic aldehydes. The strategy is amenable to broad range of MBH acetates providing a facile access to 3,4-oxepino-fused indoles in good yield.

## Introduction

3,4-Fused indole framework is ubiquitous in numerous naturally occurring molecules such as lysergic acid, clavicipitic acid, aurantioclavine, ht-13-A and ht-13-B (Figure 1) that exhibit a wide range of biological and pharmacological activities.[1–3] Among these, 3,4-oxepino-fused indole skeleton is unique and present in ht-13-A and ht-13-B, which were isolated from the *streptomyces sp.* (PA-48561). These two natural products display high affinity towards 5-HT receptors and have prospective application in the treatment of central nervous system (CNS) disorders.[3] Despite of their importance, the synthesis of 3,4-oxepino-fused indoles is under-exploited.[4] They can be readily made by sequential palladium-catalyzed coupling reaction/reductive *N*-hetero annulations,[5] intramolecular Fischer indolization[6] or by Larock indolization from the ortho-halogenated substrates.[7] Recently, 3,4-fused tricyclic indoles were also made by intramolecular amidoarylation or hydroarylation involving transition metal-catalyzed C–H activation strategy.[8] In these efficient methods alkyne-tethered acetanilides were used as the substrates, which were prepared from 3-nitro phenol in three steps. The above observations prompted us to develop an alternative strategy for the synthesis of the functionalized oxepino-fused tricyclic indoles from the readily accessible substrates.

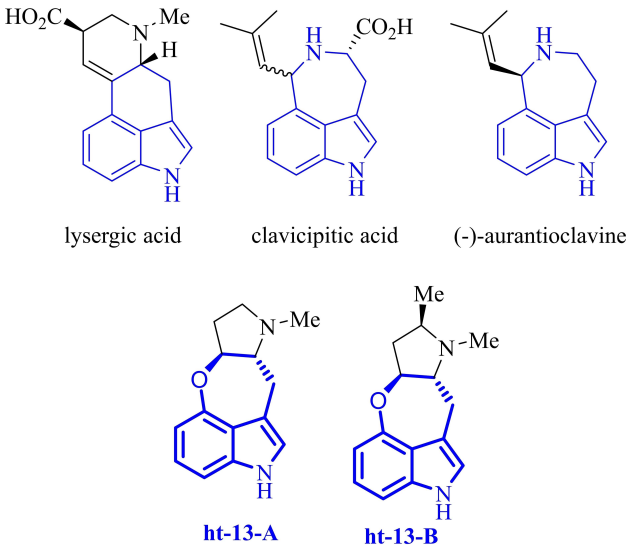

**Figure 1.** Structures of representative 3,4-fused indole alkaloids

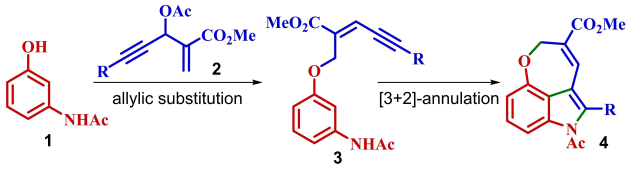
Our research group is investigating the annulation reactions using Morita-Baylis-Hillman adducts of acetylenic aldehydes as substrates for the formation of desired alkyne-tethered intermediates, which readily undergo the cyclizations.[9] In continuation, we envisioned that the MBH-acetates (**2**) of acetylenic aldehydes could be handy precursors to obtain the alkyne-tethered acetanilide (**3**) and subsequent intramolecular annulation would provide the oxepino-fused tricyclic indole derivatives (**4**) having conjugated ester functionality. Herein, we report a facile approach to access 3,4-oxepino-fused tricyclic indoles involving the successive allylic substitution/intramolecular [3+2] annulation from the reaction of MBH acetates (**2**) using a new class of nucleophilic reagent (**1**) (Scheme 1).

## Results and Discussion



To explore the planned strategy, initially the reaction conditions were optimized by the reaction between 3-acetamido phenol (**1**) and MBH Acetate **2a** (prepared from phenyl acetylene aldehyde). To obtain the desired alkyne-tethered acetamide from the above reaction, $K_2CO_3$ was tested in various

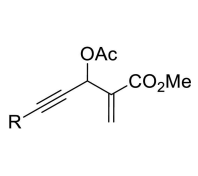
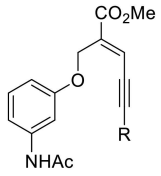
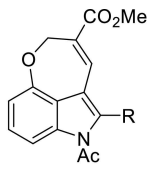
solvents such as DMF, acetonitrile, *tert*-amyl alcohol (entries 1 to 3, Table 1) and we were pleased to find that potassium

**Table 1.** Optimization of reaction conditions







| Entry | Step 1 | Step 2 | Product | Yield (%)[a] |
|---|---|---|---|---|
| 1 | $K_2CO_3$, DMF, 48 h | – | **3a** | 76 |
| 2 | $K_2CO_3$, $^t$AmOH, 48 h | – | **3a** | 91 |
| 3 | $K_2CO_3$, $CH_3CN$, 48 h | – | – | NR |
| 4 | $Cs_2CO_3$, $^t$AmOH, 48 h | – | **3a** | 60 |
| 5[b] | DBU, $^t$AmOH, 40 h | – | – | NR |
| 6[c] | – | A | **4a** | 90 |
| 7[c] | – | B | – | NR |
| 8[c] | – | C | – | NR |
| 9[d] | $K_2CO_3$, $^t$AmOH, 48 h | A | **3a** | 88 |
| 10[e] | $K_2CO_3$, $^t$AmOH, 48 h | A | **4a** | 49 |

[a]Isolated yields; [b]**2a** was decomposed after the addition of DBU; [c]Starting material for the reaction is **3a**; [d]Reaction carried out in one-pot condition; [e]After workup of the step-1, without purifying the intermediate **3a** by silica column, step-2 was carried out; NR = No Reaction; *Condition A*: $[(Cp^*RhCl_2)_2]$, $Cu(OAc)_2{\cdot}H_2O$, $AgSbF_6$, $^t$AmOH, 120 °C, 1 h; *Condition B*: $[Cp^*Rh(MeCN)_3][SbF_6]_2$, $Cu(OAc)_2{\cdot}H_2O$, acetone, rt, 10 h; *Condition C*: $[Ru(p\text{-}cymene)Cl_2)_2]$, $Cu(OAc)_2{\cdot}H_2O$, $AgSbF_6$, $^t$AmOH, 120 °C, 10 h.

carbonate in *tert*-amyl alcohol gave 91% yield of **3a**. Other base $Cs_2CO_3$ gave 60% yield of the product **3a** (entry 4, Table 1), while DBU failed to promote the allylic substitution reaction (entry 5, Table 1). Having the enyne intermediate **3a**, the intramolecular annulation was examined in the presence of the rhodium or ruthenium based catalysts, based on the literature reports.[8] To our delight, the annulation of **3a** was observed in the presence of $[RhCp^*Cl_2]_2/AgSbF_6$ (condition **A**) to provide the corresponding 3,4-oxepino-fused indole **4a** in 90% yield (entry 6, Table 1). In case of other two conditions **B** and **C**, no product formation was observed (entries 7 and 8, Table 1). We tried to perform both the steps in one-pot, wherein only the formation of enyne intermediate (**3a**) was observed (entry 9, Table 1). After typical workup of the step-1 reaction, without purifying the intermediate **3a** subjected to the annulation (step-2), which gave the 3,4-oxepino indole **4a** in 49% yield (entry 10, Table 1). Hence, we have proceeded for further investigation through the purification of intermediate and subsequent Rh-catalyzed C–H activation based annulation to obtain the 3,4-oxepino-fused indoles.

With the optimized conditions in hand, the scope of successive allylic substitution/intramolecular [3 + 2] annulations was studied using various MBH-Acetates of acetylenic aldehydes (Table 2). MBH-acetates bearing electron-rich aryls on

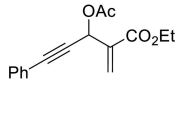
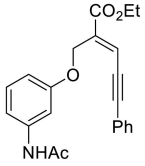
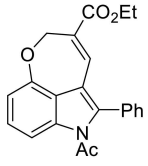
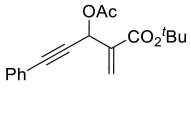
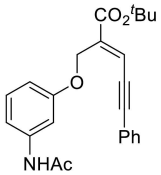
[a]Reaction Conditions: (i) **1**, $K_2CO_3$, $^t$AmOH, rt (ii) $[(Cp^*RhCl_2)_2]$, $Cu(OAc)_2{\cdot}H_2O$, $AgSbF_6$, $^t$AmOH, 120 °C; [b]Isolated yields, [c]**4a** was synthesized in 2 g scale

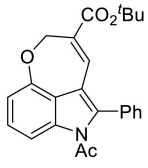


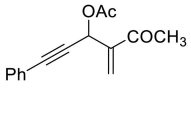


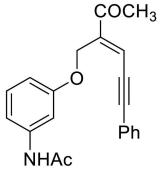


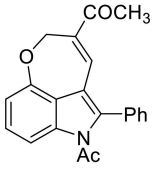












alkyne (**2b** and **2c**) as well as aryl groups on alkyne holding electron-donating (**2d** and **2e**) or electron-withdrawing (**2f** to **2i**) substitution, gave the corresponding 3,4-oxepino-fused indoles **4b** to **4i** *via* enynyl intermediates **3b** to **3i** (entries 2 to 9, Table 2). It is noteworthy to mention chloro, iodo and nitro groups are compatible in the present sequential reactions, which could be further elaborated. MBH substrates having heteroaryls such as 2-thiophenyl (**2j**) and 3-(N-*Boc*)-indolyl (**2k**) on alkyne are also tolerated in allylation to give **3j** (90%) and **3k** (85%) followed by rhodium-catalyzed annulation to offer the desired oxepino indoles **4j** and **4k** in 91% and 85% yields, respectively (entries 10 and 11, Table 2). Next, substrate **2l** with alkyl (*n*-pentyl) substitution on the alkyne was also successfully participated in allylation as well as in subsequent annulation to produce the fused indole **4l** in 82% yield (entry 12, Table 2). To verify the scalability of the described strategy, 3,4-oxepino-fused indole **4a** was prepared in 2 g scale. All the products were fully characterized by IR, mass, $^1$H NMR and $^{13}$C NMR spectral data. In addition, few representative compounds **4b** and **4j** were characterized by HSQC and HMBC NMR experiments (see supporting information).

Further, the reactivity of MBH acetates **5a** and **5b**, derived from different activated alkenes such as ethyl acrylate[10] and *tert*-butyl acrylate, were tested. Pleasingly, sequential allylic

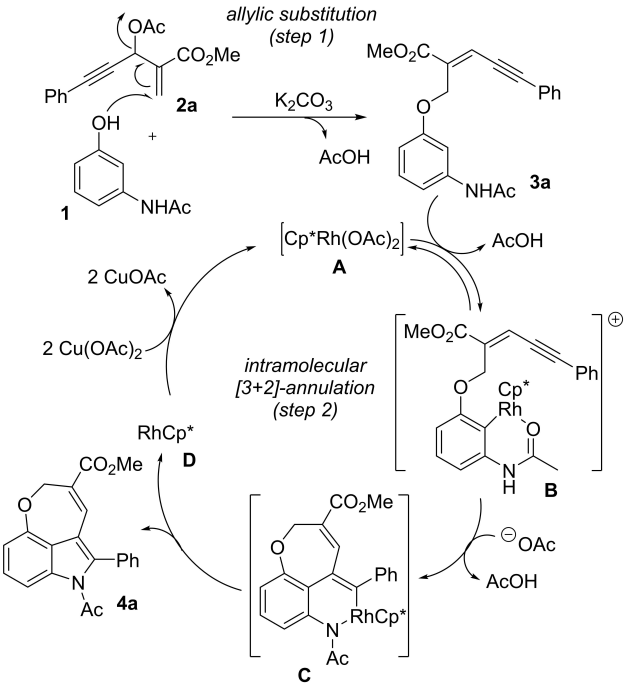
substitution/intramolecular [3 + 2]-annulation reactions of **5a** and **5b** proceeded well to provide 3,4-oxepino-fused indoles **7a** and **7b** in good yield *via* enynyl intermediates **6a** to **6b** (entry 1 and 2, table 3). To expand the scope, tolerance of other functionalities was verified by the reaction of MBH-acetate **5c** bearing keto group with 3-acetamido phenol (**1**) to get the enyne **6c**, which smoothly underwent [Rh]-catalyzed annulation to give the corresponding 3,4-oxepino indole **7c** in 78% yield (entry 3, Table 3).

**Table 3.** Scope of diverse MBH-acetates **5a** to **5c**[a]



| Entry | MBH-Acetate | Intermediate Time/Yield (%)[b] | Product Time/Yield (%)[b] |
|---|---|---|---|
| 1 |  **5a** |  **6a**, 40 h/84 |  **7a**, 1.5 h/89 |
| 2 |  **5b** |  **6b**, 36 h/82 |  **7b**, 2.0 h/86 |
| 3 |  **5c** |  **6c**, 48 h/71 |  **7c**, 2.0 h/75 |

[a]Reaction Conditions: (i) **1**, $K_2CO_3$, $^t$AmOH, rt (ii) $[(Cp^*RhCl_2)_2]$, $Cu(OAc)_2{\cdot}H_2O$, $AgSbF_6$, $^t$AmOH, 120 °C; [b]Isolated yields.

Based on the results and previous literature,[11] a plausible mechanism for this sequential reactions is proposed in Scheme 2. In the first step, MBH-acetate **2a** will undergo allylic substitution with **1** in the presence of base to provide **3a**. Treatment of **3a** with complex **A** [probably generated from the mixture of $(RhCp^*Cl_2)_2$, $AgSbF_6$, and $Cu(OAc)_2.H_2O$ produces a six-membered rhodium intermediate **B** *via* C–H bond activation involving coordination of amide directing group. Thereafter, insertion of internal alkyne into the Rh – C bond affords rhodacycle **C** through the coordination of alkyne to rhodium. The formation of C–N bond *via* reductive elimination provides the tricyclic indole **4a** and Rh(I) **D**, which reoxidised to Rh(III)-complex A with the copper(II) oxidant.

## Conclusions

In summary, we have developed a convenient approach for the synthesis of 3,4-oxepino-fused indoles starting from readily accessible MBH-acetates of acetylenic aldehydes. The present strategy is based on sequential allylic substitution/ Rh(III)-catalyzed C–H activation based intramolecular [3 + 2] annulations, which enabled the rapid construction of functionalized 3,4-fused indoles.

**Scheme 2.** Proposed mechanism

### Supporting Information Summary

Experimental procedures, characterization data and copies $^1$H and $^{13}$C NMR spectra of all new compounds as well as copies of HSQC and HMBC Spectra of **4b** and **4j** can be found.

## Indian Education System

India is a land of knowledge and history reveals that many people from different countries learnt many things from our motherland. Especially foreign travelers have visited our country for acquiring knowledge and education in the subjects like Astronomy, Mathematics, Physics, Economics, etc. Therefore, the discreet educational system of the time has strong roots in the cultural prosperity of our country. In the 21st century, India has become a super power in education with the standards of world class educational opportunities.India has always been a pioneer of the 'gurukula' system.In this system, the bondage shared by the student and the teacher is unique and special, and this is holistic approach to education in which a comprehensive development of the mind and the soul is observed best. The exact format of the 'gurukula' system is missing in the urban system of the country today.In spite of that, the spirits still remains, and this works to intensify the educational quality and excellence at all levels.In India, the study options are extensively diversified in all fields of education.

One of the best beneficial points of the Indian education system is its inexpensiveness. The teacher-student relationship in India is better than that of the foreign nations.This helps the students to stay motivated while studying andthis can help them to develop in the field of education.Indian institutions provide the students with more ground-work on helping students learn the concept theoretically.Consequently, Indians have generally high intelligence level compared to other countries. Right from our school-days to post graduate level, we have a variety of class tests and semester examsso that the students are able to be in constant touch with their books. This also means that Indians generally will have more scope in scoring in competitive exams not only in India but also in the foreign based standardized tests like GRE, GMAT, etc.

## The Challenges Faced by the Education System in India

The Indian education system is perhaps the second largest in the world, and this system has been struggling for a long time. The current situation of the student mindset compels them to get a good job after their undergraduate course. This makes most of the students drop their interest in theoretical science which kills a lot of dreams. In this connection, the words by Chris Hedges, "The true purpose of education is to make minds, not careers," are apt.The stress is prevalent everywhere in Indian institutions and its systems and we can see and feel it. In India, children are forced to go to schools at the age of four years itself, which reduces the fun that a child deserves to have during their childhood. Moreover, in our country studentsaredifferentiated based on only their marks and most of the people feel thatthe more marks students get, the more intelligent they become. Here, the grading starts right from the beginning of the student's education, and this prohibits the students from taking their own time to understand things which will make them stressful at a much younger age. If we follow Albert Einstein'squotation "everybody is a genius,but if you judge a fish by its capability to climb a tree, it will live its whole life believing that it is stupid," (Matthew Kelly, 2004), our system can be mended up to some extent.

Most importantly, the students should be taught practically, andthis is one of the most important things that our education system doesn't follow. commonsenseand application are not given proper importance. Students are made to mug up information just for the sake of writing in the examinations. In India classes are held almost continuously without any breaks, andabout only an hour in total of all the time they spend in the institutions is utilised for breaks. Many students might not like sitting hours together at the same place and listening to classes which they are not interested in. As rightly remarked by Aristotle, "Educating the mind without educating the heart is no education at all." This reduces the potential of the student in understanding the class.

The education in India is not fully state funded. There is a lot of poverty in India but the government hasn't been able to take up necessary action for free education (for at least the ones who can't afford it). Government institutions aren't being run properly in most of the areas. Though Indian education system is good when it is compared tothe other countries, we are not producing as many scholars as we should be able to produce due to the population and limited resources of our country. That is the reason why we are forced to say that the Indian education system is not up to the mark.

One of the main reasons for our failure in the education system in India is we are forced to follow the same system for all the students and the institutions both in rural and urban areas.The main drawback in India is we are forced to join the students in the institutions to increase the Gross Enrollment Ratio irrespective of the interest of the students, and we are asked to increase pass percentage in the examinations. The students who join with such force or for the sake of some incentive are not at all interested in education, and they attend the institution namesake and expect ultimate pass in the examinations. Consequently, it is leading to deterioration in the standards of our education system. The too much bureaucratic interference in the academic affairs is also one of the drawbacks here. One more hindrance is the work related grading of institutions has become very hectic to the teachers and they are unable to concentrate on the teaching and learning process wholeheartedly.

Now a days, in India the students are highly stressful and they have to face these examinations in order to score as per their parent's expectations. So without getting leisure time, students just prepare for their examinations because those who fail or get fewer marks are not treated well by the teachers, the parents and even by the classmates. Eventually, they lose all the confidence or become trouble makers. Parents pay a lot of fee even for the extra tuition, and expect outcome of their money spent. The system kills creativity and it is not at all helpful not only for students but also for teachers and parents. People talk about great performance by Indian students in the foreign countries, as the system only helps in discrimination between brilliant and dull, and also rich and poor. The people who are doctors or engineers with good salary, lawyers, C.A. or any highly paying job are only getting much respect in society. So it is all about the money in India and so people are crazy about IITs, AIIMS, IISc and so on. It is only helpful for those who run the private institutions as they make a lot of money, and it has become a business.

As rightly said by Jean-Jacques Rousseau, "Plants are shaped by cultivation and humans by education" (Jean-Jacques Rousseau, 1979), unless we shape the students in a proper way, they won't get proper education and develop into good citizens. The present scenario clearly highlights that the Indian education system is not student friendly due to dullness in the classroom, massive syllabus, and more number of examinations. This is happening at every level of education. The most unfortunate thing is that there are high expectations not only from the parents but also from the teachers in case of getting good results. Teachers give a lot of home-work and parents also expect the same. In this situation, the student gets a lot of pressure and stress; consequently the student hardly learns anything but just scores the marks.

We don't need human robots. The world has progressed and now we need people, who think creatively, innovatively, independently with the ability to connect. It is a known fact that no two brains are the same. When it comes to school one teacher stands in front of forty kids with each one having different strength, different needs, different gifts, different dreams and schools teach them at same time in a same way, that's horrific.

If our education system is compared with theeducational system like Finnish, the Indian educational system is not progressingin the right direction.The most important benefit is the freedom and practicality of education withno home work andassignments. Students are not burdened with home works and assignments as they believe that mastery is attained in class. No exams till high school, there iscontinuous andpractical teaching with low teacher-student ratio.Finnish education system is consistently been awarded as the number one education system in the world from many years. Several reports and surveys lay emphasis on the importance of high quality teachers with relevant level of pays.One important factor which needs to be considered here is that Finnish institutions do not charge much tuition fee, and education is sponsored here with the quality of education to all the students from all over the world. Parents do not pressurize their children to study. They learn everything on their own, and the formal education starts here at the age of seven. They are quite relaxed when it comes to educating their children.

The main motto of education system in Finland is 'Education for future, not just the present.' There are no such things called national testing or inspection in schools and colleges. The government looks at the performance of the candidates and recruits them for various posts.Finland has no private schools and they value 'equality over excellence' - equal opportunities for all.Though the Finnish schools have sports, they don't have sports' teams as they don't give importance to competitions.Sahlberg quotes a line from a writer named Samuli Paronen which says that, "Real winners do not compete."( Samuli Paronen,2015). In Finland, their educational system has completely been revolutionized by their intellectual and educational reforms.The Finnish system doesn't encourage forcing or standardized tests, andthere is no grading system at all for teachers. Master's degree is a must to all teachers who wish to enter the teaching profession. Teaching programs are the most rigorous and selective professional schools in the entire country. If a teacher isn't performing well, it is the individual principal's responsibility to do something about it.The educational system in Finland doesn't worry about the merit-based systems. The lists of top performing schools and teachers are not found. The environment of competition is not at all found there, instead cooperation is found.

## Conclusion:

After analyzing the education system in India critically, one can understand that it requires some changes in it in order to make both the teacher and student stress free. After all stress is the root cause for all hindrances to our development in all aspects. That is why our policy makers must go in the direction of making our education system stress-free. In this connection, grading system should be removed both for teachers and institutions as, now a days, we have different kinds of assessment methods. Record work should be minimized to the teachers particularly in the higher education, as the teachers are unable to concentrate on the work what exactly they are supposed to do. Finally, the education system should be helpful to the students in their holistic development, becausenot school but the education system shape the intellect of a student.

# Methods Impacts and Challenges of E-Resources in Current Libraries: A Study

P. Vijay Mahesh Kumar
Librarian, Good Shepherd International School, Ooty, E-mail: vijaymahesh@rocketmail.com

## 1. INTRODUCTION

Electronic resources generally called as E- resources is the order of the day, rise in Information technology, suddenly changed sources man was using once, one of the example is our evolution of e resources. The storage of ideas of the human being from manuscripts to paper and to floppies, cds, DVDs, and hard disks , to the online archives like e resources help the man to access any where 24x7 with a net connections on pc. Gathered, store, organized, accessed, retrieved and consumed information in the form of e resources made a significant impact in science and technology. According to Katz, "the best criteria for evaluating a source are purpose, authority, and scope." (1992, p. 23). It is also important in evaluation of electronic journals to consider format, currency and audience. The wide diversity of materials such as: print, audiovisual, CD-ROM, electronic journals, network databases, and multimedia products are continuously growing. Most libraries are increasing their electronic resources in response to user demand. Consequently, librarians must continually be educated in increasing their skills on automated systems and electronic resources.

## 2. E- REFERENCE SOURCES: AN OVERVIEW

They are plenty of variety of e - reference sources and they are like abbreviations and acronyms, Almanacs, Associations, organizations and conferences, audio/video & Television programs, awards and prizes, biographies, book reviews, book sellers/out of print/rare, calendars and time, career and employment, citations and style guide (MLA&APA), consumer health, consumer information, converters and calculators, country information, Dictionaries and thesauri, Directories, Embassies, Encyclopedia, Government Information, Images, Library home page/ catalogues, Maps, Atlases, & Geo Information, Movies/Films, News and current events, patents and trademarks, Quotations, Scholarships, Statistics, Universities/Colleges, weather and climate.

### *2.1. E- Statistical Sources*

They are many electronic statistical sources and one good example is that the US Census Bureau's internet site devoted exclusive to measuring electronic economy and also provides links like business and industry, 2007 economic census, economic indicators, annual survey of manufactures, annual wholesale trade survey, service annual survey, annual retail trade survey , social science electronic resources : statistics is an electronic eg: economics data, government docume archive, governments on www, international data base, int social sciences statistics and data, nation master, off stat official statistics on web, oxford latin American econo history database, and international organizations, e,g., Eu stat, food and agricultural organizations, international la organizations, international monetary fund, organization f economic cooperation and development, UNESCO, UNIC UNO, united nations high commission for refugees, uni nations populations information network, world bank, wh charity trends, radical statistics group, straight statistics.

### *2.2. Sound Recordings*

Sound recording and reproduction is an electrical mechanical inscription and recreation of sound waves such spoke voice, singing, instrumental music, sound effects two phases in sound recordings are analog and digi recordings. Electronic recording formats starts form magn tapes later tape recorder, later came stereophonic sounds, high fidelity, later transistor radio, and compact cassette , wa introduced commercially in the year 1980s employ las technology to inscribe and read digital information in a wa that avoids actual physical contact between the dises and type of stylus . compact disc technology was super cedded digital versatile disc (DVD) technology with the introduction of DVD- audio format in 1999.Motion picture soundtracks called optical recordings. The sound to be recorded converted in to an electrical signal that is used to modulate intensity of beam light.

### *2.3. Research Guide by Subjects:*

The Research Process will go smoothly if you know what resource to consult and test the genunity. As researcher you should have competency on four factors a) Choosing appropriate resources b) Searching effectively and efficiently c) evaluating resources critically d) citing resources appropriate documentation style know we have different databases which are helpful for our research and it also give authentic sources and peer review Journals and total number of hits to show the popularity of the specific journals. The Indian School of Business Hyderabad, Learning resource centre have collection of nearly 50 databases which give information on Business News, Company information, Management Literature, Marketing research, comes under broad category of databases. These databases useful research guides for the students in their project works.

### *2.4. Indexes*

Database Index helps to speed up retrieval of data and similar to book index. In database index some fields are automatically index, an email address, a user id, a social security number, are automatically indexed and database can quickly check to make sure that you are not going to introduce bad data. The basic idea of index is to limit the findings. Bitmap index, Dense Index, Sparse index, Reverse Index .balanced trees, B+ Trees and Hashes.

### *2.5. Online Databases:*

Database is the collection of file or files brought together as common file and data will be kept in a certain specific and systematic manner without any duplication called database. The databases which are in online available are called online databases. A database management is set of programs that enable storing , modify and extracting information form a database it allow add, delete, access, modify, analyze data stored in one location. They are servers called database servers that hold the actual database and run only the DBMS and related software's we should get the username and passwords to login and browse the IP enabled databases.Types of databases, Navigational DBMS , Relational DBMS, SQL DBMS, Object oriented databases, 21 centaury No SQL database .

### *2.6. E- Thesis*

E-Thesis also called online thesis, electronic thesis which can access in internet at any time ie 24x7 . Electronic thesis and dissertations bibliography includes articles, books, conference papers, technical reports, Un published e prints, and other scholarly textual sources that are useful in understanding electronic thesis and dissertations. This bibliography does not cover digital media works ( MP 3) files, editorials, e-mail messages, interviews, letters to the editors, presentation slides, or transcripts and web blog postings . Example of E - Thesis are Vidyanadhi, Sodhganga, Sodhgangothri. Vidyanidhi (Meaning Treasure of Knowledge In Sanskrit) is Indian premier digital library initiative to facilitate the creation , archiving and accessing of doctorial thesis. Vidyanidhi is an information in fracture a digital library , a portal of resources , tools and facilities for doctoral research in India. Sodhganga at inflibnet centre provides a platform for research students to deposit their Ph.D thesis and make it available to entire scholarly community in open access. The repository has the ability to capture, index, store, disseminate, and preserve ETD,s submitted by researchers. Sodhgangothri under sodhgangothri research scholars / research supervisors in universities are requested to deposit electronic version of approved synopsis submitted by research scholars to the universities for registering themselves for the Ph.D programme it reveals the trends and directions of research being conducted in Indian universities and avoid duplication of research.

### *2.7. Online Student Assessment System (OSAS)*

Inform your data today instruction to multi student achievement goals sadlier's web based online student assessment system (OSAS) is an outstanding tool to increase student learning without a "one size fits all" approach. From creating assignments and test to reporting student results, this secure assessment system makes monitoring student progress easy.

a) preparing students for the online 2014/2015 common core assessments

b) saves teachers time in creating practice worksheets and assessments

c) provides instant feedback with online administration

d) Makes it easy to track student progress and adjust instruction.

e) Is available anytime, anywhere, on any internet - accessible device.

## 3. ADVANTAGES OF E-RESOURCES

- Any where, any time 24x7 access with simple net connection on pc
- Easy in search strategy, for magazines or journals with Vol and Issues exactly with single click.
- Popularity and Value of the articles or books can be known by number of citations it has got.
- Peer reviewed sources can be kept separately for the scholarly community.
- Speed in publication and distribution than in print or any other forms.
- Feed backs, comments, and popularity can be known to the world quickly.
- Well presentations with URL links form topic wise to the another page quickly
- Animated, multimedia, charts, and audio, video can make the stuff attractive and Interesting to the user.
- It is most cost effective compared to print media, print cost, distribution cost, transportation cost can be saved.

## 4. DISADVANTAGES OF E- RESOURCES

a) It is difficult to read in computer screens

b) Lack of peer review of materials

c) Slowness of Internet

d) Power shortage

e) Lack of accessibility of resources that doesn't access the resources.

## 5. CHALLENGES OF E - RESOURCES

- As the consortia acquisition of library resources between libraries made then the role of librarian also will change drastically. Librarian plays key role in providing resources to their users is challenging task know.
- Information pollution as the number of resources on a specific topic has ever increased to choose the specific and a genuine one is very difficult, hear comes the role of librarian, he has to select and send appropriate article or resource with genuinely in time
- Make use of online resources which are available in library properly is one of the main task of the librarians in this electronic world.
- Frequent problems in hard ward and software trouble shooting of the e resources a librarian should knowledge at least and could explain to expert to rectify.
- In the newly changing and challenging trend current librarian should be able to balance both the printed and on line version of resources.
- Classification, cataloging and indexing of E-Resources and keep the site update is one of the key roles of the librarian.
- Librarians has the responsibility to increase the usage of e- resources and also educated the users about the usage and search strategies he has to take frequent orientations to the user community about e- resources of the institution and also he should took feed back regarding the e resources.
- As and when librarian should knew the barriers in usage of e- resources and he has to rectify and solve the problems facing by the users.
- Low band width for internet access
- Lack of sufficient computer systems within the library premises
- Asking Goal Oriented awareness progr Librarian , Librarian make your resear your time.
- We can provide single interface to sea journal platforms.
- Lack of Organizational Information m
- Developing next generation catalogues
- A Librarian should analyze web traff surveys analyze usage statistics and in and feed backs

## Editors-in-Chief

**Dr. B. Ramesh Babu** was ***Professor*** in the Department of Library and Information Science, University of Madras. He has been awarded **Dr. S.R. Ranganathan Memorial Gold Medal** from the University of Mysore for the First Rank in M. Lib. Sc., degree. He has been awarded **Commonwealth Fellowship for Post-Doctoral research** for the year 1999/2000. He has visited United Kingdom, France, Bangladesh and Nepal, South Korea, Muscat, Thailand, Vietnam and delivered lectures in LIS schools there. He has been conferred **Prof. Parvathaneni Gangadhara Rao Memorial Award for 2007.** He has also been conferred the **Best Teacher and Researcher Award by the National Association of Indian libraries (NAIL) for the year 2008** and **IATLIS-MOTIWALE Best LIS Teacher Award for 2011** by the IATLIS. He published more than 300 research papers and edited about 20 books, festschrifts and conference volumes. **Twenty five candidates were awarded Ph. D degree** under his guidance. He served as Visiting Fellow of many Indian Universities under UGC programme. He is the Visiting Professor in the Mahasarakham University, Thailand. He has been honoured with two festschrifts, one in four volumes entitled **"Dynamics of Librarianship in the Knowledge Society"**, and one volume entitled, **Facets of Librarianship: Yesterday, Today and Tomorrow , a collection of his reprints. He served as the member of Board of studies in about twenty universities, member of Board of Examiner in about 40 universities both in India and abroad. Currently he is Visiting Professor in Mahasarakham University, Thailand.**

**Dr. Ramesha** completed BLISc., and MLISc from Bangalore University and awarded Ph.D. from Karnatak University, Dharwad. He was started his carrier as a Librarian in the United Mission Degree College, Bangalore and joined the Karnatak University Library, Dharwad in 1999 as a Asst. Librarian. Subsequently he was moved to University of Madras, Chennai as a Lecturer. Presently he is working as a Associate Professor in the Dept. of Library and Information Science, Bangalore University, Bangalore. He was ***awarded "ILA – A.G. Motiwale Award for Young LIS Professionals - 2007"*** and **"ILA – Dr. C.D. Sharma Best Paper Award 2009 and 2011"** respectively by the Indian Library Association(ILA), Delhi. He served as Rapporteur General, Chairman in various national and international conferences and seminars held different parts of the country. He is a member of Board of Studies (BoS), PRC and Board of Examinars (BOE) for many Universities in India. As of today he has participated more then 50 national and international conferences, seminars and workshops and published over 75 research papers both in national and international journals and conference proceedings. Completed one Major and one Minor Research project funded by UGC. Dr. Ramesha served as resource person in many Academic Staff Colleges(ASC), workshops and symposia. He was visited Srilanka to present a paper in the International Conference. He is a life member of many professional associations including ILA, IASLIC, IATLIS, FIC, MALA, KALA etc. His areas of interest includes Information Literacy, Design and Development of Digital Repositories and Application of ICT in LIS.

**Dr. D. Chandran**, has the distinction of earning two masters degrees in Commerce and Library and Information Science securing gold medals in both for first ranks. The Sri Venkateswara University awarded him doctoral degree in Library and Information Science from Sri Venkateswara University,Tirupati. His publications more than 155. He has been actively involved in organising and participating many national seminars. He has edited 4 books and co-authored one book on 'Information technology' in Telugu language. He has prepared Course materials for the distance education programmes for various universities. He is an examiner and paper setter for more 20 universities and adjudicated more than 100 theses. His research interest include Library automation, database creation, digitization, computer-based information services, on-line search etc.. Under his guidance and supervision, 12 doctoral degrees and twenty M.Phil degrees were awarded. He has delivered guest lectures at a number of workshops in the universities and a resource person in a number of Distance education programmes, Academic Staff Colleges, Departments. He has been closely associated with more than a dozen professional bodies. He served as Joint Secretary for IATLIS and Vice President (south), for ILA. His teaching and research relate mostly to the area of application of Information Technology in Library and Information centers, Library Science education. He served as Chairman, Board of Studies and Head in his own department. Presently he is Chairman, BOS for the DLIS, Sri Krishnadevaraya University, Anantapur. He is a member of BOS of many universities in Andhra Pradesh, Tamilnadu, Karnataka. Currently he is working as Professor in the Dept of Library and Information Science, Sri Venkateswara University, Tirupati.

## Editors

**Dr. B. R. Doraswamy Naick,** Presently working as Librarian, JNT University College Central Library, Jawaharlal Nehru Technological University Kakinada, Andhra Pradesh. He has been put up more than 10 years of experience. He has published more than 20 research papers appeared in various journals, conference proceedings. He Attended more than 30 national and international conferences. He is a life member of many library professional bodies. His thesis on "Networking of Engineering College Libraries.... a proto type design" applauded by many experts. He was awarded Ph.D by the Sri Venkateswara University, Tirupati under the guidance of Prof D Chandran. Before joining in JNTU, he worked in S V University Library.

**Dr. P. Nageswara Rao** possesses triple Masters' degrees in Public Administration, Commerce and Library and Information Science. M.Phil and Ph.D degrees in Library and Information Science. He obtained degrees from the University of Madras and Annamalai University. He served as College Librarian in Tagore College of Arts and Science, Chennai for a period of five years. His experience in the academic libraries has motivated to undertake doctoral study in Autonomous College Libraries, which resulted in the present book form.

**Smt. M. Prasantha Kumari,** presently working as Assistant professor, DLIS, Sri Venkateswara University and joined during the year 2007. Prior to joining in the university, she worked as a librarian and guest lecturer at Anantapur. She cleared her net. Presently she submitted her doctoral degree under the guidance of Prof D Chandran and awaiting for result. She has more 15 research papers published in conference proceedings and journals at national and international level. She participated more than 20 national and international conferences.

## Associate Editors

**Dr. Mallappa F. Kumbar**, presently working as librarian in **St. Francis Institute of Management and Research**, Mumbai. He has been awarded doctoral degree under the guidance of Prof D Chandran, from Sri Venkateswara University, Tirupati, entitled "Application of T2M in B-School libraries of Mumbai City.", Further he has completed M.Phil in Library and Information Science from Alagappa University and M.L.I.Sc. from Karnatak University, Dharwad He has a more than ten years experience as librarian. He published more than 15 papers in peer reviewed journals, and conference proceedings at National and International level.

**Dr. K. Kumar** PhD. is Librarian, Sri Venkateswara College of Engineering and Technology, Chittoor, Andhra Pradesh. He has been awarded doctoral degree under the guidance of Prof D Chandran, from Sri Venkateswara University, Tirupati. Further he has completed M.Phil in Library and Information Science, M.Com (Computer Application), M.L.I.Sc, PGDLAN (Post Graduate Diploma in Library Automation Network) from Central University, Hyderabad. He has a more than twelve years experience as librarian. He published more than 40 papers in peer reviewed journals, and conference proceedings at National and International level.

**Dr. R. Sreenivasulu**, presently working as Professional Assistant in Rashtriya Sanskrit Vidya Peetha, Tirupati. He is having more than 15 years of working experience. He did his MLISc through Distance mode and awarded Ph.D in LIS entitled "Information needs of the users of TTD institutions, Tirupati", under the guidance of Prof. D. Chandran. He published more than 25 research papers. He attended a number of conferences, seminars and workshops and presented papers. He is a life member of Indian Science Congress and life member of many LIS professional Associations.

**Dr. Md. Gouse Riajuddin** presently working as Assistant Librarian, Andhra Muslim College, Guntur, Andhra Pradesh, India, for the last 20 years. He has teaching experience more than 10 years. He worked as Lecturer in the Department of Library and Information Science, Acharya Nagarjuna University, Nagarjunanagar from 1994 to 1998.

**Mr. M Suresh Babu** is presently working as librarian in Bharath Engineering college, Hyderabad. He has been submitted his doctoral degree under the guidance of Prof. D. Chandran, to Venkateswara University. He has a more than twelve years experience as librarian. He published more than 20 papers in peer reviewed journals, and conference proceedings at National and International level. He actively participated more than 15 conferences, workshops. His area of interest is Academic Librarianship and Information Technology.

# GLOBALIZATION AND ITS IMPACT ON ECONOMIC ENVIRONMENT

**B.PEERA KUMAR , P.VIJAY MAHESH KUMAR**

[1]Lecturer In Economics

[2]Lecturer In Library & Information sciences

**Globalization**

Globalization can be simply defied as the expansion of economic activities across the political boundaries of the native state. In a broader sense it is a process of strengthening economic integration , increasing economic openness and growing economic interdependence between the countries of the world economy.

International Monitory Fund (IMF) defined globalization as the growing economic interdependence of countries worldwide through increasing volume and variety of cross-border transactions in goods and services and of international capital flows and also the more rapid and wide spread diffusion of technology.

**Environment**

Environment is the sum total of what is around something or someone. It includes living things and natural forces. The environment of living things provides conditions for development and growth, as well as of danger and damage. Living things do not simply exist in their environment. They constantly interact with it. Organisms change in response to conditions in their environment. The environment consists of the interactions among plants, animals, soil, water, temperature, light, and other living and non-living things.

Environment can be divided in to four types a) Physical environments b) Economic environments c) Social environment d) Political environment. Generally globalization effects the economic environments either positively or negatively.

**Globalization –Economic Environment**

The term globalization has four important aspects a) Reduction of trade barriers and permit free flow of goods and services between countries b) Creation of environment for the free flow of capital between the countries c) creation of environment for the free flow of technology between countries d) creation of environment for the free flow of labor between countries .

Globalization effects on economic environment assets for example in order to get profit maximization the resources should be utilized more and more than actually needed. During that period income in inequalities and environmental unbalanced activities takes place regularly. To enhance the economic activities forest land may be declined that's why as long as we follow globalization we should check up the steps which are to be implemented without loss of social and economic environment quality.

The aim of globalization is to integrate the countries of the world. If we see the globalization with economic environments it has two main components one is globalization of markets and second is globalization of the product as long as we implement the policy of globalization without the loss of physical environmental quality the developing countries would be able to improve there competitive strength and achieve rapid economic growth. But it is not possible because pollution may arise while producing different goods in such countries.

**Merits of Globalization :** India has skills and investments in several sectors like agro-based industries which make it lowest cost producer and become premier production centre of the world b) India has the potential to be a manufacturing site for many global industries because it has the capabilities to manufacture almost all engineering goods. C) India has certain national advantages in some sectors like knowledge-Led-Services. It can become a multinational abroad and gain world markets d) globalization helps the entrepreneurs to spread there risks of entrepreneurship. It may be better to spread the risks over several markets e) Indian companies

http://www.ijbmas.in
INTERNATIONAL JOURNAL OF BUSINESS, MANAGEMENT AND ALLIED SCIENCES
A Peer Reviewed International Research Journal
ISSN:2349-4638

can tap the huge global capital market and perhaps rise global capital more cheaply f) globalization will enable India to attract foreign investments. As a result of globalization India is getting some benefits .

**Effects of Globalization :** Although globalization policy has some benefits there are some problems the government has to face the policy may not deliver the expected results. The following examples shows demerits or problems of this policy. a) India's share in world export of goods and services not significant.

If we take small scale industries as an example we can analyze the effect of globalization with the below chart.

(Units = Million Nos.)

| Year | Units | % Increase to prev. year | Year | Units | % Increase to prev. year |
|---|---|---|---|---|---|
| 1973-74 | 0.42 | - | 1990-91 | 6.79 | 273.08 |
| 1974-75 | 0.50 | 19.05 | 1991-92 | 7.06 | 3.98 |
| 1975-76 | 0.55 | 10.00 | 1992-93 | 7.35 | 4.11 |
| 1976-77 | 0.59 | 7.27 | 1993-94 | 7.65 | 4.08 |
| 1977-78 | 0.67 | 13.56 | 1994-95 | 7.96 | 4.05 |
| 1978-79 | 0.73 | 8.96 | 1995-96 | 8.28 | 4.02 |
| 1979-80 | 0.81 | 10.96 | 1996-97 | 8.62 | 4.11 |
| 1980-81 | 0.87 | 7.41 | 1997-98 | 8.97 | 4.06 |
| 1981-82 | 0.96 | 10.34 | 1998-99 | 9.34 | 4.12 |
| 1982-83 | 1.06 | 10.42 | 1999-00 | 9.72 | 4.07 |
| 1983-84 | 1.16 | 9.43 | 2000-01 | 10.11 | 4.01 |
| 1984-85 | 1.24 | 6.90 | 2001-02 | 10.52 | 4.06 |
| 1985-86 | 1.35 | 8.87 | 2002-03 | 10.95 | 4.09 |
| 1986-87 | 1.46 | 8.15 | 2003-04 | 11.40 | 4.11 |
| 1987-88 | 1.58 | 8.22 | 2004-05 | 11.86 | 4.04 |
| 1988-89 | 1.71 | 8.23 | 2005-06 | 12.34 | 4.05 |
| 1989-90 | 1.82 | 6.43 | 2006-07 | 12.84 | 4.05 |
| **AAGR** | **9.36** | | **AAGR** | **4.07** | |

Source: Ministry of Micro, Small and Medium Enterprises, GOI.

AAGR= Annual Average Growth Rate or Exponential Growth Rate.

**Analysis:** It is cleared from the above table that the Annual Average Growth Rate of number of units in the pre-liberalisation period, from 1973-74 to 1989-90 was 9.36 percent and in post- liberalisation it was 4.07 percent. In pre- liberalised period, the yearly growth rate was higher than average growth rate in the initial years and from 1984-85 to 1989-90; the yearly

- Foreign investment flows not quit helpful to strengthen Indian economy
- Wide gap between foreign investments approvals and actual flows
- Increase in imports is greater than the increase in exports
- Slow GDP growth rate
- Slowing down the process of poverty alleviation
- Lower employment growth

**Effects on Physical Environments;** Under the part of globalization every country will tries to enhance there business and move forwards to international trade effectively. In this sense some major issues relating to global environment that have attracted the increasing attention of economists , environmentalists ,

## Introduction

The recent developments in Information Technology change scenario. Libraries and Information Centres have embrac information technology more profoundly than many othe most of them are currently using electronic products and offers tremendous opportunities to provide solutions to some challenges now libraries are facing. Electronic Publishing or

## Conclusion

The study reveals that the faculty members and research scholars of Dravidian University mostly rely on E-ShodhSindhu e-journals for research purpose and publishing articles. They are using the available e-journals satisfactorily. The library professionals tried their best for promotion, assistance and guidance in accessing e-journals. The increase in e-journals subscription indicates that the library has made drastic changes in E-ShodhSindhu e-journals collection and services. The library has to employ different strategies for effective use of available online resources through E-ShodhSindhu. Central Library has to conduct the orientation programme for the best use of E-ShodhSindhu e-resources.

## INTRODUCTION

The recent developments in Information Technology chan scenario. Libraries and Information Centers have embr information technology more profoundly than many other fi of them are currently using electronic products and serv tremendous opportunities to provide solutions to some of the m now libraries are facing. Based on the recommendation Committee, the MHRD vide their recent note F.No.16-23/20 1st December, 2015 has has formed e-ShodhSindhu merging t initiatives, namely UGC-INFONET Digital Library Consortiu INDEST-AICTE Consortium.The e-ShodhSindhu will contin current as well as archival access to more than 15,000 core and journals and a number of bibliographic, citation and factual different disciplines from a large number of publishers and a its member institutions including centrally-funded technica universities and colleges that are covered under 12(B) and 2 the UGC Act. The main objective of the e-ShodhSindu: Consor Education E-Resources is to provide access to qualitative electr including full-text, bibliographic and factual databases institutions at a lower rates of subscription. Looking towards th of the e-journals, the present study try to analyse the use and ef e-ShodhSindu online journals by the faculty and researc Dravidian University and Sri Venkateswara University to problems and constraints faced by the users for accessing recommendations for its proper use. This study is probably or in both the universities.

satisfactorily. The library professionals tried their best for promotion, assistance and guidance in accessing e-journals. The increase in e-journals subscription indicates that the library has gone drastic changes in E-ShodhSindhu e-journals collection and services. The library has to employ different strategies for effective use of available online resources through E-ShodhSindhu. Central Library has to conduct the orientation programme for the best use of E-ShodhSindhu e-resources.

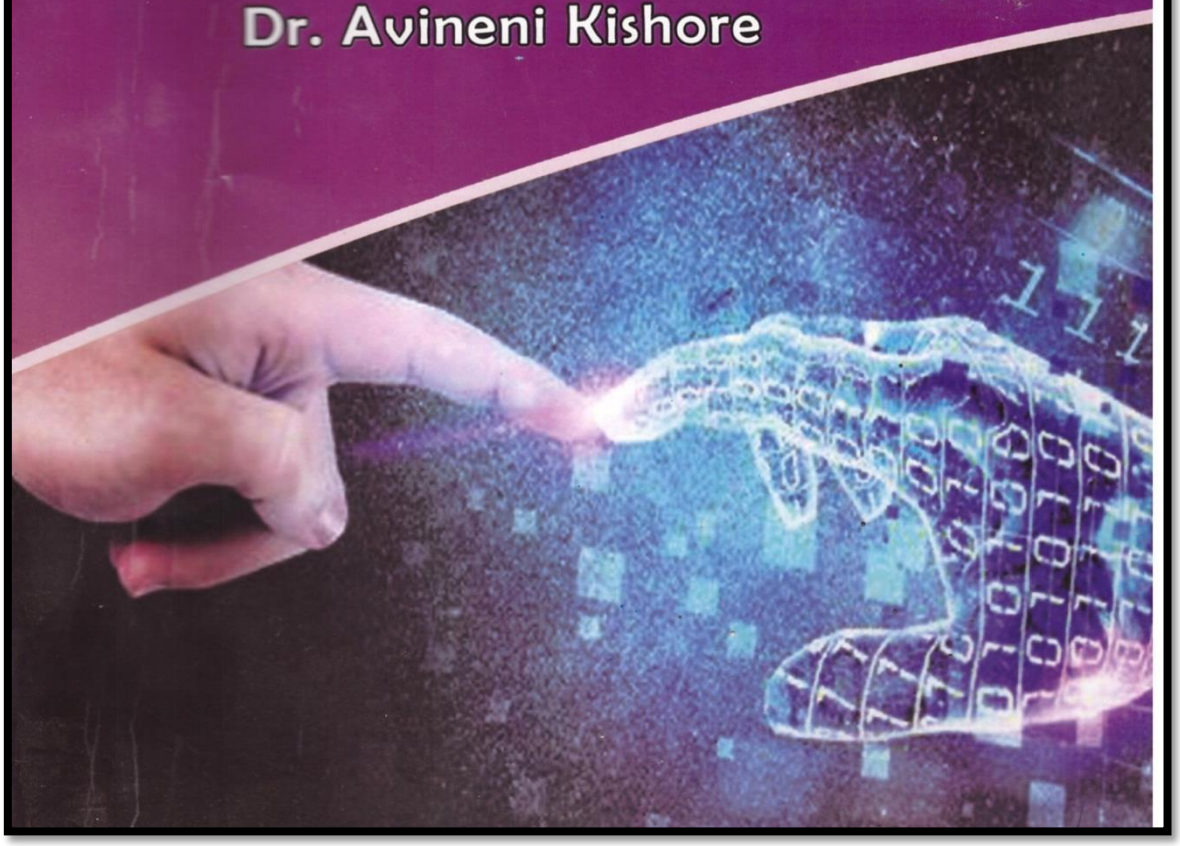
**Dr. B. Ramesh Babu** was Professor in the Department of LIS, University of Madras and former Visiting Professor at the Mahasarakham University, Thailand (2012-2013). He has been awarded Dr. S.R. Ranganathan Memorial Gold Medal from the University of Mysore for the First Rank in M. Lib. Sc., degree & Commonwealth Fellowship for Post-Doctoral research for the year 1999/2000 and worked on "Web OPACs in the UK Academic Libraries" at the Department of Information Science, Loughborough University, United Kingdom.

30 candidates were awarded Ph. D degree under his guidance. He has published more than 390 research papers in Indian and Foreign journals, Festschrift volumes and National and International seminars/workshops . He has edited about 35 books including conference proceedings and festschrifts. He has organized a number of workshops, seminars and conferences. He is a Resource person in various Distance Education Institutes. He has successfully completed 5 major projects at national and international level. He has been honoured with two festschrifts, He served as the member of Board of studies in about twenty universities, member of Board of Examiner in about 40 universities both in India and abroad. Currently he is the Co-President of the Library and Information Science Society for the Asia and the Pacific (LISSASPAC) now renamed as I-LISS (International Library and Information Science Society).

**Dr.M.Doraswamy** is Professor and Head in the Department of LIS and University Librarian, University Library, Dravidian University, Kuppam, Chittoor Dt., Andhra Pradesh. He published and presented 30 papers in national and international conferences and published 40 articles in national and international referred journals. He has edited and authored about 9 books, festschrifts and conference volumes. Thirty M.Phil degrees, Fifteen Ph.D degree were awarded under his guidance. He has prepared course materials and resources person for Distance Education students in LIS. He organized three national level conferences on LIS. He served a number of administrative positions such as Deputy Director, Directorate of Distance Education, Controller of Examinations, Chairman, BOS in Dravidian University and Member BOS, Board of Examiner (BOE), Member Selection Committee etc. Prior to Dravidian University, he worked at V R Siddhartha Engineering College, Vijayawada and S.V University Library, Tirupati.



**Dr Raavi Sarada** is the Secretary of Andhra Pradesh Library Association and since 1987 she has been the Principal of Paturi Nagabhushanm School of Library science run by the Association at Vijayawada; editor Granthalaya Sarvaswamu, the first vernacular Journal of India; Jt.Secretary Andhra Pradesh Gandhi Smaraka Nidhi and member of Gandhi hill foundation, Vijayawada.Sheis also Secretary of Sarvottama Granthalayam which works all the 365 days of a year. As a project director Bread Society Chlidren's Libraries, she is instrumental in establishing more than 1200 children's libraries in government and aided schools in all the districts of Andhra Pradesh and Telangana States. She edited good number of Books and Conference volumes She was course writer for some write-ups of Dr Ambedkar Open University Library and information courses. She is the member of many professional Associations of India. She organized many national and regional conferences in Library and Information science. She has been awarded with KALARATNA title by Govt. of Andhra Pradesh in the year 2016.She has been nominated as one of the Directors of Andhra Pradesh Granthalaya Prarishad by the Government of Andhra Pradesh.

# Usage of e –Shodh Sindhu in Promition of Research and Academic Knowledge by Scholars and PG Students in Shri Padmavati Mahila Vishvavidyalayam: A Study

**Vijay Mahesh Kumar, P. and Mastanaiah, V.**

*Librarian, PRR & VS GDC, Vidavaluru*

*Librarian, Narayana Engineering College, Nellore.*

**Abstract**

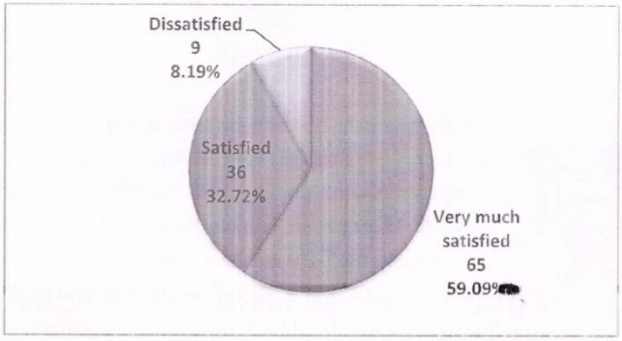
*The aim of this paper is to know about usage of E-shodhsindhu by research scholars and PG Students their awareness, area of specialization, availability, level of satisfaction, and future requirements for their study. It also explains their experience in usage of E-shodhsindhu and productivity.*

***Keywords:*** *E-ShodhSindhu, E-Books, E-Journals, E-Databases, INFLIBNET, Resource Sharing, Sri Padmavati Mahila Vishvavidyalayam.*

## Introduction

Libraries play an important role in vast changing e environment. E resources changed the role of libraries, its scope and users. It also changed its nature of Job what it has done earlier. Modern information and communication technologies had profound influence on its access to various types of online e resources like e journals, databases, e books method of resource sharing and upgrade its resources to attract its users.

## UGC INFONET- Digital Library consortium



The University Grants Commission (UGC) has initiated a programme to provide e resource over Internet to scholarly literature in all areas of learning to university sector in India. The programme is wholly funded by the UGC. All universities which comes under UGC be the members of this programme and it also be extended to degree colleges also.

## E-ShodhSindhu

Based on the recommendations of an expert committee, the MHRD has formed e-shodhsindhu merging three consortia Initiatives, namely UGC INFONET Digital Library Consortium, NLIST and INDEST-AICTE Consortium. The e-ShodhSindhu will continue to provide current as well as archival access to more than 15,000 core and peer-reviewed journals and a number of bibliographic, citation and factual databases in different disciplines from a large number of publishers and aggregators to its member institutions including centrally-funded technical institutions, universities and colleges that are covered under 12 (B) and 2(f) Sections of the UGC Act.

13) Overall to what extent are you satisfied with E- ShodhSindhu?

(65) Very much satisfied, (36) Satisfied, (09) Dissatisfied

Regarding satisfactory level most of respondents said they are much satisfied while accessing e-shodhsindhu.

**Suggestions and Recommendations**

After analysis and Interpretations of data and looking in to opinion of respondents as given in the questionnaire here are some of suggestions that have been drawn and recommended to solve the problems of Sri Padmathi Mahila Viswavidhalayamu.

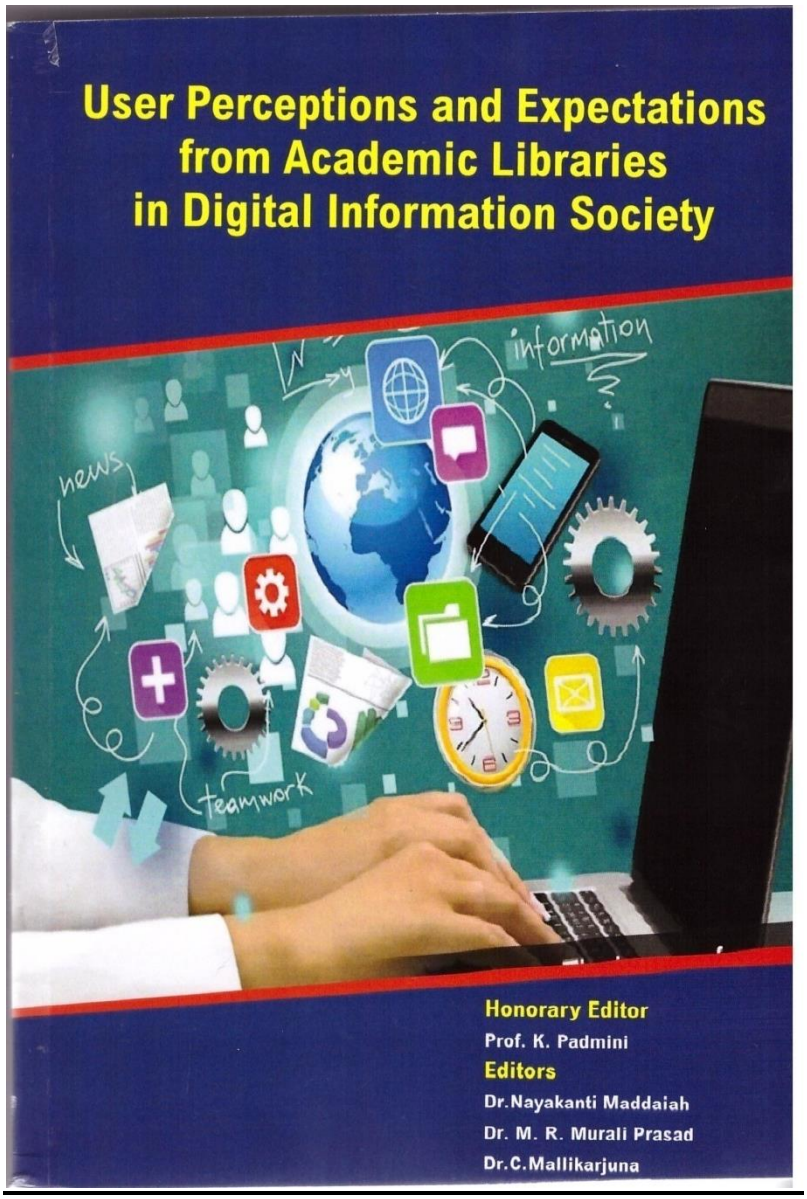
- The university library should conduct orientation and training programmes especially for the research scholars for creating awareness and better usage of e shodhsindhu
- The major problem faced by the respondents are Technical problems like in adequate computers and slow speed of Internet connections hence more number of computes be facilitated with increase in bandwidth regarding computers
- A well trained staff who can rectify technical problems on e shodhsindhu , printing, downloading, searching by using various kinds of search strategies

**Conclusion**

The present study exposes about the increased acceptance of electronic journals by the research scholars in the present environment in which the E ShodhSindhu has to play a meaningful role to assist academic and research community. Major problems encountered by the users toward access to e-consortium are lack of training and no proper orientation. Proper response as well as orientation programmes should be conducted from time to time by the university so that the problems encountered must be resolved according to users' requirements. The infrastructure facilities should be enhanced for the better utilization of E ShodhSindhu.

## EDITORS

**Dr. R. Sarangapani,** is working as University Librarian, Bharathiar University, Coimbatore, He finished his PG & Doctorate Degree in LIS at Annamalai University. He has presented 47 papers in various conference and published 15 articles in journals. He also published a book "Information Literacy Expertise". He got Best National Librarian Awards-2017 from MALA, Chennai. He is Resources Person, Invited Speaker, Key Note Speaker, Inaugural Address in various programme. He also Selection Committee Member and External Examiner in various universities in Tamil Nadu. He is a life member of ILA, TLA, ISTE, MALA & SALIS.



**Dr. V. Rajendran,** is currently working as Assistant University Librarian, Bharathiar University. He has 25 years of rich professional experience in the field of LIS. He is a research supervisor for M.Phil and Ph.D. Programme in LIS. Under his guidance four M.Phil degrees was awarded. He has published more than 20 papers in National and International conferences, 5 papers in peer reviewed Journals and attended more than 30 national and international conference, seminars, advanced training programs and workshops and also organized national conferences, workshops and seminars. He is a resource person for academic staff college, Bharathiar University. He is an active member of various academic committees in Bharathiar University.

Dr. K. Karunai Raghavan, is working as Librarian at National Engineering College, Kovilpatti. He finished his PG and Doctorate Degree in LIS at Bishop Heber College, Trichy. He is a life member of SALIS & ISTE. He has attended more than 75 SDPs, Conferences, Seminars and workshops. He has published more than 25 papers in National and International conferences, 5 papers in peer reviewed Journals. Presently he is General Secretary of SALIS.

## 6. Conclusion

His research contributes about various techniques used to improve library services and resources through social media. It has practical implications for how to effectively promote future services and resources and contributes to future researchers wanting to explore library promotional techniques. By using social media libraries can fulfill users need. Study gathers that according to the changing needs of library users, libraries need to be changed correctly. Libraries should be facilitated with internet service and develop their web page and social media page. Social media is used by libraries to supply a merging of user services, news, content etc.

# User Perceptions and Expectations from Academic Libraries in Digital Information Society

## About the Editors

**Dr. K. Padmini**, is presently working as Principal, S.V.U. College of Arts, S. V. University, Tirupati. She has a rich experience of more than 30 years in teaching and research. She guided 20 Ph.D.s and 7 M.Phils. She participated in good number of national and international conferences and presented papers. She was invited as resource person by many institutions. She is the Principal Investigator for a UGC-Major Research Project. She is a life member in 7 professional associations. She held positions like, Head of the Department, Chair-person BOS, Coordinator- NAAC, Academic Senate Member in S.V. University. Sri Potti Sreeramulu Telugu University honoured her with 'Keerthi Puraskara' in the field of Library and Information Science for the year 2017.

**Dr.Nayakanti Maddaiah** is presently working as Lecturer in Library Science in S.V.A. Government Degree College (M), Srikalahasti, Chittor Dist, Andhra Pradesh. He has been awarded with Ph.D Degree in the year of 2010 by Sri Venkateswara University, Tirupati. He has 16 years of experience in the field of library and information science and attended National and international seminars and also organized workshops and seminars at national levels. He did UGC-Minor Research Project during period 2017-19. His areas of interest are information seeking process, sources, library automation, library administration and management and providing library services using with Information Communication Technology.

**Dr. M. R. Murali Prasad** is UK Commonwealth Fellow; enlisted person in US Marquis Who's Who in the World 2018-19, Country Representative for HIFA 2012-2015 - a UK Network and a member in BoS, DLIS, Osmania University since 2018. He is currently working as a Librarian in Centre for Economic and Social Studies – an ICSSR Institution, Hyderabad. He has 18+ years of experience in Library and Information Services as a Librarian. He published 2 Books and more than 60 articles/papers/chapters in various international and national journals; and also in books. Under his supervision 8 M.Phils were awarded and 5 Ph.D. scholars are pursuing their research at present. He is Managing Editor for IJLIS; and Editor for PEARL Journal which is listed in UGC. He is also a reviewer for IFLA Journal, SAGE OPEN and many journals. He is also associating with many universities like Osmania, Dr. BRAOU, IGNOU, etc. as a resource person. His areas on interest are Information Literacy, Lib 2.0, ICT applications in Library services, Digital Library and Knowledge Management. He is life member of ILA, IASLIC, ALSD, etc. He can be contacted at: mrmp2k8@yahoo.com.

**Dr.C.Mallikarjuna** PhD in LISc from Sri Venkateswara University, Tirupati. Master Degree in Library and Information Science and an MBA in Human Resources Management from Sri Venkateswara University and IGNOU respectively. Starting his career as a Librarian from Little flower degree college, Secundrabad in the year 1999. He served as Academic Librarian 20 years in different academic libraries in Bengaluru and Hyderabad. Before becoming a Deputy Librarian in IIT Hyderabad, he worked IISc, Secretariat Library (Karnataka), ISEC, National Gallery for Modern Art, Rajiv Gandhi Institute of Technology, Bengaluru. He is Resources Person for the Dr B. R. Ambedkar Open University, IGNOU, and University of Hyderabad. His areas of interested are Open Sources Tools/Softwares Applicable in libraries (e.g. Koha, DSpace, Eprints, Vivo, WordPress, Drupal, etc.), Knowledge Management, and eLearning. Publications: He has published several articles, conference papers and one Book on UGC-NET.

# USAGE OF E-SHODHSINDHU RESOURCES BY USERS OF SRI PADMAVATHI MAHILA UNIVERSITY: A STUDY

**Vijay Mahesh**
Part Time Research Scholar
Dravadian University, Kuppam, Andhra Pradesh

**Abstract**

Based on the recommendation of an Expert Committee Ministry of Education has formed e-Shodh Sindhu merging three consortia initiatives, namely UGC-INFONET Digital Library Consortium, NLIST and INDEST-AICTE Consortium. The e-Shodh Sindhu will continue to provide current as well as archival access to more than 10,000 core and peer-reviewed journals and a number of bibliographic, citation and factual databases in different disciplines from a large number of publishers and aggregators to its member institutions including centrally-funded technical institutions, universities and colleges that are covered under 12(B) and 2(f) Sections of the UGC Act.

**Keywords:** E-Shodh Sindhu, UGC Infonet, Inflibnet, E-Journals, E-Resources.

## Introduction

Modern libraries provides literature and information through electronic sources and online services to support the academic activity and satisfy the user's information needs, so it is considered as the backbone of any research organization. The development of technology is changing the pattern of library resources and also changing the process of storage and retrieval in the digital environment from the traditional physical environment. Now the modern library is acquiring e-resources through consortia approach. Consortia approach is one of the ways to maintain cooperation, coordination and collaboration between libraries for Resourcessharingandworkasatechnologyforcollectiondevelopmentandminimizethecost.

**Sri Padmavati Mahila Visvavidyalayam** (University for Women)was founded in the year 1983 by Sri N.T.Rama Rao, the then Chief Minister of Andhra Pradesh, with the fervent desire to train women students as better builders of the Nation and to inculcate skills of leadership in all aspects of life. The University was established under the Sri Padmavati Mahila Visvavidyalayam Act of 1983, which has come into force on the 14 of April 1983.It was started with ten faculties and 300 students and twenty staff members. Today the University has a student population nearly 4000 and an academic staff of 105 and 131 academic consultants.

## Objectives of study

1. To look into the information search habits of Faculty Members and Research Scholars and PG Students using ICT facilities.
2. To study the knowledge of Faculty Members, Research Scholars and PG Students

...e of E- Shodh Sindhu Consortium
...To know whether there is essential cooperation in terms of user orientation is ...ible to the faculty members, PG Students and research scholars to use E-Shodh ...dhu Consortium.
...To know regarding frequency of usage of E-Shodh Sindhu
...know the purpose of usage of E-Shodh Sindhu
...know about level of satisfaction in using E-Shodh Sindh
...dentify the problems in facing E-Shodh Sindhu

**...ew of Literature**

Liao1 conducted a study on information seeking behavior of ...cultural researchers as teachers in Taiwan. He investigated that the critical ...s for the teachers to get needed Literature and the use pattern of information ...es is primarily the primary sources of information

Majid2 and Tan investigated the information needs and information seeking ...or of Computer engineering undergraduate students at Nanyang Technological ...ersity (NTU), Singapore. The purpose was to investigate the types of information ...s used by the students, the information formats they preferred, the ...tance of and reasons for using certain Information sources and the use of ...s electronic information sources. A questionnaire was Distributed to 200 ...mly selected students and 102 completed questionnaires were returned. The ...found that printed materials were the most preferred information format among ...tudents. The top five most preferred information sources, in the order of ...nce, were Books, lecturers, the Internet, friends and manuals. Unexpectedly, ...e of databases and Electronic journals were quite low among the computer ...ering students. The study Recommends a promotional campaign for ...ducing electronic information

Sbeba4 discusses agricultural information seeking behavior and use ...s among the African farmers and extension workers. Study suggests for ...shment of agricultural Advisory board comprising both librarians and extension ...rs to make extensive use of Non book material as a means to overcome the ...cap of illiteracy among farmers.

UNESCO (1998) observed that the rapid breakthrough in new ...ation and Communication technologies would further change the way ...dge was developed, acquired and delivered. It was also important to note that ...w technologies have offered opportunities to innovate on course content and ...g methods and to widen access to higher learning.

**...dology and Limitations**

As discussed above, the present study was confined to Sri Padmavathi Mahila ...ity. 2301 post- graduate students, 483 research scholars are studying in the ...ity. Further there are more than 231 Faculty members working in the ...ity. Due to the limited time frame, a sample survey random

***Abstract:*** In this paper, we introduce and study the concept of L – Fuzzy sub Ordered Γ - Near ring, where L is a complete lattice satisfying infinite meet distributive law. Also, we illustrate the homomorphism of an lattice fuzzy sub Ordered Γ -Near ring and prove some interesting results on it.

***Keywords :*** L – Fuzzy set, L – Fuzzy sub Gamma – Near ring, L – Fuzzy sub Ordered Gamma – Near ring, Normal L – Fuzzy sub Ordered Gamma – Near ring.
***Mathematics Subject Classification :*** *03E72, 16Y30.*

## I. INTRODUCTION

Goguen in [6] generalized the Zadeh [8] definition of a fuzzy subset of X as a mapping of X into the [0,1] into an L – Fuzzy subset, as a mapping from X to a complete lattice L. Fuzzy ideals of rings were introduced by W. Liu and it has studied by several authors. The notion of fuzzy ideals and its properties were applied to various areas like semigroups, semirings, Γ-semirings,.. etc. The concept of ideal theory in Γ - Near ring and fuzzy left (resp. right) ideals in Γ - Near ring were introduced and studied by Bh. Satyanarayana [1] and G.L Booth ([2],[3]), S. Ragamayi[13] introduced the structure of an L – Fuzzy sub Γ - Near ring, its characteristic set and L – Fuzzy ideals of a Γ - Near ring.

Now, we introduce and study the notion of an L – Fuzzy Sub Ordered Γ - Near ring, where L is a complete lattice satisfying infinite meet distributive law. We prove that the homomorphic image and its pre image of an L – Fuzzy sub ordered Γ - Near ring is also a L – Fuzzy sub ordered Γ - Near ring. Moreover we prove that homomorphic image and it's pre image of an L – fuzzy sub ordered Γ - near ring with with Supermum property is also an L – Fuzzy sub ordered Γ - Near ring with supermum property. Further, We prove the intersection of two L – Fuzzy sub ordered Γ - Near rings is also a L – Fuzzy sub ordered Γ - Near ring but the union of two L – Fuzzy sub ordered Γ - Near rings is not an L – Fuzzy sub ordered Γ - Near ring with suitable example.

In this section we recall some of the fundamental definitions, which are necessary for this paper.

## II. PRELIMINARIES

In this section we recall some of the fundamental definitions, which are necessary for this paper.

Definition 2.1 : A zero – Symmetric Γ - Near ring is a tripe (M, +, Γ), where

1. (M, +) is a group

2. "Γ" is a non – empty set of binary operators on M such that for each $\gamma \in \Gamma, (M, +, \gamma)$ is a Near ring

3. $x\gamma(y\beta z) = (x\gamma y)\beta z$, for all $x, y, z \in M$ and $\gamma, \beta \in \Gamma$.

4. $x\gamma 0 = 0$ for every $x \in M, \gamma \in \Gamma$

Definition 2.2 : Let X be a non – empty set. A mapping $\mu : X \to [0,1]$ is called a fuzzy subset of X.

Definition 2.3: Let X be a non – empty set. A mapping $\mu_L : X \to L$ is called a L – Fuzzy subset of X.

Definition 2.5: Let $\mu_L$ be any L – Fuzzy subset of a set M and let $t \in L$. The set $\mu_{Lt} = \{x \in M / \mu_L(x) \geq t\}$ is called a level subset of $\mu_L$.

Definition 2.6: Let M and N be two Γ - -Near rings and $f : M \to N$. Let $\mu_L$ be a L – Fuzzy subset of M. Then the image of $\mu_L, f(\mu_L)$ is the L – Fuzzy subset in N

© 2019, IJSRMSS All Rights Reserved

defined by

$$f(\mu_L)(y)=\begin{cases}\underset{z\in f^{-1}(y)}{Sub}\ \mu_L(z) & \text{if } f^{-1}(y)f=\varphi\\ O_L & \text{otherwise}\end{cases}$$

For all $y\in N$, where $f^{-1}(y)=\{x/f(x)=y\}$ .Let $\sigma_L$ be a L – Fuzzy subset in N. Then the inverse image $f^{-1}(\sigma_L)$ of $\sigma_L$ is the L – Fuzzy subset in M by $(\sigma_L)(x)=\sigma_L(f(x)),\ \forall x\in M$.

Definition 2.7: A L – Fuzzy subset $\mu_L$ of M is said to have the sup. Property if for any subset A of M, there exists $x_0\in A$ such that $\mu_L(x_0)=\sup_{x\in A}\mu_L(x)$

Definition 2.8: The intersection of two L – Fuzzy subset $\mu_L$ and $\sigma_L$ of a set X, denoted by $\mu_L\cap\sigma_L$, is a L – Fuzzy Subset of "X" is defined by
$(\mu_L\cap\sigma_L)(x)=\mu_L(x)\wedge\sigma_L(x),\ \forall x\in X$

Definition 2.9: Let M be a Γ - Near ring and A be a nonempty subset of M then A is said to be sub Γ - Near ring if 1) $x-y\in A$ 2) $x\gamma y\in A$, for each $\gamma\in\Gamma$ and $x,y\in M$.

Definition 2.10: A Γ-Near ring M is called an ordered Γ - Near ring if it admits a compatible relation "$\leq$":i.e., "$\leq$" is a partial ordering on M satisfies the following conditions.
1) If $x\leq y$ then $x+g\leq y+g,\forall x,y,g\in M$
2) If $x\leq y$ and $c\geq 0$ the $x\gamma c\leq y\gamma c$, and cγx≤ cγy, for all x,y,c Є M.

Definition 2.11: Let M be a partially Order Γ- Near ring, and A be a nonempty subset of M, then A is said to be Sub Ordered Γ- Near ring if
1) $x-y\in A$
2) $x\gamma y\in A$, for each $\gamma\in\Gamma$ and $x,y\in M$
3) $x\leq y$ then $x+g\leq y+g,\forall x,y,g\in M$
4) $x\leq y$ *and* $c\geq 0$ *then* $x\gamma c\leq y\gamma c,\ c\gamma x\leq c\gamma y,\ \forall x,y,c\in M$

Definition 2.12 : Let M be an Ordered Near ring and $\mu$ be a Fuzzy subset of M. We say that $\mu$ is an Fuzzy sub Ordered Near ring of M is

1. $\mu(x-y)\geq\min\{\mu(x),\mu(y)\}$
2. $\mu(x\gamma y)\geq\min\{\mu(x),\mu(y)\}$
3. $x\leq y\Rightarrow\mu(x)\geq\mu(y)$ for all $x,y\in M,\gamma\in\Gamma$

## III. L-FUZZY SUB ORDERED Γ-NEAR RING

In this paper, we introduce and study the concept of L – Fuzzy sub Ordered Γ - Near ring, where L is a complete lattice satisfying infinite meet distributive law. We prove that the homomorphic image and it's pre image of a L – Fuzzy sub Ordered Γ - Near ring is also a L – Fuzzy sub Ordered Γ - Near ring. Moreover we prove that homomorphic image and it's pre image of a L – Fuzzy sub Ordered Γ - Near ring with supermum property is a L – Fuzzy sub Ordered Γ - Near ring with Supermum property. Also, we prove that the intersection of two L – Fuzzy sub Γ - Near rings is also L – Fuzzy sub Γ - Near ring but the union of two L – Fuzzy sub Γ - Near rings is not a L –Fuzzy sub Γ - Near ring with suiable example

Definition 3.1: Let M be an Ordered Γ - Near ring and $\mu_L$ be a L – Fuzzy subset M. We say that $\mu_L$ is an L – Fuzzy sub Ordered Γ - Near ring of M if
1) $\mu_L(p-q)\geq\mu_L(p)\wedge\mu_L(q)$
2) $\mu_L(p\gamma q)\geq\mu_L(p)\wedge\mu_L(y)$
3) $p\leq q\Rightarrow\mu_L(p)\geq\mu_L(q)$ for all $p,q\in M,\gamma\in\Gamma$

Example 3.2 :Consider the additively abelian group $Z_6=\{0,1,2,3,4,5\}$ and $\Gamma=\{0,2,4\}$ Define a mapping from $Z_6\times\Gamma\times Z_6\to Z_6$ by $a\gamma b$ the usual product of $a,\gamma,b,\forall a,b\in M;\gamma\in\Gamma$ Then $Z_6$ is a $\Gamma$-Near ring. And clearly $Z_6$ is admiting a compatible relation "$\leq$" which is partial ordering on M satisfies the following conditions.

If $a\leq b$ *and* $c\leq d$ then
1) $a+c\leq b+d$
2) $a\gamma c\leq b\gamma d$
3). $c\gamma a\leq d\gamma b$;

for all $a,b,c,d\in M;\gamma\in\Gamma$
Hence $Z_6$ is an Ordered Γ- Near ring.
Now, we take a complete distributive lattice, $L=\{1,2,4\}$ with partial order $i\leq j$ define $\mu_6:Z_6\to L$ by

$$\mu(x)=\begin{cases}4 & \text{if } p=0\\ 1 & \text{if } p=0\end{cases}$$ Then $\mu_L$ is an L – Fuzzy sub Ordered Γ - Near ring of $Z_6$.

Theorem 3.3: Let M be an Ordered Γ - Near ring and $\mu_L$ be an L – Fuzzy subset of M. Then $\mu_L$ is an L – Fuzzy sub Ordered Γ - Near ring of M iff its level set $\mu_{L_t}$, $t\in L$ is a sub Ordered Γ- Near ring of M.

Proof : Let M be an Ordered Γ - Near ring and let $\mu_L$ be a L – Fuzzy subset of M, suppose $\mu_L$ is L – Fuzzy sub Ordered Γ - Near ring.

Claim : $\mu_{L_t}=\{p\in M/\mu_L(p)\geq t\}$ is a sub Ordered Γ - Near ring of M. Let $p,q\in\mu_{L_t}$ and $\gamma\in\Gamma$

$$\Rightarrow\mu_L(p)\geq t,\mu_L(q)\geq t$$
$$\mu_L(p-q)\geq\mu_L(p)\wedge\mu_L(q)$$
We have $\geq t$
Therefore $(p-q)\in\mu_{L_t}$

© 2019, IJSRMSS All Rights Reserved 

$\mu_L(p\gamma q) \geq \mu_L(p) \wedge \mu_L(q)$

and $\geq t$

Therefore $p\gamma q \in \mu_{L_t}$

Proof is clear as $\mu_{L_t}$ admits partial Ordering.

Hence, $\mu_{L_t}$ is a sub Ordered $\Gamma$ - Near ring of M.

Conversely suppose $\mu_{L_t}$ is a sub Ordered $\Gamma$ - Near ring of M.

**Claim :** $\mu_L$ is a L – Fuzzy sub Ordered Γ - Near ring of M.

Let $p, q \in M$ *and* $\gamma \in \Gamma$ , put $t = \mu_L(p) \wedge \mu_L(q)$

Then $\mu_L(p) \geq t$ ; $\mu_L(q) \geq t$.

$\Rightarrow p, q \in \mu_{L_t}$

Since $\mu_{L_t}$ is a sub Ordered $\Gamma$ - Near ring of M. we Have $p - q \in \mu_{L_t}$ *and* $p\gamma q \in \mu_{L_t}$.

Now

$p - q \in \mu_{L_t} \Rightarrow \mu_L(p-q) \geq t$

$\Rightarrow \mu_L(p-q) \geq (\mu_L(p) \wedge \mu_L(q))$ *and*

$p\gamma q \in \mu_{L_t} \Rightarrow \mu_L(p\gamma q) \geq t$

$\Rightarrow \mu_L(p\gamma q) \geq (\mu_L(p) \wedge \mu_L(q))$

Let $p \leq q$ .Suppose if possible $\mu_L(p) < \mu_L(q)$

Then there exist $t_1 \in L$ such that $\mu_L(p) < t_1 < \mu_L(q)$

Then $q \in \mu_{L_{t_1}}$ *and* $p \notin \mu_{L_{t_1}}$ which is a contradiction

Therefore $\mu_L(p) \geq \mu_L(q)$

Thus $\mu_L$ is an L-Fuzzy sub Ordered Γ - Near ring of M

Theorem 3.4 : Let M be a Ordered Γ-Near ring. Let $\mu_L$ *and* $\sigma_L$ be two L – Fuzzy sub ordered Γ - Near ring of M. Then $\mu_L \cap \sigma_L$ is also a L – Fuzzy sub Ordered Γ-- Near ring of M.

Proof : Let $p, q \in M; \gamma \in \Gamma$.

1. $(\mu_L \cap \sigma_L)(p-q) = \{\mu_L(p-q) \wedge \sigma_L(p-q)\}$
$\geq \{\mu_L(p) \wedge \mu_L(q)\} \wedge \{\sigma_L(p) \wedge \sigma_L(q)\}$
$= \{\mu_L(p) \wedge \sigma_L(p)\} \wedge \{\mu_L(q) \wedge \sigma_L(q)\}$
$= \{\mu_L \cap \sigma_L\}(p) \wedge \{\mu_L \cap \sigma_L\}(q)$

2. $(\mu_L \cap \sigma_L)(p\gamma q) = \{\mu_L(p\gamma q) \wedge \sigma_L(p\gamma q)\}$
$\geq \{\mu_L(p) \wedge \mu_L(q)\} \wedge \{\sigma_L(p) \wedge \sigma_L(q)\}$
$= \{\mu_L(p) \wedge \sigma_L(p)\} \wedge \{\mu_L(q) \wedge \sigma_L(q)\}$
$= \{\mu_L \cap \sigma_L\}(p) \wedge \{\mu_L \cap \sigma_L\}(q)$

3. *If* $p \leq q$ *then* $\mu_L(p) \geq \mu_L(q)$ *and* $\sigma_L(p) \geq \sigma_L(q)$
$(\mu_L \cap \sigma_L)(p) = \{\mu_L(p) \wedge \sigma_L(p)\}$
$\geq \{\mu_L(q) \wedge \sigma_L(q)\} = (\mu_L \cap \sigma_L)(q)$

Thus $\mu_L \cap \sigma_L$ is a L – Fuzzy sub Ordered Γ- Near ring of M

In general union of two L – Fuzzy sub Ordered Γ-Near rings may not be L – Fuzzy sub Ordered Γ - Near ring

Example 3.5: Consider the additive abelian groups $Z_4 = \{0,1,2,3\}$ *and* $\Gamma = \{0,2\}$

Define $Z_4 \times \Gamma \times Z_4 \to Z_4$ by $a\gamma b$ usual product of $a, \gamma, b$, $\forall a, b \in M; \gamma \in \Gamma$.. Then $Z_4$ is an Ordered Γ-Near ring.

Take $L = [0,1]$ Define

$\mu_L : Z_4 \to [0,1]$ *and* $\sigma_L : Z_4 \to [0,1]$ by

$\mu_L(p) = 0.8$ *if* $p = 0$
$0.6$ *if* $p = 1$
$0.4$ *otherwise*

And

$\sigma_L(p) = 0.6$ *if* $p = 0$
$0.5$ *if* $p = 2$
$0.2$ *otherwise*

Then $\mu_L$ *and* $\sigma_L$ are L – Fuzzy sub Ordered Γ- Near rings of $Z_4$.

But $\mu_L \cup \sigma_L$ is not a L – Fuzzy sub Ordered Γ- Near ring.

In particular we have the following

Theorem 3.6: Let M be an Ordered $\Gamma$ - Near ring. Let $\mu_L$ and $\sigma_L$ be two L – Fuzzy sub Ordered $\Gamma$ - Near rings of M.

Then $\mu_L \cup \sigma_L$ is also a L- Fuzzy sub Ordered $\Gamma$ – Near ring of M if $\mu_L \subseteq \sigma_L$ *or* $\sigma_L \subseteq \mu_L$.

Proof : Let M be a Ordered $\Gamma$ -Near ring .

Let $\mu_L$ *and* $\sigma_L$ be two L – Fuzzy sub Ordered $\Gamma$ - Near rings of M, Suppose $\mu_L \subseteq \sigma_L$

Let $p, q \in M; \gamma \in \Gamma$

1. $(\mu_L \cup \sigma_L)(p-q) = \{\mu_L(p-q) \vee \sigma_L(p-q)\}$
$= \sigma_L(p-q)$
$\geq \{\sigma_L(p) \wedge \sigma_L(q)\}$
$= \{\mu_L(p) \vee \sigma_L(p)\} \wedge \{\mu_L(q) \vee \sigma_L(q)\}$
$= \{\mu_L \cup \sigma_L\}(p) \wedge \{\mu_L \cup \sigma_L\}(q)$

2. $(\mu_L \cup \sigma_L)(p\gamma q) = \{\mu_L(p\gamma q) \vee \sigma_L(p\gamma q)\}$
$= \sigma_L(p\gamma q)$
$\geq \{\sigma_L(p) \wedge \sigma_L(q)\}$
$= \{\mu_L(p) \vee \sigma_L(p)\} \wedge \{\mu_L(q) \vee \sigma_L(q)\}$
$= \{\mu_L \cup \sigma_L\}(p) \wedge \{\mu_L \cup \sigma_L\}(q)$

© 2019, IJSRMSS All Rights Reserved

3.If $p \le q$ then $\mu_L(p) \ge \mu_L(q)$ and $\sigma_L(p) \ge \sigma_L(q)(\mu_L \cup \sigma_L)(p) = \{\mu_L(p) \vee \sigma_L(p)\}$
$= \{\sigma_L(p) \vee \sigma_L(p)\}$
$= \sigma_L(p) \ge \sigma_L(q) = \{\mu_L(q) \vee \sigma_L(q)\} = (\mu_L \cup \sigma_L)(q)$

Thus $\mu_L \cup \sigma_L$ is a L – Fuzzy sub Ordered $\Gamma$ - Near ring.
Similarly, if $\sigma_L \subseteq \mu_L$, we get $\mu_L \cup \sigma_L$ is a L – Fuzzy sub Ordered $\Gamma$ - Near ring.

Theorem 3.7: Let M be an Ordered $\Gamma$ - Near ring. Let $\mu_L$ be

L – Fuzzy sub Ordered $\Gamma$ - Near ring on M.
Define $\mu_L$ on $M \cup \{0\}$

by $\mu_L = \{p \in M / \mu_L(p) = \mu_L(0)\}$
Then $\mu_L$ is a sub Ordered $\Gamma$ - Near ring on M.

Proof : Let $\mu_L$ be a L – Fuzzy sub Ordered $\Gamma$ - Near ring on

M. Let

$$p, q \in \mu_L \Rightarrow \mu_L(p) = \mu_L(0) \text{ and } \mu_L(q) = \mu_L(0)$$

$$1.\ \mu_L(p-q) \ge \{\mu_L(p) \wedge \mu_L(q)\}$$
$$= \{\mu_L(0) \wedge \mu_L(0)\}$$
$$= \mu_L(0)$$
$$\Rightarrow p - q \in \mu_L$$
$$2.\ \mu_L(p\gamma q) \ge \{\mu_L(p) \wedge \mu_L(q)\}$$
$$= \{\mu_L(0) \wedge \mu_L(0)\}$$
$$= \mu_L(0)$$
$$\Rightarrow p\gamma q \in \mu_L$$

Since $\mu_L$ be an L – Fuzzy sub Ordered $\Gamma$ - Near ring on M,

where M is an ordered $\Gamma$ - Near ring, for every $p, q \in \mu_L, \mu_L$ admits partial ordering. Thus $\mu_L$ is a sub

Ordered $\Gamma$ - Near ring on M.

Theorem 3.8: Let M be an ordered $\Gamma$ - Near ring. If $\mu_L$ is a

L – Fuzzy subset of M then two level subset $\mu_{Ls}$ and $\mu_{Lt}$ with $(s < t \text{ in } L)$ of $\mu_L$ are equal if and only of there is no

$p \in M$ such that $s \le \mu_L(p) \le t$.
Proof: Let $\mu_L$ is an L – Fuzzy subset of M. Suppose there

exists no $p \in M$ such that $s \le \mu_L(p) \le t$

Now, we have to prove that $\mu_{Ls} = \mu_{Lt}$. Assume that $\mu_{Ls} f = \mu_{Lt}$

Let $p \in \mu_{Ls} p \notin \mu_{Lt}$
$\Rightarrow \mu_L(p) \ge s$ and $\mu_L(p) < t$
$\Rightarrow s \le \mu_L(p) < t$

Which is a contradiction to our supposition. Therefore $\mu_{Ls} = \mu_{Lt}$
Conversely suppose $\mu_{Ls} = \mu_{Lt}$
Now we have to prove that there exists no $p \in M$ such that $s \le \mu_L(p) \le t$, Assume that
There exists $p \in M$ such that $s \le \mu_L(p) \le t$
$\Rightarrow \mu_L(p) \ge s$ and $\mu_L(p) \le t$
$\Rightarrow p \in \mu_{Ls}$ and $p \notin \mu_{Lt}$
$\Rightarrow \mu_{Ls} f = \mu_{Lt}$.

Which is a contradiction to our supposition.
Hence there exists no $p \in M$ such that $s \le \mu_L(p) \le t$
Theorem 3.9: An Ordered $\Gamma$ - Near ring homomorphic pre – image of a L – Fuzzy sub Ordered $\Gamma$ - Near ring is a L – Fuzzy sub Ordered $\Gamma$ - Near ring.

Proof : Let $f : M \to N$ be a $\Gamma$ - Near ring homomorphism. Let $\sigma_L$ be a L – Fuzzy sub Ordered $\Gamma$ -

Nearing of N and let $\mu_L$ be the pre – image of $\sigma_L$ under 'f'.

Now, we have to prove that $\mu_L$ is L – Fuzzy sub

Ordered $\Gamma$ - Near ring of M under 'f'. Then,

$$\mu_L(p-q) = \sigma_L(f(p-q))$$
$$= \sigma_L(f(p) - f(q))$$
$$\ge \sigma_L(f(p) \wedge f(q))$$
$$= \sigma_L(f(p)) \wedge \sigma_L(f(q))$$
$$= \mu_L(p) \wedge \mu_L(q)$$

*Therefore* $\mu_L(p-q) \ge \mu_L(p) \wedge \mu_L(q)$ *again,*

$$\mu_L(p\gamma q) = \sigma_L(f(p\gamma q))$$
$$\ge \sigma_L(f(p) \wedge f(q))$$
$$= \sigma_L(f(p)) \wedge \sigma_L(f(q))$$
$$= \mu_L(p) \wedge \mu_L(q)$$

*Therefore* $\mu_L(p\gamma q) \ge \mu_L(p) \wedge \mu_L(q)$ *If* $p \le q$ *then*

$$\mu_L(p) = \sigma_L(f(p)) \ge \sigma_L(f(q))$$
$$= \mu_L(q).$$

Therefore $\mu_L(p) \ge \mu_L(q)$

## 1. Introduction

The theory of fuzzy $\Gamma-$ Near rings has been developed by Bh. Satyanarayana [1] and G.L. Booth. Later W.L.Gau and D.J. Buehrer [19] introduced the theory of vague sets as an improvement of the theory of fuzzy sets in approximating the real life situation. Vague sets are higher order fuzzy sets. According to them a vague set A in the universe of discourse U is a pair $(t_A, f_A)$ , where $t_A$ *and* $f_A$ are fuzzy subsets of U satisfying $t_A(u) + f_A(u) \leq 1, \forall u \in U$ . Later several authors had studied and applied fuzzy sets and vague sets on various algebraic structures like semi rings, semi groups,...etc. Further, by taking, the above as origin S.Ragamayi [ 20] has developed Vague Normal $\Gamma-$ Near rings in her doctorial thesis.

Furthermore K. Balakoteswara rao [2] had introduced and applied the concepts of Fuzzy sets and vague sets on " Ordered $\Gamma-$ Near ring". As a sequel of our work, now we define homomorphism on vague Ordered $\Gamma-$ Near rings. In this article, we prove that homomorphic image and inverse homomorphic image of vague Ordered $\Gamma-$ Nearring is again vague Ordered $\Gamma-$ Nearring. Also, we prove that homomorphic image and inverse homomorphic image of a vague Ordered $\Gamma-$ Nearring possessing supremum property is again vague Ordered $\Gamma-$ Nearring with supremum property .

## 2. PRELIMINARIES

**Definition 2.1 :** A zero – symmetric $\Gamma$ – Near ring is a trip[le $(M,+,\Gamma)$, where
1. $(M,+)$ is a group
2. $\Gamma$ is a non – empty set of binary operators on M such that for each $\alpha \in \Gamma, (M,+,\alpha)$ is a near ring.
3. $x \in (y\beta z) = (x\alpha y)\beta z$, for all $x,y,z \in M$ and $\alpha,\beta \in \Gamma$.
4. $x\alpha 0 = 0$ for every $x \in M, \alpha \in \Gamma$.

**Definition 2.2 :** Let M be a $\Gamma$ – Near ring and A be a nonempty of M then A is said to be sub $\Gamma$ – Near ring if
1. $x - y \in A$
2. $x\alpha y \in A$, for each $\alpha \in \Gamma$ and $x,y \in M$.

**Definition 2.3 :** Let M be a $\Gamma$ – Near ring and $\mu$ be a Fuzzy subset of M. We say that $\mu$ is a Fuzzy sub $\Gamma$ – Near ring of M If
1. $\mu(x-y) \geq \min\{\mu(x),\mu(y)\}$
2. $\mu(x\alpha y) \geq \min\{\mu(x),\mu(y)\}$ for $x,y \in M, \alpha \in \Gamma$

**Definition 2.4 :** A vague set A in the universe of discourse U is a pair $(t_A, f_A)$, where $t_A : U \to [0,1], f_A : U \to [0,1]$ are mappings such that $t_A(u) + f_A(u) \leq 1, \forall u \in U$ .The functions $t_A$ *and* $f_A$ are called true membership function and false membership function respectively.

**Definition 2.5 :** The interval $[t_A(\mu), 1 - f_A(u)]$ is called the vague value of u in A and it is denoted by $V_A(\mu)$ i.e., $V_A(\mu) = [t_A(u), 1 - f_A(u)]$.

**Definition 2.6 :** A vague sets A is contained order vague set $B, A \subseteq B$ if and only if $V_A(u) \leq V_B(u)$ i.e., $t_A(u) \leq t_B(u)$ and $1 - f_A(u) \leq 1 - f_B(u), \ni u \in U$

**Definition 2.7 :** Two vague sets A and B are equal written as $A = B$. If and only if $A \subseteq B$ and $B \subseteq A$ i.e., $V_A(u) \leq V_B(u)$ and $V_B(u) \leq V_A(u), \forall u \in U$

**Definition 2.8 :** The union of two vague sets A and B with respective truth member ship and false membership function $t_A, f_A : t_B, f_B$ is a vague set S, written as $C = A \cup B$, whose truth membership and false membership functions are related to those of A and B by $t_C = \max\{t_A, t_B\}$ ; $1 - f_C = \max\{1 - f_A, 1 - f_B\} = 1 - \min\{f_A, f_B\}$.

**Definition 2.9 :** The intersection of two vague sets A and B with respective truth membership and false membership functions $t_A, f_A : t_B, f_B$ is a vague set C, written as $C = A \cap B$, whose truth membership and false membership functions are related to those of A and B by $t_C = \min\{t_A, t_B\}$ ; $1 - f_C = \min\{1 - f_A, 1 - f_B\} = 1 - \max\{f_A, f_B\}$

**Definition 2.10 :** The union and intersection of a family $\{A_i / i \in \Delta\}$ of vague sets of a set U are defined by
$V \bigcup_{i \in \Delta} A_i(u) = \sup_{i \in \Delta} V_{A_i}(u), \forall u \in U$
$V \bigcap_{i \in \Delta} A_i(u) = \inf_{i \in \Delta} V_{A_i}(u), \forall u \in U$

**Definition 2.11 :** A vague set A of a set U with $t_A(u) = 0$ and $f_A(u) = 1, \forall u \in U$ is called zero vague set of U.

**Definition 2.12 :** A vague set A of set U with $t_A(u) = 1$ and $f_A(u) = 0, \forall u \in U$ is called unit vague set of U.

**Definition 2.13 :** Let A be a vague set of a universe U with true membership function $t_A$ and false membership function $f_A$. For $\alpha, \beta \in [0.1]$ with $\alpha \leq \beta$, the $(\alpha, \beta)$ cut or vague cut of a vague set A is the crisp subset of U is given by
$A_{(\alpha,\beta)} = \{x \in U / V_A(x) \geq [\alpha, \beta]\}$ i.e., $A_{(\alpha,\beta)} = \{x \in U / t_A(x) \geq \alpha \text{ and } 1 - f_A(x) \geq \beta\}$

**Definition 2.14 :** The $\alpha-$ cut, $A_\alpha$ of the vague set A is the $(\alpha,\alpha)$ - cut of A and hence given by $A_\alpha=\{x\in U / t_A(x)\geq\alpha\}$

**Definition 2.15 :** A vague set $A=(t_A,f_A)$ of M is said to be vague $\Gamma-$ Near ring if $p,q\in M;\ \alpha\in\Gamma$

$V_A(p-q)\geq\min\{V_A(p),V_A(q)\}$ *and*

$V_A(p\alpha q)\geq\min\{V_A(p),V_A(q)\}$

*i.e.,*

$(i).\ t_A(p-q)\geq\min\{t_A(p),t_A(q)\}$

$1-f_A(p-q)\geq\min\{1-f_A(p),1-f_A(q)\}$ *and*

$1-f_A(p\alpha q)\geq\min\{1-f_A(p),f_A(q)\}.$

**Definition 2.16 :** A $\Gamma-$ Near ring M is called an ordered $\Gamma-$ Near ring if it admits a compatible relation "$\leq$ " is a partial ordering on M satisfies the following conditions. If $a\leq b$ and $c\leq d$ then

$(i)\ a+c\leq b+d$

$(ii)\ a\gamma c\leq b\gamma d$

$(iii)\ c\gamma a\leq d\gamma b;$ *for all* $a,b,c,d\in M;\gamma\in\Gamma$

**Definition 2.17 :** Let M be a partially Ordered $\Gamma-$ Near ring and A be a nonempty subset of M then A is said to be sub Ordered $\Gamma-$ Near ring if

*i)* $x-y\in A$

*ii)* $x\gamma y\in A$ *for each* $\gamma\in\Gamma$ *and* $x,y\in M$

*iii)* $x\leq y$ *then* $x+g\leq y+g,\forall x,y,g\in M$

*iv)* $x\leq y$ *and* $c\geq 0$ *then* $y\gamma c$ *and* $c\gamma c$ *and* $c\gamma x\leq c\gamma y,\ \forall x,y,c\in M$

**Definition 2.18 :** Let M be an Ordered Near ring and $\mu$ be a Fuzzy subset of M. We say that $\mu$ is an Fuzzy sub Ordered Near ring Of M if

1) $\mu(x-y)\geq\min\{\mu(x),\mu(y)\}$

2) $\mu(x\gamma y)\geq\min\{\mu(x),\mu(y)\}$

3) $x\leq y\Rightarrow\mu(x)\geq\mu(y)$ *for all* $x,y\in M,\gamma\in\Gamma$

**Notations : Throught out the following section, we use the following notations.**

1. **OGNR** stands for Ordered $\Gamma-$ Near ring.
2. **M** stands for Zero – Symmetric Ordered $\Gamma-$ Near ring.
3. **GNR** stands for $\Gamma-$ Near ring.

## 3. Main Results

Hakimuddin khan, Musheer Ahmad and Rajit Biswas[4] had introduced the concept of vague homomorphism in groups. Taking the above as origin,In this section, we introduce and study the concept of vague homomorphism of a Ordered GNR. We prove that a homomorphic image and an inverse homomorphic image of a vague OGNR of M are also vague OGNRs of M. Also, we define homomorphic image and it's pre-image of a vague OGNR of M possessing supermum property is also a vague OGNR of M possessing supermum property.

**Definition 3.1 :** Let M and N be two Ordered $\Gamma-$Near rings. Let $f$ be a mapping from a set M into a set N. Let A be a vague set in M with vague value $V_A$. Then the image of A, $f(A)$ is the vague set in N is defined by

$$V_{f(A)(q)} = \begin{cases} \sup\limits_{r\in f^{-1}(q)} V_A(r) & \text{if } f^{-1}(q)\neq\phi \\ [0,0] & \text{otherwise} \end{cases}$$

For all $q\in N$, where $f^{-1}(q)=\{p/f(p)=q\}$

Let B be a vague set in N. Then the image of B, $f^{-1}(B)$ is the vague set in M by
$V_{f^{-1}(B)}(p)=V_B(f(p)),\forall p\in M$

**Definition 3.2 :** A vague set A of an OGNR M is said to have the Sup. Property if for any subset S of M, there exists $p_0\in S$ such that $V_A(p_0)=\sup\limits_{p\in S}V_A(p)$

**Theorem 3.3:** Let $M_1$ be an Ordered $\Gamma-$ Near ring and $M_2$ be an Ordered $\Gamma_2-$ Near ring and let $f$ be a homomorphism of $M_1$ *to* $M_2$. If B is a vague Ordered $\Gamma_2-$Near ring of $M_2$, then the inverse of B, $f^{-1}(B)$ is a vague Ordered $\Gamma_1-$ Near ring of $M_1$

Proof: For all $p,q\in M_1;\gamma_1\in\Gamma$,

1. $$\begin{aligned} V_{f^{-1}(B)}(p-q) &= V_B(f(p-q)) \\ &= V_B(f(p)-f(q)) \\ &\geq \min\{V_B(f(p)),V_B(f(q))\} \\ &= \min\{V_{f^{-1}(B)}(p),V_{f^{-1}(B)}(q)\} \end{aligned}$$

2. $$\begin{aligned} V_{f^{-1}(B)}(p\gamma_1 q) &= V_B(f(p\gamma_1 q)) \\ &= V_B(f(p)g(\gamma_1)f(q)) \\ &\geq \min\{V_B(f(p)),V_B(f(q))\} \\ &= \min\{V_{f^{-1}(B)}(p),V_{f^{-1}(B)}(q)\} \end{aligned}$$

3. *If* $p\leq q$ *then* $$\begin{aligned} V_{f^{-1}(B)}(p) &= V_B(f(p)) \\ &\geq V_B(f(q)) \\ &= V_{f^{-1}(B)}(q) \end{aligned}$$

Hence $f^{-1}(B)$ is a vague Order $\Gamma_1-$ Near ring on $M_1$.

**Theorem 3.4 :** $M_1$ be an Ordered $\Gamma-$ Near ring and $M_2$ be an Ordered $\Gamma_2-$ Near ring and let $f$ be a homomorphism of $M_1$ *onto* $M_2$. If A is a vague Ordered $\Gamma-$ Near ring of $M_1$ with Supermum property, then the homorphic image of A, $f(A)$ is a vague Ordered $\Gamma_2-$ Near ring of $M_2$.

Proof : Let $p,q\in M_2;\gamma_2\in\Gamma_2$

Neither $f^{-1}(p)$ *nor* $f^{-1}(q)$ is empty, since f is onto;

Let $p_0\in f^{-1}(p)$ *and* $q_0\in f^{-1}(q)$ be such that

$V_A(p_0)=SupV_A(\alpha)$ *where* $\alpha\in f^{-1}(p)$

*and* $V_A(q_0)=SupV_A(b)$ *where* $b\in f^{-1}(q)$.

Then

$$1.\ V_{f(A)}(p-q)=\sup_{r\in f^{-1}(p-q)} V_A(r)$$
$$\geq V_A(r), r\in f^{-1}(p-q)$$
$$=V_A(p_0-q_0)$$
$$\geq \min\{V_A(p_0),V_A(q_0)\}$$
$$=\min\{V_{f(A)}(p),V_{f(A)}(q)\}$$

$$2.\ V_{f(A)}(p\gamma_2 q)=\sup_{r\in f^{-1}(p\gamma_2 q)} V_A(r)$$
$$\geq V_A(r), r\in f^{-1}(p\gamma_2 q)$$
$$=V_A(p_0\gamma_1 q_0), \gamma_1\in\Gamma_1$$
$$\geq \min\{V_A(p_0),V_A(q_0)\}$$
$$=\min\{V_{f(A)}(p),V_{f(A)}(q)\}$$

$$3.\ For\ p\leq q\ then\ V_{f(A)}(p)=\sup_{r\in f^{-1}(p)} V_A(r)$$
$$\geq V_A(r), r\in f^{-1}(p)$$
$$=V_A(p_0)$$
$$\geq V_A(q_0)$$
$$=V_{f(A)(q)}.$$

Hence $f(A)$ is a vague Ordered $\Gamma_2$ − Near ring of $M_2$

**Definition 3.5 :** Let $A=(t_A,f_A)$ *and* $B=(t_B,f_B)$ be vague OGNRs of M. If there exists $\phi\in Aut(M)$ such that $V_A(p)=V_B(\phi(p)),\forall p\in M$ *i.e.,* $t_A(p)=t_B(\phi(p))$ *and* $f_A(p)=f_B(\phi(p))$, then we say that A and B are homologous vague OGNRs of M. Clearly, if A and B are homologous, then B and A are also homologous.

**Theorem 3.6 :** Let $B=(t_B,f_B)$ be a vague OGNR of M and $\phi\in Aut(M)$. If $A=(t_A,f_A)$ is a vague set of M such that $V_A(p)=V_B(\phi(p)),\forall p\in M$, then A and B are homologous vague OGNRs of M.

Proof : Let $p,q\in M;\gamma_1\in\Gamma$

$$1.\ V_A(p-q)=V_B(\phi(p-q))$$
$$=V_B(\phi(p)-\phi(q))$$
$$\geq \min\{V_B(\phi(p)),V_B(\phi(q))\}$$
$$=\min\{V_A(p),V_A(q)\}$$

$$2.\ V_A(p\gamma_1 q)=V_B(\phi(p\gamma_1 q))$$
$$=V_B(\phi(p)\gamma_1\phi(q))$$
$$\geq \min\{V_B(\phi(p)),V_B(\phi(q))\}$$
$$=\min\{V_A(p),V_A(q)\}$$

$$3.\ For\ p\leq q\ then\ V_A(p)=V_B(\phi(p))$$
$$\geq V_B(\phi(q))$$
$$=V_A(q)$$

Therefore A is a vague OGNR of M.
Hence A and B are homologous vague OGNR of M.

**Theorem 3.7 :** Let $A=(t_A,f_A)$ be a vague OGNR of M and let $f:M\to M$ be an onto homomorphism. Then the vague set $A^f=(t_{A^f},f_{A^f})$ define by $V_{A^f}(p)=V_A(f(p)),\forall p\in M$ is a vague OGNR of M.

Proof : Let

$$1.\ V_{A^f}(p-q)=V_A(f(p-q))$$
$$=V_A(f(p)-f(q))$$
$$\geq \min\{V_B(f(p)),V_B(f(q))\}$$
$$=\min\{V_{A^f}(p),V_{A^f}(q)\}$$
$$2.V_{A^f}(p\gamma_1 q)=V_B(f(p\gamma_1 q))$$
$$=V_B(f(p)\gamma_1 f(q))$$
$$\geq \min\{V_A(f(p)),V_A(f(q))\}$$
$$=\min\{V_{A^f}(p),V_{A^f}(q)\}$$

3. *For* $p\leq q$ *then* $V_{A^f}(p)=V_B(f(p))$
$$\geq V_A(f(q))$$
$$=V_{A^f}(q)$$

Hence $A^f$ is a vague OGNR of M.

## 4. Conclusions

In this paper, we developed Vague homomorphism on Ordered GNR and proved that the homomorphic image of a Vague Ordered GNR of M is also a Vague Ordered GNR of M. Also, pre- homomorphic image of a Vague Ordered GNR of M is also a Vague Ordered GNR of M.

ABSTRACT

The luminescence characteristics of $Eu^{3+}$ activated 30 PbO+(50–*x*) $B_2O_3$+5 $TeO_2$+10 NaF+5 $AlF_3$+*x* $EuF_3$ (PBTNAEu) glasses prepared by melt-quenching process were studied for red laser applications. The phonon-side band mechanism of $Eu^{3+}$: $^5D_2$ emission state was discussed with the help of photoluminescence excitation and the Raman spectral features. The Judd-Ofelt intensity parameters that will be used to evaluate various laser characteristic parameters were determined from both the absorption and the emission spectra. The absorption from $^7F_0$ ground and $^7F_1$ first excited states was considered by applying the thermal correction. The emission spectra were used to study the luminescence enhancement and the asymmetric environment around the $Eu^{3+}$ ions. The quantum efficiency of emitted luminescence was determined from the experimental and radiative decay times of $^5D_0$ emission state. From the experimental results, it was suggested that the PBTNAEu glass containing 2.0 mol% of $EuF_3$ has more potentiality for red laser applications.

## 1. Introduction

The oxyfluoride based glasses activated with trivalent rare earth (RE) ions have drawn much attention as optoelectronic devices (such as switching, memory and sensor devices), solid state lasers (like visible and infrared lasers), optical amplifiers (like fiber and waveguide amplifiers), efficient dielectrics and infrared to visible converters owing to their widespread inhomogeneous band-widths, huge quantity of RE ion solubility, high thermal stability, good glass forming tendency and high quantum efficiency compared to other conventional glasses [1,2]. It is clear that the luminescence intensity and its efficiency depend greatly on the ligand environment in the vicinity of RE ions. Thus, the glassy materials with considerably low phonon energy, least $OH^-$ content, relatively high thermal stability and prolonged chemical durability are more favourable to develop potential solid-state lasers to achieve the requirements of present advanced technology in eco-friendly way [3,4].

The studied 30 PbO+50 $B_2O_3$+5 $TeO_2$+10 NaF+5 $AlF_3$ (PBTNA) glass has high-quality glass forming tendency, considerably high thermal stability, relatively large rigidity, low $OH^-$ content and low phonon energy (1005 $cm^{-1}$) [5]. The inclusion of little quantities of impurities for example network modifiers and alkali ions to the network of borate avoid the multi-phase formation by modifying the $BO_3$ units as $BO_4$ units. The absorption spectral profile indicates that they are transparent to UV–Vis–NIR regions. The optical band gap energy of undoped PBTNA glass is found nearly 2.642 eV and it decrease gradually with the addition of RE impurities creating additional quantum states thereby to structural modifications. These key results initiated to search the applicability of $Eu^{3+}$ -doped PBTNAEu glasses as visible and fiber lasers to meet the requirements of industrial, medical, science and engineering applications.

The trivalent europium ($Eu^{3+}$) ions have been used as the best choice to produce intense red emission through $^5D_0 \rightarrow {}^7F_2$ transition as well as a good spectroscopic probe to study the asymmetry of the host environment in its vicinity where it presents [6]. The non-degenerate $^7F_0$ and $^5D_0$ energy states and fairly simple energy level structure of $Eu^{3+}$ ions facilitates to investigate the site to site structural modifications. Particularly, the $Eu^{3+}$ -doped glassy materials find wide range of applications as lasers, display devices and white LEDs [7–9]. The luminescence properties of different concentrations of $Eu^{3+}$ ions in different multi-component host matrices such as $TeO_2{\cdot}WO_3.GeO_2$ [10], $PbF_2{\cdot}TeO_2{\cdot}H_3BO_3$ [11], $PbF_2{\cdot}WO_3{\cdot}TeO_2$ [12], (Li, Na, K) $F{\cdot}PbO{\cdot}TeO_2{\cdot}H_3BO_3$ [13] and $PbO{\cdot}H_3BO_3{\cdot}TiO_2{\cdot}AlF_3$ [14] were reported for visible lasers. The present host glass has been designed with high thermal stability and good glass forming tendency with easy fiber

drawing compared to our previous work [10–14].

The present research work reports the structural, spectroscopic and optical analysis of various amounts of $EuF_3$ -doped PBTNAEu glasses for red laser applications. The Judd and Ofelt (J-O) model [15,16] was applied to evaluate different radiative and laser characteristic parameters. The phonon side band mechanism, luminescence decay, non-radiative multi-phonon relaxation rates were discussed in detail. The suitability of studied glasses for laser applications was also explored.

## 2. Experimental techniques

The $Eu^{3+}$ -activated lead-borate based oxyfluoride glasses: 30 PbO+ (50–$x$) $B_2O_3$+5 $TeO_2$+10 NaF+5 $AlF_3$+$x$ $EuF_3$ (PBTNAEu), where $x = 0$, 1.0, 2.0 and 5.0 mol%, were prepared through melt quenching method. PbO of assay 98.0% from Himedia, $H_3BO_3$ of assay ≥99.5% from Merk, $TeO_2$ of assay ≥99% from Sigma Aldrich, NaF of assay ≥97% from Merk, $AlF_3$ of assay 97% from Sigma Aldrich and $EuF_3$ of assay ≥99.9% from Alfa aesar were used as starting materials. About 20 g batches of homogeneous powders of starting chemicals were used to prepare the studied glasses and they were named as PBTNAEu0, PBTNAEu1, PBTNAEu2 and PBTNAEu5 glasses for $x = 0$, 1.0, 2.0 and 5.0 mol%, respectively. The prepared glass samples were polished for optical quality with 0.16 ± 0.01 cm thickness and they were used for further characterizations. The details of method of preparation and estimation of significant basic properties were explored in our earlier work [5].

The X-ray diffraction (XRD) profiles were obtained with RIGAKU (Miniflex-600) X-ray diffractometer using $\lambda_{CuK\alpha} = 1.5406$ Å. The KBr technique Fourier transforms infrared (FTIR) spectral patterns were obtained on PerkinElmer Spectrum One: FT-IR Spectrometer. The Raman analysis was carried out on HORIBA LAB-RAM HR MICRO-RAMAN Spectrometer. The scanning electron microscope and energy dispersive X-ray (SEM-EDX) analysis was carried out on VEGA3 TESCAN equipped with BrukerEasy EDS instrument. The optical absorption investigations were done on PerkinElmer Lambda 950 spectrophotometer. The excitation and emission spectral measurements were recorded with Hitachi-F7000 Fluorescence spectrophotometer. The lifetime of $Eu^{3+}$: $^5D_0$ emission state was carried out using JOBIN YVON FLUOROLOG-3 fluorimeter provided with xenon flash lamp and photomultiplier tube (PMT) as a detector. The experimental quantum yield (QY) was measured with Edinburgh FLS 980 spectrometer equipped with an integrating sphere. All the spectral measurements were executed at normal temperature.

## 3. Results and discussion

### 3.1. Basic properties

The doping of different amounts of $EuF_3$ to the PBTNAEu glasses leads considerable changes in some of their physical and optical properties due to the structural modifications around the $Eu^{3+}$ ions and they are evaluated following our previous work [**5**] and summarized in Table 1. The density (ρ), index of refraction (n), average-molecular weight ($\overline{M}$) and molar-volume ($V_m$) increases with increase of $EuF_3$ content as illustrated in Fig. 1. The reflection losses are found to be 5.00 ± 0.02% showing high transparency for the studied glasses.

### 3.2. Structural analysis

The powder XRD and FTIR patterns of PBTNAEu2 glass are presented in Fig. 2. The absence of sharp crystalline peaks and the presence of broad band in the 2θ ranges from 10° to 35° (see Fig. 2a) confirm the glassy nature of studied glasses. The FTIR spectral features shown in Fig. 2b are identical to that of undoped PBTNA glasses [5]. This spectrum reveals the presence of various vibrational modes occurs in PBTNAEu glasses. The assignment of these bands has been done following the literature [ [17–19] and they are summarized in Table 2.

**Table 1**
Comparison of density (ρ±0.01 g/cm$^3$), refractive index (n±0.001), $Eu^{3+}$ ions concentration (N±0.02 × $10^{-20}$ ions/cm$^3$), dielectric constant (K±0.01) reflection losses (R±0.02), average molecular weight ($\overline{M}$± 0.05), molar volume ($V_m$±0.02) and optical band gap energy ($E_g$±0.01) of PBTNAEu glasses.

| Property | PBTNAEu0 | PBTNAEu1 | PBTNAEu2 | PBTNAEu5 |

The Raman analysis is one of the important spectroscopic tools for identifying the existence of various molecular groups and/or structural modes [20–24]. By knowing the energy corresponding to the different vibrational modes, one can confirm the presence of different boroxol units and B–O & Pb–O bond vibrations. The presence of different functional groups noticed from the FTIR spectra (shown in Fig. 2b) have been confirmed from the Raman analysis. The Raman spectra of PBTNAEu0 and PBTNAEu2 glasses in the Raman shift ranges from 400 cm$^{-1}$ to 1600 cm$^{-1}$ is described in Fig. 3. These spectra reveal an intense Raman band at around 751 cm$^{-1}$ along with other considerably weak bands at around 410, 494, 674, 882, 974, 1079, 1222, 1330, 1425 and 1568 cm$^{-1}$.

The Raman band noticed at around 410 cm$^{-1}$ has been ascribed to the symmetric stretching vibrations of Te–O–Te linkage [20]. The Raman peak located at around 494 cm$^{-1}$ is due to the vibrations of isolated di-borate groups as well as Pb–O bonds [21]. The Raman band observed at around 674 cm$^{-1}$ has been assigned to the presence of ring type *meta*-borate units and in-plane bending modes of $BO_3$ units [22]. The Raman bands positioned at around 751 and 882 cm$^{-1}$ represent the presence of symmetric boroxol rings containing $BO_3$ and mixed $BO_3$–$BO_4$ units, respectively while the bands at around 974 and 1079 cm$^{-1}$ are owing to B–O stretching vibrations in $BO_3$ and $BO_4$ structural units, respectively [23]. The Raman peak noticed at 1222 cm$^{-1}$ is ascribed to the B–O stretching vibrations [21]. The Raman peaks positioned at around at 1330 and 1425 cm$^{-1}$ are attributed to B–O stretching vibrations linked with $BO_2O$ triangles and $BO_4$ units, respectively [22]. The Raman band located at around 1568 cm$^{-1}$ is ascribed to the B–O stretching vibrations involving non-bridging oxygens (NBOs) [24]. The assignment of Raman bands is also summarized in Table 2.

The chemical composition of PBTNAEu0 glass has been confirmed from the SEM-EDX studies and the obtained results are presented in Fig. 4. The EDX spectrum reveals the presence of boron (4.14 atm %), oxygen (53.44 atm%), fluorine (34.29 atm%), sodium (1.70 atm%), aluminum (1.05 atm%), tellurium (0.54 atm%) and lead (4.84 atm%) confirming the composition (PbO–$B_2O_3$–$TeO_2$–NaF–$AlF_3$) of PBTNAEu0 host glass without any impurity elements. The percentage of atomic weight of different elements is also presented in Fig. 4.

### 3.3. Absorption spectral analysis

In order to evaluate some of the significant spectroscopic properties, the room temperature absorption spectra of PBTNAEu glasses have been recorded and analyzed. These spectra consist of a total of five weak bands in visible region and two considerably intense bands in infrared (IR) region. All these bands have been originated from the $^7F_0$ and $^7F_1$ energy lavels to various higher energy levels and they are positioned at around 464 nm ($^7F_0 \rightarrow {}^5D_2$), 525 nm ($^7F_0 \rightarrow {}^5D_1$), 532 nm ($^7F_1 \rightarrow {}^5D_1$), 578 nm ($^7F_0 \rightarrow {}^5D_0$), 585 nm ($^7F_1 \rightarrow {}^5D_0$), 2085 nm $^7F_0 \rightarrow {}^7F_6$) and 2200 nm ($^7F_1 \rightarrow {}^7F_6$). The assignment of absorption transitions has been done following Carnall et al. [**25**]. A representative absorption spectrum of

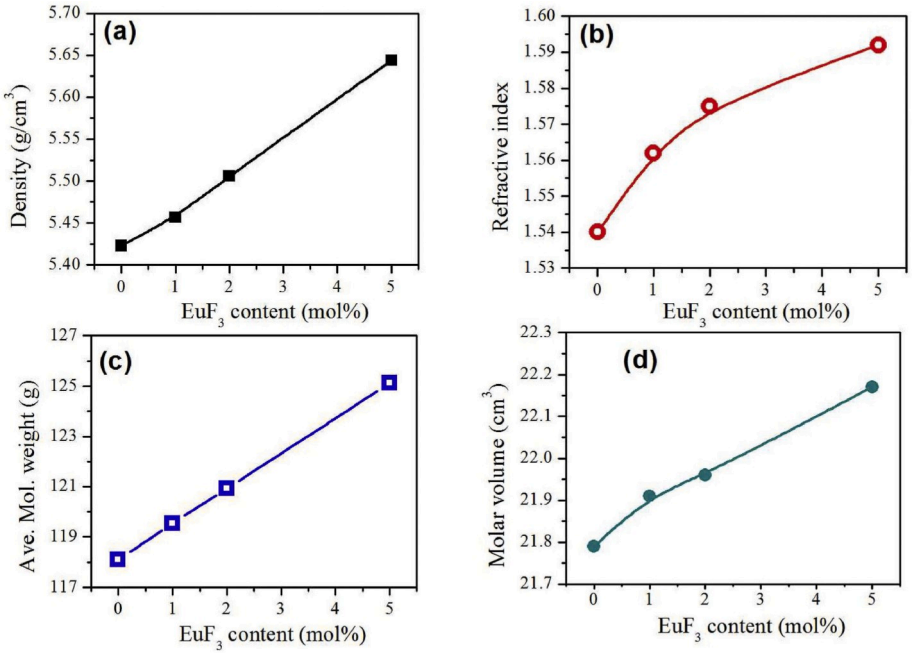

**Fig. 1.** Variation of density (a), refractive index (b), average molecular weight (c) and molar volume (d) as a function of $EuF_3$ content in PBTNAEu glasses.

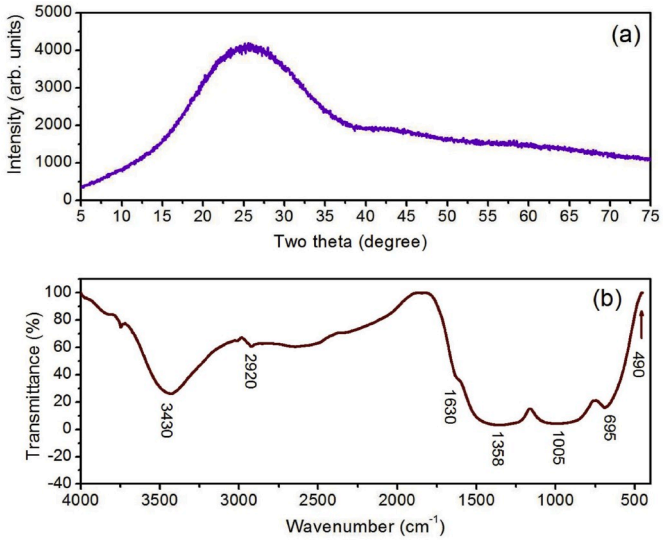

**Fig. 2.** XRD (a) and FTIR (b) patterns of PBTNAEu2 glass.

PBTNAEu2 glass is shown in Fig. 5.

The absorption spectrum of PBTNAEu0 glass in the spectral region from 400 to 2400 nm shown in Fig. 6 consists of a fundamental absorption edge at about 435 nm. Further, the absorption coefficients of different absorption bands increase with increase of $EuF_3$ content but their positions remain unaltered showing the uniform distribution of $Eu^{3+}$ ions in PBTNAEu glasy materials. A representative spectra showing the variation of absorbance of $^7F_0 \rightarrow {}^7F_6$ (2085 nm) and $^7F_1 \rightarrow {}^7F_6$ (2200 nm) transitions with $EuF_3$ content is illustrated as inset of Fig. 6. The covalent or ionic bonding character of $Eu^{3+}$ ions with $O^{2+}/F^{-1}$ has been known by evaluating the bonding parameter, $\delta = \left[\left(1 - \overline{\beta}/\beta\right) \times 100\right]$, here $\overline{\beta}$ represents the mean nephelauxetic ratio. The magnitude of bonding parameter is positive for covalent and negative for ionic bonds [26]. The positions of absorption bands, their nephelauxetic ratios and bonding parameters are presented in Table 3. The average value of δ is found to be +0.0066 indicating covalent character for $Eu^{3+}$ and $O^{2+}/F^{-1}$ bonds in PBTNAEu glasses.

**Table 2**
Assignment of FTIR and Raman band positions ($cm^{-1}$) in PBTNAEu glasses.

| FTIR | Assignment [17–19] | Raman | Assignment [20–24] |
|---|---|---|---|
| 3430 | symmetric stretching vibrations of $OH^-$ group | 1568 | stretching vibrations of B–O bonds involving non-bridging oxygens |

| | | 674 | Ring type *meta*-borate units and in-plane bending mode of $BO_3$ units |
| | | 494 | vibrations of isolated di-borate groups as well as Pb–O bonds |
| | | 410 | symmetric stretching vibrations of Te–O–Te linkage |

It is well known that the optical band gap energy ($E_g$) corresponding to the direct allowed transitions is more significant to select a suitable material for efficient optoelectronic and photonic devices. It can be obtained using the relation, $\alpha . (h\nu) = B (h\nu - E_g)^q$, where α represents the coefficient of absorption at the fundamental edge, $h\nu$ represents the energy of photon and B is a constant and it is independent of energy. The factor q = 2, 3, ½ and ⅓ for indirect-allowed, indirect-forbidden, direct-allowed and direct-forbidden transitions, respectively [27]. The

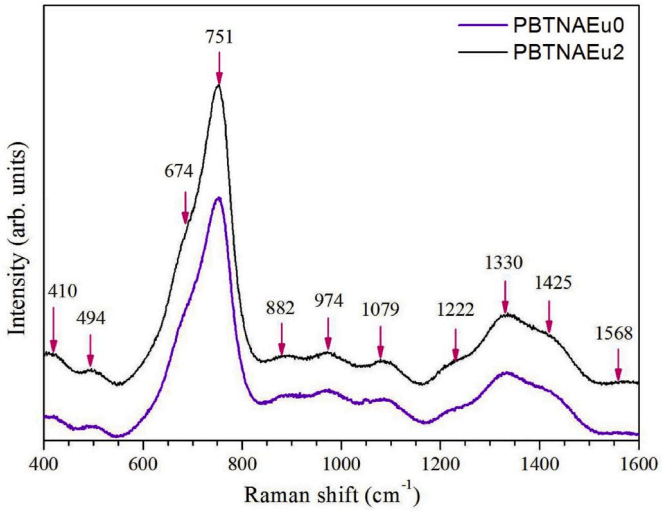

**Fig. 3.** Raman spectra of PBTNAEu glasses.

value of $E_g$ can be obtained by extrapolating the linear part of Tauc's plot (i.e., $(\alpha h\nu)^2$ versus $h\nu$ curve) to meet the $h\nu$ axis at $(\alpha h\nu)^2 = 0$. The Tauc's plots for q = ½ in PBTNAEu glasses are described in Fig. 7. The values of $E_g$ are found to be 2.627, 2.298 and 2.004 eV for PBTNAEu1, PBTNAEu2 and PBTNAEu5 glasses, respectively while for PBTNAEu0 glass, it is found to be 2.642 eV [5]. The gradual decrease of value of $E_g$ with increase of $EuF_3$ content is an indication for the formation of additional quantum level as well as slight structural amendments. The optical band gap energies are comparable to those reported for PTBEu (~2.60 eV) [11] and TBLFE (2.69 eV) [28] glasses.

### 3.4. Thermal correction

In case of $Eu^{3+}$ ion, the $^7F_0$ and the $^7F_1$ energy levels are separated by a small energy difference and it is close to $K_BT$, where $K_B$ is the Boltzmann's constant and T is the absolute temperature. The contributions of population of the $^7F_0$ ground and the $^7F_1$ first quantum states are about 65% and 35%, respectively at room temperature [29,30]. Therefore, the thermal population of $^7F_1$ first quantum state should be taken into account. The fractional thermal population of any excited quantum state ($C_J$) has been determined using the following equation.

$$\frac{C_J}{C_0} = \left(\frac{g_J}{g_0}\right)\exp\left\{-\frac{(E_J - E_0)}{K_B.\,T}\right\} \quad (1)$$

where $C_0$ represents the population of ground state. $E_J$ and $g_J(=2J+1)$ represent the energy and degeneracy of excited state, respectively. In case of PBTNAEu glasses, the thermal correction factors for $^7F_{0,1} \rightarrow {}^{2S+1}L_J$ transitions are estimated to be $C_0 = 0.6506$ and $C_1 = 0.3162$, respectively at T = 300 K.

### 3.5. Excitation spectra and phonon side band

In order to select a suitable radiation to produce strong emission from the studied glasy materials, the photoluminescence excitation spectra ranges from 350 nm to 600 nm were recorded by controlling the emission through $Eu^{3+}$: $^5D_0 \rightarrow {}^7F_2$ (613 nm) transition. These spectra reveal eleven excitation bands originated from the $^7F_0$ and $^7F_1$ energy levels to other higher energy levels. The observed bands have been ascribed to $^7F_0 \rightarrow {}^5D_4$ (363 nm), $^7F_0 \rightarrow {}^5L_7$ (378 nm), $^7F_1 \rightarrow {}^5L_7$ (383 nm), $^7F_0 \rightarrow {}^5L_6$ (395 nm), $^7F_0 \rightarrow {}^5D_3$ (416 nm), $^7F_0 \rightarrow {}^5D_2$ (465 nm), $^7F_1 \rightarrow {}^5D_2$ (526 nm), $^7F_0 \rightarrow {}^5D_1$ (534 nm), $^7F_1 \rightarrow {}^5D_1$ (553 nm), $^7F_0 \rightarrow {}^5D_0$ (579 nm) and $^7F_1 \rightarrow {}^5D_0$ (589 nm) transitions. Among these, the excitation band noticed at ~465 nm ($Eu^{3+}$: $^7F_0 \rightarrow {}^5D_2$) is found to be the prominent one and it could be the best choice to produce intense emission from the PBTNAEu glasses. For reference, the excitation spectrum of PBTNAEu2 glass is presented in Fig. 8. Further, the intensities of these transitions enhances with the activation of $EuF_3$ showing uniform distribution of $Eu^{3+}$ ions in PBTNAEu glasses. The inset of Fig. 8 shows the variation of intensity of $^7F_0 \rightarrow {}^5D_2$ (~465 nm) transition with $EuF_3$ content.

The excitation spectra also reveal phonon-side band (PSB) linked with $Eu^{3+}$: $^7F_0 \rightarrow {}^5D_2$ transition on higher energy region and it is positioned at ~447 nm (PSB–I: ~22,371 $cm^{-1}$) with a sub-peak at ~440 nm (PSB–II: ~22,727 $cm^{-1}$). The $Eu^{3+}$: $^7F_0 \rightarrow {}^5D_2$ transition is purely electronic transition and positioned at ~465 nm (~21,505 $cm^{-1}$) and it is considered to be the zero phonon line (ZPL) as described in Fig. 9. Additionally, the phonon energy related to the vibronic transitions has

| Mean bonding parameter, $\delta = +0.0066$ | | | | |

been determined from the shift of the PSB from the pure-electronic-band (PEB). It is well known that the bonding nature of $Eu^{3+}$ ions with surrounding ligand field affects the coupling of vibrational modes to the electronic excited states. The PSBs associated with PEB helps us to recognize the vibrational modes associated with the ligand field around the $Eu^{3+}$ ions.

It is known from the literature [31] that the occurrence of PSB indicates that the incident (excited) radiation coupled not only with the excess energy of vibrational levels in the vicinity of $Eu^{3+}$ ions but also with its electronic states. The phonon side band mechanism at 465 nm excitation is clearly illustrated in Fig. 10. Further, the difference in energies of PEB and PSB represent the phonon energy and it corresponds to maximum energy of the vibrational modes of host matrix surrounding the $Eu^{3+}$ ion. The PSBs noticed at an average energy shift of ~866 and ~1222 cm$^{-1}$ from the ZPL are referred as PSB–I and PSB–II, respectively (see Fig. 9) and they can ascribed to the B–O bond stretching modes in $BO_4$ and pyro-borate groups, respectively. These vibrational modes have been correlated with Raman bands noticed at around 882 and 1222 cm$^{-1}$ (see Fig. 3).

### 3.6. Photoluminescence

Since the excitation band positioned at 465 nm corresponding to the

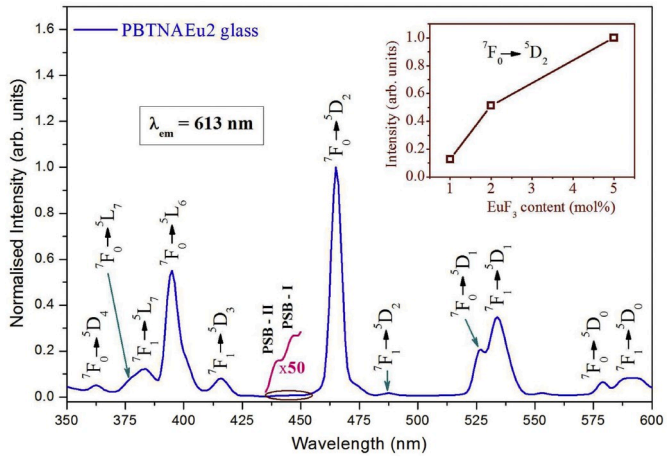

**Fig. 8.** Normalized excitation spectrum ($\lambda_{em}$ = 613 nm) of PBTNAEu2 glass. In set shows the variation of intensity of $^7F_0 \rightarrow {}^5D_2$ (465 nm) excited-state transition as a function of $EuF_3$ content in PBTNAEu glasses.

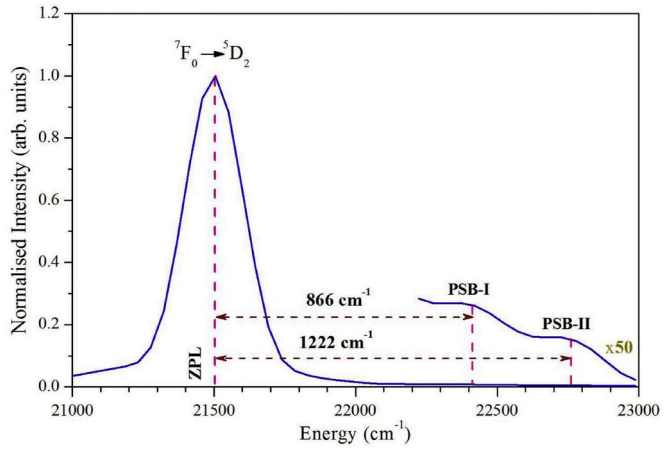

**Fig. 9.** Phonon side band spectrum of PBTNAEu2 glass with $^7F_0 \rightarrow {}^5D_2$ (465 nm) excited-state transition.

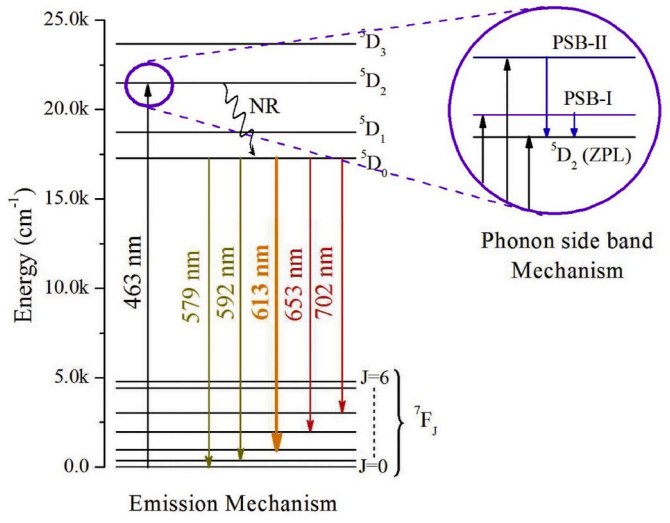

**Fig. 10.** Partial energy level diagram describing the emission and phonon side band mechanisms.

$Eu^{3+}$: $^7F_0 \rightarrow {}^5D_2$ transition has highest intensity compared to others, the emission analysis has been done at 465 nm excitation only. The luminescence spectra of PBTNAEu glasses are depicted in Fig. 11. These spectra reveal five emission bands corresponding to the $^5D_0 \rightarrow {}^7F_0$ (579 nm), $^5D_0 \rightarrow {}^7F_1$ (592 nm), $^5D_0 \rightarrow {}^7F_2$ (613 nm), $^5D_0 \rightarrow {}^7F_3$ (653 nm) and $^5D_0 \rightarrow {}^7F_4$ (702 nm) transitions. Upon 465 nm excitation, the $Eu^{3+}$ ions get excited to $^5D_2$ higher energy state and then de-excite non-radiatively to $^5D_0$ metastable state. Once the condition of population inversion achieved, then lasing action takes place through $^5D_0 \rightarrow {}^7F_2$ transition. The partial energy level structure shown in Fig. 10 describes the emission mechanism of PBTNAEu glasses at 465 nm excitation.

These emission spectra also reveal that the shape of the observed emission bands do not change even the content of $EuF_3$ varied from 1.0 mol% to 5.0 mol% except their intensity which increase with the addition of $EuF_3$ content confirming the absence of luminescence quenching in PBTNAEu glasses in the investigated $EuF_3$ range i.e., $0 \leq x \leq 5.0$ mol %. The in set of Fig. 11 shows the variation of intensity of $^5D_0 \rightarrow {}^7F_2$ transition with $EuF_3$ content in PBTNAEu glasses. These results are similar to TPBFEu [32] and TLKZnFEu [33] glasses. The emission spectral features are identical to our previous reports on $Eu^{3+}$ -doped PTBEu [11], LTTEu [12], RLTB [13] and LBTAF [14] glasses. Among the observed emission transitions, the $^5D_0 \rightarrow {}^7F_2$ (613 nm) transition is found to be the most intense and proficient transition. The emission spectra make known that the studied glasses emit strong, intense and enhanced red luminescence when excited at 465 nm wavelength.

It is well known that the $^5D_0 \rightarrow {}^7F_1$ transition is a magnetic-dipole (M-D) and the $^5D_0 \rightarrow {}^7F_2$ transition is electric-dipole (E-D) in nature obeying the selection rules $\Delta J = 1$ and $\Delta J = 2$, respectively [34]. Further, the transition probability of M-D ($^5D_0 \rightarrow {}^7F_1$) transition is almost insensitive to the host matrix while the transition probability of E-D ($^5D_0 \rightarrow {}^7F_2$) transition is more responsive to the environment surrounding the $Eu^{3+}$ ions. The ratio of intensity of E-D to M-D transitions, called the asymmetric ratio ($R_A$) provides essential information about the symmetry around the $Eu^{3+}$ ions in which it is situated. Therefore,

$$R_A = \frac{\int I_{ED}.d\lambda}{\int I_{MD}.d\lambda} \tag{2}$$

where $\int I_{ED}.\, d\lambda$ and $\int I_{MD}.d\lambda$ are the intensities of $^5D_0 \rightarrow {}^7F_2$ and $^5D_0 \rightarrow {}^7F_1$ transitions, respectively. Thus, the $Eu^{3+}$ ion has been used as a probe to study the site symmetry of any host matrix in which they are present. If the intensity ratio is greater than unity then the $Eu^{3+}$ ions occupy higher symmetry sites in the host matrix resulting intense luminescence through $^5D_0 \rightarrow {}^7F_2$ (E-D) transition than $^5D_0 \rightarrow {}^7F_1$ (M-D) transition and

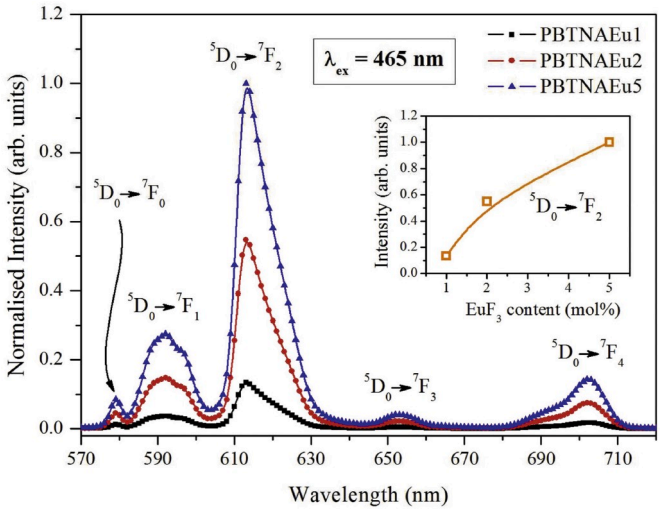

**Fig. 11.** Emission spectra ($\lambda_{ex}$ = 465 nm) of PBTNAEu glasses. In set is the variation of intensity of $^5D_0 \rightarrow {}^7F_2$ transition as a function of $EuF_3$ content.

vice versa. In the present investigation, the values of $R_A$ are found to be 3.61, 3.65 and 3.72 for PBTNAEu1, PBTNAEu2 and PBTNAEu5 glasses, respectively. The increased values of $R_A$ with the addition of $EuF_3$ improves the site symmetry of PBTNAEu host in the vicinity of $Eu^{3+}$ ions promoting enhanced luminescence through $^5D_0 \rightarrow {}^7F_2$ transition with the addition of $EuF_3$ content. The asymmetric ratio of PBTNAEu2 glass is found higher than LTTEu (2.78) [12], TPBFEu (~3) [32], TLKZnFEu10 (2.879) [33] and SB33 (2.53) [35] glasses.

The colour of the emitted light from the PBTNAEu glasses is examined by evaluating the Commission International de I'Eclairage (CIE) colour coordinates using the emission spectra shown in Fig. 11. The evaluated CIE coordinates are found to be (0.570, 0.392), (0.639, 0.355) and (0.648, 0.351) for PBTNAEu1, PBTNAEu2 and PBTNAEu5 glasses, respectively. The location of CIE coordinates shown in Fig. 12 indicates that the colour of emitted luminescence shifts from reddish-orange to pure-red when the $EuF_3$ content changes from 1.0 mol% to 5.0 mol% producing a tunable luminescence at 465 nm excitation. Among the studied glasses, the PBTNAEu2 glass emits enhanced red luminescence when excited at 465 nm wavelength. The CIE coordinates of PBTNAEu2 glass (0.639, 0.355) are comparable to those reported for $PbO–Na_2O–P_2O_5–Eu_2O_3$ (0.634, 0.346) [9], TWGEu05 (0.645, 0.342) [10], TPBFEu (0.639, 0.360) [32] and TLKZnFEu10 (0.638, 0.362) [33] glasses. They are also comparable to commercial red illuminates like $Y_2O_3$: $Eu^{3+}$ (0.64, 0.34) [KX-YOX, Kasei Optonix Ltd., Japan] and (Y,Gd) $BO_3$:$Eu^{3+}$ (0.65, 0.35) [KX-504, Kasei Optonix Ltd., Japan].

### 3.7. Intensity parameters

The quantificational investigation of various spectroscopic and laser characteristic properties of luminescent materials activated with RE ions has been successfully carried out by the use of standard J-O model [15,16]. The probability rates of 4f-4f radiative transitions of RE ions has been represented by means of three phenomenological J-O intensity parameters ($\Omega_{\lambda=2,4,6}$), which can be evaluated by minimizing the difference between the experimental ($f_{exp}$) and theoretical ($f_{cal}$) oscillator strengths by least squares fit approximation. Knowing the $\Omega_\lambda$ parameters, one can find the probability rate of radiative transitions ($A_R$), radiative decay time ($\tau_R$), radiative branching ratio ($\beta_R$) and the stimulated emission cross-section ($\sigma_{emi}$). However, the standard J-O model fails to analyze the luminescence properties of some RE ions, such as $Pr^{3+}$ and $Eu^{3+}$ ions in some host matrices. Thus, the strategy of standard J-O model has been modified accordingly to evaluate the radiative parameters of these ions in different host matrices [36].

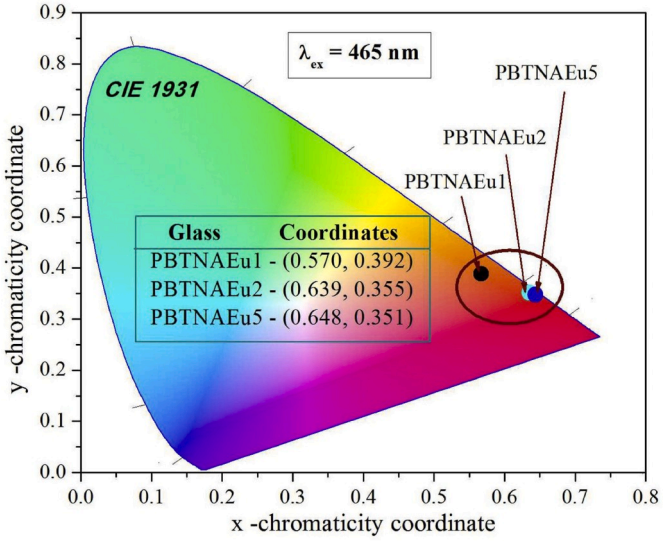

**Fig. 12.** CIE chromaticity coordinate diagram of PBTNAEu glasses.

In case of $Eu^{3+}$ ion, the absorption spectra consists of different transitions originated from both $^7F_0$ and $^7F_1$ energy levels due to considerably small energy gap of the order $K_BT$. Thus, the standard J-O model becomes unwieldy and the corresponding $\Omega_\lambda$ intensity parameters have been obtained by modifying the experimental oscillator strengths with thermal-correction factors to $^7F_0$ and $^7F_1$ state (see section 3.4). Though the thermal-correction has been applied to the oscillator strengths, the least squares fit process becomes invalid to determine the $\Omega_\lambda$ intensity parameters due to zero magnitude of $\|U^4\|^2$ matrix elements. The values of $\|U^\lambda\|^2$ have been collected from Carnall et al. [25] and they are summarized in Table 4. In order to evaluate the $\Omega_\lambda$ intensity parameters of $Eu^{3+}$ ions by overcoming the above discussed difficulties, several efforts have been made for alternate approaches.

In one approach, the $\Omega_\lambda$ parameters have been evaluated by the use of $^7F_0 \rightarrow {}^5D_J$ (J = 0, 2, 4, 6) individual bands from the absorption spectra ignoring thermal correction [29]. This approach has given fever results for radiative parameters of $Eu^{3+}$ ions in some host matrices [14]. Dejneka et al. [30] determined the $\Omega_\lambda$ intensity parameters by adopting thermal correction. Since the $\|U^4\|^2 = 0$ for all the transitions (see Table 4), the magnitude of $\Omega_4$ intensity parameter becomes insignificant in these two approaches. The oscillator strengths for the observed absorption transitions with and without thermal correction are also presented in Table 4. In another approach, the $\Omega_\lambda$ intensity parameters have been evaluated from the $^5D_0 \rightarrow {}^7F_{2,4,6}$ emission transitions [37]. According to standard J-O model, the $\|U^\lambda\|^2$ values for emission transitions originating from $^5D_0$ metastable state becomes zero except for $^5D_0 \rightarrow {}^7F_2$, $^7F_4$, $^7F_6$ transitions. The detailed procedure of evaluating the $\Omega_\lambda$ intensity parameters from the $^5D_0 \rightarrow {}^7F_2$, $^7F_4$, $^7F_6$ emission transitions was explored in our earlier work [38].

Though the PBTNAEu2 and PBTNAEu5 glasses emit enhanced red luminescence at 465 nm excitation, the evaluation of radiative and other optical properties are restricted to PBTNAEu2 glass sample only owing to least consumption of $EuF_3$ thereby reducing the cost and protecting the environment. In the present investigation, the $\Omega_\lambda$ intensity parameters have been determined using both the emission and the room temperature absorption spectra with thermal correction for oscillator strengths. Applying the thermal correction, the $\Omega_\lambda$ parameters are evaluated as $\Omega_2 = 11.49 \times 10^{-20}$ $cm^2$, $\Omega_4 \approx 0$ and $\Omega_6 = 1.91 \times 10^{-20}$ $cm^2$ for PBTNAEu2 glass. A comparison of $\Omega_\lambda$ parameters evaluated from the $^5D_0 \rightarrow {}^7F_{1,2,4,6}$ emission transitions is given in Table 5. Since the emission band corresponding to the $^5D_0 \rightarrow {}^7F_6$ transitions is not located in visible region, the $\Omega_6$ intensity parameter is considered as zero ($\Omega_6 \approx 0$) in evaluating various radiative properties. The $\Omega_\lambda$ intensity parameters of PBTNAEu2 glass obtained from the emission spectral features are very close to other reports [ [13,39–41]]. Table 6 summarizes the $\Omega_\lambda$ parameters for different host glasses.

It is well known that the $\Omega_2$ intensity parameter is a measure of covalency and asymmetry of the host medium in the vicinity of RE ions in which they are present. Higher the magnitude of $\Omega_2$ parameter greater will be the asymmetry and the covalency of metal-ligand bonds [42]. So, the $\Omega_2$ parameter is more sensitive to the host. But the $\Omega_4$ parameter is practically constant and the $\Omega_6$ parameter do not vary appreciably as it depends on the viscosity of the host medium. In the present research work, the considerably higher value of $\Omega_2$ parameter is an indication for the large asymmetric environment around the $Eu^{3+}$ ions. These results are similar to that of the intensity ratio evaluated from the emission spectral profiles. The covalency of $Eu^{3+}$ ions with host ligands is also higher confirming the results obtained from the bonding character (δ) described in see section 3.3.

### 3.8. Radiative parameters

The $\Omega_\lambda$ parameters were used to evaluate the various radiative parameters, such as radiative transition probability rate ($A_{rad}$), radiative lifetime ($\tau_{rad}$) and radiative branching ratio ($\beta_{rad}$). These parameters are further used to obtain significant laser properties like emission cross-

[a] Evaluated from the thermally corrected absorption transitions.

sections ($\sigma_{emi}$), gain band-widths ($\sigma_{emi} \times \Delta\lambda_{eff}$) and optical gains ($\sigma_{emi} \times \tau_{exp}$) for the potential emission transitions. The $\Omega_\lambda$ parameters obtained from the $^5D_0 \rightarrow {}^7F_{1,2,4,6}$ emission transitions are more reliable than those evaluated from the thermally corrected $^7F_0 \rightarrow {}^5D_J$ absorption transitions. Thus, the $\Omega_\lambda$ parameters evaluated from the emission spectra have been used to determine various radiative and laser properties as the $\Omega_2$ intensity parameter is close to that obtained from thermally corrected absorption transitions (see Table 6). Some of the significant laser characteristic parameters like experimentally measured branching ratios ($\beta_{exp}$) and effective band-widths ($\Delta\lambda_{eff}$) have been obtained using the emission spectral profiles. If the experimentally measured branching ratio ($\beta_{exp}$) for any emission transition is found higher than 50%, then it emits intense luminescence with considerably high quantum efficiency [43]. The magnitude of $\sigma_{emi}$ for $\Psi J \rightarrow \Psi' J'$ emission transition is given as

$$\sigma_{emi}(\Psi J, \Psi' J') = \frac{\lambda_p^{\,4}}{8\,\pi\,c\,n^2\,\Delta\lambda_{eff}} A_{rad}(\Psi J, \Psi' J') \quad (3)$$

where $\lambda_P$ represents the wavelength corresponding to emission peak maximum, $c$ represents the velocity of light, $\Delta\lambda_{eff}$ represents the effective-bandwidth of $\Psi J \rightarrow \Psi' J'$ transition. Table 5 presents the observed laser parameters of PBTNAEu glasses. These values obtained for PBTNAEu2 glass are comparable to LiPbAlB [8], TWGEu05 [10], PTBEu20 [11], TPBFEu16 [32], TLKZnF:$Eu^{3+}$ [33] and TeEu1.5 [44] glasses. Table 7 summarizes the laser parameters of different multi-component glasses.

### 3.9. Luminescence decay, non-radiative losses and quantum efficiency

The lifetime of $Eu^{3+}$: $^5D_0$ emission state of PBTNAEu glasses has been determined from the luminescence decay profiles obtained by monitoring the emission (613 nm) and excitation (465 nm) wavelengths corresponding to $^5D_0 \rightarrow {}^7F_2$ and $^7F_0 \rightarrow {}^5D_2$ transitions, respectively. All these decay profiles are suitably fitted to $I(t) = I(0) \cdot e^{-t/\tau}$, where $I(0)$ represents the intensity at t = 0 and $\tau$ represents the decay time of corresponding emission state. The luminescence decay profiles of PBTNAEu1, PBTNAEu2 and PBTNAEu5 glasses are presented in Fig. 13 (a), (b) and (c), respectively. The experimentally measured lifetime ($\tau_{exp}$) of $Eu^{3+}$: $^5D_0$ emission state is evaluated taking the first e-folding times of the initial intensity. For the studied PBTNAEu1, PBTNAEu2 and PBTNAEu5 glasses, the lifetime values are fund to be 1.11, 1.09 and 1.07 ms, respectively. The accuracy in determining the lifetime is nearly ±0.01 ms. In general, the dependence of lifetime of $Eu^{3+}$: $^5D_0$ emission state is fever on its concentration [45]. In the present investigation, the observed results show a shortening in lifetime with the addition of $EuF_3$. The variation of decay time of $Eu^{3+}$: $^5D_0$ emission state in PBTNAEu glasses with $EuF_3$ content is shown in Fig. 13d.

One of the reasons for shortening in lifetime is the multiphonon-

**Table 7**
Comparison of laser characteristics parameters of $Eu^{3+}$: $^5D_0 \rightarrow {}^7F_2$ (613 nm) transition in different multi-component glasses.

| Glass Host | Laser characteristics parameters | | | | |
|---|---|---|---|---|---|
| | $\Delta\lambda_{eff}$ (nm) | $\beta_{exp}$ (%) | $\sigma_{emi}$ ( $\times 10^{-21}$ $cm^2$) | ($\sigma_{emi} \times \Delta\lambda_{eff}$) ( $\times 10^{-27}$ $cm^3$) | ($\sigma_{emi} \times \tau_{exp}$) ( $\times 10^{-24}$ $cm^2$-s) |
| PBTNAEu2 [Present work] | 10.89 | 69 | 3.87 | 4.22 | 6.96 |
| LiPbAlB [8] | 11.24 | 63 | 0.499 | 0.56 | – |

| PTBEu20 [11] | 12.35 | 65 | 0.87 | 1.074 | 4.89 |
| TPBFEu16 [32] | 9.712 | 70.47 | 1.458 | 1.416 | – |
| TLKZnF:$Eu^{3+}$ [33] | 6.3753 | 72.38 | 2.210 | 1.4089 | – |
| TeEu1.5 [44] | 10.44 | 64 | 2.319 | 2.421 | – |

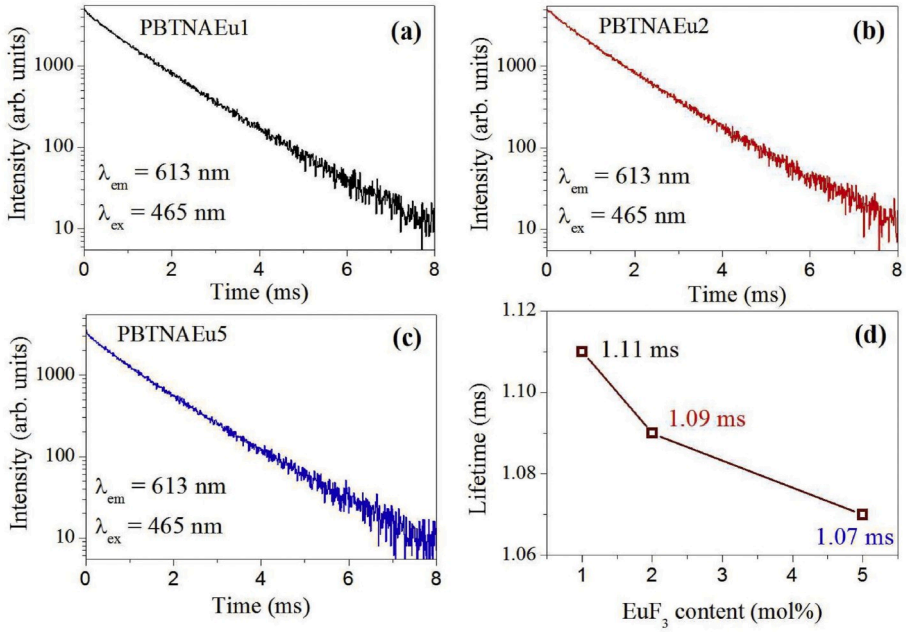

**Fig. 13.** Logarithmic plots of decay profiles of $Eu^{3+}$: $^5D_0$ emission state for PBTNAEu1 (a), PBTNAEu2 (b) and PBTNAEu5 (c) glasses. The variation of lifetime as a function of $EuF_3$ content in PBTNAEu glasses (d).

relaxation rates ($W_{MP}$). The non-radiative decay rates ($W_{NR}$) include the multiphonon-relaxation rates ($W_{MP}$), energy transfer rates ($W_{ET}$), concentration quenching rates ($W_{CQ}$) and the $OH^-$ content rates ($W_{OH}$) and thus, $W_{NR} = W_{MP} + W_{ET} + W_{CQ} + W_{OH}$. In case of PBTNAEu glasses, the $W_{OH}$ becomes insignificant due to small value of $OH^-$ content [**5**]. For the studied concentrations of $EuF_3$ in PBTNAEu glasses, the $W_{ET}$ and $W_{CQ}$ become insignificant due to the absence of luminescence quenching. To bridge the energy gap of ~12,475 $cm^{-1}$ between the $^5D_0$ emission state and its lower lying $^7F_6$ state, the PBTNAEu glasses require nearly 12 phonons owing to its small phonon energy. Therefore, the multiphonon-relaxation rates play a key role in the shortening of decay time. The NR multiphonon-relaxation rates ($W_{MP}$) responsible for shortening in lifetime ($W_{MP} = W_{NR} = \tau_{exp}^{-1} - \tau_{rad}^{-1}$) for PBTNAEu1, PBTNAEu2 and PBTNAEu5 glasses are found nearly 351, 362 and 373 $cm^{-1}$, respectively. These values show that no considerable change takes place when the content of $EuF_3$ is increased from 1.0 mol% to 5.0 mol% in PBTNAEu glasses.

The quantum efficiency (η) of a laser host material is one of the important parameters for its applicability as a practical laser and it has been obtained from the ratio of experimental and radiative lifetimes. Therefore,

$$\eta = \frac{\tau_{exp}}{\tau_R} \quad (4)$$

where $\tau_{exp}$ and $\tau_R$ represents the experimental and radiative lifetimes, respectively. For PBTNAEu1, PBTNAEu2 and PBTNAEu5 glasses, the quantum efficiencies are evaluated to be 60.99%, 60.56% and 60.11%, respectively. These values are found higher than LiPbAlB (58%) [**8**], PTBEu20 (40%) [11], LTTEu20 (53%) [12], TPBFEu16 (53.4%) [32], TLKZnFEu10 (51.6%) [33], Tellurite (57.2%) [39], Borosilicate (33%) [44] and $Eu^{3+}$: B1TMK (56.76%) [46] glasy materials. These results suggest that the studied PBTNAEu glasses show improved quantum efficiencies compared to above mentioned reports. The experimental quantum yield (QY) of PBTNAEu2 glass is found to be 9.52% which is close to $Li_2B_4O_7$:Eu (1.0 mol%) glass (QY = 10.7%) [36]. Based on the evaluated spectroscopic, radiative and laser characteristic properties, it has been suggested that the PBTNAEu2 glass has more potentiality to produce enhanced and rich red luminescence through $^5D_0 \rightarrow {}^7F_2$ (613 nm) transition.

## 4. Conclusions

Optically transparent PBTNAEu glasses containing different amounts of $EuF_3$ ($0 \leq x \leq 5.0$ mol%) were prepared and characterized for red laser applications. The presence of Te–O–Te, Pb–O and O–B–O linkage and $BO_4$ units has been confirmed from the Raman spectra. The SEM-EDX results confirm the intrinsic nature of studied glass composition. Thermal correction factors for $^7F_0$ and $^7F_1$ energy levels are found to be $C_0 = 0.6506$ and $C_1 = 0.3162$, respectively at T = 300 K. The phonon energy corresponding to PSB–I (~866 $cm^{-1}$) and PSB–II (~1222 $cm^{-1}$) has been attributed to the B–O stretching vibrations in $BO_4$ and pyroborate groups, respectively. The $^5D_0 \rightarrow {}^7F_J$ emission spectral profiles have been used to examine the enhanced luminescence and asymmetricity around the $Eu^{3+}$ ions. The $\Omega_\lambda$ parameters obtained from the $^5D_0 \rightarrow {}^7F_1$, $^7F_2$, $^7F_4$, $^7F_6$ emission transitions have been used to evaluate various laser characteristic parameters. The luminescence decay profiles of $Eu^{3+}$: $^5D_0$ emission state have been well fitted to single exponential function. The lifetime shortening of has been assigned to the non-radiative multi-phonon relaxation rates. The luminescence quantum efficiencies are estimated to be around 60%. The observed experimental results suggest that the PBTNAEu2 glass could be the best candidate for rich red laser applications.

ABSTRACT

The $Tb^{3+}/Bi^{3+}$ co-doped $SrAl_2O_4$ (SAOTB) nanophosphors were synthesized and characterized through X-ray diffraction, Raman, photoluminescence excitation, emission and luminescence decay studies. The studied materials were crystallize into monoclinic phase with lattice parameters a = 8.4419 Å, b = 8.8217 Å, c = 5.1592 Å. The phase of SAOTB nanophosphors was confirmed by the Raman analysis. The morphological study reveals homogeneous distribution of particles of different size. The luminescence of $Tb^{3+}$ ions was enhanced by the effective sensitization of $Bi^{3+}$ ions when excited at 340 nm corresponding to $Bi^{3+}$: $^1S_0 \rightarrow {}^1P_1$ transition. The spectral overlap of $Tb^{3+}$: $^7F_6 \rightarrow {}^5G_6$ and $Bi^{3+}$: $^3P_1 \rightarrow {}^1S_0$ transition reveals the existence of transfer of energy from $Bi^{3+}$ to $Tb^{3+}$ ions. The SAOTB nanophosphors emit strong and enhanced green luminescence through $Tb^{3+}$: $^5D_4 \rightarrow {}^7F_J$ transitions when excited at 340 nm radiation. The colour perception and the luminescence quantum efficiency were investigated using the emission spectral profiles. The luminescence decay time of $Tb^{3+}$: $^5D_4$ emission level in SAOTB nanophosphors was found to be nearly 2.60 ms. The experimental results suggest that the SAOTB nanophosphors were more potential for display applications.

## 1. Introduction

The mono-phase nanophosphors activated with trivalent rare earth (RE) ions have been the most significant materials in the field of photonics, optoelectronics and display technology. They find wide range of applications as lasers, sensors, surface coatings, energy storage devices etc., owing to their improved tunable emission, high thermal stability, good chemical durability and eco-friendly nature [1–5]. They possess excellent optimistic properties such as compact size, low power consumption, long lifetime, and excellent luminescence efficiency [6,7]. Among the available phosphate, borate, silicate, and molybdate phosphors, the $SrAl_2O_4$ crystallized into monoclinic phase exhibits excellent luminescence properties, good ultraviolet (UV) absorption, high thermal strength, prolonged chemical stability and environmental friendly nature [8–12]. The significance of $SrAl_2O_4$ nanophosphors for various applications were described in our previous work [13,14]. They crystallized into monoclinic structure with lattice parameters a = 8.4419 Å, b = 8.8217 Å, c = 5.1592 Å [15]. The transmission electron microscope (TEM) study confirms the nanophase of $SrAl_2O_4$ phosphors and the Fourier transform infrared (FTIR) investigations validate the presence of Al–O, Sr–O and Sr–O–Al vibrational bands.

From the literature [16–18], it is clear that the $Tb^{3+}$ ions activated nanophosphors are favourable to tune the colour of emitted luminescence from blue to green by the way of controlling $Tb^{3+}$ ions concentration. For <0.5% concentrations, the blue luminescence ($Tb^{3+}$: $^5D_3 \rightarrow {}^7F_J$) become superior while for ≥ 0.5% concentrations, the green luminescence ($Tb^{3+}$: $^5D_4 \rightarrow {}^7F_J$) become superior. The trivalent bismuth ($Bi^{3+}$) with [Xe] $4f^{14}5d^{10}6s^26p^3$ electronic configuration has been identified as an efficient activator to enhance the luminescence of some of the trivalent RE ions due to its electronic transitions between 6s [2] ground and 6s6p excited energy levels. It has been one of the interesting metal-ions for various photonic applications due to its diverse oxidation levels (such as 0, +1, +2, +3 and + 5) and multi-type energy level structure. $Bi^{3+}$ can also be used as probe to investigate the

luminescence of $RE^{3+}$ active ions due to its host sensitive optical properties associated with 6s [2] lone pair electrons [19–21]. Since the $^1S_0 \rightarrow {}^3P_0$, $^3P_2$ transitions are totally spin forbidden, the $Bi^{3+}$ ions show broad absorption through $^1S_0 \rightarrow {}^3P_1$, $^1P_1$ transitions in any host environment. This broad absorption facilitates to absorb UV light and initiate energy transfer from $Bi^{3+}$ ions to other luminescent centers, like $RE^{3+}$ ions. Thus, the $Bi^{3+}$ could acts as an efficient sensitizer to enhance the luminescence of $RE^{3+}$ ions.

The present work reports the effect of $Bi^{3+}$ on the luminescence of $Tb^{3+}$ ions in $SrAl_2O_4$ nanophosphors. The energy transfer from $Bi^{3+}$ to $Tb^{3+}$ ions under UV excitation, the site-symmetry around $Tb^{3+}$, the colour perception, the lifetime of $Tb^{3+}$: $^5D_4$ emission level and the luminescence quantum efficiency were reported. The structural and morphological investigations together with the applicability of SAOTB nanophosphors for display applications were also discussed.

## 2. Experimental

In order to investigate the effect of $Bi^{3+}$ sensitization on $Tb^{3+}$ luminescence, the $SrAl_2O_4$:$x$$Tb^{3+}$/$y$$Bi^{3+}$ (SAOTB) nanophosphors, where $x = 0$, 5.0 mol% and $0 \leq y \leq 10.0$ mol% were synthesized by solid-state reaction method using $SrCO_3$ (99%-Sigma), $Al_2O_3$ (99.9%-Himedia), $Tb_4O_7$ (99.9%-Alfa Aesar) and $Bi_2O_3$ (99.9%-Merck) as starting materials and $H_3BO_3$ (99.5%-Merck) as a flux. The initial materials were taken in stoichiometric amounts along with 2.0 wt% of $H_3BO_3$ and they were mixed well using acetone to get homogeneous powders. These powders were heat treated at 200 °C for 3 h and then sintered at 1050 °C. The samples were referred as SAOT0B0 for $x = 0$ mol% and $y = 0$ mol%, SAOT0B1 for $x = 0$ mol% and $y = 1.0$ mol% and SAOT5B0, SAOT5B1, SAOT5B3, SAOT5B5, SAOT5B10 for $x = 5.0$ mol% and $y = 0$, 1.0, 3.0, 5.0, 10.0 mol%, respectively.

The crystalline phase of SAOTB nanophosphors was obtained with X' Pert- Pro Materials Research Diffractometer using $\lambda_{CuK\alpha} = 1.5406$ Å. The Raman spectral analysis of SAOT0B0 was carried out with BRUKER RFS27 FT-Raman spectrometer using Nd: YAG laser ($\lambda = 1064$ nm). The morphology of SAOT5B5 nanophosphor was examined with Hitachi SU-70 scanning electron microscope (SEM). The photoluminescence excitation, emission and luminescence decay analysis was carried out using Jobin YVON Fluorolog-3 spectrofluorimeter provided with xenon flash lamp. All the measurements were carried out at room temperature.

## 3. Results and discussion

### 3.1. PXRD, Raman and morphological studies

The powder X-ray diffraction (PXRD) patterns of SAOTB nanophosphors shown in Fig. 1 (a) are well consistent with JCPDS No. 34-0379 and confirm that they crystallized into monoclinic phase. The schematic representation of the unit cell of monoclinic $SrAl_2O_4$ is shown in Fig. 1 (b). From the PXRD patterns one can notice that the intensity of SAOTB nanophosphors decrease with the addition of $Tb^{3+}$ or $Bi^{3+}$ or $Tb^{3+}$/$Bi^{3+}$ ions. When the electron density of the doped atom is different than that of the surrounding atoms, then a change in intensity of PXRD peaks (i.e., some peaks become more intense and other peaks less intense) as well as a shift in peak position takes place. However, the degree of these changes depends on the percentage of addition of impurities. If the electron densities of the doped atom and the surrounding atoms are close, then there is a probability to enhance the intensity of PXRD peaks. On the other hand, if the electron densities are differ then there is a possibility for reduction in intensity of PXRD peaks. In the present work, the effective ionic radius of $Sr^{2+}$ (1.18 Å) is considerably larger than the effective ionic radii of $Tb^{3+}$ (0.92 Å) and $Bi^{3+}$ (1.03 Å). Thus, the $Tb^{3+}$ and $Bi^{3+}$ replace the $Sr^{2+}$ sites rather than the $Al^{3+}$ (0.535 Å) sites without any change in coordination environment of $SrAl_2O_4$ crystal lattice. The increased amounts of $Tb^{3+}$ and $Bi^{3+}$ result a strain in lattice constant by stretching the bonds without any change in the phase of $SrAl_2O_4$ due to the difference in electron density of $Sr^{2+}$ and the impurities ($Tb^{3+}$ and $Bi^{3+}$). Thus, a reduction in intensity of PXRD peaks occurs without a change in their positions confirming the absence of phase modifications. According to the Scherrer's formula, the average size of SAOTB crystallites is estimated to be ~45 nm.

In order to identify the presence of different molecular units and to confirm the monoclinic phase of synthesized samples, the Raman analysis has been carried out for SAOT0B0 and it is presented in Fig. 1 (c). A sharp and intense Raman peak positioned at around 467 $cm^{-1}$ confirms the monoclinic phase of SAOTB nanophosphor. The observed Raman profile is similar to $SrAl_2O_4$ nanosized particles [22]. The Raman band noticed at 467 $cm^{-1}$ has been ascribed to the O–Al–O bending vibrations [23]. According to Raman selection rules, nearly 81 active modes are possible for monoclinic $SrAl_2O_4$ [24]. In the present investigation, nearly ten weak Raman features along with intense band at 467 $cm^{-1}$ have been identified. The observed Raman results support the FTIR results presented in our previous work [13,14].

In order to study the surface morphology, the grain size and the shape of particles, the SEM image of SAOT5B5 was obtained and shown in Fig. 2. The SEM results reveal a grain like morphology with homogeneous distribution of particles of different size. The average size of crystallites is found to be in the order of nanometer scale of the order of ~56 nm, which is close to those obtained from the PXRD studies. The nanophase of $SrAl_2O_4$ has been confirmed by TEM analysis [15]. The homogeneous distribution and the nanoscale crystallites could be responsible for enhanced luminescence from the SAOTB nanophosphors.

### 3.2. Luminescence of $Bi^{3+}$

The photoluminescence excitation and emission spectra of SAOT0B1 nanophosphor are illustrated in Fig. 3. The excitation spectrum reveals an intense band positioned at around 340 nm corresponding to $Bi^{3+}$: $^1S_0 \rightarrow {}^1P_1$ transition and the emission spectrum exhibits a broad band with peak maximum at around 378 nm corresponding to $Bi^{3+}$: $^3P_1 \rightarrow {}^1S_0$ transition. The Stokes shift between the excitation and emission maxima is estimated to be 2956 $cm^{-1}$, which is close to those reported for C-$GdO_3$: $Bi^{3+}$ (2700 $cm^{-1}$), $Y_2O_3$: $Bi^{3+}$ (2400 $cm^{-1}$) [25] and B-$GdO_3$: $Bi^{3+}$ (5700 $cm^{-1}$) [26]. The broad emission band with full width at half maximum (FWHM) of ~113.1 nm reveals that the $Bi^{3+}$ ions can act as good sensitizers to enhance the luminescence of $Tb^{3+}$ ions. The partial energy level diagram shown in Fig. 4 describes the excitation and emission mechanism of $Bi^{3+}$ ions in SAOTB nanophosphors.

### 3.3. Luminescence of $Tb^{3+}$/$Bi^{3+}$

The concentration of $Tb^{3+}$ ions has been optimized as 5.0 mol% for proficient green emission from SAOT nanophosphors [15]. In order to investigate the effect of $Bi^{3+}$ ions sensitization on the luminescence of $Tb^{3+}$ ions, different concentrations of $Bi^{3+}$ ions ($0 \leq y \leq 10.0$ mol%) activated SAOTB nanophosphors have been synthesized and characterized through photoluminescence excitation, emission and luminescence decay. The excitation spectra of SAOTB nanophosphors in the spectral region from 200 nm to 475 nm monitoring the emission at 544 nm corresponding to $Tb^{3+}$: $^5D_4 \rightarrow {}^7F_5$ transition are shown in Fig. 5. The excitation spectra consist of eleven $Tb^{3+}$ excitation bands. The excitation bands due to

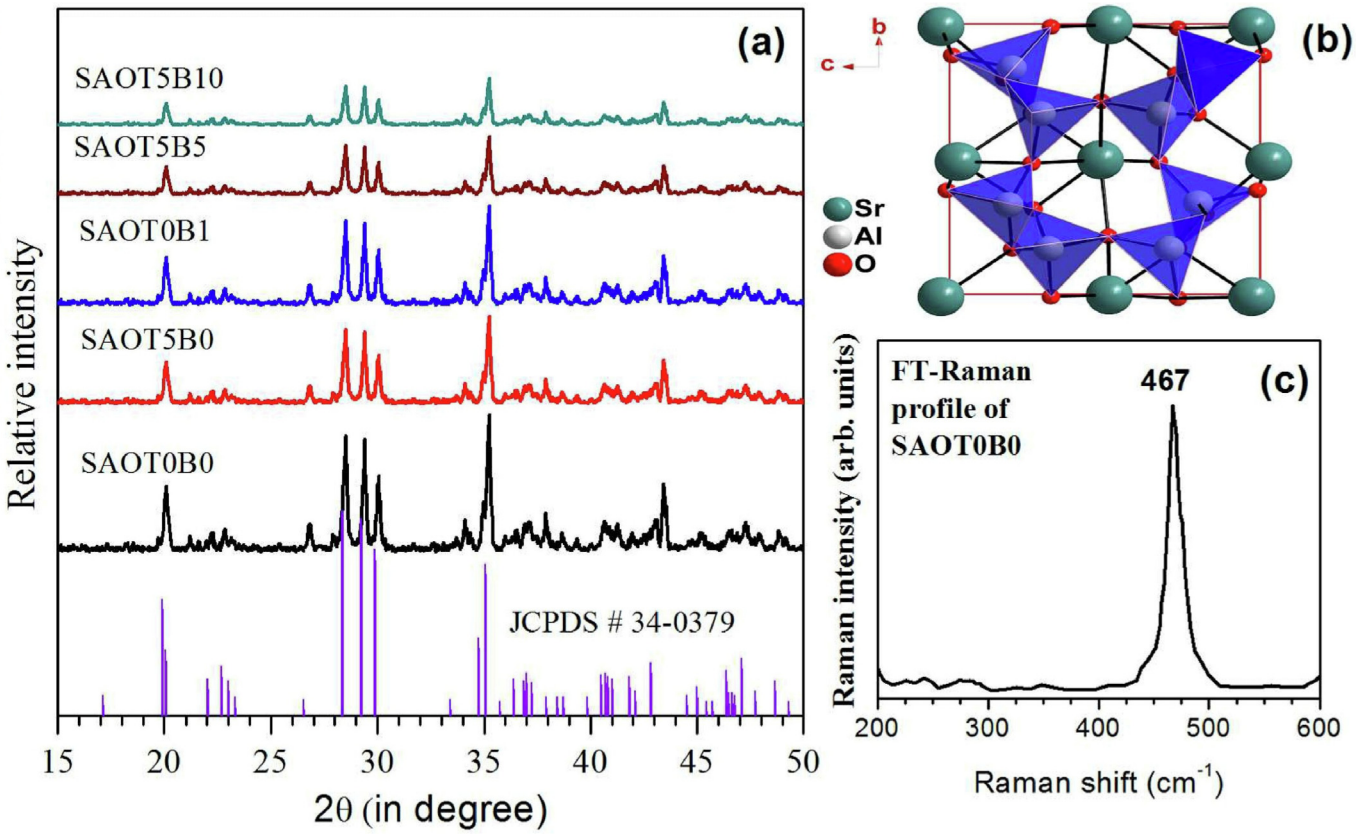

**Fig. 1.** The PXRD profiles of SAOTB nanophosphors (a) and the unit cell of SAOT0B0 (b) and the FT-Raman spectrum of SAOT0B0 (c).

$Tb^{3+}$ ions have been attributed to $^7F_6 \rightarrow {}^5K_7$ (239 nm), $^7F_6 \rightarrow {}^5K_9$ (255 nm), $^7F_6 \rightarrow {}^5F_5$ (286 nm), $^7F_6 \rightarrow {}^5H_6$ (304 nm), $^7F_6 \rightarrow {}^5D_1$ (319 nm), $^7F_6 \rightarrow {}^5L_7$ (339 nm), $^7F_6 \rightarrow {}^5L_9$ (353 nm), $^7F_6 \rightarrow {}^5L_{10}$ (371 nm), $^7F_6 \rightarrow {}^5G_6$ (378 nm), $^7F_6 \rightarrow {}^5D_3$ (390 nm) and $^7F_6 \rightarrow {}^5D_4$ (471 nm) transitions [27]. The excitation band located at around 340 nm has been ascribed to $Bi^{3+}$: $^1S_0 \rightarrow {}^1P_1$ transition.

The excitation spectra reveal an interesting variation in intensity of $Tb^{3+}$ ions with the addition of $Bi^{3+}$ ions. As the concentration of $Bi^{3+}$ ions increases, the intensity of $^7F_6 \rightarrow ({}^5K_7, {}^5K_9, {}^5F_5, {}^5H_6)$ transitions decrease and that of $^7F_6 \rightarrow ({}^5D_1, {}^5L_7, {}^5L_9, {}^5L_{10}, {}^5G_6, {}^5D_3, {}^5D_4)$ transitions increase. Since the excitation band of $Bi^{3+}$ ions occurs at ~340 nm ($Bi^{3+}$: $^1S_0 \rightarrow {}^1P_1$), the $Bi^{3+}$ ions are enable to enhance the intensity of $^7F_6 \rightarrow ({}^5D_1, {}^5L_7, {}^5L_9, {}^5L_{10}, {}^5G_6, {}^5D_3, {}^5D_4)$ transitions. The increased intensity of these transitions represents the uniform distribution of both $Tb^{3+}$ and $Bi^{3+}$ ions in SAOTB nanophosphors. It is well known that if a transfer of energy existed between an activator and sensitizer, there should be a characteristic excitation band of sensitizer in the excitation spectrum of activator obtained by monitoring its emission and there should be an overlap between the emission band of sensitizer and the excitation band of activator [28]. The excitation spectra of SAOTB nanophosphors obtained monitoring the emission through $Tb^{3+}$: $^5D_4 \rightarrow {}^7F_5$ (544 nm) transition (see Fig. 5) consists of $Bi^{3+}$: $^1S_0 \rightarrow {}^1P_1$ transition located at ~340 nm. In the present investigation, an overlapping region of emission band of $Bi^{3+}$ (sensitizer) and the excitation band of $Tb^{3+}$ (activator) has been noticed and it is illustrated in Fig. 6. One can notice from Fig. 6 that the $Tb^{3+}$: $^7F_6 \rightarrow {}^5G_6$ excitation band and the $Bi^{3+}$: $^3P_1 \rightarrow {}^1S_0$ emission band are located at ~378 nm. Since the $Tb^{3+}$: $^5L_7$ (~29498 $cm^{-1}$) and the $Bi^{3+}$: $^1P_1$ (~29412 $cm^{-1}$) energy levels have almost the same energy, the transfer of energy has been initiated from $Bi^{3+}$ to $Tb^{3+}$. These results evidence the existence of energy transfer from $Bi^{3+}$ ions to $Tb^{3+}$ ions. Thus, the luminescence analysis of SAOTB nanophosphors has been carried out by exciting at 340 nm wavelength only.

The emission spectral profiles of SAOT5By ($0 \leq y \leq 10.0$ mol%) nanophosphors excited at 340 nm wavelength in the spectral region from 480 nm to 640 nm are illustrated in Fig. 7. These spectra consist of four emission bands located at around 489, 544, 585 and 623 nm corresponding to $^5D_4 \rightarrow {}^7F_6$, $^5D_4 \rightarrow {}^7F_5$, $^5D_4 \rightarrow {}^7F_4$, $^5D_4 \rightarrow {}^7F_3$ transitions, respectively. Among these, the $^5D_4 \rightarrow {}^7F_5$ transition (544 nm) has maximum intensity exhibiting strong green emission. Additionally, the intensity of $^5D_4 \rightarrow {}^7F_J$ transitions enhances with increase of $Bi^{3+}$ concentration due to the transfer of energy from $Bi^{3+}$ ions to $Tb^{3+}$ ions upon excitation at 340 nm wavelength. The inset of Fig. 7 describes the variation of intensity of $Tb^{3+}$: $^5D_4 \rightarrow {}^7F_5$ (544 nm) transition as a function of $Bi^{3+}$ concentration in SAOT5By nanophosphors.

Upon 340 nm excitation, the population density of $Tb^{3+}$: $^5D_4$ metastable level enhances in three different ways. In the first way, the ground state $Bi^{3+}$ ions absorb the energy of incident photons and jumps to $Bi^{3+}$: $^1P_1$ level and then decays non-radiatively (NR) to $Bi^{3+}$: $^3P_1$ level causing blue emission through $Bi^{3+}$: $^3P_1 \rightarrow {}^1S_0$ (378 nm) transition when excited at 340 nm wavelength. The emitted photons through $Bi^{3+}$: $^3P_1 \rightarrow {}^1S_0$ transition stimulates some of the ground state $Tb^{3+}$ ions to $Tb^{3+}$: $^5G_6$ energy level. These excited $Tb^{3+}$ ions de-populate to $Tb^{3+}$: $^5D_4$ metastable level through a fast non-radiative process resulting to improve its population. In the second way, some of the excited $Bi^{3+}$ ions at $Bi^{3+}$: $^1P_1$ level excites few $Tb^{3+}$ ions to $Tb^{3+}$: $^5L_7$ energy level by energy transfer process. In the third way, some of $Tb^{3+}$ ions absorb the energy of incident photons and get excited to $Tb^{3+}$: $^5L_7$ energy level. These excited $Tb^{3+}$ ions at $Tb^{3+}$: $^5L_7$ energy level de-populate to

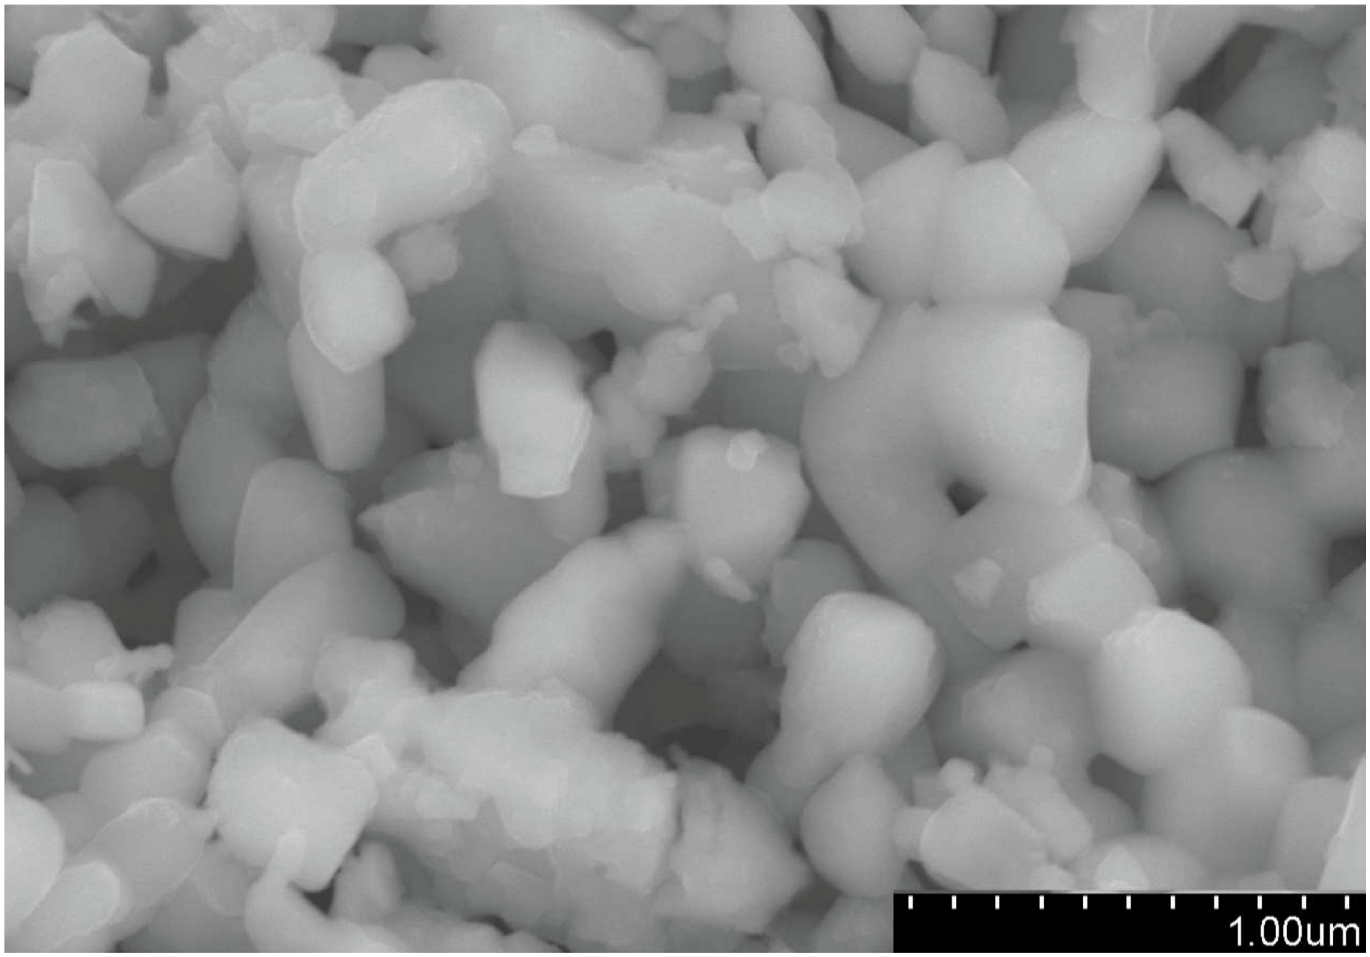

**Fig. 2.** The SEM image of SAOT5B5 nanophosphor.

$Tb^{3+}$: $^5D_4$ metastable level through a fast non-radiative decay resulting to enhance the population density at $Tb^{3+}$: $^5D_4$ metastable level. Once there exists population inversion between the $Tb^{3+}$: $^5D_4$ metastable level and its $Tb^{3+}$: $^7F_J$ lower lying energy levels, a strong and intense luminescence occurs through $Tb^{3+}$: $^5D_4 \rightarrow {}^7F_J$ transitions. The emission and the energy transfer mechanism in SAOTB

nanophosphors at 340 nm excitation is illustrated in partial energy level diagram shown in Fig. 4.

The intensity of a magnetic-dipole transition ($\Delta J = \pm 1$) of $RE^{3+}$ ions becomes proficient when it has a centre of inversion symmetry with its surrounding atoms. On the other hand, the intensity of an electric-dipole transition ($\Delta J = \pm 2$) becomes prominent when it has non-inversion symmetry with its surrounding atoms [29]. In case of $Tb^{3+}$ ions, the $^5D_4 \rightarrow {}^7F_6$ (489 nm) is an electric-dipole transition and the $^5D_4 \rightarrow {}^7F_5$ (544 nm) is a magnetic-dipole transition. The emission spectral profiles shown in Fig. 7 reveal that the intensity of $^5D_4 \rightarrow {}^7F_5$ (544 nm) magnetic-dipole transition dominates the intensity of $^5D_4 \rightarrow {}^7F_6$ (489 nm) electric-dipole transition confirming the centre of inversion symmetry around the $Tb^{3+}$ ions in SAOTB nanophosphors. Furthermore, when the magnitude of intensity ratio of electric-dipole (ED) to magnetic-dipole (MD) transitions ($I_{ED/MD}$) is lower than unity, then the $Tb^{3+}$ ions invariably are present in non-inversion symmetric environment [30]. The values of $I_{ED/MD}$ are found to be 0.69, 0.74, 0.83, 0.94 and 0.85 for SAOT5B0, SAOT5B1, SAOT5B3, SAOT5B5 and SAOT5B10 nanophosphors, respectively. These results show that the $Tb^{3+}$ ions has non-inversion symmetry with its surrounding atoms. In the present investigation, the SAOT5By nanophosphors exhibit enhanced luminescence due to the effective sensitization of $Bi^{3+}$ ions by the process of transfer of energy from $Bi^{3+}$ to $Tb^{3+}$ active centers. Since, the value of $I_{ED/MD}$ increase with increase of $Bi^{3+}$ ions concentration, reaches to maximum at y = 5.0 mol% and then decrease for further rise of its concentration, the optimum concentration of $Bi^{3+}$ ions for effective and enhanced luminescence from the SAOTB nanophosphors become y = 5.0 mol%.

The Commission International de l'Eclairage (CIE) coordinates evaluated from the emission spectra (shown in Fig. 7) have been used to study the colour perception of emitted luminescence of SAOTB nanophosphors. These coordinates are found to be (0.162, 0.185), (0.296, 0.478), (0.267, 0.569), (0.287, 0.607), (0.302, 0.615) and (0.312, 0.605) for SAOT0B1, SAOT5B0, SAOT5B1, SAOT5B3, SAOT5B5 and SAOT5B10 nanophosphors, respectively and they are presented in CIE diagram shown in Fig. 8. From this figure one can notice that the SAOT0B1 nanophosphor emits intense blue luminescence and the SAOT5B0 nanophosphor emits green luminescence at 340 nm excitation. But the luminescence from the $Tb^{3+}$/$Bi^{3+}$ codoped SAOTB nanophosphors varies from bluish-green to intense green to yellowish-green when the concentration of $Bi^{3+}$

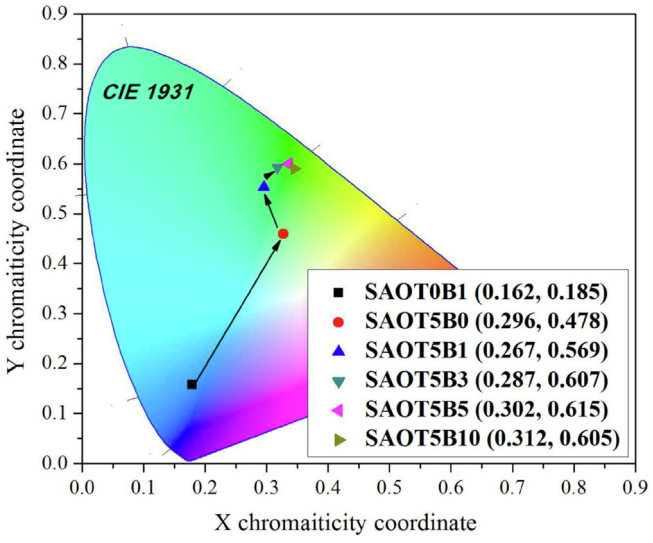

**Fig. 8.** The CIE diagram of SAOTB nanophosphors.

ions changes from 1.0 mol% to 10.0 mol%. The colour coordinates of SAOT5B5 nanophosphor (0.302, 0.615) are well located in the bright and intense green region of CIE diagram and they found close to the ITU-R BT.709-4 standard green (0.300, 0.600) and β-SiAlON:$Eu^{2+}$ (0.31, 0.60) nanophosphor [31].

The luminescence decay of $Tb^{3+}$: $^5D_4$ metastable level has been examined by exciting SAOTB nanophosphors at 340 nm wavelength and controlling the emission at 544 nm corresponding to $Tb^{3+}$: $^5D_4 \rightarrow {}^7F_5$ transition. The decay profiles of studied phosphors are well fitted to $I = I_0\, e^{-t/\tau}$, where $I$ is the intensity at time t, $I_0$ is the initial intensity and $\tau$ is the lifetime of metastable level and it can be estimated taking the first e-folding times the initial intensity of decay profiles. For SAOT5B0 nanophosphor, the lifetime is found to be ~2.53 ms, while for all the SAOT5By ($0 \leq y \leq 10.0$ mol%) nanophosphors, the lifetime is found close to ~2.60 ms, i.e., no considerable variation in lifetime of $Tb^{3+}$: $^5D_4$ metastable level is noticed when the concentration of $Bi^{3+}$ ions varies from 1.0 mol% to 10.0 mol%. However, the addition of $Bi^{3+}$ ions results a slight increase in lifetime (i.e., from 2.53 ms to 2.60 ms) due to energy transfer from $Bi^{3+}$ ions to $Tb^{3+}$ ions. For reference, the logarithmic plots of luminescence decay curves of SAOT5B0 and SAOT5B5 nanophosphors are shown in Fig. 9.

In order to know the applicability of studied phosphors for display applications, it is essential to know its luminescence quantum efficiency (η) that can be evaluated using the formula, $\eta = \frac{1}{\tau} \int I(t)\,.\,dt$, where $I(t)$ and τ represents the maximum luminescence intensity and the lifetime, respectively. For SAOT5By ($0 \leq y \leq 10.0$ mol%) nanophosphors, the value of η is found to be 0.78. The experimental results show that the luminescence intensity of $Tb^{3+}$ ions enhanced by constructive sensitization of $Bi^{3+}$ ions in SAOTB nanophosphors with no considerable variation in their quantum efficiency. Among the studied materials, the SAOT5B5 nanophosphor could be the best candidate to produce strong and intense green luminescence in a eco-friendly manner.

## 4. Conclusions

The SAOTB nanophosphors have been synthesized and characterized for various display applications. The studied materials crystallize into nanoscale monoclinic phase and the crystallites have been distributed homogeneously causing enhanced luminescence. Upon 340 nm excitation, the emitted luminescence has been tuned from bluish-green to intense green to yellowish-green when the concentration of $Bi^{3+}$ ions varies from 1.0 mol% to 5.0 mol % to 10.0 mol%. The $Bi^{3+}$ ions effectively sensitize the luminescence of $Tb^{3+}$ ions in SAOTB nanophosphors by transferring their energy to $Tb^{3+}$ ions. The SAOTB nanophosphors emit enhanced green luminescence due to non-inversion symmetric environment around the $Tb^{3+}$ ions. The observed results confirm that the SAOT5B5 nanophosphor has the highest potentiality to design new display devices operating at 544 nm green luminescence.

**ABSTRACT**

A sequence of substituted phosphonates containing the thiazolidinedione moiety was synthesized with good yields. The structures of all the synthesized compounds were confirmed by NMR ($^{31}$P, $^{1}$H and $^{13}$C) and IR spectroscopy, mass spectrometry and C, H, N elemental analyses. In silico molecular docking study was also carried out to evaluate their interaction and binding modes on ligands against human PPAR $\gamma$ protein for their anti-diabetic activity. From the docking results, it was determined that the compounds (Z)-dimethyl 5-(3-nitrobenzylidene)−2,4-dioxothiazolidin-3-ylphosphonate (7a), (Z)-dimethyl 5-(3-chloro-4-fluorobenzylidene)−2,4-dioxothiazolidin-3-ylphosphonate (7f), (Z)-dimethyl 5-(2,4-dichlorobenzylidene)−2,4-dioxothiazolidin-3-ylphosphonate (7e) and (Z)-dimethyl 5-((5-methoxypyridin-2-yl)methylene)−2,4-dioxothiazolidin-3-ylphosphonate (7j) have shown better binding energies (**−7.8**, **−7.6**, **−7.5** and **−7.6** Kcal/mol) with the target gene, PPAR $\gamma$ than the reference drug, Rosiglitazone (**−7.4** Kcal/mol). In vitro anti-diabetic activity of the title compounds was also screened by standard $\alpha$-amylase inhibition assay. Some of the tested compounds proved to possess promising activity when compared with the reference drug.

**GRAPHICAL ABSTRACT**

## Introduction

A global status report on non- communicable diseases[1] revealed that Type 2 diabetes mellitus (T2DM), is a quickly progressing disease worldwide. Greenfield and Chisholm[2] reported that thiazolidinediones (TZDs) are oral anti-diabetic drugs that control Type 2 diabetes via enhancement of insulin sensitivity.[3] Pioglitazone 1, Rosiglitazone 2 and Lobeglitazone 3 (Figure 1) are examples of drugs belonging to TZD category. They act as PPAR$\gamma$ agonists and showing their effectiveness in controlling T2DM. However they are effective in controlling T2DM, hepatotoxicity is certainly one of their severe side effects. Consequently, researchers are searching out higher options in novel drug improvement for T2DM.

Literature[4a–f] reported that in organic synthesis and biochemistry, the phosphonate moiety is a key functional group. Phosphonates are structurally related to phosphorous acid as reported by Savignac and Iorga.[5] In the literature,[6–11] it is reported that phosphonates have found extensive applications in agriculture and as pharmaceuticals. They have been reported to show a wide range of biological activities with use herbicides, pesticides, detergentsv and with antibacterial, anti-diabetic, antiviral and antitumor properties. Numerous biomolecules which might be inhibitors of a few biosynthetic pathways carry a phosphonate motif. Resistance to biodegradation makes organophosphorus of interest for designing novel drugs as reported by Kononova and Nesmeyanova.[12] Recent investigations by Pettersen *et al.*[13] demonstrated the use of organophosphorus compounds in diabetic treatment. Several patents have been filed and granted on various P containing compounds as potential anti-diabetic agents. These results encouraged the author to synthesize some new organophosphorus compounds with potent anti-diabetic activity.

Scheme 1. Synthesis of Phosphonates 7a–j.

On the premise of preceding reviews and continuing interest in the synthesis of phosphonates containing TZD moiety and in the extension of our studies to broaden new anti-diabetic agents, we targeted the synthesis of some new phosphonates containing TZD moiety. Molecular docking studies were also carried out to assess their interaction and binding modes with the target receptor.

## Results and discussion

### Chemistry

In the present work, we have synthesized a series of phosphonates containing TZD moiety from 2,4-thiazolidinedione in high yields with simple chemistry. The synthetic route was shown in (Scheme 1).

IR, $^{1}$H, $^{13}$C, $^{31}$P NMR, mass spectral data and elemental analyses were carried out to characterize 7a–j which are described in the Experimental. IR absorptions in the range 1729–1720 and 1218–1210 cm$^{-1}$ were assigned to C = O and P = O stretching vibrations respectively for 7a–j. In $^{1}$H NMR spectra, signals due to Ar-H were observed as in the range of $\delta$ 8.31–7.65 ppm. The singlets at $\delta$ 3.72 and $\delta$ 8.02 were due to methyl protons of P-O-CH$_3$ and = C-H protons respectively for 7a–j. $^{13}$C NMR chemical shift for = C-H carbon and methyl carbons of P-O-CH$_3$ were observed at 142.8 and 51.5 ppm respectively. $^{31}$P NMR spectra showed signals for 7a–j in the range 22.8–15.6 ppm. $M^{+\cdot}$ ions were found in the predictable m/z values in mass spectra. The representative spectra ($^{1}$H, $^{31}$P and IR) of new compounds 7a–j are available in the Supplemental Materials (Figures S 1-S 19).

### Pharmacology

From the docking results, it is observed that the compounds **7a**, **7f, 7h, 7e** and **7j** formed higher binding energies (**−7.8**, **−7.6**, **−7.4, −7.5** and **−7.6** *Kcal/mol*) with the target gene, PPAR $\gamma$ than the reference compound (**−7.4** *Kcal/mol*). Although the binding energies of the rest of the compounds were close to the reference compound, they were fitted in the active site of the target gene properly. Binding energies and bonding pose of ligands with target protein were mentioned in detail in Table S 1 and Figure S 20. (See Supplemental Materials). Out of the all title compounds, **7c**, **7d** and **7e** have formed hydrophobic interactions with the target protein (Figure S 21). The present investigation demonstrates that the synthesized compounds will be possible promising anti-diabetic drugs, which can be effectively used in the treatment of manifestation of diabetic complications.

Molecular docking results motivated us to screen the title compounds for their *in vitro* anti-diabetic activity by α-amylase inhibition activity method at four concentrations of 50, 100, 150 and 200 µg/mL. The screening results (See Supplemental Materials for Table S 2) of 7a–j showed that most of the derivatives exhibit good α-amylase inhibition activity when compared with the standard drug, Acarbose. Especially compound 7j bearing a 5-methoxypyridin-2-yl moiety (44.3–82.2 µg/mL), 7a bearing a 3-nitrobenzylidene motif (43.9–79.6 µg/mL), 7f incorporating a 3-chloro-4-fluorobenzylidene motif (41.4–76.5 µg/mL) and 7e bearing a 2,4-dichlorobenzylidene moiety (40.9–75.4 µg/mL) exhibited good inhibition when compared with the standard drug, Acarbose (47.8–85.9 µg/mL).

## Conclusion

The present study reports the successful synthesis of phosphonates in high yield with simple chemistry. *In silico* molecular docking study was performed for the ligands against human PPAR$\gamma$ protein for their anti-diabetic activity. The study showed that 7a (3-$NO_2$), 7f (3-Cl, 4-F), 7 h (-H), 7e (2,4-di-Cl) and 7j (4-$OCH_3$) were formed higher binding energies (−7.8, −7.6, −7.4, −7.5 and −7.6 *Kcal/mol*) with the target gene, PPAR$\gamma$ than the reference drug, Rosiglitazone (−7.4 *Kcal/mol*) which demonstrate that the synthesized compounds may become the promising next generation of anti-diabetic agents. *In vitro* anti-diabetic activity was also performed by α-amylase inhibition activity method. The screening results of 7a–j showed that most of the derivatives exhibit good α-amylase inhibition activity when compared with the standard drug, Acarbose. Especially the compounds 7j, 7a, 7f and 7e exhibited good inhibition when compared with the standard drug.

## Experimental

### Materials and characterization techniques

The chemical compounds were purchased from Sd. Fine Chem. Ltd., India; Qualigens, Mumbai and some of them have been purified the usage of popular processes. The purity of the compounds was checked by TLC chromatography on Al sheet of silica gel. *J* (coupling constants) and $\delta$ (chemical shift) values have been said in Hz and ppm, respectively. Bruker AMX spectrometer became used to record $^{31}$P (161.9 MHz), $^{1}$H (400 MHz) and $^{13}$C (100 MHz) NMR spectra. The symbols 's' for singlet, 'd' for doublet, 't' for triplet and 'm' for multiplet have been used to represent peaks in NMR spectra. LC-MS were recorded on SHIMADZU 2010 A. Thermo Finnigan Flash 1112 apparatus was used for CHN evaluation. Bruker IFS 55 (Equinox) FTIR spectrometer in KBr was used to report IR spectra. The Supplemental Materials contains sample $^{1}$H, $^{13}$C and $^{31}$P NMR spectra for products 7 (Figures S 1 – S 19).

### Procedures

#### Synthesis of 2,4-thiazolidinedione[2,14]

A solution containing of chloroacetic acid (0.5 mol) in water (50 mL) and of thiourea (0.5 mol) in water (50 mL) were mixed in a round bottomed flask and stirred for 15 min to obtain a white ppt on cooling. Concentrated HCl (50 mL) was added slowly using a dropping funnel and refluxed for 10–15 h at around 105 °C. On cooling, the contents of the flask solidified to a cluster of white needles shaped compound. Traces of HCl removed by using washing with water after which dried. The pure compound became obtained by recrystallization from ethyl alcohol. m.p. 122–124 °C.

#### Synthesis of 5-substituted-2,4-thiazolidinedione (5a–j)[15–17]

Substituted benzaldehyde (0.1 mol) [3a–j] was added to 2,4-thiazolidinedione (0.1 mol) in toluene in the presence of piperidine and refluxed at 110 °C for 6–7 h and then cooled to room temperature to precipitate out the corresponding TZD derivatives (5a–j). TLC (ethylacetate: *n*-hexane, 6:4) was used for verifying the improvement of the process.

#### Synthesis of phosphonates (7a–j)

The compound **5a** (0.01 mol) in THF:Pyridine (20 mL, 1:2 ratio) and sodium hydride (0.01 mol) were mixed at 0 °C and stirred for 1 h at 15 °C to offer the sodium salt of **5a**. Afterward, dimethyl phosphorochloridate (0.01 mol)[6] in dry THF (10 mL) was added and the reaction mixture was kept at 10oC and then stirred for 4 h at 40 °C. After completion of the reaction checked by TLC, the reaction mixture was filtered to remove salt (NaCl) and leaving the filtrate. The crude product was obtained from the filtrate using a rotary evaporator. The pure compound (Z)-dimethyl-5-(3-nitrobenzylidene)−2,4-dioxothiazolidin-3-yl phosphonate was obtained by column chromatography using ethyl acetate: *n*-hexane (3:2) as eluent. The same experimental protocol was used to synthesize the remaining title compounds 7b–j.

### Characterization of title compounds (7a–j)

*(Z)-dimethyl 5-(3-nitrobenzylidene)-2,4-dioxothiazolidin-3-ylphosphonate (7a).* Yield: 85%; Solid. mp: 234–236 °C; $^{1}$H NMR (DMSO-$d_6$) 8.43 (s, 1H, Ar-H), 8.12 (d, $J$ = 8.4 Hz, 1H, Ar-H), 7.73 (s, 1H, =C-H), 7.49 (d, $J$ = 8.4 Hz, 1H, Ar-H), 6.67 (t, $J$ = 8.0 Hz, 1H, Ar-H), 3.64 (s, 6H, O-$CH_3$); $^{13}$C NMR (DMSO-$d_6$) 118.2 (C-1), 165.4 (C-2), 164.1 (C-4), 51.5 (C-9, C-10), 142.8 (C-11), 135.5 (C-12), 133.8 (C-13), 128.7 (C-14), 123.8 (C-15), 145.9 (C-16), 123.4 (C-17); $^{31}$P NMR (DMSO-$d_6$) 22.4 ppm; IR (KBr) ($\nu_{max}$ cm$^{-1}$): 2922 (=C-H), 1743 (C = O), 1228 (P = O), 1017 (P-O-$C_{alip}$); LCMS (m/z, %): 359 (M + H$^+$, 100); For $C_{12}H_{11}N_2O_7PS$; calcd: C, 40.23; H, 3.09; N, 7.82; found: C, 40.29; H, 3.03; N, 7.89%.

*(Z)-dimethyl 5-(4-nitrobenzylidene)-2,4-dioxothiazolidin-3-ylphosphonate (7b).* Yield: 88%; Solid. mp: 212–214 °C; $^{1}$H NMR (DMSO-$d_6$) 8.14 (d, $J$ = 8.4 Hz, 2H, Ar-H), 8.01 (d, $J$ = 8.4 Hz, 2H, Ar-H), 7.73 (s, 1H, =C-H), 3.64 (s, 6H, O-$CH_3$); $^{13}$C NMR (DMSO-$d_6$) 118.2 (C-1), 165.4 (C-2), 164.1 (C-4), 51.5 (C-9, C-10), 142.8 (C-11), 140.5 (C-12), 129.5 (C-13, C-17), 124.3 (C-14, C-16), 145.6 (C-15); $^{31}$P NMR (DMSO-$d_6$) 22.0 ppm; IR (KBr) ($\nu_{max}$ cm$^{-1}$): 2922 (=C-H), 1741 (C = O), 1226 (P = O), 1016 (P-O-$C_{alip}$); LCMS (m/z, %): 359 (M + H$^+$, 100); For $C_{12}H_{11}N_2O_7PS$; calcd: C, 40.23; H, 3.09; N, 7.82; found: C, 40.32; H, 3.05; N, 7.90%.

*(Z)-dimethyl 5-(4-fluorobenzylidene)-2,4-dioxothiazolidin-3-ylphosphonate (7c).* Yield: 81%; Solid. mp: 203–204 °C; $^{1}$H NMR (DMSO-$d_6$) 7.87–7.25 (m, 4H, Ar-H), 7.73 (s, 1H, =C-H), 3.64 (s, 6H, O-$CH_3$); $^{13}$C NMR (DMSO-$d_6$) 118.2 (C-1), 165.4 (C-2), 164.1 (C-4), 51.5 (C-9, C-10), 142.8 (C-11), 131.2 (C-12), 131.7 (C-13, C-17), 116.6 (C-14, C-16), 161.4 (C-15); $^{31}$P NMR (DMSO-$d_6$) 21.2 ppm; IR (KBr) ($\nu_{max}$ cm$^{-1}$): 2918 (=C-H), 1727 (C = O), 1215 (P = O), 1015 (P-O-$C_{alip}$); LCMS (m/z, %): 332 (M + H$^+$, 100); For $C_{12}H_{11}FNO_5PS$; calcd: C, 43.51; H, 3.35; N, 4.23; found: 43.58; H, 3.29; N, 4.28%.

*(Z)-dimethyl 5-(4-chlorobenzylidene)-2,4-dioxothiazolidin-3-ylphosphonate (7d).* Yield: 87%; Solid. mp: 238–240 °C; $^{1}$H NMR (DMSO-$d_6$) 7.76–7.52 (m, 4H, Ar-H), 7.73 (s, 1H, =C-H), 3.64 (s, 6H, O-$CH_3$); $^{13}$C NMR (DMSO-$d_6$) 118.2 (C-1), 165.4 (C-2), 164.1 (C-4), 51.5 (C-9, C-10), 142.8 (C-11), 134.5 (C-12), 129.5 (C-13, C-17), 127.3 (C-14, C-16), 132.6 (C-15); $^{31}$P NMR (DMSO-$d_6$) 19.7 ppm; IR (KBr) ($\nu_{max}$ cm$^{-1}$): 2912 (=C-H), 1722 (C = O), 1211 (P = O), 1010 (P-O-$C_{alip}$); LCMS (m/z, %): 348 (M + H$^+$, 100); For $C_{12}H_{11}ClNO_5PS$; calcd: C, 41.45; H, 3.19; N, 4.03; found: C, 41.52; H, 3.13; N, 4.10%.

*(Z)-dimethyl 5-(2,4-dichlorobenzylidene)-2,4-dioxothiazolidin-3-ylphosphonate (7e).* Yield: 90%; Solid. mp: 246–248 °C; $^{1}$H NMR (DMSO-$d_6$) 7.73 (s, 1H, =C-H), 7.71 (d, $J$ = 8.0 Hz, 1H, Ar-H), 7.49 (s, 1H, Ar-H), 7.32 (d, $J$ = 7.6 Hz, 1H, Ar-H), 3.64 (s, 6H, O-$CH_3$); $^{13}$C NMR (DMSO-$d_6$) 118.2 (C-1), 165.4 (C-2), 164.1 (C-4), 51.5 (C-9, C-10), 142.8 (C-11), 132.4 (C-12), 131.7 (C-13), 127.9 (C-14), 126.7 (C-15), 129.3 (C-16), 135.3 (C-17); $^{31}$P NMR (DMSO-$d_6$) 20.5 ppm; IR (KBr) ($\nu_{max}$ cm$^{-1}$): 2915 (=C-H), 1726 (C = O), 1213 (P = O), 1016 (P-O-$C_{alip}$); LCMS (m/z, %): 382 (M + H$^+$, 100); For $C_{12}H_{10}Cl_2NO_5PS$; calcd: C, 37.71; H, 2.64; N, 3.67; found: C, 37.78; H, 2.60; N, 3.72%.

*(Z)-dimethyl 5-(3-chloro-4-fluorobenzylidene)-2,4-dioxothiazolidin-3-ylphosphonate (7f).* Yield: 92%; Solid. mp: 241–243 °C; $^{1}$H NMR (DMSO-$d_6$) 7.73 (s, 1H, =C-H), 7.71 (d, $J$ = 8.0 Hz, 1H, Ar-H), 7.45 (s, 1H, Ar-H), 7.25 (d, $J$ = 7.6 Hz, 1H, Ar-H), 3.64 (s, 6H, O-$CH_3$); $^{13}$C NMR (DMSO-$d_6$) 118.2 (C-1), 165.4 (C-2), 164.1 (C-4), 51.5 (C-9, C-10), 142.8 (C-11), 133.4 (C-12), 129.1 (C-13), 122.3 (C-14), 157.4 (C-15), 117.6 (C-16), 129.2 (C-17); $^{31}$P NMR (DMSO-$d_6$) 21.3 ppm; IR (KBr) ($\nu_{max}$ cm$^{-1}$): 2916 (=C-H), 1727 (C = O), 1216 (P = O), 1015 (P-O-$C_{alip}$); LCMS (m/z, %): 366 (M + H$^+$, 100); For $C_{12}H_{10}ClFNO_5PS$; calcd: C, 39.41; H, 2.76; N, 3.83; found: C, 39.47; H, 2.70; N, 3.89%.

*(Z)-dimethyl 5-(4-methoxybenzylidene)-2,4-dioxothiazolidin-3-ylphosphonate (7g).* Yield: 91%; Solid. mp: 228–230 °C; $^{1}$H NMR (DMSO-$d_6$) 7.73 (s, 1H, =C-H), 7.49 (d, $J$ = 8.0 Hz, 2H, Ar-H), 6.67 (d, $J$ = 8.0 Hz, 2H, Ar-H), 3.90 (s, 3H, O-$CH_3$), 3.64 (s, 6H, O-$CH_3$); $^{13}$C NMR (DMSO-$d_6$) 118.2 (C-1), 165.4 (C-2), 164.1 (C-4), 51.5 (C-9, C-10), 142.8 (C-11), 126.8 (C-12), 131.4 (C-13, C-17), 116.2 (C-14, C-16), 157.9 (C-15), 54.6 (C-18); $^{31}$P NMR (DMSO-$d_6$) 16.8 ppm; IR (KBr) ($\nu_{max}$ cm$^{-1}$): 2881 (=C-H), 1721 (C = O), 1226 (P = O), 1008 (P-O-$C_{alip}$); LCMS (m/z, %): 344 (M + H$^+$, 100); For $C_{13}H_{14}NO_6PS$; calcd: C, 45.48; H, 4.11; N, 4.08; found: C, 45.54; H, 4.05; N, 4.14%.

*(Z)-dimethyl 5-benzylidene-2,4-dioxothiazolidin-3-ylphosphonate (7h).* Yield: 85%; Solid. mp: 207–209 °C; $^{1}$H NMR (DMSO-$d_6$) 7.78–7.29 (m, 5H, Ar-H), 7.73 (s, 1H, =C-H), 3.64 (s, 6H, O-$CH_3$); $^{13}$C NMR (DMSO-$d_6$) 118.2 (C-1), 165.4 (C-2), 164.1 (C-4), 51.5 (C-9, C-10), 142.8 (C-11), 134.7 (C-12), 129.3 (C-13, C-17), 127.8 (C-14, C-16), 126.6 (C-15); $^{31}$P NMR (DMSO-$d_6$) 17.5 ppm; IR (KBr) ($\nu_{max}$ cm$^{-1}$): 2903 (=C-H), 1727 (C = O), 1210 (P = O), 1012 (P-O-$C_{alip}$); LCMS (m/z, %): 314 (M + H$^+$, 100); For $C_{12}H_{12}NO_5PS$; calcd: C, 46.01; H, 3.86; N, 4.47; found: C, 46.07; H, 3.80; N, 4.52%.

*(Z)-dimethyl 5-((6-methoxypyridin-2-yl)methylene)-2,4-dioxothiazolidin-3-ylphosphonate (7i).* Yield: 84%; Solid. mp: 253–255 °C; $^{1}$H NMR (DMSO-$d_6$) 7.73 (s, 1H, =C-H), 7.67 (t, $J$ = 7.6 Hz, 1H, Ar-H), 6.54 (d, $J$ = 7.6 Hz, 2H, Ar-H), 3.93 (s, 3H, O-$CH_3$), 3.64 (s, 6H, O-$CH_3$); $^{13}$C NMR (DMSO-$d_6$) 118.2 (C-1), 165.4 (C-2), 164.1 (C-4), 51.5 (C-9, C-10), 142.8 (C-11), 150.7 (C-12), 161.5 (C-14), 107.4 (C-15), 137.8 (C-16), 112.4 (C-17), 53.5 (C-18); $^{31}$P NMR (DMSO-$d_6$) 18.6 ppm; IR (KBr) ($\nu_{max}$ cm$^{-1}$): 2912 (=C-H), 1729 (C = O), 1218 (P = O), 1016 (P-O-$C_{alip}$); LCMS (m/z, %): 345 (M + H$^+$, 100); For $C_{12}H_{13}N_2O_6PS$; calcd: C, 41.86; H, 3.81; N, 8.14; found: C, 41.92; H, 3.75; N, 8.19%.

*(Z)-dimethyl 5-((5-methoxypyridin-2-yl)methylene)-2,4-dioxothiazolidin-3-ylphosphonate (7j).* Yield: 80%; Solid. mp:

221–223 °C; $^{1}$H NMR (DMSO-$d_6$) 8.17 (s, 1H, Ar-H), 7.73 (s, 1H, =C-H), 7.49 (d, $J$ = 8.4 Hz, 1H, Ar-H), 7.13 (d, $J$ = 8.4 Hz, 1H, Ar-H), 3.93 (s, 3H, O-$\underline{CH_3}$), 3.64 (s, 6H, O-$\underline{CH_3}$); $^{13}$C NMR (DMSO-$d_6$) 118.2 (C-1), 165.4 (C-2), 164.1 (C-4), 51.5 (C-9, C-10), 142.8 (C-11), 144.6 (C-12), 128.5 (C-14), 153.3 (C-15), 121.4 (C-16), 122.3 (C-17), 54.7 (C-18); $^{31}$P NMR (DMSO-$d_6$) 18.8 ppm; IR (KBr) ($\nu_{max}$ cm$^{-1}$): 2814 (=C-H), 1722 (C = O), 1222 (P = O), 1019 (P-O-C$_{alip}$); LCMS (m/z, %): 345 (M + H$^+$, 100); For $C_{12}H_{13}N_2O_6PS$; calcd: C, 41.86; H, 3.81; N, 8.14; found: C, 41.93; H, 3.77; N, 8.21%.

### *In silico molecular docking studies*

The structure of PPAR $\gamma$ (PDB: 5YCP) and the reference drug, Rosiglitazone (Pub Chem ID 77999) (Figure S14) was downloaded from the RCSB protein Data Bank and Pub Chem Database. The water molecules and hetero atoms were removed from the structures and were loaded into MOE working environment followed by protonation and energy minimization using MMFF94x force field at a cut off value of 0.05. Chem sketch Module has been used for structure drawing of the compounds; energy minimized was done with universal force field (UFF) and converted into pdb format as required for docking. Alpha triangle placement methodology was used for effective docking of all the title compounds and the poses are generated by superposition of triplets of receptor site points and ligand atom triplets. For each compound, 10 conformations were generated and they were refined and rescored. Interactions of the ligands with target protein were analyzed using PyMol Visualizer.[18]

### *α-Amylase inhibitory activity*

The α-amylase inhibitory activity had been executed employing standard procedure according to B. Nickavar and G. Amin (2011)[19] which was at first proposed by Patil *et al* with slight modifications.[20] (See Supplemental Materials for detailed procedure).

## Acknowledgment

Authors thanks to Dr. C. Naga Raju, Department of Chemistry, S. V. University, Tirupati for his constant support; Lila Impex pharmaceuticals, Vijayawada and HCU, Hyderabad for providing spectral data.

## Abstract

**Background:** The prevalence of diabetes in the world population hás reached 8.8 % and is expected to rise to 10.4% by 2040. Hence, there is an urgent need for the discovery of drugs against therapeutic targets to sojourn its prevalence. Previous studies proved that NF-κB serves as a central agent in the development of diabetic complications.

**Objectives:** This review intended to list the natural plant compounds that would act as inhibitors of NF-κB signalling in different organs under the diabetic condition with their possible mechanism of action.

**Methods:** Information on NF-κB, diabetes, natural products, and relation in between them, was gathered from scientific literature databases such as Pubmed, Medline, Google scholar, Science Direct, Springer, Wiley online library.

**Results and conclusion:** NF-κB plays a crucial role in the development of diabetic complications because of its link in the expression of genes that are responsible for organs damage such as kidney, brain, eye, liver, heart, muscle, endothelium, adipose tissue and pancreas by inflammation, apoptosis and oxidative stress. Activation of PPAR-α, SIRT3/1, and FXR through many cascades by plant compounds such as terpenoids, iridoids, flavonoids, alkaloids, phenols, tannins, carbohydrates, and phytocannabinoids recovers diabetic complications. These compounds also exhibit the prevention of NF-κB translocation into the nucleus by inhibiting NF-κB activators, such as VEGFR, RAGE and TLR4 receptors, which in turn, prevent the activation of many genes involved in tissue damage. Current knowledge on the treatment of diabetes by targeting NF-κB is limited, so future studies would enlighten accordingly.

**Keywords:** Diabetes; NF-κB; diabetic complications; hyperglycemia; inflammatory mediators; insulin resistance; natural products.

# Non-differentiable multi objective fractional minimax programming problem under $[F, \alpha, \rho, d]$-convex functions

**Dr. G Varalakshmi**
Department, of Statistics, D.K. Govt. College for Women (A), Nellore, Andhra Pradesh, India

**Abstract**
In this paper, we derive some theorems and duality theorems on non-differentiable Multiobject Fractional Minimax Programming Under $[F, \alpha, \rho, d]$ convex function.

**Keywords:** $[F, \alpha, \rho, d]$ convex function and Duality

## 1. Introduction

Minimax fractional problems appear in the formulation of discrete and continous rational approximation problems with respect to the Chebyshev Norm [3], in continuous rational games [12], in multiobjective programming [15], in engineering design as well as in some portfolio selection problems discussed by Bajona-Xandri and Martinez legaz [2].

Minimax mathematical programming has been of much interest in the recent past [1, 4, 5, 11, 13, 17, 18, 19]. Schmitendorf [11] established necessary and sufficient optimality conditions for minimax problem. Tanimoto [14] applied these optimality conditions to define a dual problem and derived duality theorms, which were extended for the fractional analogue of generalized minimax problem by Yadav and Mukherjee [18].

Motivated by various concepts of generalized convexity, Liang *et al*. [8, 9] introduced a unified formulation of generalized convexity, which was called $[F, \alpha, \rho, d]$- convexity and obtained some corresponding optimality conditions and duality results for the single objective practional problems and multiobjective problems. Recently, Liang and Shi [10] obtained sufficient conditions and duality theorems for minimax fractional problem under $[F, \alpha, \rho, d]$-convexity. Lia *et al*. [7] derived necessary and sufficient conditions for nondifferentiable minimax fractional problem with generalized convexity and applied these optimality conditions to construct one parametric dual model and also discussed duality theorems, Lai and Lee [6] obtained duality theorems for two parametric-free dual models of non-differentiable minimax fractional problem involving generalized convexity assumptions. Recently, Mishra *et al*. [12] established duality results for one parametric and two parametric-free dual models of nondifferentiable minimax fractional programming problem under generalized univexity.

But no serious attempt in utilizing multiobjective fractional minimiax under $[F, \alpha, \rho, d]$-convexity. Hence in this Paper an attempt is made to fill the gap in the aim of research by developing some theorems based on $[F, \alpha, \rho, d]$ convex function.

## 2. Formulation

We now consider the following non-differentiable minimax fractional programming problem.

### 2.1. Primal Problem

$$(FP)\quad \min_{x \in R^n} \sup_{y \in Y} \frac{f_i(x, y) + (x^t, Bx)^{\frac{1}{2}}}{h_i(x, y) - (x^t, Dx)^{\frac{1}{2}}},$$

$$\text{Subject to } g_j(x) \leq 0,\ x \in X,$$

Where Y is a compact subset of $R^m, f_i, h_i : R^n \times R^m \to R$ are $C^1$ on $R^n \times R^m$ and $g_j : R^n \to R^p$ is $C^1$ on $R^n$. B and D are nxn positive semidefinite matrices.

Let $S = \{x \in X : g(x) \leq 0\}$ denote the set of all feasible solutions of $(FP)$. For each $(x, y) \in R^n \times R^m$, we define

$$\phi(x, y) = \frac{f_i(x, y) + (x^t, Bx)^{\frac{1}{2}}}{h_i(x, y) - (x^t, Dx)^{\frac{1}{2}}},$$

Such that for each $(x, y) \in s \times Y, f_i(x, y) + (x^t, Bx)^{\frac{1}{2}} \geq 0$ and $h_i(x, y) - (x^t, Dx)^{\frac{1}{2}} > 0$. For each $x \in s,$ we define

$$J(x) = \left\{ j \in J \quad g_j(x) = 0 \right\}. \text{ where } J = \{1, 2, ..... p\}$$

$$Y(x) = \left\{ y \in Y : \frac{f_i(x, y) + (x^t, Bx)^{\frac{1}{2}}}{h_i(x, y) - (x^t, Dx)^{\frac{1}{2}}} = \sup_{z \in Y} \frac{f_i(x, z) + (x^t, Bx)^{\frac{1}{2}}}{h_i(x, z) - (x^t, Dx)^{\frac{1}{2}}} \right\},$$

$$k(x) = \left(s, t_i, \bar{y}\right) \in N \times R_+^s \times R^{ms} : 1 \leq s \leq n+1, t = (t_1, t_2 ..... t_s) \in R_+^s$$

$$\text{with } \sum_{i=1}^{s} t_i = 1, \ \bar{y} = (\bar{y}_1, \bar{y}_2 ..... \bar{y}_s) \text{ with } \bar{y}_i \in Y(x) \ (i = 1, 2, .... s)$$

Since f and h are continuously differentiable and Y is compact in $R^m$, it follows that for each $x^* \in s, y(x^*) \neq \phi$, and for any $\bar{y}_i \in Y(x^*)$, we have a positive constant

$$k_0 = \phi(x^*, \bar{y}_i) = \frac{f_i(x^*, \bar{y}_i) + (x^{*t}, Bx^*)^{\frac{1}{2}}}{h_i(x^*, \bar{y}_i) - (x^{*t}, Dx^*)^{\frac{1}{2}}}$$

We shall need the following generalized Schwartz inequality.
Let B be a positive semidefinite matrix of order n. Then for all $x, w \in R^n,$

$$x^t Bw \leq (x^t Bx)^{\frac{1}{2}} (w^t Bw)^{\frac{1}{2}} \tag{21.1.1}$$

We observe that equality holds if $Bx = \lambda Bw$ for some $\lambda \geq 0$. Evidently, if $(w^t Bw)^{\frac{1}{2}} \leq 1,$ we have $x^t Bw \leq \left(x^t Bw\right)^{\frac{1}{2}}$.

If the functions $f_i$, $g_i$ and $h_i$ in problem $(FP)$ are continuously differentiable with respect to $x \in R^n$.

**2.2. Dual Formulation**

$$(D) \qquad \max_{(s, t^*, \bar{y}) \in K(z)} \ \sup_{(z, \mu, v, w) \in H(s, t_i^*, \bar{y})} \frac{\sum_{i=1}^{s} t_i^* \left\{ f_i(z, \bar{y}_i) + z^t Bw \right\} + \sum_{j=1}^{p} \mu_j g_j(z)}{\sum_{i=1}^{s} t_i^* \left\{ h_i(z, \bar{y}_i) - z^t DV \right\}}$$

Where $H(s, t_i^*, \bar{y})$ denote the set of all $(z, \mu, v, w) \in R^n \times R_+^p \times R^n \times R^n$
Satisfying

$$\nabla \left( \frac{\sum_{i=1}^{s} t_i^* \left\{ f_i(z, \bar{y}_i) + z^t Bw \right\} + \sum_{j=1}^{p} \mu_j g_j(z)}{\sum_{i=1}^{s} t_i^* \left\{ h_i(z, \bar{y}_i) - z^t DV \right\}} \right) = 0$$

$$\begin{cases} w^t\, Bw \le 1, \quad (z^t\, Bz)^{\frac{1}{2}} = z^t\, Bw, \\ v^t\, Dv \le 1, \quad (z^t\, Dz)^{\frac{1}{2}} = z^t\, Dv \end{cases}$$

If the set $H(s, t^*, \bar{y})$ is empty, we define supremum over it to be $-\infty$. For convenience, we use the notation:

$$\psi(\square) = \left[\sum_{i=1}^{s} t_i^* \left\{h_i(z, \bar{y}_i) - z^t Dv\right\}\right]\left[\sum_{i=1}^{s} t_i^* \left\{f_i(\cdot, \bar{Y}_i) + (\cdot)^t, Bw\right\} + \sum_{j=1}^{p} \mu_j g_j(\cdot)\right]$$

$$-\left[\sum_{i=1}^{s} t_i^* \left\{f_i(z, \bar{y}_i) + z^t, Bw)\right\} + \sum_{j=1}^{p} \mu_j g_j(z)\right]\left[\sum_{i=1}^{s} t_i^* \left\{h_i(\cdot, \bar{Y}_i) - (\cdot)^t\, Dv\right\}\right]$$

Suppose that

$$\sum_{i=1}^{s} t_i^* \left\{f_i(z, \bar{y}_i) + z^t Bw\right\} + \sum_{j=1}^{p} \mu_j g_j(z) \ge 0 \quad \text{and} \quad \sum_{i=1}^{s} t_i^* \left\{h_i(z, \bar{y}_i) - z^t Dv\right\} > 0, \quad \text{For all } (s, t^*, \bar{y}) \in k(z),$$

$(z, \mu, w, v) \in H(s, t^*, \bar{y})$.

**3. Definition**

Let $R^n$ be the n-dimensional Euclidean space and X and open set in $R^n$.

**Definition (3.1):** A functional $F: X \times X \times R^n \to R$ is said to be sublinear if $\forall x, \bar{x} \in X$

(i) $F(x, \bar{x}; a_1 + a_2) \le F(x, \bar{x}; a_1) + F(x, \bar{x}; a_2)\ \forall\, a_1, a_2 \in R^n$

(ii) $F(x, \bar{x}; \beta a) = \beta F(x, \bar{x}; a)\ \forall \beta \in R_+$ And $\forall a \in R^n$.

By (ii) it is clear that $F(x, \bar{x}, 0) = 0$.

**Definition (3.2)**

[8, 9] given an open set $x \subset R^n$, a number $\rho \in R$, and two functions $\alpha: X \times X \times \to R_+ \setminus \{0\}$ and $d\left(\cdot, \cdot\right) X \times X \to R$, a differentiable function $\zeta$ over x is said to be $(F, \alpha, \rho, d)$ - convex at $\bar{x}$, if for any $x \in X$, $F: X \times X \times \to R^n \to R$ is sublinear, and $\zeta$ (x) satisfies the following condition.

$$\zeta(x) - \zeta(\bar{x}) \ge F\left(x, \bar{x}; \alpha(x, \bar{x}) \nabla \zeta(\bar{x})\right) + \rho d^2(x, \bar{x})$$

**Definition (3.3)**

Given an open set $x \subset R^n$, a number $\rho \in R$, and two functions $\alpha: X \times X \times \to R_+ \setminus \{0\}$ and $d\left(\cdot, \cdot\right) X \times X \to R$, a differentiable function $\zeta$ over x is said to be $(F, \alpha, \rho, d)$ -Pseudo convex at $\bar{x}$, if for any $x \in X$, there exists a sublinear functional $F: X \times X \times R^n \to R$ such that $\mu(x) < \mu(\bar{x}) \Rightarrow F\left(x, \bar{x}; \alpha(x, \bar{x}) \nabla G(\bar{x})\right) - \rho^2 d^2(x, \bar{x})$

Further $\mu$ is said to be strictly $F(\alpha, \rho, d)$ -Pseudo convext at $\bar{x}$ if for any $x \in X$, there exists a sublinear functional $FiX \times X \times R^n \to R$

Such that

$F\left(x, \bar{x}; \alpha(x, \bar{x}) \nabla \zeta(\bar{x})\right) \ge -\rho d^2(x, \bar{x}) \Rightarrow \zeta(x) > \zeta(\bar{x})$.

**4. Necessary optimality condition**

If $x^*$ is a solution of problem $(FP)$. Assuming $z_{\bar{y}}(x^*)$ to be empty, there exist $(s, t^*, \bar{y}) \in k(x^*)$, $w, v \in R^n$ and $\mu^* \in R_+^p$ satisfying

$$\nabla\left(\frac{\sum_{i=1}^{s} t_i^*\left\{f(x^*, \bar{y}_i)+x^{*t}Bw\right\}+\sum_{j=1}^{p}\mu_j^* g_j(x^*)}{\sum_{i=1}^{s} t_i^*\left\{h(x^*, \bar{y}_i)-x^{*t}DV\right\}}\right)=0$$

$$\sum_{j=1}^{p}\mu_j^* g_j(x^*)=0$$

$$t_i^* \in R_+^s \ (i=1, 2, ..... s), \ \sum_{i=1}^{s} t_i^* = 1$$

$$w^t\ Bw \le 1, \quad (x^{*t}\ Bx^*)^{\frac{1}{2}} = x^{*t}\ Bw,$$

$$v^t\ Dv \le 1, \quad (x^{*t}\ Dx^*)^{\frac{1}{2}} = x^{*t}\ Dv$$

**5. Duality Theorems**

**5.1. Theorem (Weak Duality):** Suppose that x and $(z, \mu, v, w, s, t, \bar{y})$ are respectively the feasible solution for $(FP)$ and (D). Also assume that $\psi(\square)$ is $[F, \alpha, \rho, d]$-Pseudo Convex at z and the inequality $\frac{\rho}{\alpha(x, z)} \ge 0$. Holds, then

$$\sup_{y\in Y} \frac{f_i\ (x, y)+(x^t, Bx)^{\frac{1}{2}}}{h_i\ (x, y_i)-(x^*, Dx)^{\frac{1}{2}}} \ge \frac{\sum_{i=1}^{s} t_i^*\left\{f_i\ (z, \bar{y}_i)+z^tBw\right\}+\sum_{j=1}^{p}\mu_j g_j(z)}{\sum_{i=1}^{s} t_i^*\left\{h_i\ (z, \bar{y}_i)-z^tDV\right\}}$$

**Proof:** By means of a contradiction, suppose that

$$\sup_{y\in Y} \frac{f_i\ (x, y)+(x^t\ Bx)^{\frac{1}{2}}}{h_i\ (x, y)-(x^t\ Dx)^{\frac{1}{2}}} < \frac{\sum_{i=1}^{s} t_i\left\{f_i\ (z, \bar{y}_i)+z^tBw\right\}+\sum_{j=1}^{p}\mu_j g_j(z)}{\sum_{i=1}^{s} t_i\left\{h_i\ (z, \bar{y}_i)-z^tDv\right\}}$$

For $y \in Y$. If we replace y by $\bar{y}_i$ in the above in equality and sum up after multiplying by $t_i$, then we have

$$\left[\sum_{i=1}^{s} t_i\left\{f_i\ (x, \bar{y}_i)+(x^t\ Bx)^{\frac{1}{2}}\right\}\right]\left[\sum_{i=1}^{s} t_i\left\{h_i\ (z, \bar{y}_i)-z^tDv\right\}\right]$$

$$<\left[\sum_{i=1}^{s} t_i\left\{f_i\ (z, \bar{y}_i)+z^tBw\right\}+\sum_{j=1}^{p}\mu_j g_i(z)\right]\left[\sum_{i=1}^{s} t_i\left\{h_i\ (x, \bar{y}_i)-(x^t\ Dx)^{\frac{1}{2}}\right\}\right]$$

Using the generalized Schwartz inequality and (2.2.2) we get

$$\phi(x) \le \left[\sum_{i=1}^{s} t_i\left\{h_i\ (z, \bar{y}_i)-z^tDv\right\}\right]\left[\sum_{i=1}^{s} t_i\left\{f_i\ (x, \bar{y}_i)+(x^t\ Bx)^{\frac{1}{2}}+\sum_{j=1}^{p}\mu_j g_j(x)\right\}\right]$$

$$-\left[\sum_{i=1}^{s} t_i\left\{f_i\ (z, \bar{y}_i)+z^tBw\right\}+\sum_{j=1}^{p}\mu_j g_j(x)\right]\left[\sum_{i=1}^{s} t_i\left\{h_i\ (x, \bar{y}_i)-(x^t\ Dx)^{\frac{1}{2}}\right\}\right]$$

$$<\sum_{j=1}^{p}\mu_j g_j(x)\sum_{i=1}^{s} t_i\left\{h_i\ (z, \bar{y}_i)-z^tDv\right\}$$

Since $\sum_{i=1}^{s} t_i \left\{ h_i(z, \bar{y}_i) - z^t Dv \right\} > 0 \ \sum_{j=1}^{p} \mu_j g_j(x) \le 0,$

It follows that $\psi(x) < 0 = \psi(z)$

As $\psi$ (.) is $(F, \alpha, \rho, d)$ - Pseudo Convex at z. Therefore $F\left(x, z; \alpha(x, z)\nabla\psi(z)\right) < -\rho d^2(x, z),$ that is

$$F(x, z; \alpha(x, z)\left[\sum_{i=1}^{s} t_i \left\{ h_i(z, \bar{y}_i) - z^t Dv \right\}\right] \nabla \left[\sum_{i=1}^{s} t_i \left\{ f_i(z, \bar{y}_i) + z^t Bw + \sum_{j=1}^{p} \mu_j g_j(z) \right\}\right]$$

$$-\left[\sum_{i=1}^{s} t_i \left\{ f_i(z, \bar{y}_i) \times z^t Bw \right\} + \sum_{j=1}^{p} \mu_j g_j(z)\right] \nabla \left[\sum_{i=1}^{s} t_i \left\{ h_i(z, \bar{y}_i) - z^t Dv \right\}\right] < -\rho d^2(x, z)$$

On multiplying the above inequality by

$$\frac{1}{\alpha(x, z)\left[\sum_{i=1}^{s} t_i \left\{ h_i(z, \bar{y}_i) - z^t\, Dv \right\}\right]^2}$$ and using the sublinearity of F, we have

$$F(x, z; \nabla \left( \frac{\sum_{i=1}^{s} t_i \left\{ f_i(z, \bar{y}_i) + z^t\, Bw \right\} + \sum_{j=1}^{p} \mu_j g_j(z)}{\sum_{i=1}^{s} t_i \left\{ h_i(z, \bar{y}_i) - z^t\, Dv \right\}} \right) < \frac{-\rho d^2(x, z)}{\alpha(x, z)\left[\sum_{i=1}^{s} t_i \left\{ h_i(z, \bar{y}_i) - z^t\, Dv \right\}\right]^2}$$

Using the fact that $\frac{\rho}{\alpha(x, z)} \ge 0,$

We have

$$F\left( x, z; \nabla \left( \frac{\sum_{i=1}^{s} t_i \left\{ f_i(z, \bar{y}_i) + z^t\, Bw \right\} + \sum_{j=1}^{p} \mu_j g_j(z)}{\sum_{i=1}^{s} t_i \left\{ h_i(z, \bar{y}_i) - z^t\, Dv \right\}} \right) \right) < 0 \qquad (5.1.1)$$

In the right of (2.2.1) in equality (5.1.1) contradicts F(x, z; 0) =0.

**Theorem (5.2) (Strong Duality)**

Suppose that $\bar{x}$ is optimal for $(FP)$ and $\nabla g_j(\bar{x}),\ j \in J(\bar{x})$ is linearly independent. Then there exist $(\bar{s}, \bar{t}, \bar{y}^*) \in k(\bar{x})$ and $(\bar{x}, \bar{\mu}, \bar{v}, \bar{w}) \in H(\bar{s}, \bar{t}, \bar{y}^*)$ such that $(\bar{x}, \bar{\mu}, \bar{v}, \bar{w}, \bar{s}, \bar{t}, \bar{y}^*)$ is feasible for (D).

Further, if the weak duality (theorem 5.1) holds for all feasible $(z, \mu, v, w, s, t, \bar{y})$ of (D), then $(\bar{x}, \bar{\mu}, \bar{v}, \bar{w}, \bar{s}, \bar{t}, \bar{y}^*)$ is optimal for (D) and the two objectives have the same extreme values.

**Proof:** Since $\bar{x}$ is optimal for $(FP)$ and $\nabla g_j(\bar{x}),\ j \in J(\bar{x})$ is linearly independent. Then by necessary condition there exist $(\bar{s}, \bar{t}, \bar{y}^*) \in k(\bar{x})$ and $(\bar{x}, \bar{\mu}, \bar{v}, \bar{w}) \in H(\bar{s}, \bar{t}, \bar{y}^*)$ such that $(\bar{x}, \bar{\mu}, \bar{v}, \bar{w}, \bar{s}, \bar{t}, \bar{y}^*)$ is feasible for (D) and the two objective values are equal. The optimality of $(\bar{x}, \bar{\mu}, \bar{v}, \bar{w}, \bar{s}, \bar{t}, \bar{y}^*)$ for $(FP)$ thus follows from weak duality (Theorem 5.1).

**Theorem (5.3) (Strict Converse Duality)**

Let $\bar{x}$ and $(\bar{z}, \bar{\mu}, \bar{v}, \bar{w}, \bar{s}, \bar{t}, \bar{y}^*)$ be optimal solutions for $(FP)$ and (D) respectively. Also suppose that $\psi$ (.) is strictly $[F, \alpha, \rho, d]$-Pseudo Convex at $\sum$, for all $(\bar{s}, \bar{t}, \bar{y}^*) \in k(\bar{x})$, $(\bar{z}, \bar{\mu}, \bar{w}, \bar{v}) \in H(\bar{s}, \bar{t}, \bar{y}^*)$, and the inequality $\frac{\rho}{\alpha(x, z)} \ge 0$ holds, and $\nabla g_j(\bar{x}),\ j \in J(\bar{x})$ is linearly independent. Then $\bar{z} = \bar{x};$ that is, $\bar{z}$ is optimal for $(FP)$.

**Proof:** We shall assume that $\bar{z} \neq \bar{x};$ and exhibit a contradiction. Since $(\bar{z}, \bar{\mu}, \bar{v}, \bar{w}, \bar{s}, \bar{t}, \bar{y}^*)$ is feasible for (D), it follows that

$$\nabla\left(\frac{\sum_{i=1}^{\bar{s}} \bar{t}_i \left\{f_i(\bar{z}, \bar{y}_i^*) + \bar{z}^t B\bar{w}\right\} + \sum_{j=1}^{p} \bar{\mu}_j g_j(\bar{z})}{\sum_{i=1}^{s} \bar{t}_i \left\{h_i(\bar{z}, \bar{y}_i^*) - \bar{z}^t D\bar{v}\right\}}\right) = 0$$

The above inequality along with the sublinearity of F and $\frac{\rho}{\alpha(\bar{x}, \bar{z})} \geq 0$

$$F(\bar{x}, \bar{z}; \nabla\left[\frac{\sum_{i=1}^{\bar{s}} \bar{t}_i \left\{f_i(\bar{z}, \bar{y}_i^*) + \bar{z}^t B\bar{w}\right\} + \sum_{j=1}^{p} \bar{\mu}_j g_j(\bar{z})}{\sum_{i=1}^{\bar{s}} \bar{t}_i \left\{h_i(\bar{z}, \bar{y}_i^*) - \bar{z}^t D\bar{v}\right\}}\right] = 0$$

$$\geq \frac{-\rho d^2(\bar{x}, \bar{z})}{\alpha(\bar{x}, \bar{z})}$$

Which together with the sublinearity of F and $\alpha(\bar{x}, \bar{z}) > 0$ yields

$$F\left(\bar{x}, \bar{z}; \alpha(\bar{x}, \bar{z})\right) \nabla \left[\frac{\sum_{i=1}^{\bar{s}} \bar{t}_i \left\{f_i(\bar{z}, \bar{y}_i^*) + \bar{z}^t B\bar{w}\right\} + \sum_{j=1}^{p} \bar{\mu}_j g_j(\bar{z})}{\sum_{i=1}^{\bar{s}} \bar{t}_i \left\{h_i(\bar{z}, \bar{y}_i^*) - \bar{z}^t D\bar{v}\right\}}\right] \geq -\rho d^2(\bar{x}, \bar{z})$$

Using strict $[F, \alpha, \rho, d]$- Pseudo convexity of $\psi(.)$, we obtain $\psi(\bar{x}) > \psi(\bar{z})$

Since $\psi(\bar{z})$ =0, then we have $\psi(\bar{x}) > 0,$ that is

$$\left[\sum_{i=1}^{\bar{s}} \bar{t}_i \left\{h_i(\bar{z}, \bar{y}_i^*) - \bar{z}^t D\bar{v}\right\}\right] \left[\sum_{i=1}^{\bar{s}} \bar{t}_i \left\{f_i(\bar{x}, \bar{y}_i^*) + (\bar{x}^t B\bar{w})\right\} + \sum_{j=1}^{p} \bar{\mu}_j g_j(\bar{x})\right]$$

$$> \left[\sum_{i=1}^{\bar{s}} \bar{t}_i \left\{f_i(\bar{z}, \bar{y}_i^*) + \bar{z}^t B\bar{w}\right\} + \sum_{j=1}^{p} \bar{\mu}_j g_j(\bar{z})\right] \left[\sum_{i=1}^{\bar{s}} \bar{t}_i \left\{f_i(\bar{z}, \bar{y}_i^*) + (\bar{z}^t B\bar{w})\right\} + \sum_{j=1}^{p} \bar{\mu}_j g_j(\bar{z})\right]$$

$$\left[\sum_{i=1}^{\bar{s}} \bar{t}_i \left\{h_i(\bar{x}, \bar{y}_i^*) - (\bar{x}^t D\bar{v})\right\}\right] \qquad (5.3.1)$$

The relations (2.1), (2.2.2), (5.3.1) and

$\sum_{j=1}^{p} \bar{\mu}_j g_j(\bar{x}) \leq 0$ Imply

$$\sup_{y \in Y} \frac{f_i(\bar{x}, y) + (\bar{x}^t \bar{B}x)^{\frac{1}{2}}}{h_i(\bar{x}, y) - (\bar{x}^t D\bar{x})^{\frac{1}{2}}} > \frac{\sum_{i=1}^{\bar{s}} \bar{t}_i \left\{f_i(\bar{z}, \bar{y}_i^*) + \bar{z}^t B\bar{w}\right\} + \sum_{j=1}^{p} \mu_j g_j(\bar{z})}{\sum_{i=1}^{s} \bar{t}_i \left\{h_i(\bar{z}, \bar{y}_i^*) - \bar{z}^t D\bar{v}\right\}} \qquad (5.3.2)$$

Since $\bar{x}$ is optimal for $(FP)$ and $g_j(\bar{x}), j \in J(\bar{x})$ is linearly independent, by strong duality (Theorem 5.2), there exist $(\bar{s}, \bar{t}, \bar{y}^*) \in k(\bar{x})$ and $(\bar{x}, \bar{\mu}, \bar{v}, \bar{w}) \in H(\bar{s}, \bar{t}, \bar{y}^*)$ such that $(\bar{x}, \bar{\mu}, \bar{v}, \bar{w}, \bar{s}, \bar{t}, \bar{y}^*)$ turns to be an optimal solution of (D) and

$$\sup_{y\in Y} \frac{f_i(\bar{x}, y) + (\bar{x}^t \bar{B}x)^{\frac{1}{2}}}{h_i(\bar{x}, y) - (\bar{x}^t D\bar{x})^{\frac{1}{2}}} = \frac{\sum_{i=1}^{\bar{s}} \bar{t}_i \left\{f_i(\bar{z}, \bar{y}_i^*) + \bar{z}^t B\bar{w}\right\} + \sum_{j=1}^{p} \bar{\mu}_j g_j(\bar{z})}{\sum_{i=1}^{\bar{s}} \bar{t}_i \left\{h_i(\bar{z}, \bar{y}_i^*) - \bar{z}^t D\bar{v}\right\}}$$

Which contradicts the fact of (5.3.2). Hence $\bar{x} = \bar{z}$.

# Vector convex functions for differentiable multiobjective fractional programming problem

**Dr. G Varalakshmi**
Statistics Lecturer in D.K. Govt. College, Nellore, Andhra Pradesh, India

**Abstract**
The concept of Differentiable multiobjective fractional programming problem under V-convex functions and some other classes of non linear Composite problems as a special case.

**Keywords:** V-convex functions, multiobjective fractional programming

## 1. Introduction

In the differentiable case, Jeyakumar and Mond [6] defined a vector invexity that avoids the major difficulty of verifying that the inequality holds for the same function $\eta$ for invex functions Jeyakumar and Mond [6] established sufficient optimality criteria under V-pseudo invexity and obtained duality results under these assumptions. Egudo & Hanson [3] used the concept of Zhao [7] to generalize, the concept of V-invexity of Jeyakumar and Mond [6] to the non smooth case by replacing the gradients with gradients of Clarke [2] V. Jeyakumar and Mond [6] defined on generalized convex mathematical programming. But they not consider this in multiobjective fractional programming problem. Hence, in this paper an attempt is mode to fill the gap in the aim of research we extended the concept of Differentiable multiobjective fractional programming problem under Vector convex functions and some other classes of non linear Composite problems as a special case.

## 2. Notations & Preliminaries

Consider constrained multiobjective fractional optimization problem.

$$\text{(VFP) V- Minimize } \left[\frac{f_i(x)}{g_i(x)},---,\frac{f_p(x)}{g_p(x)}\right]$$

Subject to $h_j(x) \le 0,\ j = 1,2.....,m$

Where $\frac{f_i}{g_i}: X_\circ \to R.$ and $h_j : X_\circ \to R^m$ are differential functions and $X_\circ$ is an open set in $R^n$. Here the symbol V-minimize stands for vector minimization. This is the problem of finding the set of weak minimum for points (VFP). When P=1, the problem (VPF) reduces to a Scalar optimization problem and it is denoted by (FP). Convexity of the Scalar problem (FP) is characterized by the inequalities.

$$\frac{f_i(x)}{g_i(x)} - \frac{f_i(a)}{g_i(a)} - \frac{f_i^{\,1}(a)}{g_i^{\,1}(a)}(x-a) \ge 0$$

$$h_j(x) - h_j(a) - h_j^{\,1}(x)(x-a) \ge 0 \forall x, a \in x_\circ.$$

The functional form $(x-a)$ here plays no role in establishing the following two well-known properties in scalar convex programming:
(s). Every feasible Kuhn - Tucker point is a global minimum
(w) weak duality holds between (FP) and its associated dual problem. Having this in mind, considered problem (FP) for which there exists a function $\eta : X_\circ * X_\circ \to R^n$ such that

$$\text{(I) } \frac{f_i(x)}{g_i(x)} - \frac{f_i(a)}{g_i(a)} - \frac{f_i^{\,1}(a)}{g_i^{\,1}(a)}\eta(x,a) \ge 0$$

$$h_j(x) - h_j(a) - h_j^{\,1}(a)\mu(x,a) \ge 0, \forall x, a \in x_\circ.$$

and showed that such problems (known now as invex problem) also. Possess properties (s) and (w). Since then, various generalization of conditions ( I ) to multiobjective problems and many properties of functions that satisfy ( I ) have been established in the literature. However, the major difficulty is that the invex problems require the same function $\eta(x,a)$ for the objective function and the constraints. This requirement turns out to be a severe restriction in applications. Because of this restriction, pseudo liner multiobjective, problems and certain non-linear multiobjective fractional programming problems require separate treatment as far as optimality and duality properties are concerned. In this chapter we show how this situation can be improved and how the properties (s) and (w) can be extended to hold for generalized convex multiobjective problems and certain multi- objective fraction problems. To this, we modify the condition (I) in the next section as follows:

## 3. New classes & generalized convex vector functions

A vector function $\frac{f_i}{g_i}: X_\circ \to R^p$ is said to be V-Convex if there exist functions $\mu : X_\circ * X_\circ \to R^p$ and $\alpha_i : X_\circ * X_\circ \to R_+ \setminus \{0\}$ such that for each $x, a \in X_\circ$, and for i=1,2,……,p,

$$\frac{f_i(x)}{g_i(x)}-\frac{f_i(a)}{g_i(a)}-\alpha(x,a)\frac{f_i^{1}(a)}{g_i^{1}(a)}(x-a)\geq 0,$$

When p=1, the definition of Vector Convexity reduces to the notion of convexity. The problem of (VPF) is said to be V-Convex if the vector function

$$\left(\frac{f_1}{g_2},\frac{f_2}{g_2}.....\frac{f_p}{g_p}\right)\&(h_1,h_2,.....,h_m)$$

is V- convex. Equivalently, Vector Convexity of (VFP) means that there exists function $\mu: X_\circ * X_\circ \to R^n$ and $\alpha_i,\beta_j: X_\circ * X_\circ \to R_+ \setminus\{0\},\quad i=1,2,...,p,\ j=1,2,..m$ such that

$$(VI)x,a\in X_\circ \Rightarrow \begin{cases}\dfrac{f_i(x)}{g_i(x)}-\dfrac{f_i(a)}{g_i(a)}-\alpha_i(x,a)\dfrac{f_i'(a)}{g_i'(a)}(x-a)\\ h_j(x)-h_j(a)-\beta_j(x,a)h_j'(a)(x-a)\end{cases}$$

Let $\alpha_i(x,a)=1=\beta_j(x,a),\ for\ i=1,2,...p,\ j=1,2,...,m$ and p=1, the scalar problem (FP) becomes the strongly pseudo convex programming problem.

**Example 2.2.1**

Consider the function $Z: R^n \to R^p$ defined by

$$Z(x)=\left(\frac{f_1}{g_1}(\varphi\varphi(x)),...,\frac{f_p}{g_p}(\varphi\varphi(x)\right)$$

where $\frac{f_i}{g_i}: R^n \to R, i=1,2,...,p$ are strongly pseudo-convex functions with real positive functions $\alpha_i(x,a),\varphi: R^n \to R^n$ is subjective with $\phi'(a)$ onto for each $a\in R^n$. Then, the function Z is V-convex. To see this, Let $x,a\in R^n$

$u=\phi(x), v=\phi(a),$ Then, by strong pseudo convexity,

$$\frac{f_i(\varphi\varphi(x)}{g_i(\varphi\varphi(x)}-\frac{f_i(\varphi\varphi(a)}{g_i(\varphi\varphi(a)}=\frac{f_i(u)}{g_i(u)}-\frac{f_i(v)}{g_i(v)}\geq\alpha_i(u,v)\frac{f_i'(u)}{g_i'(v)}(u-v)$$

Since $\phi'(a)$ is onto $(u-v)=\varphi'(a)(x-a)$ is solvable for some $(x-a)\in R^n$

Hence

$$\frac{f_i(\varphi\varphi(x)}{g_i(\varphi\varphi(x)}-\frac{f_i(\varphi\varphi(a)}{g_i(\varphi\varphi(a)}\geq\alpha_i(u,v)\frac{f_i'(v)}{g_i'(v)}\varphi(a)(x-a)$$

$$=\overline{\alpha_i}(x,a)(f_i.\phi)'(a)(x-a),$$

Where $\overline{\alpha_i}(x,a)=\alpha_i(\phi(x),\phi(a))>0.$

**Example 2.2**

Consider the composite vector function $Z(X)=\left(\frac{f_i(F_1(x)}{g_i(G_1(x)},...,\frac{f_p(F_p(x)}{g_p(G_p(x)}\right),$ where for each i=1,2,…,p. $\frac{F_i}{G_i}: X_\circ \to R$ is continuously differentiable and pseudo linear with the possible proportional function $\alpha_i(.,.)$ and $\frac{f_i}{g_i}: R\to R$ is convex. The Z is V- Convex with this follows from the following convex inequality and pseudo linear equality conditions.

$$f_i\left(\frac{F_i(x)}{G_i(x)}\right)-f_i\left(\frac{F_i(a)}{G_i(a)}\right)\geq f_i'\left(\frac{F_i(a)}{G_i(a)}\right)\left(\frac{F_i(x)}{G_i(x)}-\frac{F_i(a)}{G_i(a)}\right)$$

$$=f_i'\left(\frac{F_i(a)}{G_i(a)}\right)\alpha_i(x,a)\frac{F_i'(a)}{G_i'(a)}(x-a)\quad \text{for a simple}$$

numerical example of a composite vector function, consider

$$Z(x_1,x_2)=\left(e^{x_1/x_2},\frac{x_1-x_2}{x_1+x_2}\right),\text{Where}$$

$$X_\circ=\{(x_1,x_2)\in R^2/x_1\geq 1,x_2\geq 1\}.$$

We now show that the Vector Convexity is preserved under smooth convex transformation.

**4. Necessary Theorem**

**Theorem**: Let $\psi: R\to R$ be differentiable and convex with positive derivative everywhere. Let $P: X_\circ \to R^p$ be V-convex. Then, the function

$P_\psi(x)=(\psi(p,(x)),..\psi(h_p(x)),x\in X_\circ$ is V-Convex

**Proof:** Let $x,a\in X_\circ$, Then from the monotonicity of $\psi$ and Vector Convexity of P, we get

$$\psi(P_i(x))\geq\psi(P_i(a))+\alpha_i(x,a)P_i'(a)(x-a))\geq\psi(P_i(a))+\psi'(P_i(a))\alpha_i(x,a)P'(a)(x-a)$$

$$=\psi(P_i(a))+\alpha_i(x,a)(\psi.P_i)'(a)(x-a)$$

Thus, $P.\psi(x)$ is V-Convex the notations of pseudo-convexity and quasi-convexity for a scalar function can now be extended to a vector function. A vector function $\frac{f_i}{g_i}: X_\circ \to R^p$ is said to be V-pseudo convex if there exists functions $\mu: X_\circ * X_\circ \to R^p$ and $\beta_i: X_\circ * X_\circ$ such that for each $x,a\in X_\circ$,

$$\sum_{i=1}^{p}\frac{fi'(a)}{gi'(a)}(x-a)\geq 0\Rightarrow\sum_{i=1}^{p}\beta_i(x,a)\frac{f_i(x)}{g_i(x)}\geq\sum_{i=1}^{p}\beta_i(x,a)\frac{f_i(a)}{g_i(a)}$$

The vector function $\frac{f_i}{g_i}$ is said to be V-quasi-convex if there exists functions $\mu : X_\circ * X_\circ \to R^p$ and $\bar{r_i} : X_\circ * X_\circ \to R_+ \setminus \{0\}$ such that for each $x, a \in X_\circ$, $\sum_{i=1}^{p} \bar{r}_i(x,a)\frac{f_i(x)}{g_i(x)} \le \sum_{i=1}^{p} \bar{r}_i(x,a)\frac{f_i(a)}{g_i(a)}$ is inconsistent. Assume that $\sum_{i=1}^{p} \tau_i \frac{f_i'(a)}{g_i'(a)} = 0$, for some $0 \neq \tau \in R^p, \tau_i \ge 0$. Suppose that $a$ is not a weak minimum for $\frac{f_i}{g_i}$. Then there exists $x_\circ \in R^n$ such that $\frac{f_i(x_\circ)}{g_i(x_\circ)} \le \frac{f_i(a)}{g_i(a)}$, i=1, 2,…,p. Since $\frac{f_i}{g_i}$ is V-convex, there exist $\alpha_i(x_\circ, a), i = 1,2,..,p$

$$\frac{1}{\alpha_i(x_\circ, a)}\left(\frac{f_i(x_\circ)}{g_i(x_\circ)} - \frac{f_i(a)}{g_i(a)}\right) \ge \frac{f_i'(a)}{g_i'(a)}(x_\circ - a).$$

So, $\sum_{i=1}^{p}\left(\frac{\tau_i}{\alpha_i(x_\circ,a)}\right)\frac{f_i(x_\circ)}{g_i(x_\circ)} - \frac{f_i(a)}{g_i(a)} < 0$,

and hence $\sum_{i=1}^{p} \tau_i \frac{f_i'(a)}{g_i'(a)}(x_\circ - a) < 0.$ This is a contradiction.

## 5. Sufficiency theorem

Consider the multiobjective fractional problem (VFP). Suppose that the Lagrange multiplier conditions that $\sum_{i=1}^{p}\tau_i \frac{f_i'(a)}{g_i'(a)} + \sum_{j=1}^{m}\lambda_j h_j'(a) = 0, \lambda_j h_j(a) = 0, \tau \in R^p, \tau \neq 0, \tau \ge 0, \tau \in R^m, \lambda \ge 0$, hold at a feasible point $a \in X_\circ$. If $\left(\tau_1\frac{f_1}{g_1}, \tau_2\frac{f_2}{g_2}, ..., \tau_p\frac{f_p}{g_p}\right)$ is V-pseudo convex with respect to $\mu$ and $(\lambda_1 h_1, ....., \lambda_m h_m)$ is V-quasi convex with respect to $\mu$ then $a$ is a global weak minimum point for (VFP).

**Proof:-** Suppose that $a$ is not a global minimum point. Then there exists feasible $x_\circ \in X_\circ$ such that $\frac{f_i(x_\circ)}{g_i(x_\circ)} < \frac{f_i(a)}{g_i(a)}$, i=1, 2,.., p. So, $\sum_{i=1}^{p}\beta_i(x_\circ,a)\tau_i\frac{f_i(x_\circ)}{g_i(x_\circ)} < \sum_{i=1}^{p}\beta_i(x_\circ,a)\tau_i\frac{f_i(a)}{g_i(a)}$. Now by the V-pseudo convexity condition, we get $\sum_{i=1}^{p}\tau_i\frac{f_i'(a)}{g_i'(a)}\mu(x_\circ,a) < 0$. Since the Lagrangian condition holds at $a$, $\sum_{j=1}^{m}\lambda_j h_j'(a)\mu(x_\circ,a) > 0$ From the V-quasi-convexity condition, we get $\sum_{j=1}^{m}\bar{r_j}(x_\circ,a)\lambda_j h_j(x_\circ) > \sum_{j=1}^{m}\bar{r_j}(x_\circ,a)\lambda_j$ this is a contradiction, since $\lambda_j h_j(x_\circ) \le 0, \lambda_j h_j(a) = 0, and \bar{r_j}(x_\circ, a) > 0, \ for j = 1,2,...,m$

## 6. Duality

### Dual Formulation

V-maximize $\left(\frac{f_1}{g_1}(\xi), ....., \frac{f_p}{g_p}(\xi)\right)$,

(VFD) Subject to

$$\sum_{i=1}^{p}\tau_i\frac{f_i'}{g_i'}(\xi) + \sum_{j=1}^{m}\lambda_j h_j'(\xi) \ge 0, \lambda_j \ge 0, \tau_i \ge 0, \tau e = 1, \lambda_j h_j(\xi) \ge 0, \ j = 1,2,..,m.$$

Where e= (1, 1… 1). Note that the Lagrangian conditions in sufficiency theorem hold for (VFP) at a weak minimum point $a$ under a constraint qualification and they can equivalently be written as

$$\sum_{i=1}^{p}\tau_i\frac{f_i'(a)}{g_i'(a)} + \sum_{j=1}^{m}\lambda_j h_j'(a) = 0, \lambda \ \ge 0, \tau \ \ge 0, \tau e = 1, \lambda_j h_j(a) = 0, \ j = 1,2,.., \ m.$$

**Weak Duality Theorem:** Consider the multiobjective fractional problem (VFP) and (VFD). Let $x$ feasible for (VFP) and $(\xi, \tau, \lambda)$ be feasible for (VFD). If $\left(\tau_1\frac{f_1}{g_1}, \tau_2\frac{f_2}{g_2}, ..., \tau_p\frac{f_p}{g_p}\right)$ is V-pseudo convex and $(\lambda_1 h_1, ....., \lambda_m h_m)$ is V-quasi convex with respect to the same $\mu$, then

$$\left(\frac{f_1(x)}{g_1(x)}, ...., \frac{f_p(x)}{g_p(x)}\right)^T - \left(\frac{f_1(\xi\xi}{g_1(\xi\xi}, ...., \frac{f_p(\xi\xi}{g_p(\xi\xi}\right)^T \notin in + R^p{}_+ .$$

**Proof:** from the feasibility conditions, $\lambda_j h_j(x) - h_j h_j(\xi\xi \le 0$, for each j=1,2,..,m. Since $\bar{r_j}(x,\xi)$ is positive $\sum_{j=1}^{m}\bar{r}_j(x,\xi)[h_j(x) - h_j(\xi\xi] \le 0$. Hence, $\sum_{j=1}^{m}\lambda_j h_j'(\xi\xi\mu(x,\xi) \le 0,$ and so, $\sum_{i=1}^{p}\tau_i\frac{f_i'(\xi\xi}{g_i'(\xi\xi}\mu(x,\xi) \ge 0,$ the conclusion now follows from the V-pseudo convexity condition since $\tau e = 1$ and $\beta_i(x,\xi) > 0$.

### Theorem: Strong Duality Theorem

Assume that $a$ is a weak minimum of (VFP) and that a suitable constraint qualification is satisfied at $a$. Then there exist $(\tau, \lambda)$ such that $(a, \tau, \lambda)$ is a feasible for (FVD).

**Proof:** since $a$ is a weak minimum for (FVP) and a constraint qualification is satisfied at $a$, from the Lagrangian conditions, there exists $(\tau, \lambda)$ such that $(a, \tau, \lambda)$ is a feasible for (VFD). Clearly the values of (VFP) and (VFD) are equal at $a$, since the objective function for both problems are the same. By the generalized Vector Convexity hypothesis, weak duality holds, hence if $(a, \tau, \lambda)$ is not a weak optimum for

(VFD), there must exist $(\xi, \tau^*, \lambda^*)$ feasible for (VFD), $\xi \neq a$ such that

$$\left(\frac{f_1(\xi)}{g_1(\xi)},....,\frac{f_p(\xi)}{g_p(\xi)}\right)^T - \left(\frac{f_1(a)}{g_1(a)},....,\frac{f_p(a)}{g_p(a)}\right)^T \in in + R^p_+$$

Contradicting weak duality.

# చారిత్రక, వేద పురాణాల్లో చేనేత మూలాలు

- డా॥ గోపవరం పద్మప్రియ, ఆంధ్రోపన్యాసకురాలు, డి.కె.ప్రభుత్వ మహిళా డిగ్రీ కళాశాల, నెల్లూరు.

పడుగు, పేకల అల్లికల నైపుణ్యాలతో, అగ్గిపెట్టెలో పట్టే చీరలతో, 30 గజాల నేతతో ప్రపంచపటం మీద చేసిన కీర్తి సంతకం భారతదేశ చేనేత పరిశ్రమది. భారత దేశానికి వ్యవసాయం, చేనేతలు రెండు కళ్లు. ప్రపంచ చేనేత భాగస్వామ్యతలో 85 శాతం మనదే. 30 మిలియన్ల ప్రజలకు జీవనభృతి కల్పిస్తూ, భారతదేశపు వెన్నెముకగా చేనేత పరిశ్రమ గణతికెక్కినది. భారతదేశపు స్వాతంత్ర్య సంగ్రామపు రెపరెపల్లో మన రాట్నం విజయకేతనం ఎగ రేసింది. ఆ రాట్నాన్ని అశోక చక్రం కనుమరుగు చేసినట్లు, నేడు మరయంత్రపు చక్రాలు చేనేత కళను మసక బారుస్తు న్నాయి. దాన్ని ప్రాణప్రదంగా కాపాడుకుంటూ వస్తున్న నేతన్న బతుకు మాత్రం కొడగట్టి పోతున్న దీపమైనది. పడుగు, పేకలపై నాడి, కండెల్లా అల్లాడి పోతూ నేతను బతికించాలని చూసే నేతన్న చేనేత చరిత్ర ఈనాటిది కాదు. సహస్ర శతాబ్ధాల నాటిది. ఆ చరిత్ర పుటల్లో వేద పురాణాల్లో దాగిన ఆ చరిత్రను తెలుసుకోవడం మన బాధ్యత.

## చారిత్రక ఆధారాలు :

క్రీ.పూ. 5500 సం॥ పూర్వమే వస్త్రం కలదని, ప్రత్తి - నూలు - మగ్గం అనే వాటిని భారతదేశంలోకి వచ్చిన రెండవ తరంవారైన ఆస్ట్రిక్ జాతి వారు ప్రవేశ పెట్టినట్లు సునీల్ చటర్జీ (1953 అక్టోబర్‌లో అహమ్మదాబాద్‌లో జరిగిన ఆల్ ఇండియా ఓరియంటల్ కాన్ఫెరెన్స్) అభి ప్రాయపడ్డారు. వేదం కాలంలో మగ్గం పుట్టిందనే కొందరి విశ్వాసాన్ని 1921 సం॥ నాటి మొహంజదారో త్రవ్వకాలు తోసిపుచ్చాయి. ఇండియా ప్రభుత్వం ప్రకటించిన గ్రంధం "Mohanjedaro between 1927-31" లో

1) 431 పేజిలో పనిముట్ల వర్గంలో 55 నెం॥ గల ఎముకలలో చేయబడిన వస్తువును ఒక నేత పలకగా నిర్ధారణ చేశారు.
2) 1928 సం॥లో ప్రచురించిన టెక్నలాజికల్ బులెటన్ 3వ నెంబరు, సిరిస్ 'బి' ప్రకారం కొన్ని వెండి, రాగి వస్తువుల మడతల మధ్యనున్న నునిని గుడ్డ ముక్కగా ఇండియన్ సెంట్రల్ కమిటీ తేల్చింది.
3) దొరికిన నూలు ముక్కల్లో ఒకటి 34 నెంబరుదని, ఇంచికి 60 పోగులు పడుగు, 20 పోగులు పేకలు కలవని, కొన్ని జములు పోగులు కనిపించాయని వివరించింది.

## వస్త్రం - నేత :

వస్త్రం ముందా? నేతముందా? అంటే నేత భావనే ముందనేది పరిశోధకుల అభిప్రాయం. "క్షేత్ర గణితం" ఆధారంగా బుట్టలల్లిక ప్రారంభమై క్రమంగా ఆ అల్లిక వస్త్రంలోకి ప్రవేశించింది. వస్త్రం కంటే ముందే నేత కలదన డానికి ఆధారాలున్నాయి

1) బోర్నియా అడవుల్లో కోయవారు నార గుడ్డలు అల్లి వస్త్రాలు కట్టుకునేవారు.
2) అలాగే ఉత్తర కెనడాలో ఇండియనులనబడేవారు కుందేటి వెంట్రుకలతో చారల కంబళ్లు నేటికి చేస్తున్నారు.
3) మెడిటేరియన్స్ రంగు నార ప్రాంతంలో నారపోగు పడుగును పై నుండి క్రిందకి రాళ్లతో వ్రేలాడగట్టి పేక పోగులను నేస్తారు. ప్రతి శిల్కు లభించే ప్రాంతాల్లో పడుగును నేల మీద పరచి నేస్తారు. ఈ విధానమే మగ్గాల ఉత్పత్తికి పునాదైనది.

చేనేత పరిశ్రమ ప్రాచీనతను తెలిపే ఆధారాలు చరిత్రలోనే కాదు మనకు సాహిత్యంలోను కన్పిస్తాయి.

## సాహిత్యాధారాలు :

సాహిత్యం నాగరిక సామాజిక, సాంస్కృతిక లక్షణం. సమాజ దర్పణం, సమాజ లక్షణాల్ని పొందు పరచడం

Scanned with CamScanner

దాని లక్షణం. చేనేత, మూలపురుషుడు మొ॥ అంశాలు ప్రథమ సాహిత్యం నుంచి మనకు కన్పిస్తూనే ఉన్నాయి.

**ఋగ్వేదం :**

గుణత్రయాత్మకం యజ్ఞసూత్రం బ్రాహ్మణ్య హేతుకం
దేవలేన పురాదత్తం దేవతాభ్యశ్చవాజ్ఞయా॥

(త్రిగుణ స్వరూపమైన యజ్ఞోపవీతము బ్రాహ్మణ్యానికి కారణభూతమైనది. పూర్వం పరమశివుని ఆజ్ఞానుసారం దేవలుని చేత అవి దేవతలకు ఈయబడ్డది)

**సామవేదం :**

మనసా వాచా వదంతి సత్యం దేవాంగం దేవతా యజ్ఞా భుజం, యజ్ఞకర్తారం, యజ్ఞరూపం, విశ్వస్పభర్తారం గోప్పారం, హర్తారం తస్యరూపమే వైతత్సర్యం సూత్ర కర్తార మహు ప్రజా పతిస్తప సాతప్త్యా దేవాంగ మబ్రువత్.

(దేవతలందరు దేవాంగుని గురించి మనస్సులోను, తమ మాటల్లోను యజ్ఞభోక్త, యజ్ఞ స్వరూపులు, యజ్ఞాధికారం, సమస్త విశ్వానికి అధినాధులు, రక్షకుడు, లయకర్త ఈ సమస్తము దేవల రూపమేననే సత్యాన్ని చెప్పున్నారు. ఇతడే యజ్ఞసూత్రకర్తని చెప్పున్నారు. దేవలుడు గూర్చి తపస్సు చేసి ఈ లోకాన్ని ఎలా సృష్టించాలో బ్రహ్మదేవుడు ప్రార్థించెను)

**యజుర్వేదం :**

సర్వేషాం మానరక్షార్థం, వస్త్రం కర్తుం తథాపరా నిర్గుణో నిరహంకారో, నిర్వికల్పావ్యవహం శకాగుణత్రయేణ సంయుక్తావ్యాభకం దేహ సంయుత: తతో దేవాంగ నామ్నాహం ప్రసిద్ధి మ భజం పురాసత్యాం రేన మయా సృష్టా మద్యం శియా మహోయెశా: తదా ప్రభృతి దేవాంగ బ్రాహ్మణ ఇత భూతరే ప్రతీతిం ప్రాప్య వర్తంతి వస్త్ర సూత్ర ప్రహేతవ: అప్రాకృత ద్విజా ఏతే సర్వలోక ప్రపూజితా:

(ప్రపంచ ఉత్పత్తికి పూర్వమే నేను నిర్గుణుడను, నిర్వికల్పుడను, నిరహంకారుడును. లోక సృష్టి జరిగిన పిమ్మట భూమి యందలి ప్రాకృత బ్రాహ్మణులకు, క్షత్రియులకు, వైశ్యులకు నియమితమైన వైదిక కర్మల యందు అధికార సిద్ధి కల్గిజాలిన యజ్ఞోపవీతమును నిర్మించుట కొరకు)

ఋగ్వేద కాలంలో దేవతలకు యజ్ఞోపవీతం నిర్మించిన దేవలుడు, యజుర్వేద కాలం నాటికి దేవతలతో పాటు భూమిపై గల బ్రాహ్మణ, క్షత్రియ, వైశ్యులకు యజ్ఞోపవీత నిర్మాణానికి ఉద్భవించినట్లు చెప్పబడినది.

**బ్రహ్మాండ పురాణం :**

దేవౌ ధాతృవిధారతౌ భృగో: ఖ్యాతి రసూయత।
శ్రియంచ దేవదేవస్య పత్నీర్నాయణస్య యా॥ అయతిర్ని
యతిశ్చైవ మేరో: కన్యామహాత్మన:। భార్యే ధాతృవిధాత్రో
స్తేతయో ర్జాతౌ సుతా పుభౌ॥ ప్రాణుశ్చైవ మృకండు శ్చ
వియమహమహాయశా:। మనస్విన్యా మహం తస్మా త్పుత్రో
వేదశిరా మయ॥ ధూమ్రవత్యాం సమభవత్ ప్రాణ స్యావి
నిబోధ మే। ప్రాణస్య ద్యుతిమాన్ పుత్ర స్తూత్పన్నస్య
నిజాత్మజ:। అజరా శ్చ తయో: పౌత్రాశ్చ బహవో భవన్॥

(భృగుమహర్షికి ఖ్యాతి యను భార్యయందు నారాయణుని పత్నియగు శ్రీయును, ధాత విధాతలును జన్మించిరి. ఆ ధాతవిధాతలు మేరుపుత్రిక లగు ఆయతిని, యతిని బెండ్లి యాడిరి. విధాతకు ప్రాణుడును. ధాతకు మృకండుడును, వానికి మనస్విని (మరుద్వతి) యందు నేనును (మార్కండేయుడు), నాకు ధూమ్రవతియందు వేదశిరుడును (భావనముని) ఇట్లు వారికి పుత్రులు, పౌత్రులు పలువురు గలిగిరి) (అనుషంగ పాదము 11వ అధ్యాయము)

ప్రాణు శ్చైవ మృకండుశ్చ బ్రహ్మకోశో సనాతన:।
మనస్విన్యా మృకండన్య మార్కండేయా భభూవహ॥ సుతో
వేదశిరా స్తస్య ధూమ్రవత్యా మజాయత। పీవర్యాం
వేదశిరస: పుత్రా వంశకరా శ్శతం॥ మార్కండేయ సమా
ఖ్యాత ఋషయో వేదపారగా:॥

(భృగువంశజుం దగు ప్రాణుని తమ్ముడు మృకండునకు మనస్విని యందు మార్కండేయుడు జనించెను. అతనికి పీవరి (భద్రావతి) యందు వేదపారంగతులగు మార్కండేయులను (పద్మశాలి) పేరుగల నూర్వురు కుమారులు గలిగిరి)

Scanned with CamScanner

**భారత, భాగవతాలు :**

భారత, భాగవతాల్లో దేవాంగ కుల మూల పురుషుడైన దేవలుని ప్రస్తావన అనేక సంచర్భాల్లో కన్పిస్తుంది.

1. సర్పయాగక్రతువు కోసం వివిధ విధులు నిర్వహించడానికి నియమించబడిన ఋత్విజులలో 'దేవలుడు' ఒకడు (ఆ.ప. ద్వి.ఆ. 208), 2. సత్యవతిని, అసితవంశానికి చెందిన వాడుగా దేవలుని ప్రస్తావన కలదు. (ఆ.ప.ద్వి.ఆ.వ. 208)
2. అష్టసుడు గంధర్వుడిలో ఏ వ్యక్తిని పురోహితునిగా స్వీకరించాలో చెప్పమనగా దేవలుని తోబుట్టువైన ధౌమ్యుడని పురోహితునిగా స్వీకరించమని వివరించెను (ఆ.ప., స.ఆ.ఏ. 158).
3. భాగవత చతుర్థస్కంధము, ప్రథమ అధ్యాయం, విష్ణు పురాణాలు ప్రథమాంశంలో 10వ అధ్యాయంలో మార్కండేయ పురణాం వివరించబడింది.

**కుల పురాణాలు :**

ప్రతికులానికి చరిత్ర ఉన్నట్లే చేనేతనాశ్రయించిన దేవాంగ, పద్మశాలీల చరిత్రను తెలిపే కుల పురాణాలు లభ్యమవుతున్నాయి. చేనేత మూల పురుషుడుగా దేవాంగ పురాణం, దేవల మనుబ్రహ్మగాను, పద్మశాలీ పురాణం భావన మహర్షిని చేనేత ప్రతిపాదించాయి.

**దేవాగం పురాణం :**

వ్యాస మహర్షి రచించిన బ్రహ్మాండ పురాణంలో బ్రహ్మ నారద సంవాదాత్మకమైన 29 అధ్యాయాల వృత్తాంతం చేనేతకుల మూల పురుషుడికి సంబంధించినది. అది అనంతర కాలంలో మృగమై పోయింది. కర్ణాటక లిపిలో బాదరాయణము నుండి గ్రహించిన దేవల చరిత్రను 1914లో పింజల సోమశేఖర శర్మ దేవాంగ పురాణంగా రచించారు. తర్వాత ఇది అనేక ప్రక్రియల్లో, అనేక రూపాలలో వివిధ రచయితలచే రచించబడింది.

**సారాంశం :**

బ్రహ్మ స్థావర, జంగమాత్మకాలైన 14 లోకాల సృష్టి అనంతరం స్త్రీ, పురుషుల మానరక్షణావశ్యకతలో బ్రహ్మ తన అశక్యతను గుర్తించి శివుడని ఆశ్రయించెను. శాశ్వతానందంలో ఉన్న పూర్వకల్ప వస్త్రప్రదాతైన మనువును తన ఫాలనేత్రమునించి సృష్టించెను. తన జన్మ కారణాన్ని కోరగా విష్ణువు సహాయంతో దేవ, మానవ, రాక్షస దేహ రక్షణకై వస్త్ర సృష్టి కావించమనెను. వస్త్ర నిర్మాణానికి భూమండంలోని ఆమోద పట్టణాన్ని అనువైనదిగా గుర్తించి తన కార్యక్రమం నిర్విఘ్నంగా సాగుటకై పార్వతీ దేవిని ప్రార్థించగా ఆమె నుంచి చక్రాన్ని, అనుగ్రహాన్ని పొంది, సువార్ణశ్రమం చేసి విష్ణువుకై తపస్సు చేరి విష్ణువు నాభి నుంచి అక్షయం కాని తంతువులను పొందెను. తనకు పొంచి వున్న ఆపదను గుర్తించి విష్ణువు తన చక్రము నుంచి మరొక చక్రాన్ని సృష్టించి ఇచ్చెను.

దేవలుడు సువర్ణాశ్రమమును వీడి లవణ సముద్ర తీర ప్రాంతంలోని మాయాశ్రమంలో కపటముని వద్ద విశ్రమించెను. వారిని మాయా రాక్షసులుగా గుర్తించి వారిపై విష్ణు చక్రాన్ని ప్రయోగించి రాక్షస సంహారం చేసెను. కాని ఆ సైన్యంలో 1) వజ్రముష్టి, 2) ద్రుమాక్షి, 3) ద్రుమాన్త, 4) చిత్రసేన, 5) వంచ సేనలు మాకుమ్మడిగా దాడిచేసారు. పార్వతి దేవిని ప్రార్థించగా ఆమె చౌడీశ్వరీ దేవిగా అవతరించి వారిని అంతమొందించెను. ఆ జగన్మాత ఆదేశాను సారం అసిత, శ్రోణిత, హరిత, నీల, పేత వర్ణాలలో ఉన్న ఆ రాక్షసుల రక్తంలో దేవలుడు తంతువులను ముంచెను అని చిత్ర వర్ణాలలో మారి పోయాయి. దేవలుడు ఆమోద పట్టణం చేరి ఆ తంతువు సహాయంతో దేవ మానవులను నస్త్ర సృష్టించగా వించెను.

**పద్మశాలి పురాణం :**

పద్మపురాణము సృష్టిఖండము 33 అధ్యాయము. స్కాందపురాణము నాగరఖండము 21వ అధ్యాయము, చతురశీతిలింగమహత్వఖండము 36వ అధ్యాయము, బ్రహ్మవైవర్తపురాణము ప్రకృతిఖండము 154వ అధ్యాయము, మత్స్య పురాణము 166వ అధ్యాయము, నారదీయపురాణము, 4, 5 అధ్యాయములు, భాగవత పురాణము, ద్వాదశస్కంధము 8వ అధ్యాయములలో

Scanned with CamScanner

మార్కండేయ పురాణము కొద్ది భేదాలతో వర్ణింపబడి యున్నది.

పద్మశాలీ వంశస్తుల మూల పురుషుడు భావనా మహర్షి - మార్కండేయుని కుమారుడు. మార్కండేయుని యజ్ఞము నుంచి పంచవటి, భావన ఋషి జన్మించారు. వీరిని భావనారాయణుడు, పద్మశాలి అని దేవతలు ధీవించారు. పంచవటి, భావనారాయణులను విద్యాభ్యాసం కొరకు నారదుని వెంట మార్కండేయ దంపతులు పంపించారు. వీరు మహావిష్ణువును దర్శించుకోగా, జనులందరు అర్ధనగ్నులుగా తిరుగుతున్నారని వారి మాన రక్షణకు వస్త్రాలు తయారుచేయమని విష్ణుమూర్తి తన నాభి కమలం నుండి సన్నని తంతువులను ఇచ్చి వాటితో పట్టునూలు తయారుచేసి పడుగు, పేకలను ఏర్పరచి సమస్త లోక జనులకు మానరక్షకుడివై వుండి, "నా అంశవైన ఓ! పద్మశాలి నీ కీర్తి ఆచంద్రార్కము నిలిచి వుంటుందని", శ్రీ మహావిష్ణువు దీవించాడు. పంచవటి తపస్సు కొరకై వెళ్ళిపోగా భావనా మహర్షి వాటిని తీసుకొని వస్త్ర నిర్మాణ విద్యను శివుడు వద్ద నేర్చుకొని భూలోకానికి బయలుదేరాడు. భావనాఋషి తెచ్చే పద్మ తంతువులను నాశనం చేయమని కాలువాసురడు మూలకాసురుడ్ని పంపిస్తాడు. భావనఋషిని అడ్డగించి అతనిపై యుద్ధం చేసి పద్మ తంతువులను మింగివేస్తాడు. వాటిని మింగి వేయగానే భావనాఋషి రుద్రరూపుడై మూలకాసురుడి సైన్యాన్ని ఓడించి మూలకాసురుడి ఉదరము చీల్చి పద్మ తంతువులను బయటకు తీస్తాడు. ఆ పద్మ తంతువులు పంచవర్ణములుగా బయట పడినవి. ఆ కారణంగా నేడు ఇన్ని రంగులుగా వస్త్రములు ఉండుటకు కారణం అదియే. భావనాఋషి మూలకాసురుని శల్యాన్ని మగ్గంగా, వాని వెన్నుపూసను 'దోనె'గా, రెండు కొమ్ములను 'నాడెలుగా", నరాలను తాళ్ళుగా చేసుకొని వస్త్ర నిర్మాణానికి కావలసిన పనిముట్లను తయారు చేసుకొన్నాడు.

వీటి సహాయంతో వస్త్ర నిర్మాణం చేసి తన తల్లిదండ్రులైన మార్కండేయునికి, దాక్షవతికి ఇవ్వగా పద్మతంతువులు ఇచ్చిన శ్రీ మహావిష్ణువుకి ప్రసాదించమని తల్లిదండ్రులుసలహా ఇస్తారు. వారి సలహా మేరకు శ్రీ మహా విష్ణువునికి పీతాంబరాలు బహుకరించగా, వాటిలో పసుపు వర్ణం కలిగిన వాటిని తీసుకొని ప్రేమతో ధరించాడు. శ్రీమహాలక్ష్మికి పుష్పములు గులాబి వర్ణం కలిగిన పట్టు వస్త్రాలను ఇచ్చాడు. అప్పుడుఆమె ఓ మహర్షి నీ కళా కౌశలం అద్భుతం నీ ఆడపడుచుగా నాకు ఆయనం లభించింది కాబట్టి ఈ రోజు నుండి మీరు పద్మశాలీలుగా పేరు పొందుతారని దీవించింది. భావనాఋషి సూర్యుడి కుమార్తె ఆయన బద్రావతిని వివాహం చేసుకొని కాలువాసురిడిని చంపి ఆ రాజ్యన్నికైవసం చేసుకొని, అందులో పద్మ భీజములను భూమిపై చల్లి వాటి నుంచి ప్రకాశవంతమైన పత్తిని ఉత్పత్తి చేసి దానిని దారాలుగా చేసి రకరకాలరంగులతో వస్త్రోత్పత్తి చేస్తు 101 మంది పుత్రులతో జీవించసాగారు. ఇలా మార్కండేయ గోత్ర నామంతో, యజుశాఖతో, భృగు సూత్రముతో పద్మశాలీ వంశం వర్ధిల్లినది.

## చేనేతకుల తెగలు :

భారతదేశంలో దాదాపు 29 చేనేత కుల తెగలు కలవు. 1)పద్మశాలి 2)దేవాంగ 3)జాండ్ర 4)పట్టుశాలి 5)సాలి 6)స్వకులశాలి 7)కురిమిసెట్టిశాలి 8)సేనాపతులు 9)కైకాల 10)కర్ణభక్తులు 11)తొగటశాలీలు 12)తొగట వీరక్షత్రియ 13)కరికాల భక్తులు 14)సాధనాశూరులు 15)అచ్చుకట్లవాళ్లు 16)దూదేకుల 17)కురి 18)ఖత్రి 19)నీలి 20)నీలకంఠ 21)కోష్టి 22)నక్కల 23)పట్కార్ 24)కైకోలన్ 25)సెంగుండు 26)సెంగుతర్ 27)సాలివన్ 28)సెస్సి మొదలైన చేనేత ఉపకులాలుగా భారతదేశా అంతటా వ్యాపించి యుండగా ఇందులో మొదటి 18 దక్షిణ భారతదేశంలో ఉన్నాయని గుర్తించడమైనది.

ఇందులో ప్రధానంగా దేవాంగ, పద్మశాలీలు విశిష్టులుగా చెప్పుకుంటారు. ఒకరికంటె ఒకరు గొప్ప అనేభావన ఆయా కులాలను కదిలించి సంభాషించినప్పుడు తెలుస్తుంది. సాహిత్యపరమైన ఆదారాలు, ఈ రెండు కూలాలకే కన్పిస్తాయి. దేవాంగులైతే రాజ్యపాలనలోను భాగ స్వామ్యత వహించినట్లు ఆనవాళ్లు కలవు. వీరిజాతి

Scanned with CamScanner

జనకుడైన దేవల మహర్షి సంప్రదాయాన్ని అనుసరిస్తూ వస్త్ర, గాయత్రీ, సూత్రోద్యోగాలు కావిస్తూ రాచరిక మర్యాదలను పాటించే వారని, తమిళనాట వడవీటిని పాలించే వారని భద్రగవి, లింగకవులు తమ ద్విపద పురాణంలో రాశారు. హరిహరరాయలు, బుక్క రాయలు, శ్రీ కృష్ణ దేవరాయల కాలంలో వీరు సామంతులుగా ఉన్నారని, దానికి నిదర్శనంగా ప్రతి సంవత్సరం ఆషాడ అమావాస్య నాడు చూడాంబికకు షోడషోపచారాలు నిర్వహించి చౌడేశ్వరీ దేవి జ్యోతిర్మహోత్సవం జరుపుతారు. వీర సైనిక లక్షణానికి గుర్తుగా నేటికి ఖడ్గసాధన, రక్తతర్పణ చేయడం జరుగుతోంది. పద్మశాలి కుల పురాణం ప్రసిద్ధి కెక్కింది.

# దేవాంగుల వరప్రదాయని - చౌడేశ్వరీ దేవి

- డా॥ గోపవరం పద్మప్రియ, శాఖాధిపతి, తెలుగు విభాగం, డి.కె.ప్రభుత్వ మహిళా డిగ్రీ కళాశాల, నెల్లూరు.

"ఆర్యావర్త : పుణ్యభూమిర్మధ్యం విన్ధహిమగయో: నీ వృజ్జన పదౌ దేశ విషయౌ తూపవర్తనమ్" అని అమరం. జనపద సంబంధమైనది జానపదం. జానపదమంటే పల్లెటూరు. పల్లె, దేశం, రాజ్యం, చోటు అనేవి నైఘంటి కార్థాలు. జానపదాల్లో ఉండేవారు జానపదులు. కొన్ని సమాన లక్షణాలు గల జన సముదాయమూ జానపదమే. ఆధునిక జానపద విజ్ఞాన శాస్త్రవేత్తలు జానపదానికి నూతన దృక్పథాన్ని ప్రతిపాదించారు. నివాస స్థలాలు అప్రధానమై సంస్కృతి ప్రధాన భూమిక వహించింది. ప్రపంచమంతా 'సంస్కృతి' మూలాంశంగా జానపద విజ్ఞానం బయలుదేరింది. సాహిత్యం, సంస్కృతి, ఆచార సంప్రదాయాలు, కళలు, చేతివృత్తులు మొదలయినవి ఇందులో భాగమయ్యాయి.

ఈ విశాలమయిన జానపద విజ్ఞానంలో చేనేతవృత్తికి ప్రాచీనమైన, ప్రధానమైన భాగస్వామ్యం కలదు. భారత దేశంలో వ్యవసాయం తరువాత అతిపెద్ద వృత్తి చేనేత. దీని ఔన్నత్యాన్ని తెలిపే సామెతలూ జనవ్యవహారంలో కలవు.

"కదురు, కవ్వంబులు గలయాడునింట కరువు కాట కములు కలికాన లేవు"

"అందచందములేని ఆడకూతురుకు అందమేరు పరచు ఆ పత్తిచెట్టు"

ఇలా చేనేత ప్రాధాన్యత విస్తారమైనది. దీనిని ఆశ్ర యించి దాదాపు 29 తెగలవాళ్ళు జీవిస్తున్నారు వారిలో ప్రముఖమైన కులం దేవాంగ పద్మశాలి.

దేవాంగ పురాణంలో చేనేతకుల ఆవిర్భావం, వారు కొలిచే చౌడేశ్వరి దేవి మహాత్మ్యము వర్ణించబడింది. ఈ సృష్టి ఏర్పడిన ప్రారంభ దినాల్లో దేవతలు, మానవాది సమస్తదేవతలు తమ మానములకు ఎలాంటి ఆచ్ఛాదన లేకపోవుటచే సిగ్గుచెంది ఆకులు, చెట్టుబెరడులు, జంతు చర్మాలతో కప్పుకొనుచుండిరి. వీటితో విసుగు చెందిన వారు బ్రహ్మదగ్గరకు వెళ్లి తమ దీనావస్థను విన్నవించు కున్నారు. తమ మానములను కాపాడుకొనుటకు వస్త్రకారుని సృష్టించమని బ్రహ్మదేవుడిని వేడుకున్నారు. అప్పుడు బ్రహ్మదేవుడు వీరితో కైలాసానికి వెళ్ళి ఓ సదా శివా! నీ ఆజ్ఞ ప్రకారము నాకు ఇచ్చిన శక్తి సామర్థ్యముల మేర జగత్‌సృష్టిని గావించాను. కాని వస్త్రము సృష్టిచేయు శక్తి సామర్థ్యాలు తమరు నాకు ఇవ్వలేదు. పూర్వ కల్పమందు వస్త్ర నిర్మాత నీయందు సాయుజ్యమై వున్నాడు, అతడిని తిరిగి సృష్టించమని ప్రార్థించగా, అప్పుడు సదాశివుడు కొద్దిసేపు ధ్యాననిమగ్నుడైనాడు. అప్పుడు ఆ సదాశివుని సద్యోజాత ముఖమునందలి ఫాల నేత్రము నుండి ఒక దివ్యతేజస్సు వెలుపలికి వచ్చి ఒక పురుషాకారముగా ఆవిర్భవించింది. ఆ దేవతల సమక్షంలో వారికి 'దేవల' అని నామకరణం చేశాడు. అనగా దేవతలచే లాలింపబడినవడా! అని ; దేవాంగ: అంటే దేవతల యొక్క అంగవస్త్రములు చేసినవాడు అగుట వలన దేవాంగుడుగా, నా మానసపుత్రుడుగా ప్రసిద్ధి చెందుతాడు అని ఆశీర్వదించాడు.

### పరమేశ్వరుడు వస్త్రములు నిర్మించి అందరికి ప్రదానము చేయమని దేవల మను బ్రహ్మను ఆజ్ఞా పించుట :

శివుడు దేవల మునితో క్షీరసాగరమునకు వెళ్ళి అచ్చటవున్న శ్రీమన్నారాయణుడిని దర్శించి తంతువులను గ్రహించి శీఘ్రముగా ఆమోద పట్టణానికి వెళ్ళి ఆ పట్టణానికి పాలకుడిగా వుంటూ వస్త్రాలు నిర్మించి సకల దేవతలకు, సకల జాతుల వారికి వస్త్రములు ఇచ్చి పది దిక్కుల యందు నీ కీర్తిని వ్యాపింపచేయి. నీకు జన్మించిన నీ వంశమువారు ఉత్తములు, సంస్కారవంతులు, దైవ బ్రాహ్మణ భక్తిగలవారు, యుక్తాయుక్త విచక్షణ జ్ఞానము

Scanned with CamScanner

కలవాయగా ప్రసిద్ధికెక్కుతారని దీవించాడు. దేవలుడు అచిరిధంగా ఆమోద పట్టణానికి బయలుదేరాడు.

**పంచరాక్షసులు దేవలుడిని మోసగించి చంప బూనుట :**

తంతువులను తీసుకొని ఆమోద పట్టణానికి బయలు దేరగా ఈ విషయం తెలుసుకున్న కొందరు రాక్షసులు ఆ తంతువులను దొంగలించి వస్త్ర నిర్మాణం ఆపుటకు తంతువులను దొంగలించుటకు మాయా మునీశ్వరుడి వేషం ధరించి మాయా ఆశ్రమాన్ని సృష్టించి దేవలుడిని ఆకర్షించేటట్లు చేశారు. ఆ మాయా ఆశ్రమాన్ని చూసి ముగ్ధుడై లోపలికి ప్రవేశించాడు. అక్కడ కపటమంత్రాలు జపిస్తున్న ఒక వృద్ధ మునీశ్వరుడు కనిపించాడు. దేవలుడి పట్ల వినయ విధేయతలు చూపిస్తూ అతిథిగా ఆనాటి రాత్రి అక్కడే బస చేయమని వేడుకున్నారు. వారి మాటలు నమ్మి అక్కడే నిద్రించాడు. హఠాత్తుగా అర్ధరాత్రి వారి వేషాలు తొలగించి వజ్రముష్టి, ధూమవ్యక్తులు, ధూమ్రాస్యుడు, చిత్రసేనుడు, పంచసేనుడు అను వీరు తమ నిజరూపాలలో దేవలుడిని చంపడానికి ప్రయత్నిస్తారు. దేవలుడు విష్ణువు నుండి పొందిన సుదర్శన చక్రాన్ని ప్రయోగిస్తాడు. అది ఆ అయిదుగురిని తప్ప మిగతా వారిని చంపుతుంది. ఆ రాక్షసులలో పెనుగులాడి ఏమీ చేయలేక మహాదేవిని స్మరించాడు.

**మహాదేవి ఆవిర్భావము :**

అప్పుడు శివుని పత్ని అర్ధనారీశ్వరి యగు దుర్గా దేవిని - జగజ్జనని, త్రిలోక మాతవు, దుర్గవు, చండివి, ... ఇలా స్తుతిస్తూ కాపాడమని ప్రార్థించాడు. ఆయన ప్రార్థనను మన్నించి నాయనా దేవలా! భయపడకుము ఒక ముహూర్తము (24 నిమిషాలు) లోపల నా బలము నీవు తెలుసుకోగలము నా శూలంచే వారిని సంహరిస్తాను, వారి రక్తం త్రాగుతాను అని అభయమిచ్చింది. ఆషాడమాస అమావాస్య అర్ధరాత్రి అంత్య సమయంలో ఆవిర్భవించింది.

**మహాదేవి పంచ రాక్షసులలో యుద్ధం చేయుట:**

నాలుగు భుజములు కలిగి అతిపెద్దదైన నాలుకను చాచి కన్నులు అగ్నిగుండం వలె ఎరుపెక్కినవై మహాబలం గల ఆ మహాదేవి అట్టహాసం చేస్తూ శూలమును, చక్రమును, కత్తిని, గదను చేతబట్టి భయంకరమైన ఆయుధాలు కల్గి, కాటుకవలె నల్లగా మెరిసిపోవుచు కోటి సూర్య వెలుగులు గల ఒక శక్తివంతమైన కిరీటాన్ని శిరస్సుపై ధరించి మిక్కిలి బలవంతురాలై శూలాన్ని త్రిప్పుచూ వారితో పోరుకు సిద్ధమైనది. రాక్షసులు ఆయుధాలు సమకూర్చుకున్నారు. కాని ఆ తల్లి హూంకారానికి రాక్షసులంతా మూర్చిల్లినారు. ఆమె శూలాన్ని గిరగిరా త్రిప్పుతూ గదా, ఖడ్గ, చక్రములనే నాలుగాయుధాలలో పెక్కుమంది రాక్షసులను చంపింది. తనచేతి శూలముతో పంచరాక్షసులను చంపింది.

ఆ పంచ రాక్షసుల రక్తం ఎరుపు, తెలుపు, నలుపు, పసుపు పచ్చరంగుల్లో ప్రవహించింది. వెంటనే దేవలుడు తన వద్దనున్న ఒక్కొక్క తంతువులను ఒక్కొక్క రంగు రక్తంలో తడిపి తన వద్దనున్న తంతువులు పంచ వర్ణాలయ్యేటట్లు చేసుకున్నాడు.

**పంచరాక్షసుల రక్తము ఐదురంగుల్లో ప్రవహించుటకు కారణం :**

ఒకానొకప్పుడు 5గురు రాక్షసులు శుక్రాచార్యుని వద్దకు విద్యనిమిత్తమై వచ్చారు. వారు దేవయాని అందానికి ముగ్ధులై ఆమె వద్దకు వెళ్లి మా ఐదుగురి వివాహ మాడమని కోరారు. ఆమె మిక్కిలి వ్యధ చెంది గురుపుత్రి సోదరితో సమానం ఆడదంటే మీ దృష్టిలో అంతచులకనా? మీరు ఏదో ఒక సందర్భంలో ఆడదానిచేతిలో మరణిస్తారని శపించి అక్కడనుంచి వెళ్ళిపోయింది. వారు ఈ శాప నివృత్తి కొరకు బలపరాక్రమాల కొరకు శివునిపై తపస్సు

Scanned with CamScanner

చేశారు. పరమేశ్వరుడు ప్రత్యక్షమై వరం కోరు కోమనగా మా రక్తాన్ని ప్రజలు ధరించాలని పరమేశ్వరుడు కోరారు. తథాస్తు అని వరమిచ్చాడు. అందువల్లనే వారి రక్తాలు వివిధ రంగుల్లో ప్రవహించాయి. వాటిల్లో దేవ లుడు తంతువులు ముంచి ఆ దారాలతో నేసిన వస్త్రాలు ప్రజలు ధరిస్తున్నారు.

## మహాదేవికి చౌడేశ్వరి అనునామం ఏర్పడడం :

పంచరాక్షసులలో యుద్ధం చేయడానికి వచ్చిన ఆ మహాదేవి కిరీటం కోటిసూర్యుల ప్రకాశంతో వెదజల్లినది. ఆ కిరీట కాంతులకు వెలుగులకు రాక్షసరాజులు స్తంభించిపోయారు. అటువంటి శక్తివంతమైన చూడ మును ధరించుట వలన చూడేశ్వరి, చూడాంబా అని పిలువబడింది కాలక్రమంలో అది చౌడేశ్వరి అయింది. దేవలుడు అతని సంతతి వారైన దేవాంగ వంశీయు లందరు తమ కులదేవతగా చౌడేశ్వరీదేవిని కొలుస్తూ వస్తున్నారు.

## చౌడేశ్వరీ పూజావిధానం :

చౌడేశ్వరీ దేవికి దేవాంగులు దసరా పండుగ దినాల్లో ఆమెను ఒక శక్తి స్వరూపిణిగా భావించి పూజిస్తారు. ఆ దేవతా ప్రతిమను చేసి రోజుకో అలంకారంతో అలంకరించి ప్రతిపూట నైవేద్యం సమర్పిస్తారు. దసరా రోజున కత్తి వేయడం కూడా ఈ కులములో ఆచారంగా కన్పిస్తుంది. పులివాహనం బొమ్మగీసి దానిపై అన్నపురాసి పోసి రక్త తర్పణ గావించి కత్తిపట్టుకొని ఆమెను దండకాలతో స్తుతిస్తారు. ఆ తరువాత కత్తివేసుకొని ఆ ప్రతిమను ఊరంతా ఊరేగిస్తారు. ప్రతినిత్యం ఆ పండుగదినాల్లో కత్తిపట్టుకొని, దండకంతో స్తుతిస్తూ నైవేద్యం సమర్పిస్తారు. దాన్నే 'తళియ' అంటారు. ఆ నైవేధ్యాన్ని ప్రతి దేవాంగుల ఇంటికి పంచుతారు. ఇలా చౌడేశ్వరీ దేవి దేవాంగుకుల రక్షకురాలిగా, వరాలమూటగా ప్రసిద్ధికెక్కినది.

ఈనాడు మనం అనుభవిస్తున్నసాంఘీక, సాహిత్య స్వేచ్ఛ వెనుక మనమూహించలేనంత ఉద్యమ నేపధ్యం కన్పిస్తుంది .సాంఘీక దురాచారాల నిర్మూలనకు ,స్త్రీవికాసం కొరకు రాజా రామ్మోహన్ రాయ్, కందుకూరి వీరేశలింగం లాంటివారు ఎంత పోరాటం చేయవలసి వచ్చిందో ,అంతే పోరాటాన్ని మాట్లాడే భాష ,రాసే భాష ఒకే విధంగా ఉండడానికీ చేయాల్సి వచ్చింది .ఈనాడు వ్యవహారిక భాషోద్యమం గురించి ప్రస్తావిస్తే నేటి తరానికి హాస్యాస్పదంగానే ఉంటుంది . కాలమిచ్చిన తీర్పు వల్ల నేడు కొన్ని వందల పేజీలు మనం మాట్లాడే భాషలోనే అచ్చవుతు ప్రజల మధ్యకు వస్తున్నాయి .

కాని పూర్వం మాట్లాడే భాష వేరుగా , రాసే భాష వేరుగా చెలామణి అవుతూ వచ్చింది.అయితే ఈ భేదం పట్ల పూర్వం మనకంత నిరసన భావం కూడా లేదు .భారతదేశం లో సార్వత్రిక విద్యా విధానం అమలు లోకి వచ్చిన తర్వాత పరిస్థితుల్లో మార్పులొచ్చాయి .1852సంII లో మద్రాసు ,బొంబాయి, కలకత్తాల్లో విశ్వ విద్యాలయాలు ఏర్పాటు చేశారు.వాటిలో చదువుకొన్నవారు దేశంలో విద్యావ్యాప్తికి కృషి చేస్తారని తలచారు. అయితే ఆంగ్లం లో చదువుకోవడం వల్ల దేసబాషల అభివృద్ధికి వీరు తగిననత కృషి చేయలేదనే చెప్పవచ్చు.1901లోగవర్నర్ జనరల్ గా ఉన్న లార్డ్ కర్జన్ సిమ్లాలో ఒక సమావేశం ఏర్పాటు చేసి ప్రాథమిక స్థాయి నుంచి విశ్వవిద్యాలయ స్థాయి వరకు పరిష్కరించవలసిన సమస్యల గురించి చర్చించి 150 తీర్మానాలను చేశారు. దానిలో భాగంగా మాతృభాషలో వ్యాసరచనలను నిర్బంధపాఠ్యాంశంగా ప్రవేశపెట్టాలని అలాగే ఇంగ్లీషు లోని పుస్తకాలను ప్రాంతీయ బాషల్లోకి అనువదించేటప్పుడు వారికి శిక్షణ కల్పించాలనినిర్ణయించారు ఇలాంటి తరుణంలో1906 సంవత్సరంలో J.A ఏట్స్ గంజాం ,విశాఖ ,గోదావరి జిల్లాలకు పరీక్షా అధికారిగా నియమించబడ్డాడు ఇతనికి తెలుగు బాగా ఒంట బట్టింది .ఆయన మన పుస్తకాల్లో ఉన్న తెలుగుకి, ఆ పుస్తకాలను బోధించే అధ్యాపకులు మాట్లాడే తెలుగు మధ్య భేదాన్ని గుర్తించి ఆయన ఆశ్చర్యపోయారు.ఈ విషయం గురించి కళాశాల అధ్యక్షులైన టి. శ్రీనివాస అయ్యంగారు ని ఈ విషయమై ప్రస్తావించగా విజయనగరం లో ఉన్న గురజాడ వెంకటమిడి లోని గిడుగు రామ్మూర్తి పంతులు తనకంటే బాగా చెప్పగలరని సూచించాడు. ఏట్స్ వాళ్ళిద్దరిని సంప్రదించి చర్చించి ఈ వ్యవహారిక,గ్రాంధిక బాషా బేధాల వ్యత్యాసాన్ని తగ్గించడానికి ఉపాధ్యాయ వార్షిక సమావేశాలు ఏర్పాటు చేసి గిడుగు చేత ఉపన్యాసాలిప్పించాడు. ఇది పండితులందరికి కంట్లో కారం అయింది. ఈ సమయంలోనే స్కూల్ ఫైనల్ పరీక్ష F.A స్థానంలో ఇంటర్మీడియట్ వచ్చింది. అప్పుడు విద్యార్థులు ఎంచుకోవలసిన అనువాద అంశాలు,

Scanned with CamScanner

వ్యాసాలకు పరిచయించి దగడ పెంచుతుంది. ఈ సందర్భంలో V.I లెనిన్‌గారు Language like as Deathఅని వ్యాఖ్యాన్ని ప్రచురించారు. ఈ విధమైన పరిణామాలు వెలిసి ఉద్యమంలో వ్యవహారిక భాష నిరంతరంగా ఒక ఉద్యమాన్ని లేవదీశారు.

ఈ గడిచిదను గమనించి మద్రాసులోనిహైకోర్టులు 1911లో పెద్దలను ఒక ఒక సంఘాన్నిఏర్పాటు చేసింది.ఇందులో 9 మందిసభ్యులు ఉన్నారు. ఇందులో ఆరుగురు ఆంగ్లేయులు కాగా మిగతా వారులు, నలుగురు వ్యవహారిక భాష వాదులు ఒకరు గ్రాంథిక వాదులు వీరు అనేక చర్చలు సమావేశాలు జరిపిన తరువాత గిడుగు రామ్మూర్తి పంతులుని Memorandum of Modern Telugu గురజాడ Deccan పుణ్యాన శిష్ట వ్యవహారిక భాషలోనే రచనలు సాగించాలని సిద్ధపరిచి ఇచ్చారు. కాని గ్రాంథిక వాదులు వ్యవహారిక వాదాన్ని ఎదుర్కోడానికి ఆంధ్ర సాహిత్య పరిషత్తు ఏర్పాటు చేశారు. శిష్ట వ్యవహారాన్ని గ్రామ్యమని ఊరూరాసభలు జరిపి సంతకాలు సేకరిస్తూ వచ్చారు. మొత్తమ్మీదను చీరాలలోనే గ్రాంథిక ఏలుబడి చెల్లుతూ వచ్చింది. క్రమంగా ఉత్తరోత్తరా వచన రచనల్లో వ్యవహారిక భాష ప్రాధాన్యం పెరుగుతూ వచ్చింది .క్రమక్రమంగా కాల ప్రవాహంలోఅన్ని రంగాల్లోనూ వ్యవహారిక భాష పేరొందుకుంది దీనికి ప్రధాన కారకులు గిడుగు, గురజాడలు. గిడుగు సిద్ధాంతవాది అయితే గురజాడ అచరణ వాది. గిడుగు భాషా సంస్కరణకు, కందుకూరి సంఘ సంస్కరణకు తన సాహిత్యం లో ప్రతిపాదిక చేసి అడుగడుగు ప్రోత్సాహకుడు అయ్యాడు. గురజాడ సహాయంతో సహాయంతో గిడుగురామ్మూర్తి పంతులు భాషా సంస్కరణకు తన జీవితాన్ని ధారపోసాడు.పూర్వరచనలన్నీ శిష్టవ్యవహారికం లోనికిపోగినాయని, మధ్యలోనే భాష కృతకంగా మారిపోయిందని భావించిన గిడుగు రామ్మూర్తి పంతులు ఆ విషయాన్ని నిరూపించడానికి వ్యవహారిక భాషను పూర్ణ ప్రాచ్య చేయడానికి కినాలుగు మార్గాలను అనుసరించారు.

1. భాషా తత్వాన్నివివరిస్తూ ప్రపంచంలోని ఇతర భాషావాఙ్మయమంతాలౌకిక భాషలోనే పొందని అలాగే తెలుగు భాషలో కూడా ఆయాకవులు ఆనాటి శిష్టవ్యవహారికాన్ని కావ్యాల్లో ప్రయోగిస్తూ వచ్చారని కాల పరిణామంలో మధ్యలో తెలుగు పరిస్థితి మారిందని ఇతని అభిప్రాయం. ఆ విషయాన్ని ఉదాహరణ పూర్వకంగా నిరూపించారు

2. తాళపత్ర గ్రంథాల్లోనూ, గ్రంథ పరిష్కారాల్లోనూ లౌకికభాష స్థానంలో గ్రాంథిక భాషను వచ్చారని భావించి లక్ష్య సహితంగా నిరూపించారు.

3. గ్రాంథిక భాషను నిర్వచించడం, స్వరూపాన్ని నిరూపించడం కష్టమని తేల్చి చెప్పాడు. భాషా స్వరూపాన్ని వర్ణించే వ్యాకరణ గ్రంథాలే పరస్పర విరుద్ధ భావాల్ని వ్యక్తం చేస్తున్నాయి. ఒక వ్యాకరణం ఒక పదాన్ని గ్రామ్యంగా పేర్కొంటే మరొక వ్యాకర్త దాన్ని గ్రామ్యం కాదంటారు. వారికి వారే ఏది తప్పో ఏది ఒప్పో సమగ్రంగా చెప్పలేకపోతున్నారు. గ్రాంథిక భాషలో మాత్రమే రాసిన గ్రంథం మన్యుకి ఒక్కటి కూడాఉండదని గిడుగు అభిప్రాయం ఇది ఇతని మూడో మార్గం.

Scanned with CamScanner

4. ప్రాచీన కవులు అన్నికావ్యాల్ని సమగ్రంగా పరిశీలించక పోవడం వల్ల వ్యాకరణ కర్తలు,నిఘంటు కారులు ,పండితులు తప్పుగా భావించి లక్షణ విరుద్ధమని,గ్రామ్యాలని నిందించిన రూపాలు వందలకొద్ది కావ్యాల్లో కలవని నిరూపిందారు . వ్యాకరణం ప్రయోగ మూలం కావడంవల్ల కవి ప్రయోగం లక్షణం కంటే బలవత్తర మైనది. కవులు ప్రయోగించిన రూపాలు ఆ లక్షణంతో సమన్వయం కాకపోతే ఆ లక్షణమే అసమగ్రమవుతుంది ,అంతే కాని ఆ కవి ప్రయోగాలు నిందాలు, గ్రామ్యాలు కావని అలాంటి ప్రయోగాలు వందల కొద్ది కావ్యాల్లో కలవని చూపించడం నాలుగోమార్గం. అందుకే "ఆర్యవ్యవహారంబుల దృష్టంబు గ్రాహ్యంబు" (బా.వ్యా-సం.ప 23) అంటారు బాలవ్యాకరణం లో చినయసూరి.

ఈనాలుగు మార్గాలను ఉదాహరణ సహితంగా నిరూపించడానికి గిడుగు రామ్మూర్తిపంతులుగారు 4 గ్రంథాలు రాశారు.

1.వ్యాసావళి

2.గద్యచింతామణి

3.ఆంధ్రపండిత భిషక్కుల భాషాభేషజం

4.బాలకవిశరణ్యం

ప్రస్తుత వ్యాసం నాలుగో మార్గాన్ని నిరూపించే బాలకవిశరణ్యాన్నిచర్చించడం ప్రధాన లక్ష్యం వ్యాకరణాల్లో ఇలాంటి పరిస్థితి సెలకొనడానికి ప్రధాన కారణం ఆ మూలాగ్రం వాఙ్మయాన్ని చదవక పోవడమే కారణం అంటాడు. ప్రధానంగా ఈ గ్రంథంలోబాల వ్యాకరణ సూత్రాలు చెప్పిన రూపాలను తీసుకొని వాటిని ని సాధు నిరూపణ చేయడానికి పూనుకున్నాడు .సాహిత్యంలో ఉపయోగించిన శబ్దాలను అసాధువులని చెప్పడం తప్పని ఇతని అభిప్రాయం. జనవ్యవహారంలో లేని దానిని కవి ప్రయోగించడు కొన్ని గ్రంథాలను ప్రమాణాలుగా తీసుకుని ఇవి సాధువులు , అసాధువులని, నిందాలని పేర్కొనడం తగదని ఇతని అభిప్రాయం.

వాఙ్మయమంటెల్లజుచినవారలెవరు?
బాస యెల్లను బండితల్బాపుకొనిరి?
సాహసముగాది పెద్దల సభ్యభాష
తప్పుతప్పనిదూరుట?తగనికవులు
పల్కులును దప్పులంటయు వాసిగనుక—

అని నిరసనవ్యక్తంచేశాడు.అలాగే .....

లోకయాత్ర కొరకు లౌకికభాషలు
పుట్టి ప్రజలనోట నొందియుండు
జీవలోకమందు జీవంబభాషలు

Scanned with CamScanner

జనుల తలపుదెలుపు సాధనములు

లోక వ్యవహారంలో ప్రజల భావాల్ని తెలిపేది భాషని ,కాళ్లు చేతులు అవి ఎలా తమ పనులు చేస్తాయో అలాగే భాష ఉచ్వాస ,నిశ్వాస కరణ ప్రయత్నాల ద్వారా తన విధిని నిర్వర్తిస్తుందని ,ఈ శబ్ద సిద్ధిని తెలపడానికి శాస్త్రాలు సరిపోవని అభిప్రాయపడుతూ ,పరిమితమైన శబ్ద జాలానికి కాక లోక భాషకు ప్రక్రియను ఏర్పరచినవారే గొప్పవారని వివరించారు.

లోకమందుభాషలలోన నున్న
సిద్ధి శబ్దాల పరిపాటి చిత్తగించి
మేరమీరక ప్రక్రియలేరుపరచి
వ్యాకృతికి ద్రోవచూపినవారి గనుడు

దీన్నిబట్టి చూస్తే అసలు భాషకు వ్యాకరణం ఏర్పరచడం కష్టమనే అభిప్రాయం మనకు కలుగుతుంది. వ్యాకరణ పేత్తలు చెప్పిందే వేదం కాదనేది గిడుగు అభిప్రాయం .ఇక్కడ ఒక ఉదాహరణను పరిశీలిద్దాం.
"కూతు శబ్దముప్రాథమైక వచనంబునకు రువర్ణంబగు"(బా.వ్యా-ఆ.ప 8) "కూతురు-కూతులు – కూతురులు – కూతుళ్ళు-కూతురిని ఇత్యాది రూపంబులు గ్రామ్యంబులని యేరుంగునది " అనే సూత్రం ప్రకారం కూతురు మాత్రమే సరి అయిన రూపమని,గ్రాహ్యమని అర్థం . మరి శిష్టవ్యవహారంలో ఉన్న కూతురిని– కూతురికి – కూతుళ్ళూ మొదలైన రూపాలన్నీ గ్రామ్యాలైయిపోయాయని, అవి రాయడానికి తగినవి కాదని పండితులు వాటిని బహిష్కరించారు. అందువల్ల పూర్వపు గ్రంధాలను అచ్చు వేసేటప్పుడు, పరిష్కరించేటప్పుడు ఆ వ్యవహారిక భాషా పదాల స్థానంలోఈ రూపాన్ని చేర్చారు. వ్యాఖ్యానాల్లో, టీకల్లో కూతురు ,కూతురిని అని ఉన్న చోట్ల అంతా ఆ కవులకు అపఖ్యాతి కలుగుతుందని లేక గ్రామ్యాలనే వాటిని దిద్ది వేశారు. అయితే జీవాద్భాష ఒకరు దిద్దితే అక్కడే ఆగేది కాదు. సాక్షాత్తు చిన్నయ్యసూరే తాను రాసిన హిందూ ధర్మ శాస్త్ర గ్రంథం లో కూతుండ్రు అని రాశాడు. ఇది తప్పని గాని ఒప్పని గాని తన లక్షణగ్రంథంలో చెప్పలేదు. తను రాసినశబ్దాన్నే తాను గ్రహించలేదు కాబట్టి ఏది తప్పు, ఏది ఒప్పని మనంనిర్ణయించలేమంటాడు.

ఇక్కడ మనం చెప్పదలచేదేమిటంటే ఏవ్యాకరణమూ ప్రమాణమూకాదు అలాగనీ నిరాదరణీయమూ కాదు. పాణిని అష్టాధ్యాయిలోనే కాత్యాయనుడు 10 పేలకుపైగా తప్పులుదిద్దాడు. అలాగే బహుజనపల్లి సీతారామాచార్యులు మొ. వారు బాలవ్యాకరణం లో వదిలిన అనేక విషయాల్ని ప్రస్తావించారు. ఇక్కడ మనం చిన్నయ సూరిని తప్పుపట్టలేము, ఆయన గ్రందమే వేదమని చెప్పలేదు. శిస్తుల ప్రయోగాల నుండి శేషమును తెలుసుకోవాలని చెప్పాడు. అంతేగాక లక్షణ విరుద్ధమైన దానిని పెద్దలు వాడితే దానిని యదా ప్రకారంగానే గ్రహించాలన్నాడు. ఇది తెలియని మనము ఇవి మాత్రమే ప్రయోగార్హాలని , ఇవి గ్రామ్యాలని, నింద్యాలని చెప్పడం , అవి ప్రయోగానికి అనర్హాలని చెప్పుకోవడం మన పండితుల తప్పని నిరూపించాడు. ఈ

Scanned with CamScanner

అంతరం వల్లనే శిష్ట వ్యవహారిక భాషని, గ్రాంధికభాషని రెండు విభాగాలైంది. ఒకప్పటి శిష్టవ్యవహారికమే నేడు గ్రాంధికమని మన గిడుగు వారల అభిప్రాయం.

నన్నయ్య 'ప్రవాహినీ దేశ్య' అన్నారు.భాష నిరంతరం మారుతూ ఉంటుంది. ప్రాచీనులు వాడిన ఆనాటి వ్యవహారిక భాషను ఆ ప్రక్రియలతో సహా అనుసరించడం సరికాదంటాడు.

ఏరు పారునట్లు పారుచునుండును
దేశ భాష తెరుగు తెలియుటరది
మారుచుండు గాని మారుపు గనరాదు
లోటు చూచి కనుడు లోని గుట్టు
మనమే కానలేము మనము మారెడుచొప్పు
భాసయొక్కటే కాదు బ్రహ్మాండ
మెల్ల మారుచుండు తెరున్గా లొక్కో
ఎప్పుదేద్ది కలదో యప్పతికడే నిత్య
మదియ మనకు సేవ్యమగుట యొప్పు.

భాషకేకాదు బ్రహ్మాండానికీ మార్పు సహజమనీ ఎప్పుడు దేనిని వ్యవహరిస్తామో అదే నిత్యమని దానినే మనం అనుసరించాలని చెప్పి వ్యవహారిక భాషోద్యమాన్ని నడిపిన కారణాన ఈనాడు మనం ఆ ఫలాలను అనుభవిస్తున్నాము. ప్రతీ రంగంలోనూ వ్యవహారిక భాష మాత్రమే ప్రయోగించ బడుతుంది. ఇంకా సాహిత్యమైతే ప్రాంతీయతనూ ఆదరిస్తుంది. మాండలిక సాహిత్య సృష్టికి ఊపిరి వ్యవహారిక భాషోద్యమమని చెప్పవచ్చు. ఈనాడు వ్యవహారక భాష ప్రయోగం కోసం కూడా ఇంత ఉద్యమం జరిగిందా అన్న స్థాయిలో వ్యవహారిక భాష వేయిచెరుగులా తెలుగు నేల నలుమూలలా విస్తరించింది. దీనికి కారణమైన గిడుగు రామ్మూర్తి పంతులు గారికి , గురజాడ గారికి ఆంధ్రజాతి ఋణపడ్డది. ఈ ఘనులను ఇలా స్మరించుకోవడం చంద్రునికో నూలుపోగులాంటిది.

ఆధార గ్రంధాలు :

1. బాలకవి శరణ్యం – గిడుగు రామ్మూర్తి పంతులు.
2. బాలవ్యాకరణం – చిన్నయసూరి.
3. ఆంధ్రశబ్ద చింతామణి – నన్నయ.

సామాజిక చిత్రణ సాహిత్యం పని. ఈ పని ప్రక్రియా రూపాల నుంచి ఇజాలవైపు కొనసాగింది. సమాజంలోని ప్రతి చిన్న అంశాన్ని అక్షరబద్ధం చేస్తూ కాలం, దేశం, సమాజం, సంస్కృతుల్లో వచ్చే మార్పుల్ని పొందుపరుస్తూ పురాణం, ఇతిహాసం, కావ్యం, ప్రబంధం, గేయం, కథ, వచన, కవిత్వం ఇలా సాహిత్యం సమాజంతో పాటూ తాను పరిణామం చెందుతూ వచ్చింది. ఈ సమాజం గురించి చెప్పడం మాత్రమే సాహిత్యం యొక్క పని కాదు. అంతకంటే మెరుగైన సమాజ నిర్మాణమూ సాధ్యమవుతుందని బోధించడం వాని బాధ్యత. రచయితా అస్పృహను కలిగే రచనలు చేస్తాడు. ఇందులో భాగంగానే వస్తు పరిణామం జరిగింది. వైదికమత పునరుద్ధరణ కోసం నరేంద్రుడి ప్రేరణలో నన్నయ్య భారతాన్ని తెలుగులోకి అనువదించాడు. తిక్కన శైవ – వైష్ణవ సామరస్యం కోసం హరిహరాద్వితాన్ని స్థాపించాడు. శతక రచక నాటి సంఘంలో ఉండే లోటుపాట్లను విప్పి చూపి సంస్కరణలకు దారితీసింది. ప్రబంధ సాహిత్యం ఆనాటి భోగలాలసతను వ్యక్తపరుస్తుంది.

ఆధునిక సాహిత్యంలో సామాజిక తపన, మానవతాకాంక్ష సమతాభావన ప్రతిఫలిస్తాయి. శ్రీశ్రీ యుగంలో అభ్యుదయం వైపు సాగిన సాహిత్యం శాఖోపశాఖలుగా విస్తరించి ఈ అభ్యుదయం, విప్లవ పంథా అణచివేయబడ్డ ప్రతి సమూహం వైపు పయనించి స్త్రీ, దళిత, మైనారిటీ వాదాల రూపంలో వర్గసాహిత్యంగా రూపుదాల్చింది.

సమాజంలో సగం మంది స్త్రీలు..... సాంఘికంగా స్త్రీ సమాజంలో మోసగింపబడుతుంది. కేవలం ఒక పనిముట్టుగా మాడబడుతోంది. ఆర్థిక స్వేచ్ఛ లేమి, పురుషాధిక్యత ఈ పరిస్థితుల మధ్య సాంఘిక న్యాయంకోసం సాహితీ రూప ఉద్యమమూ ఊపందుకుంది. అది 80వ దశకం నుంచి ప్రారంభమై నేటిదాకా కొనసాగుతూనే వుంది. అయితే స్త్రీ తన హక్కుల కోసం, సామాజిక న్యాయం కోసం తన అస్థిత్వపు పోరాటం సాహిత్యంలో ప్రథమం నుంచి కన్పిస్తూనే ఉన్నాయి. సీత తన అస్థిత్వం కోసం భూగర్భంలో కలిసిపోయింది. ద్రౌపది నిండు సభలో తన స్థానాన్ని నిర్ణయించమని ప్రశ్నించింది. ఇలాంటి ఉదాహరణలు సాహిత్యంలో కోకొల్లలు. చేనేత సాహిత్యంలో నా వెతుకులాటలో స్త్రీ అస్తిత్వపు పోరాట ధోరణులూ అక్కడక్కడా కన్పిస్తున్నాయి. చేనేత సాహిత్యం అనగానే భారతదేశ చరిత్రలో చేనేత నిర్వహించిన పాత్ర, ప్రస్తుత సంక్షోభం, ప్రభుత్వచర్యలు – వైష్యాలు, దానికి కారణాలు, చేంత వృత్తిలోని శ్రమ, దానిలోని కళావిలువలు ఇవే కన్పిస్తాయి. కాని వీటితోపాటు స్త్రీ జీవన చిత్రణ, స్త్రీ హింస, అస్థిత్వపు పోరాటం అటు జానపద సాహిత్యంలోను, ఇటు శిష్ట సాహిత్యంలోను కన్పిస్తుంది.

జానపద పాటలాట్లు :-

పిల్లలపాట పల్లెల పదుగులలో దొరికే ఓ చక్కని జానపద పాటలాట. అందులో ఒక రకం జానపదగీతం పాటలాట్లు. అందులో ఒక పల్లెకి చెందిన స్త్రీలందరూ పాటలు. అది చూసేవాళ్ళు గుర్తించక, గుంపులుగా పాటలాడ తీరాల్సిన అవసరం వారి అవసరాల కోసం ప్రకృతిదేవుడే ఒకొక్కరికి ఒకొక్కటిని చేసిపెట్టాడు. తేనెటీగకి అదనపుపని అవసరమైనట్లు పెట్టాడు. వారిలో ఒకరి చేతిలో చాకలి పనిలాంటి మంచినీటి ఊట ప్రవహిస్తుంది. బట్టలు, కుటుంబ సభ్యులూ చనిపోతే చనిపోయే చిన్న ఉయ్యాలుంటుంది. ఇంట్లో స్త్రీలు చూపులు చదవడం / రాళ్ళాటలో కుదిరలు చూడడం, పిల్లల్లో ఫిరంగులు పదుగుపెట్టడంలో స్త్రీలు వారికి గంత పెట్టడం వారి చదువు చేస్తుంటారు. ఈ క్రమంలో రాళ్ళు తిప్పుతూ స్త్రీ పాడే పాటలు, మర్రం ఆడిస్తూ మూళ్ళు తీసే కూనిరాగాలు జానపద గీతాలుగా కూడుకున్నవున్నాయి. వీటి ఎప్ చాలా చదవ అంతరించిపోయాయి. ఇందులోని రాళ్ళు పాటలు స్త్రీ మానసిక చిత్రణ, వారి అభిరుచిని తెలియచేస్తుంది.

స్త్రీలు ఇంట్లో కూర్చుని చేసే చదువే రాళ్ళు తిప్పడం ఒకటి. బట్టలు చేసేవరిలో కీలకమైంది ఈ రాళ్ళు. చదువరి అన్ని రాయి కట్టలను రాళ్ళాటకి చుట్టి రాళ్ళపై చుట్టాన్ని తిప్పి చిన్న చిన్న కుదుపులు చుట్టించడమే ఈ రాళ్ళాట్లను ఉపయోగిస్తారు. రాళ్ళాట్లు తిప్పుతూ పాడే పాటల్నే రాళ్ళు పాటలంటారు. ఇవి అజ్ఞాతకవు రోదసిలో పాగుతాయి. ఈ పాటలు చదువుతూ స్త్రీ పడ్డింది. తల్లిదండ్రులను సోదరులను తలచుకుంటూ – పడ్డింటిపై తనకు గల మమకారం ప్రదర్శిస్తోంది.

చదువు చదువు చదవవే చిలకా
అమ్మకి కుతలాలు చెప్పవే చిలకా
పాలూరు నీళ్ళకు ఇచ్చిరా చిలకా
పడ్డింటి అన్నల్ని చూసిరా చిలకా
పొందూరు పంచెలా ఇచ్చిరా చిలకా
కడ దాటి రాద ఆగవే చిలకా
కడ దిండా చీళ్ళు తెచ్చియ్యి చిలకా

స్త్రీ పడ్డింటి వారిని తలచుకుంటూ వారి రాకకోసం ఎదురుచూస్తూ వారు వచ్చేటట్లు కాకిని కూడుచుంటుంది.

కాకమ్మ నీ కాల కట్టేము గట్టి, రన్నమ్మ మా వార్ని రాగయ్యి కాకి
కాకమ్మ కూతలు కర్ణలు కావు, కన్నవారొచ్చేటి వేళలు కావు
నీరేడు మందుంది అన్న వాదున్న నీడు వస్తారని నెలకన్నారాడు
అారు దున్నారని కమ్మోళ్ళే పంపు, వినోయి పెద్దన్న ఎన్నటికి రావ
ఏటేటా పెద్దమ్మ కుప్పనూర్చుతు, ఎదలేదు పెద్దిలా నిను చూడారు

ఈ అంశాన్ని చర్చించిన విశ్వనాథ మరికొన్ని చోట్ల కూడా ఈ విషయాన్ని ప్రస్తావించారు. ఆయన అభిప్రాయంలో స్త్రీ తన భర్తలోని బాధ్యతలను కూడా తీసుకోవాలి అని వివరించారు.

ఒక స్త్రీ తన భర్తకున్న ఈ విధంగా ఎందుకుంటుంది? ఏమంటుంది? అన్నది ప్రస్తుతం పాడుతోంది.

కాలుకి దుమ్ము కొట్టి కడుగా పోదు
పొరుగు రాసిన రాలు తుడిచా పోదు
అన్న వెంగలు పెట్టి అడిగా పోదు
పైరు వెంగలు పెట్టి పుటిమా పోదు

కాబట్టి గానుగు తీసే ఈ రాట్నం పాటలో దున్నపోతు ఎలా ఉండవద్దు. ఒక ఇల్లాలు

మొగుడెందుకే వారీ మొగుడెందుకే –
అరటి మొగుడెందుకే వారి మొగుడెందుకే
రాట్నం వల్లంగుంటి దున్నపోతు గోల్కొండ
మొగుడెందుకే వారీ మొగుడెందుకే

మొగుడు చేతుల్లో బాధపడేకంటే తన స్వంత కాళ్లమీద నిలబడితే వచ్చే భర్తం నుండి దూరమై పోవడం సులభమని స్త్రీ కావాల్సిన ఆర్థిక స్వావలంబన గురించి చెప్పి తన ఆత్మ విశ్వాసాన్ని ప్రకటిస్తుంది.

ఈ జానపద సాహిత్యంలో పుట్టింటి కోసం ఆరాటపడే అతివలు, తల్లిదండ్రులకు దూరంచే అంశాలు, ఆత్మవిశ్వాసంతో నిలబడే సంఘటనలూ కనిపిస్తున్నాయి.

**చిత్ర సాహిత్యం :-**

ఆధునిక కాలంలో పారిశ్రామికీకరణ, గ్లోబలైజేషన్ చేనేత రంగాన్ని అభద్రతాభావానికి గురిచేసిన విధానం దీని ద్వారా మగ్గం గుంతలో కాళ్లుపెట్టి తొక్కుడి బెక్కల్ని లయబద్ధంగా కొడుతూ కుదిపేస్తే కూర్చుని లాగుతూ, ఇంకో చేత్తో పలకను ఆడిస్తూ ఈవారకు, అవారకు పదుగులు చేసే కొమ్ము చుట్టుకి అనుగుణంగా తలను కనుపుతూ జీవనయానం చేసే నేతన్న దుఃఖమయ జీవితాన్ని కవిత్వ కెమెరాతో చిత్రించారు. ఈ చిత్రీకరణలో అక్కడక్కడ స్త్రీ వేదనా భరితమైన జీవితం, వారి అస్తిత్వపు పోరాటాలు కెమెరా స్టైలో అక్కడక్కడ తళుక్కుమంటున్నాయి.

2004, 2005 సంలో చిమ్ సాహిత్యంలో చేనేత కథనాలపై చర్చోపపులు నిర్వహించి ఆ సాహిత్యాన్ని చేనేత గుంటకోత పేరుతో ప్రచురించారు. విరసం కూడా ఈ బాటలో మగ్గం ముక్కులవుతుంటే కవితా సంపుటిని ప్రచురించింది. ఈ సాహిత్య సంపుటులలో 'చేనేత చెల్లి' కవిత స్థలమేదైనా, రంగు ఏదైనా స్త్రీ పరిస్థితిలో మార్పు లేదనే విషాన్ని ధృవీకరిస్తుంది. స్త్రీ అందరినీ చేనేత వృత్తి సాగు చేసే వృత్తిలో స్త్రీ సంపాదాగం. అటు ఇంటి పనిలోను, ఇటు వృత్తిలోను తన పాత్రను అద్భుతంగా నిర్వహించారు.

పొంచెక్కుల తాడు కాలికి కట్టుకున్నట్లు
పనికి పనికి నేస్తున్నట్లు ఒక్కటే పరుగు
చీపిరిలా సంజకసువూ, చీకటి చిమ్ముతూనే
చిర చిర్లాడుతూ మగడు కేకేస్తే చాలు
నాదలా గుంట దిక్కు వురుకు తావు
ఇంటిపని, పిల్లల పనీ చూస్తూనే
చిక్కుపడన పోగు సరిచూస్తావు

ఉదయం నుంచి పొయ్యిలా మండి మోసిన బరువు
ప్రతికంచానికి రుచులతో నింపి
ప్లేట్లూ, గ్లాసులూ, గిన్నెలు, కంచాలు కడిగి
అట్టనడుమెత్త మధ్యాహ్నం ఆగిన మగ్గాన్ని, కునికీ

భర్తని కుంటుతున్న ఆదాయాన్ని చూచి
తిండి అటుపు తీరకుండానే బాదు బరువు తొక్కడానికి
మగ్గం మీదికెక్కుతావు

సంసారాన్ని, భర్త బరువును తన భుజాలకెత్తుకుని మోస్తున్న ఆ ఇల్లాలి కష్టాల్ని, ప్రాధాన్యతను గుర్తించే వారు లేరు ఈ విషయాన్ని ఇక్కడ 'నోట్' చేయడం జరిగింది.

మెలకువెప్పుడొస్తే అప్పుడు రాత్రి మగ్గమై ఆడినా
మెప్పులేదు, గుర్తింపు లేదు, అయ్యో పాపమన్న ఆర్ద్రత లేదు

స్త్రీలకు భర్త రూపంలో ఎదురయ్యే మరో సమస్య భర్తల చెడు అలవాట్లు. సంసారాన్ని మోయాల్సిన భర్త అలవాట్లకు బానిసలై ఆ సంసారం పట్ల స్త్రీ పడే వేదన ఇలా వుంటుంది.

ఏ తాగుడు, పేకాటకు బానిసయ్యాడో
ఏ అరుగు ముచ్చట్లకతుక్కు పొయ్యాడో
ఏటెక్కు సినిమా ట్రిక్కులకు చిక్కుకు పొయ్యాడో ఆరాతెల్సి
ఎంత గుబ గుబలాడి పొయ్యాడో
కొట్టుకు లాడిన కండెకు తెల్సు
కదిలిన గుడ్డకు తెల్సు
గుడ్డమీది బొమ్మకు తెల్సు
ఒంటరి నీ వూర్చుకు తెల్సు
అన్నీ చూసిన అర్ధరాత్రి అశ్రు పాతానికి అంతా తెల్సు.

Peer Reviewed and UGC Approved:VOLUME:9, ISSUE:1(1), JANUARY:2020

భర్త వ్యసనాలను ఎవరికి చెప్పుకోలేక, బాధను దిగమ్రింగలేక ఆ స్త్రీ పడే మనోవేదనను పై కవిత స్పష్టం చేస్తుంది. వ్యసనాలతోటి, వృత్తిని నిర్లక్ష్యం చేస్తూ, ఆర్థిక దుస్థితి దిగజార్చితే దీనికి కారణం ఏమిటని ప్రశ్నిస్తే తప్పు తాను చేసినా, ఇంటి భారాన్ని మోస్తున్న ఆ తల్లికి ప్రశ్నించే హక్కు లేదని, భావ ప్రకటనా స్వాతంత్ర్యపు హక్కును కాలరాస్తూ పురుషాధిక్యతను హింసతో చాటుతాడు.

దిన దినం సేదదీరని ఇబ్బందులు పోల్చుకొని
ఎంటీల తాకట్టుకూ, చీట్లపాటకూ, పెరిగినప్పులకు కారణమడిగితే
పట్టిచ్చెలా చూసుకుంటాడును కున్న పెనిమిటి
చిరుత పులిలా దూకి తన్నులు, గుద్దులతో నిన్ను హింసిస్తాడు
తెగిన నక్కలా నిన్ను తోసేస్తాడు

పట్టుదారంలా సుతిమెత్తగా చూసుకుంటాడనుకున్నా పెనిమిటే చిరుతపులిలా రక్కుతున్నాడు. ప్రశ్నించే హక్కు లేమితో పాటు బానిసత్వపు సంకెళ్ళు నిన్ను వెంటాడుతాయి.

తాను టిపినికి, టీ నీళ్లకు పోయి
గంటలూ వృధా కొట్టినా పర్వాలేదు గాని
నీ వల్ల ఏ క్షణ అవసరానికి ఆలస్యం జరిగినా
పురుష పెత్తనం చిందులు నిలదిస్తాయి
ప్రశ్నల గద్దింపులు నిన్ను చుట్టుముట్టాయి

భర్తకు అన్నం వడ్డించడంలో గాని, అవసరాలను అందించడంలో గాని, ఆలస్యం చేస్తే ఏమి పనిచేయని దానిలాగా స్త్రీని జమకడతారు. ఇంట్లో పనిబాట లేకుండా కూర్చొని ఏం ఉద్దరిస్తున్నావని' గద్దిస్తాడు. అరుగుల మీద, టీ కొట్టు దగ్గర అతను చేసిన పని గుర్తురాదు. ఇంట్లో నీశ్రమా గుర్తుకు రాదు. ఎడతెగని సమస్యలను ఈదలేక, ఎవ్వడో పోయించిన సారాలో తేలి తాళికట్టిన వాడు దుమ్ములో దేకుతుంటే ఎన్నిసార్లు వీధులు వెదికి నడిపించు వచ్చావు. అయినా స్త్రీ కష్టాన్ని, ఇష్టాన్ని గుర్తించేవారు లేరు. అందరూ ఆఓను పనిముట్టుగా చూసేవారే. భర్త అవసరాలు తీర్చే యంత్రం, ఇంటి భారాన్నే మోసే జంత్రం. స్త్రీ ఏ వృత్తిలో ఉన్న, ఏ ఇంటిలో వున్న ఆమె ఒక జీవమ్ము పనిముట్టుగానే మా సమాజం నిర్ధారిస్తుంది.

ఈ దేశం ఏం మిగిల్చిందీ
ఆకలి చీకటీ, ఆందోళన, అభద్రత తప్ప
మెట్టినింట్లో, పుట్టినింట్లో
నాల్గు గోడల కటకటాల గుడిసెల పంజరాల లోలోపల
గిజ గిజలాడిన ప్రాణమున్న పనిముట్టు జీవితమేగా నీది!

Scanned with CamScanner

ఇక్కడ వరకు స్త్రీ దైన్యపు జీవితాన్ని చిత్రిస్తూ, అందులో నుంచి నిర్గమించి చైతన్యంతో అడుగులు వేస్తే జీవితం చిక్కబడుతుందని చైతన్య పరుస్తుంది క్రింది కవి.

నిరాశ వురవడికి కొట్టుకు పోకు
నువ్వూ నిప్పుల వంతెనగా వుద్యమించు
నీ మగని మత్తు పారిపోతుంది
నీ కలత దిబ్బ కరిగిపోతుంది

అని తిరగబడక పోతే నీ స్వేచ్ఛ, స్వాతంత్ర్యాలు నీకు రావని, వ్యసనాలబారిన బడ్డ మగడిని వారిని తెచ్చుకోవడానికి ముందు మనలో మార్పురావాలని ఉద్యమించాలని సూచిస్తున్నారు.

సాహిత్యమేదైనా స్త్రీ వేదనలో మార్పు లేదు. ఆ మార్పుకు శ్రీకారము స్త్రీయే చుట్టాలి.

ఏ సాహిత్యంలోనైనా స్త్రీ వేదన, అస్పృశ్యపు పోరాటాలు కన్పిస్తూనే ఉన్నాయనడం వ్యాస సారాంశం.

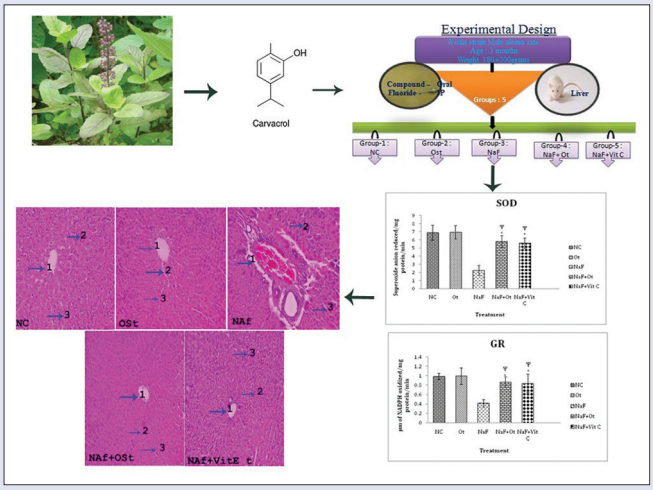
Submitted: 02-09-2018 Revised: 04-10-2018 Published: 26-04-2019

## ABSTRACT



**Background:** *Ocimum sanctum* (OS) Linn. commonly known as Holy Basil or Tulsi is an Ayurvedic herb of India. The culinary, medicinal, and industrial importance of this plant led to explore its chemical and pharmacological properties. **Objective:** The present study was carried out to know the anti-oxidant activity of carvacrol bioactive compound of OS in sodium fluoride (NaF) rats and free-radical scavenging activities of OS. **Materials and Methods:** Superoxide dismutase (SOD), catalase (CAT), glutathione peroxidase (GPx), glutathione reductase (GR), glutathione (GSH), GSH-s-transferase (GST), malonaldehyde (MDA), alanine aminotransferase (AAT), aspartate aminotransferase (AST), alkaline phosphatase (ALKP), calcium (Ca), and phosphorus ($P_4$) levels are estimated in all experimental groups. 2,2-Diphenyl-1-picrylhydrazyl (DPPH), hydrogen peroxide ($H_2O_2$), and hydroxyl radical activities are analyzed in the ethanolic extract of OS. **Results:** SOD, CAT, GPx, GR, GSH, activities, and Ca levels depleted and GST, MDA, AAT, AST, ALKP, and $P_4$ levels elevated in NaF intoxicated rats. Whereas carvacrol supplementation normalized all the antioxidant enzymes and hepatic markers in NaF toxicity rats. DPPH, $H_2O_2$, and hydroxyl radical of OS showed potent free-radical scavenging activities. In addition, histopathological studies also prove that carvacrol protected the liver tissue from fluoride toxicity in rats. **Conclusion:** The present study revealed that carvacrol of OS modulated the antioxidant enzymes and hepatic stress markers in NaF rats. Our research study will be helpful in the development of new active principle and nutraceuticals in the area of drug resistance and therapeutic compounds against disease vectors.

**Key words:** Antioxidant enzymes, carvacrol, free radical scavenging activity, *Ocimum sanctum*, rats

## SUMMARY

- To summarize, the current investigation clearly confirmed that carvacrol bioactive compound of *Ocimum sanctum* protects the hepatic tissue from sodium fluoride toxicity.

**Abbreviations used:** OS: *Ocimum sanctum*; NaF: Sodium fluoride; SOD: Superoxide dismutase; CAT: Catalase; GPx: Glutathione peroxidase; GR: Glutathionereductase; GSH: Glutathione; GST: Glutathione-s-transferase; MDA: Malonaldehyde; AAT: Alanine aminotransferase; AST: Aspartate aminotransferase; ALKP: Alkaline phosphatase; Ca: Calcium; $P_4$: Phosphorus; DPPH: 2,2-Diphenyl-1-picrylhydrazyl; $H_2O_2$: Hydrogen peroxide; TLC: Thin-layer chromatography; HPLC: High-performance liquid chromatography; EDTA: Ethylenediaminetetra acetic acid; $FeCl_3$: Ferric chloride; TCA: Trichloroacetic acid; TBA: Tert-Butyl alcohol; NaOH: Sodium hydroxide; BHA: Butylated hydroxyanisole; SPSS: Statistical package for the social sciences; GC-MS: Gas chromatography–Mass spectrometry; TBARS: Thiobarbituric acid-reactive substances.

## INTRODUCTION

Medicinal plants play a central role in traditional medicines and are precursors for the modern pharmaceuticals and allopathic medicines.[1] The scientific studies available on a good number of medicinal plants indicate that promising phytochemicals can be developed for many human health problems, including diabetes, cancer, and infectious diseases.[2,3] The medicinal value of plants lies in the bioactive compounds such as alkaloids, flavonoids, tannins, and phenolic compounds that produce a definite physiological action against diseases.

*Ocimum sanctum* (OS) is known as Holy Basil in English or Tulasi in Hindi, belongs to the family Lamiaceae and is considered as a sacred plant in Hindu culture.[4] OS Linn. has been widely known for its medicinal value for thousands of years.[5] Folklore claims that OS have antiseptic, antimicrobial, anti-bactericidal, anti-inflammatory, anti-oxidative, antiulcer, antidiarrheal, and chemopreventive properties.[6,7]

Carvacrol ($C_6H_3[OH][C_3H_7]$) is a natural component found in OS. Carvacrol, is a monoterpenoid phenol. It has antimicrobial, antitumor, antimutagenic, antigenotoxic, analgesic, antispasmodic, anti-inflammatory, angiogenic, and antiparasitic properties.

Fluorosis is a global disease. Humans take fluoride from water, food, and air, which can develop into dental, skeletal, and nonskeletal fluorosis. The clinical manifestations of fluorosis are mainly teeth and bone damage, but organs and soft tissues such as the liver, kidney, nervous system, reproductive system, blood vessels, and muscles may also be damaged by this disease.

The objective of this study was to investigate the antioxidant, hepatoprotective activity, of carvacrol in NaF intoxicated rats. This is the first report on the effect of carvacrol of OS in fluorosis rats.

## MATERIALS AND METHODS

### Selection and collection of plant material

Leaves of OS were collected from Tirupati, Andhra Pradesh, India and identified by the Dr. Madhav Chetty, Department of Botany, S. V. University, Tirupati. Voucher specimen of OS No 1183 was deposited in the Botany department.

### Extraction of bioactive compound

The bioactive compound carvacrol of OS was extracted by different methods. OS was grinded and add ethanol. Filter the mixture and dry it, by using a rotoevaporator, the mixture is then washed with hexane. This, in turn, gets washed again, with ethyl acetate. At this point, the mixture is dried again, this time using a rotoevaporator and freeze-drying to ensure complete dryness. Once the mixture is completely dry, the mixture is again treated with hexane and ethyl acetate. At this point, thin-layer chromatography (TLC) is performed. After the TLC, the compound is dissolved in 99% ethanol and is further purified using TLC.

The compound is soaked in ethyl acetate, once more. After filtering and drying, it is subjected to high-performance liquid chromatography (HPLC). It is this last process, HPLC that enables the identification of many compounds. Of which, carvacrol is isolated, but check the carvacrol compound with standard compound and used for the study [Figure 1].

### Chemicals and reagents

All chemicals used were of analytical grade and were purchased from Sigma–Aldrich, Merck and all chemicals and reagents were used without further purification.

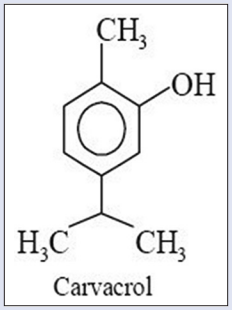

**Figure 1:** Structure of Carvacrol bioactive compound of *Ocimum sanctum*

### Preparation of extracts

Leaves of the plant were air-dried for several days. The dried plant materials were ground to a coarse powder using a dry mill. For the extraction procedure, 500–800 g of powdered plant material was soaked in 95% ethanol for 72 h. The solvent was then removed by rotary evaporation. The dried extract was used for the study of free radical scavenging activities.

#### *Grouping of animals*

The rats were divided into five groups of six rats in each group and treated as follows:

- Group I – Normal Control (NC): Six rats were received saline through orogastric tube for 60 days
- Group II – Ocimum Bioactive compound (Carvacrol) Control (OSt): Six rats received OS bioactive compound Carvacrol (25 mg/kgBW) for 60 days
- Group III – NaF treatment (Na F t): Six rats received the sodium fluoride (NaF) (10 mg/kgBW) dissolved in drinking water for 60 days
- Group IV – NaF + Ocimum Bioactive compound (Carvacrol) treatment (NaF + OSt): Six rats received NaF (10 mg/kgBW) dissolved in drinking water and ocimum bioactive compound carvacrol (25 mg/kgBW) for 60 days
- Group V – Na F + Vitamin C treatment (NaF + Vitamin C): six rats received NaF and Vitamin C for 60 days.

After completion of 60 days treatment and after 24 h of the last treatment the animals were sacrificed by cervical dislocation and the liver tissue was excised at 4°C. The tissues are washed with ice cold saline and immediately stored in a deep freezer at −80°C for further biochemical analysis. Blood samples are also collected, serum was separated and stored for biochemical estimations.

### Biochemical estimations

The selected antioxidant enzymes such as superoxide dismutase (SOD), catalase (CAT), glutathione peroxidase (GPx), glutathione reductase (GR), glutathione (GSH), GSH–s– transferase (GST), and malonaldehyde (MDA), levels were monitored by the methods of Misra and Fridovich,[8] Aebi,[9] Flohe and Gunzler,[10] Carlberg and Mannervik,[11] Akerboom and Sies,[12] Habig *et al.*,[13] and Ohkawa *et al.*,[14] respectively. Alanine aminotransferase (AAT), aspartate aminotransferase (AST) and alkaline phosphatase (ALKP) activities and Calcium (Ca), phosphorus ($P_4$) levels are measured using standard kits.

The experiments were carried out in accordance with guidelines Approved by the institutional Animal Ethics Committee (ResolutionNo. 10/08/a/CPCSCA/IAEC/SVU/09-10/ZOOL/KRS/Dt. 25.09.2009) in its resolution number (9/IAEC/SVU/2001/dt. 4.03.2002).

### Estimation of free radical scavenging activity

The hydroxyl radical scavenging activity of OS was determined by the method of Halliwell *et al.*[15] The reaction mixture consisted of 1 mM Ethylenediaminetetra acetic acid (EDTA), 10 mM Ferric chloride, 10 mM $H_2O_2$, 10 mM deoxyribose, 1 ml of different dilutions of the extract (100–500 µg/ml), 50 mM phosphate buffer (pH 7.4), and 0.1 ml of ascorbic acid in sequence. The mixture was incubated at 37°C for 1 h. A volume of 1 ml portion of the incubated mixture was mixed with 1 ml of 10% Trichloroacetic acid and 1 ml of 0.5% Tert-Butyl alcohol (TBA) (in 0.025 M Sodium hydroxide containing 0.025% butylated hydroxyanisole) to develop the pink chromogen measured at 532 nm.

The ability of OS to scavenge hydrogen peroxide ($H_2O_2$) was determined according to the method of Ruch *et al.*[16] A solution of $H_2O_2$ (2 mM) was prepared in phosphate buffer (0.1 mM, pH 7.4) at 20°C. An aliquot of the extracts was dissolved in phosphate buffer (1 ml; 0.1 mM, pH 7.4) at

various concentrations (100–500 µg/ml) and mixed with 600 µl of $H_2O_2$. Ascorbic acid was used as the reference standard. The concentration of $H_2O_2$ was measured by reading the absorbance at 230 nm after 10 min against a blank solution containing phosphate buffer without $H_2O_2$. The extracts were capable of scavenging $H_2O_2$ in a concentration-dependent manner.

The stable 1,1-diphenyl-2-picrylhydrazyl radical (DPPH) was used for the determination of free radical-scavenging activity of OS. Different concentrations of each ethanolic extract were added and an equal volume of DPPH (100 µM). After 15 min at room temperature, the absorbance was recorded at 517 nm.[17]

## Statistical analysis

The data are expressed as mean values with their standard deviation Readings of the five different groups were compared using one-way ANOVA analysis with Dunnett's multiple comparison test. Statistical analysis was performed using the Statistical package for the social sciences (SPSS) (Version 13.5; SPSS Inc., Chicago, IL, USA). Using M. S. Office, excel software the data have been analyzed for the significance of the main effects (factors), and treatments along with their interactions. Differences were considered statistically significant at $P < 0.001$.

# RESULTS

## Free radical scavenging effect

In DPPH test, the ability of a compound to act as a donor for hydrogen atoms or electrons was measured spectrophotometrically. The scavenging activities of DPPH exerted by OS ethanolic extract and each extract as well as ascorbic acid are summarized in Figure 2. The ethanolic extract at the concentration of 100, 200, 300, 400, and 500 µg/mL exhibited 54.2%, 65.5%, 72.4%, 76.58%, and 86.9% inhibition, respectively, where standard drug ascorbic acid at the same concentration exhibited 63.07%, 68.37%, 78.46,% 87.73%, and 90.89% inhibition, respectively. In the present investigation, OS at different doses demonstrated significant DPPH scavenging activity indicating their abilities to act as radical scavengers.

The deoxyribose method is a simple assay to determine the rate constants for reactions of hydroxyl radicals. Ferric-EDTA was incubated with $H_2O_2$ and ascorbic acid at pH 7.4. Hydroxyl radicals were formed in free solution and were detected by their ability to degrade 2-deoxy-2-ribose into fragments that on heating with TBA at low pH form a pink chromogen. Any hydroxyl radical scavenger added to the reaction would compete with deoxyribose for the availability of hydroxyl radicals, thus reducing the amount of MDA formation. We herein tested the scavenging activity of each extract along with positive control ascorbic acid. OS at concentration 100, 200, 300, 400, and 500 µg/mL inhibited the production of hydroxyl radicals by 40.2%, 62.19%, 70.46%, 81.24%, and 83.68%, while at same concentration, ascorbic acid showed 57.47%, 63.02%, 71.53%, 89.71%, and 83.23%, respectively [Figure 2]. In the current study, OS at different doses demonstrated significant hydroxyl radical scavenging activity.

The ethanolic extract at the concentration of 100, 200, 300, 400, and 500 µg/mL exhibited 31.2%, 52.46%, 62.84%, 71.4% and 82.6% inhibition, respectively, where standard drug α-tocopherol at the same concentration exhibited 23.07%, 68.37%, 72.46%, 76.73%, and 90.89% of $H_2O_2$ inhibition, respectively. The composition of $H_2O_2$ into water may occur according to the antioxidant compounds as the antioxidant component present in the extract are good electron donors, they may accelerate the conversion of $H_2O_2$ to $H_2O$. Our results showed that the $H_2O_2$ scavenging activity of OS decreases than that of α-tocopherol.

## Effect of carvacrol on hepatic antioxidant enzymes in fluorosis rats

In the present investigation, SOD, CAT, GPx, GR, activities, GSH levels are depleted in fluoride intoxicated rats. However, with carvacrol supplementation in NaF rats, we observed the significant elevation of these anti-oxidant enzymes. However, GST, MDA levels significantly increased in fluoride intoxicated rats, but carvacrol treatment decreased GST and MDA levels in NaF rats [Figure 3].

## Effect of carvacrol of on serum markers and fluorosis markers in fluorosis rats

In the current study, we observed that AAT, AST, ALKP activities, and $P_4$ levels are elevated and Ca levels depleted in NaF intoxicated rats. This

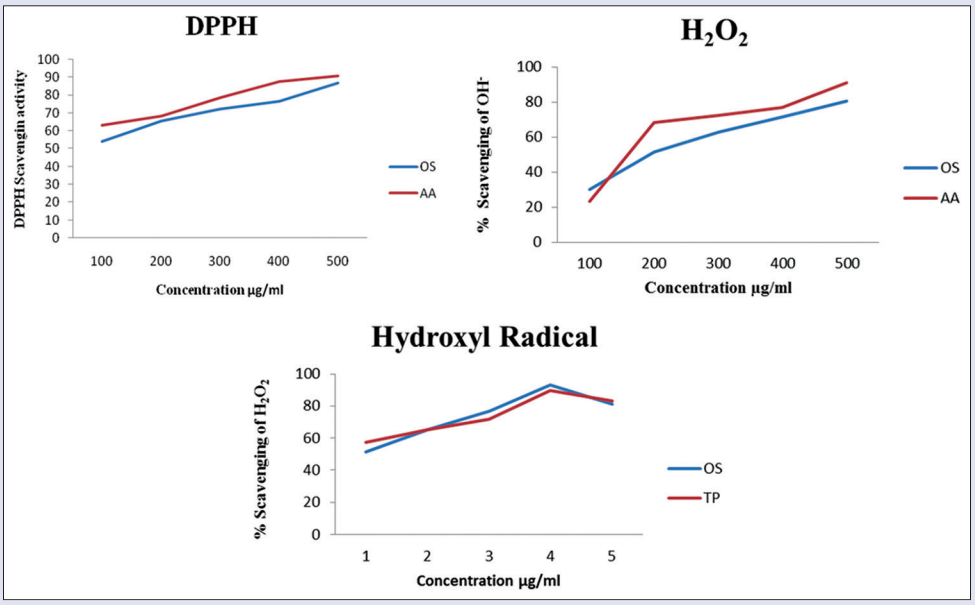

**Figure 2:** Free radical scavenging activity (Hydrogen peroxide, Hydroxy Radicals and 2,2-Diphenyl-1-picrylhydrazyl) of ethanolic extract of *Ocimum sanctum* with ascorbic acid and α tocopherol as standards

indicates severe liver damage in fluorosis condition. Carvacrol treatment for 60 days significantly modulated all the liver markers in fluorosis rats [Table 1].

## Effect of carvacrol on liver tissue in fluorosis rats

In the current study, we observed the degeneration of central vein, hepatocytes, sinusoids, and blood coagulation in NaF intoxicated rats. However, with carvacrol treatment regeneration of central vein, hepatocytes, and sinusoids are observed in NaF rats. Thus, carvacrol supplementation protects the liver tissue from NaF toxicity in rats [Figure 4].

# DISCUSSION

The present study was carried out to know the free radical scavenging effect of OS and antioxidant activity of the bioactive compound of OS Carvacrol in NaF intoxicated rats.

DPPH assay method is based on the ability of 1,1-diphenyl-2-picrylhydrazyl, a stable free radical, to decolorize in the presence of antioxidants.[18] DPPH has characteristic absorbance maximal at 517 nm, which decreases with the scavenging of the proton radical. Antioxidants react with DPPH and convert it to 1-1-diphenyl-2-picrylhydrazine. The degree of discoloration indicates the scavenging potential of OS. This property has been widely used to evaluate the free radical scavenging effect of natural antioxidants.[19] The study reported the free-radical scavenging activity of ethanolic extract of OS.[20] The standard antioxidant ascorbic acid has showed rich DPPH radical scavenging activity at lesser concentrations than the ethanolic extract of OS [Figure 2].

$H_2O_2$ is endogenously produced in the cell, regulates various important physiological processes.[21] Nevertheless, it is overabundance in a cell causes cellular damage because of its interaction with cellular metal ions generates highly reactive hydroxyl radicals. $H_2O_2$ changed into the water in the presence of electron donor by cellular enzymes and external antioxidants. The ethanolic extract of OS converted the $H_2O_2$ into the water on concentration-dependent manner. The increased concentrations of the extract have shown an increase in $H_2O_2$ scavenging activity [Figure 2].

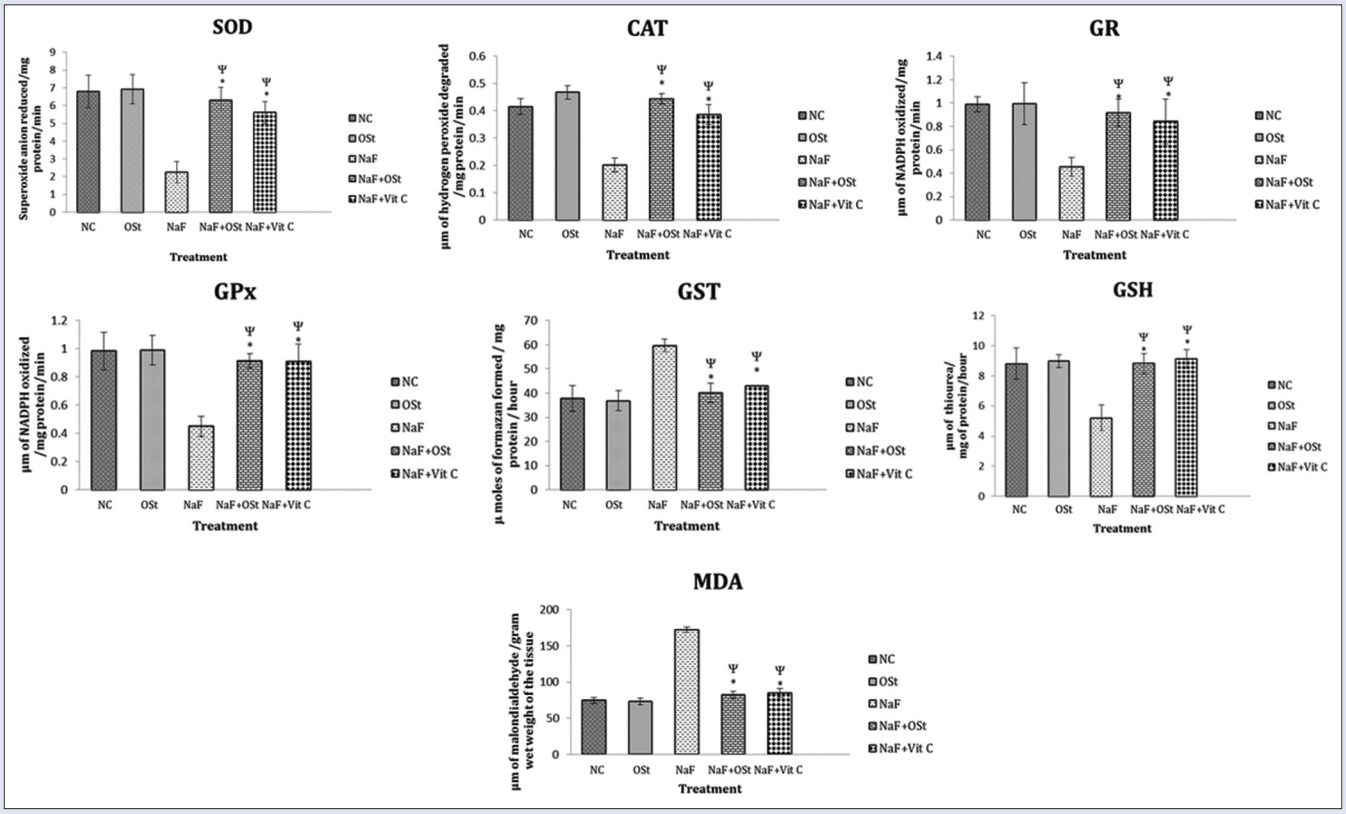

**Figure 3:** Effect of Carvacrol on superoxide dismutase, catalase, glutathione reductase, glutathione peroxidase, glutathione-s-transferase, glutathione and malonaldehyde levels in the liver tissues of Normal and Fluorosis rats. Data are expressed as means ± standard deviation ($n = 6$). *The values are significant compared to the following: control (*$P < 0.001$), Fluorosis (*$P < 0.01$) (Dunnett's multiple comparison tests)

**Table 1:** Effect of carvocral on liver markers and fluorosis markers in sodium fluoride rats

| Groups | AST (IU/L) | ALT (IU/L) | ALP (IU/L) | Ca (mg/dL) | PP (mg/dL) |
|---|---|---|---|---|---|
| Group I (NC) | 586.82 (±12.48) | 94.12 (±1.68) | 414 (±8.26) | 11.31 (±0.62) | 14.24 (±0.24) |
| Group II (OSt) | 545 (±11.26) | 117.535 (±2.14) | 385 (±10.24) | 11.46 (±0.22) | 12.46 (±0.16) |
| Group III (NaFt) | 606.442* (±6.48) | 101.62* (±8.68) | 614* (±11.268) | 8.2* (±0.0.72) | 16.82* (±0.036) |
| Group IV (NaF + Ot) | 572.267* (±4.62) | 87.48* (±4.52) | 380* (±8.42) | 10.84* (±0.082) | 13.14* (±0.032) |
| Group V (NaF+Vitamin C) | 66.731* (±3.14) | 84.189* (±4.12) | 151* (±08.14) | 11.22* (±0.12) | 13.86* (±0.064) |

All the values are means±SD of six individual observations. *Significant at $P<0.001$ with respect to normal control. AST: Aspartate aminotransferase; ALT: Alanine aminotransferase; ALP: Alkaline phosphatase; Ca: Calcium; PP: Phosphorus; SD: Standard deviation

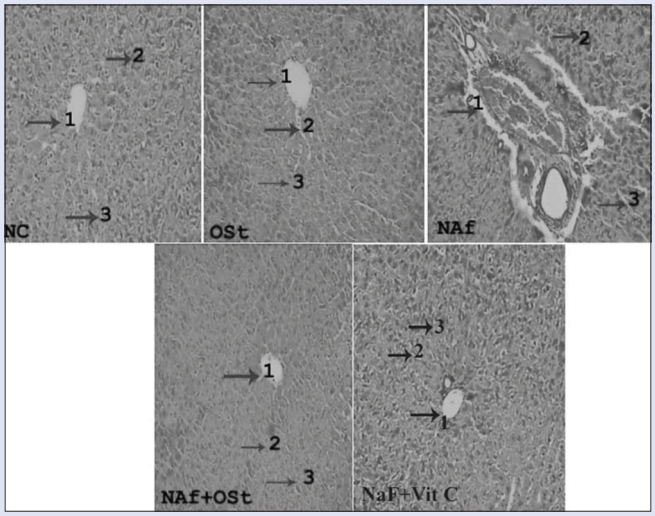

**Figure 4:** Effect of Carvacrol on Liver tissue in Fluorosis rats. (1) Normal Control (Nc). (i) Normal central vein, (ii) Normal hepatocytes, (iii) Normal sinusoids. (2) Carvocral treatment (OSt): (i) Nomal cenntral vein, (ii) Normal hepatocytes, (iii) Normal sinusoids. (3) Sodium fluoride (i) Degeneration of central vein, (ii) Degeneration of hepatocytes, (iii) Degeneration of sinusoids. (4) Sodium fluoride + Carvocral treatment (sodium fluoride + OSt) showed (i) Regeneration of central vein, (ii) Regeneration of hepatocytes, (iii) Regeneration of sinusoids. (5) Sodium fluoride + Vitamin C treatment (sodium fluoride + Vitamin C) (i) Regeneration of central vein, (ii) Regeneration of hepatocytes, (iii) Regeneration of sinusoids

Overall comparison of radical scavenging properties of ethanolic extract with standard ascorbic acid and α tocopherol showed that the OS has shown lower activity than standard, though it has a huge number of antioxidant compounds (found in GC–MS analysis). This difference could be due to the presence of individual antioxidant compounds in the extract which are lower at given concentrations, whereas ascorbic acid and α-tocopherol as standard and completely individual compound; hence, it ultimately showed rich antioxidant activity at tested concentrations than ethanolic extract.

The antioxidant property of active compounds in the ethanolic extract of OS was confirmed by DPPH radical, Hydroxyl, and $H_2O_2$ assays. The importance of these tests is likely to evaluate the antioxidant activity of OS.[22]

In the present investigation, the antioxidant enzymes SOD, CAT, GPx, GR, and GSH are depleted in NaF intoxicated rats. This shows that NaF supplementation for 60 days causes depletion of these antioxidant enzymes. This may be due to the oxidative stress and free radical production in NaF rats. However with Carvacrol of Ocimum treatment in NaF rats for 60 days reversed these antioxidant enzymes. Carvacrol may be responsible for the upregulation of antioxidant enzymes in NaF rats. Carvacrol treatment significantly recuperated the activities of antioxidant enzymes in NaF intoxicated rats [Figure 3].

Carvacrol supplementation may decrease the production of free radicals in fluorosis rats; this may cause up-regulation of antioxidant enzymes. Carvacrol treatment also decreased oxidative damage in NaF intoxicated rats. Hence, all the hepatic antioxidant enzymes are normalized with carvacrol treatment in NaF rats.

Oxidative stress is recognized to be associated with more than 100 diseases such as diabetes, hepatitis, and other diseases. There is a strong correlation between TBARS as a marker of lipid peroxidation and products that reflect oxidative damage to DNA. MDA and GST levels elevated in NAF rats. Oxidative stress in fluorosis rats may be responsible for upregulation of MDA and GST. However, carvacrol treatment, MDA and GST levels depleted in NaF rats [Figure 3].

Liver damage induced by NaF generally reflects disturbances of liver cell metabolism which lead to changes in the activities of many enzymes. AAT, AST, and ALKP are sensitive markers of liver toxicity and their elevated levels are indicative of cellular leakages and loss of functional integrity of cell membrane in the liver. In the current study, we reported significant elevation in AAT, AST, and ALKP activities in NaF intoxicated rats. This shows that during fluorosis condition hepatic cellular dysfunction may result in the upregulation of the liver markers. Whereas carvacrol supplementation depleted serum markers in NaF rats. This show the hepatoprotective activity of carvacrol. Carvacrol could minimize the production of toxic free radicals and enhance the activities of their scavengers, diminishing hepatocellular injury in NaF rats [Table 1].

Ca and $P_4$ are fluorosis markers. In our study, we reported that Ca levels decreased and $P_4$ levels increased in NaF intoxicated rats. This may be due to alterations in the metabolism of Ca and $P_4$. Whereas carvacrol treatment for 60 days, these fluorosis markers are came back to near to normal levels.

In the present study, we reported that fluorosis rat liver showed the degeneration of central vein, hepatocytes, sinusoids, and blood coagulation. However with carvacrol treatment regeneration of central vein, hepatocytes, and sinusoids are observed in NaF rats. This shows the hepatoprotective effect of carvacrol [Figure 4].

The antioxidant and free radical scavenging activities of OS might be due to the presence of phenolic compounds in extracts which is confirmed by phytochemical analysis. Furthermore, it can be concluded that the antioxidant activity of plant extracts is not limited to phenolics. Activity may also due to other antioxidant secondary metabolites, such as volatile oils, carotenoids, and vitamins.[23]

To summarize, the current investigation clearly confirmed that carvacrol bioactive compound of OS protects the hepatic tissue from NaF toxicity. In this study, we reported that antioxidant enzymes and liver markers are modulated with carvacrol treatment in NaF-induced fluorosis rats. This may be due to the free radical scavenging activity of Ocimum. Our gas chromatography–mass spectrometry analysis also confirmed the presence of many bioactive compounds in Ocimum and these compounds may have pharmacological activities. To the best of our knowledge, this study is the first report on the effect of Carvacrol of Ocimum in fluorosis rats.

*DOI:*
*10.2174/1381612826666200730221035*

**Abstract:** ***Background:*** The prevalence of diabetes in the world population hás reached 8.8 % and is expected to rise to 10.4% by 2040. Hence, there is an urgent need for the discovery of drugs against therapeutic targets to sojourn its prevalence. Previous studies proved that NF-κB serves as a central agent in the development of diabetic complications.

***Objectives*:** This review intended to list the natural plant compounds that would act as inhibitors of NF-κB signalling in different organs under the diabetic condition with their possible mechanism of action.

***Methods*:** Information on NF-κB, diabetes, natural products, and relation in between them, was gathered from scientific literature databases such as Pubmed, Medline, Google scholar, Science Direct, Springer, Wiley online library.

***Results and Conclusion*:** NF-κB plays a crucial role in the development of diabetic complications because of its link in the expression of genes that are responsible for organs damage such as kidney, brain, eye, liver, heart, muscle, endothelium, adipose tissue and pancreas by inflammation, apoptosis and oxidative stress. Activation of PPAR-α, SIRT3/1, and FXR through many cascades by plant compounds such as terpenoids, iridoids, flavonoids, alkaloids, phenols, tannins, carbohydrates, and phytocannabinoids recovers diabetic complications. These compounds also exhibit the prevention of NF-κB translocation into the nucleus by inhibiting NF-κB activators, such as VEGFR, RAGE and TLR4 receptors, which in turn, prevent the activation of many genes involved in tissue damage. Current knowledge on the treatment of diabetes by targeting NF-κB is limited, so future studies would enlighten accordingly.

**Keywords:** Diabetes, Insulin resistance, Hyperglycemia, NF-κB, Inflammatory mediators, Diabetic complications, Natural products.

## 1. INTRODUCTION

Plants are naturally available resources in discovering drugs for the treatment of many diseases. From past decades, pharmaceutical and chemical industries are looking towards plant compounds and their derivatives because of their potential action with safe and least side effects [1]. Plants produce secondary metabolites, such as phenols, flavonoids, terpenoids, alkaloids, tannins, iridoids, and others, to overcome their stress. However, humans found such metabolites as a good choice to treat many deadly diseases. Plant compounds with different chemical composition determine their interaction with disease-sensitive therapeutic target proteins where interaction causes structural changes in proteins leading to the suppression of damage associated with target protein [2]. Scientists identified many plant compounds that regulate the nuclear factor kappa B (NF-κB) in diabetes. We can find such regulations in this review in the following pages.

Diabetes is characterized into two categories; Type 1 diabetes (T1D) and Type 2 diabetes (T2D). Absolute lack of pancreatic beta islets leads to insufficient insulin release into the blood, which is the hallmark of T1D. Insulin secreted beta islets of the pancreas are destructed by the immune system of the body, which coincided with the hyperglycaemic condition of blood [3]. In T2D, secretion of insulin by the pancreas is normal, but insulin receptors cannot properly uptake blood insulin into cells; hence, it is called insulin resistance. This condition also increases blood glucose levels and leads to hyperglycemia. Hyperglycemia is common in T1D and T2D, causing too many complications in diabetic patient organs, such as kidney (Diabetic nephropathy), brain (diabetic neuropathy), eye (diabetic retinopathy), liver, heart (diabetic cardiomyopathy), skeletal muscle, endothelium, adipose tissue, and pancreas. Hyperglycemia induces overproduction of reactive oxygen species (ROS) and the formation of advanced glycation end products (AGEs), which initiate endothelial dysfunction and pro-inflammatory response through activation of NF-κB protein [4]. Activated NF-κB enhances the release of vascular cell adhesion molecules, cytokines, chemokines, and transforming growth factors. Subsequently, up-regulation of monocyte chemoattractant protein 1 (MCP-1), Tumor necrosis factor-alpha (TNF-α), interleukin 6 (IL6), interleukin 1β ( IL1β) and the cluster of differentiation 36 (CD36), leads to endothelial cell apoptosis and inflammatory process [5, 6].

NF-κB is a part of the Rel protein family consisting of evolutionarily conserved proteins that regulate many genes associated with inflammation and immunity. Rel family comprises five related proteins, such as NF-κB1/p50, NF-κB2/p52, RelA/p65, RelB and c-Rel [7]. The p50 and p52 are processed subunits from large precursor's p105 and p100, respectively, through the ubiquitin-proteasome pathway. These subunits lose their c-terminal regions holding ankyrin repeats, and they do not contain transactivation domains in their c-terminal region in contrast to RelA, RelB, and c-Rel but playing the main role in controlling the selectivity of NF-κB function [5]. This Rel protein family members together form homo and heterodimers, enter into the nucleus where they bind to deoxyribonucleic acid (DNA) regulatory sites, the so-called κB sites, and

activates specific gene expression. In general, these dimers present in the cytoplasm of the cell in inactive condition due to the association of inhibitor of NFκB (IκB) include IκBα, IκBβ, IκBγ (NEMO: NF-kappa-B essential modulator) and B-cell lymphoma 3 (Bcl-3) that belongs to IκB family. These inhibitor proteins have 6 to 7 ankyrin repeats, which mediate binding/mask to nuclear localization sequences (NLSs) of NF-κB dimers and retain in the cytosol. In addition to the above inhibitory proteins, large precursor proteins p105 and p100 of p50 and p52, respectively, possess ankyrin repeats; hence, they also kept in the IκB family [8]. During stimulus on various pathological conditions, activation of NF-κB takes place by the degradation of IκB proteins through polyubiquitination, which leads to the relieve of dimers that enter into the nucleus and bind to DNA for expression of genes.

Though there are multiple ways for activation of NF-κB, two major ways are classical/ canonical and alternative/ non-canonical pathways [9] (Fig. **1**). In the classical pathway, extracellular stimulus transforming growth factor b-activated kinase 1 (TAK1) induces the activation of a kinase complex inhibitor of nuclear factor kappa-B kinase-α (IKKα)-IKKβ-NEMO, which, in turn, phosphorylates IκBα to release heterodimer p50-RelA from the complex. On phosphorylation, IκBα is released from the complex to sequester and degraded by the ubiquitin-proteasome complex. Now, the heterodimer enters into the nucleus and triggers the gene expression. In an alternative pathway, upon activation of receptor signals, NF-κB-inducing kinase (NIK) induces IKKα homo dimer activation to phosphorylate p100, which is complexed with RelB protein. Phosphorylated P100 ubiquitinated and then further takes into proteasome processing to release p52; now, it forms p52-RelB heterodimer. This dimer enters into the nucleus and prompts gene expression by binding DNA [10, 11]. Overall, NF-κB is regulated by protein kinases, protein phosphatases, proteasome, ubiquitination and DNA binding phases, and these can be targets for any chemical molecule which may, in turn, inhibit the activity of NF-κB. Thus, the natural compounds may non-selectively inhibit NF-κB activity through the above-said targets, and such compounds have been considered as NF-κB inhibitors.

The explanation in the following pages describes how diabetes affects the organs of diabetic patients and their protection by plant compounds with reference to NF-κB (Table **1**). We also mentioned the mechanism of action of natural plant compounds on the NF-κB pathway (Fig. **2**).

## 2. DIABETIC COMPLICATIONS AND ANTI-DIABETIC COMPOUNDS

### 2.1. Diabetic Kidney

Diabetic nephropathy is an end-stage renal failure and chronic kidney disease associated with cardiovascular mortality in diabetic patients. Around 30 % of patients with diabetes suffer from diabetic nephropathy complications and ultimately undergo renal dialysis or transplantation [12]. The noticeable pathological changes in this condition are decreased glomerular filtration, persistent albuminuria, increased albumin creatinine ratio and interstitial tubule fibrosis [13]. Accumulation of fibroblasts, monocytes, T cells, and macrophages in the kidney of diabetic patients is a key hallmark for intrarenal tissue inflammation. Hyperglycemic condition accumulates AGEs, which activates the NF-κB pathway. IκBα-NF-κB p65-p50 complex dissociated by hyperglycemia, where NF-κB p65-50 translocates into the nucleus to promote the secretion of many pro-inflammatory cytokines, including Transforming growth factor-beta 1 (TGF-β1), interleukin-1 β (IL-1β), IL-6, MCP-1, and TNF-α, which lead to diabetic nephropathy deterioration [14, 15]. MCP-1 and intercellular adhesion molecule-1 ( ICAM-1) facilitate diabetic

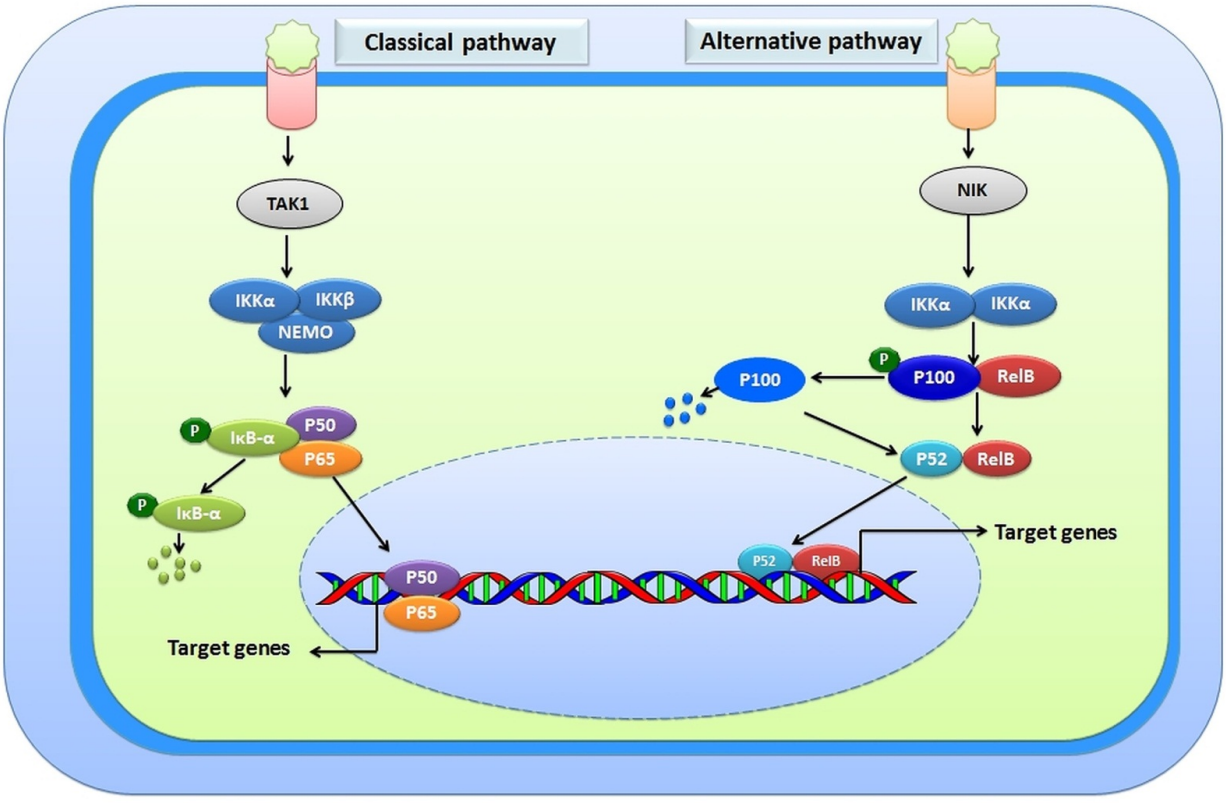

**Fig. (1).** Activation of NF-κB signalling through canonical and alternative pathways. (*A higher resolution / colour version of this figure is available in the electronic copy of the article*).

nephropathy by extravasating macrophages from the blood to the kidney [16]. Hyperglycemia upregulates protein kinase C (PKC), which in turn, activates TGF-β1, a member of the TGF-β family considered as a predominant pathogenic agent because it regulates tubulointerstitial and glomerular fibrosis by activating NF-κB canonical pathway and promoting massive production of collagen along with fibronectin in the kidney [17,18]. Nitric oxide (NO) plays a crucial role in modulating intraglomerular hemodynamics and in accumulating extracellular matrix in the kidney in chronic diabetic patients. One of the nitric acid synthase (NOS) isoform, i.e., inducible nitric acid synthase (iNOS), synthesizes a large amount of NO upon inflammatory stimulation. NO excess production in diabetic condition coincides with the adaptation of the renal tissue to dietary salt intake, diuresis and natriuresis [19, 20]. Oxidative stress is one of the most important factor for the development of renal complications in diabetes. The main reason for oxidative stress is the overproduction of ROS in the kidney. The mitochondrial protein sirtuin 3 (SIRT3) prevents this stress in diabetes and is responsible for the activation of cellular antioxidant superoxide dismutase (SOD) [21]. Additionally, nuclear factor erythroid-derived 2-related factor 2 (Nrf2) is a transcription factor that manages oxidative stress by activating oxidative enzymes that subsequently sustain cellular redox potential. Heme oxygenase-1 (HO-1) and NAD(P)H quinone oxidoreductase 1 (NQO1) are the Nrf2 upregulating genes for stress response. HO-1 and NQO1 both act as antioxidants and scavenge the diabetic induced ROS [22, 23]. Forkhead box O3a (FOXO3a) is a transcriptional activator that activated by sirtuin 1 (SIRT1), which in turn activates the cellular antioxidant genes, including catalase (CAT) and SOD which prevent the lipid peroxidation [24]. Nucleotide-binding oligomerization domain, leucine-rich repeat and pyrin domain 3 (NLRP3) inflammasome can involve in the cleavage of pro-inflammatory cytokines such as pro-IL-1β and pro-interleukin-18 (pro-IL-18) to IL-1β and IL-18 mature form respectively in diabetic nephropathy. Thioredoxin-interacting protein (TXNIP) acts as a mediator of oxidative stress by inhibiting thioredoxin during oxidative stress and hyperglycemic state. Importantly, TXNIP interacts with NLRP3 and causes insulin resistance in diabetes [25, 26]. SIRT1 enzyme plays a key role in the deacetylation of many regulatory proteins of the cell. Recently, it was noted that SIRT1 closely associates with metabolic adaptations of obesity and plasma glucose maintenance by regulating insulin secretion [27, 28]. Toll-like receptor 4 (TLR4) is a membrane receptor that involves a cascade of events when it is stimulated by lipopolysaccharide through lipopolysaccharide-lipopolysaccharide binding protein complex. In addition, activated TLR4 binds to the myeloid differentiation factor 88 (MyD88) for the production of pro-inflammatory cytokines (TNF-α, IL-1, and IL-6) via NF-κB mediator in the diabetic kidney [29]. Hyperglycemic condition enhances the formation of AGEs that interact on different cells with the receptor for advanced glycation end products (RAGE) and activates signals to produce cytokines such as NF-κB, TGF-β1 and TNF-α. These molecules increase extracellular matrix, induce thickening of the glomerular basement membrane and activation of myofibroblasts leads to irreversible tubular damage in the kidney [30, 31]. Besides, matrix metalloproteinases (MMP) such as MMP-2 and MMP-9 are proteolytic enzymes, which play an important role in regulating the extracellular matrix and the proliferation of mesangial cells. Thus, their significant overexpression has been identified in diabetic nephropathy [32].

### *2.1.1. Diabetic Kidney Protection by Plant Compounds*

The anti-inflammatory effect of astragaloside IV was proved in streptozotocin (STZ) induced diabetic rats. Renal tissue inflammation of diabetic rats was decreased by the astragaloside IV through inhibiting NF-κB pathway associated genes expressions such as collagen, ICAM-1, TNF-α, MCP-1 and NF-κB p65 [33]. In another study, a natural iridoid glucoside compound aucubin protected kidney cells of high-fat diet and STZ induced diabetic nephropathy in C57BL/6 mice. Aucubin has elevated the antioxidant defense in diabetic mice by triggering NQO1, HO-1, SOD, CAT, Nrf2, FOXO3a, SIRT1, and SIRT3 genes. Nephropathy associated inflammation was significantly reduced by modulating expression levels of TNF-α, IL-6, IL-1β, Phospho-IκBα (p-IκBα), IκBα and NF-κB p65 [34]. A flavonoid baicalein compound has been tested for nephroprotective effects on a high-fat diet and STZ-induced T2D wistar strain rats. By preventing NF-κB activation, suppressing iNOS, and TGF-β1 expression, baicalein mitigated oxidative stress and reduced inflammation. This compound also reduces the pro-inflammatory cytokine levels, such as TNF-α, IL-1β and IL-6 [35]. Another natural compound berberine is an isoquinoline alkaloid present in *Cortex phellodendri,* and *Berberis vulgaris* plants exhibited renal protection in STZ induced diabetic rats. Berberine reduced renal inflammation by decreased control of IL-1β, IL-6, MCP-1 and inhibition of p65, IκBα and TLR4 indicates that compound protected renal tissue through blockage of TLR4/NF-κB pathway [36]. Cepharanthine and piperine have protected the diabetic nephropathy in Sprague dawley diabetic rats induced by STZ. These compounds protected the kidney by modulating expression levels of the inflammasome, such as TXNIP, NLRP3, IL-1β, TNF-α and NF-κB [37]. In STZ-induced diabetic male sprague-dawley rats, diabetic nephropathy complication, the nephron inflammation and chlorogenic acid anti-inflammatory property were focused by Bao *et al*. (2018). Chlorogenic acid exhibited renal tissue protection in diabetes by activating Nrf2/HO-1 that inhibits NF-κB transcriptional cascade [38]. Diosmin exhibited nephroprotective property in diabetic wistar strain rats induced by alloxan monohydrate through controlling inflammatory cytokines and oxidative stress markers. Diosmin elevated the endogenous antioxidant enzymes, such as SOD, CAT and reduced the lipid peroxidation. Diabetic rats treated with diosmin showed that downregulation of inflammatory mediators such as IL1β, IL-6, TNF-α and NF-kB -p65 [39]. Renal tissue ameliorative effect of ellagic acid was taken to attention in high-fat diet supplement and STZ induced diabetic rats (HFD/STZ). HFD/STZ complications of diabetic nephropathy were significantly reduced by the ellagic acid by suppressing TGF-β, fibronectin in renal tissue. Ellagic acid also reduced the pro-inflammatory cytokines, such as IL-1β, TNF-α in serum. Moreover, ellagic acid inhibited the NF-κB activation in high glucose stress-mediated NRK52E proximal tubular epithelial cells of rats in *invitro* [40]. Genistein also nullified renal podocyte abnormality, inflammation and fibrosis by reducing the expressions of NF-κB p65, TGF-β1 and RAGE in the renal tissue [41]. Diabetic kidney in STZ-induced wistar strain male albino rats was protected by hesperidine and quercetine through elevating the SOD, CAT and SIRT1 levels. Both compounds significantly reduced the oxidative stress in the kidney. These also decreased the lipid peroxidation (Malondialdehyde (MDA) content) and NF-κB expression in diabetic conditions [42]. The effect of marein, a natural compound from *Coreopsis tinctoria,* was tested in rat mesangial cells for anti-renal inflammation under a high concentration of glucose. Marein potentially inhibited hyperglycemia-induced inflammation by down-regulating MCP-1, NF-κB p65 proteins in rat mesangial cells [43]. The renal protective function of naringenin in high-fat diet and STZ induced diabetes in male BALB/cA mice were tested at different doses. Naringenin nullified the kidney inflammation by reducing inflammatory markers such as NF-κB, IL-1β, IL-6, MCP-1, TGF-β1, NF-κB p65, NF-κB p50, PKC and collagen [44]. Diabetic nephropathy complications were ameliorated by salvianolic acid B in high glucose-induced mesangial cells. Salvianolic acid B exhibited potentiality against hyperglycemia by modulating MMP-9 and MMP-2 activities by way of NF-κB inhibition [45]. In another study, male wistar strain albino rats induced to diabetes by fed with a high-fat diet and a low dose of STZ. When they were treated with swertiamarin, the kidney was protected by decreasing NF-κB p65 by suppressing the expression of pro-inflammatory genes, such as IL-6, TNF-α and IL-1β in both tissue and plasma [46]. Ursolic acid present in many

plants was exhibited anti-inflammatory properties in diabetic rats and kidney cells *in vitro*. Ursolic acid prevented the diabetic nephropathy by modulating the expression levels of TLR4 pathway associated genes such as TLR4, MyD88, NF-κB, TNF-α, IL-1β, IL-6 and IL-18 levels in kidney of diabetic rats and hyperglycaemic kidney cell lines *in vitro* [47].

### 2.2. Diabetic Brain

Diabetic neuropathy is a common pathological condition in diabetes which impair both somatic and autonomous nervous system. The plethora of changes such as loss of sensation, impaired cardiovascular control, and diarrhoea, problems of diabetic foot, and impotence and tendon reflexes in patients with diabetes affects the quality of life, and sometimes life risks [48]. Molecular evidences in experimental animals revealed that AGEs, oxidative stress, polyol pathway activity, alteration in cholesterol and fatty acid metabolism in neuropathy consequences changes in signalling pathways, such as mitogen-activated protein kinases (MAPKs), NFκ-B p50/p65 and poly(ADP-ribose) polymerase (PARP). Expressed NFκ-B further initiates the inflammation in nerve cells by producing pro-inflammatory cytokines, such as TNF-α, IL-1β, IL-6 [49]. IKKβ/NF-κB inflammatory pathway is identified as a critical hallmark in the development of hypothalamic insulin resistance and glucose tolerance. Whereas, reduced neuropathy complications were observed in IKKβ/NF-κB inhibited high-fat diet-induced obesity and associated diabetic animals [50]. Elevated blood glucose is closely linked to neuronal damage. Glucose toxicity in neurons is due to intracellular oxidation of glucose that leads to excessive ROS generation and decreases antioxidant enzymes such as SOD, CAT and Glutathione (GSH) content [51]. Clinical studies have found that neuronal disruption was coinciding with elevated glucose levels in diabetic patients. In animal studies, diabetes induced by STZ and infused glucose was promoting apoptosis in neurons and schwann cells. Oxidative stress can stimulate changes in animals with diabetes, including apoptotic caspase-3 [52]. Nrf2 is a transcription factor, reported to reduce ageing and other chronic diseases that occurred from oxidative stress. An increased level of Nrf2 by many natural compounds in diabetic rats improves the cytoprotective and antioxidant enzyme HO-1[53]. The upregulation of cyclooxygenase-2 (COX-2) is occurred in neurons of diabetic animals by inflammatory stimuli, oxidative stress, hyperglycemia, and PKC activation [54]. In ischemic diabetic brain injury, high-mobility group box1 (HMGB1), a non-histone DNA binding protein induces severe inflammation of the brain through the NF-κB pathway [55].

#### *2.2.1. Diabetic Brain Protection by Plant Compounds*

Male mice (C57BL/6J) transferred into diet-induced experimental diabetic animals and supplemented with a natural dietary flavonoid butein compound to know the anti-diabetic character. By inhibiting IKKβ/NF-κB signalling, butein significantly prevented inflammation of the hypothalamus nerves in high-diet induced obesity animals [56]. Chrysin is a naturally occurring flavonoid compound that exhibits neuroprotective property in STZ induced diabetes rats. Oxidative stress, altered inflammatory markers (NF-κB p65, IL-6, IL-1β, TNF-α) and apoptosis (caspase-3) were observed in the diabetic cerebral cortex and hippocampus. Chrysin reduced oxidative stress, inflammation and apoptosis via the NF-κB pathway in diabetic rats [57]. A flavonoid compound fisetin was shown therapeutic potential in diabetic neuropathy of diabetic rats induced by STZ. Fisetin therapeutic benefit was confirmed by its regulating effect on Nrf2, IL-6, COX-2, HO-1 and NF-κB profile in sciatic nerves [49]. Quinolizidine alkaloid, the oxymatrine, has declined the diabetes-associated cognitive impairments in STZ induced wistar strain male albino rats. Oxymatrine declined the diabetic complications such as Oxidative stress through decreasing lipid peroxidation, increasing SOD activity and GSH content, inflammation by inhibiting IL-1β, TNF-α and NF-κB p65 expressions; and apoptosis by suppressing caspase-3 activity on the dose-dependent manner in cerebral cortex and hippocampus of the diabetic brain [58]. Rosmarinic acid exhibited neuroprotective activity in STZ induced diabetic rats. It was noted that the rosmarinic acid protective role related to decreased brain edema, inhibited NF-κB p50/p65 and reduced HMGB1 expression [55]. By targeting Nrf2/HO-1/NF-κB and COX signalling cascades, rutin combination with nimesulide exhibited neuroprotective role in diabetic rats induced by STZ. Rutin significantly decreased the oxidative stress through elevating SOD, CAT activity and GSH content. Rutin protected the sciatic nerves from inflammation and apoptosis by decreasing NF-κB p65, TNF-α, Nrf2, HO-1 and caspase-3 markers in diabetic rats [59]. Tocotrienol prevented diabetes neuropathy complications in STZ induced diabetic rats by suppressing inflammation and apoptosis. Hyperglycemia associated inflammation was suppressed by tocotrienol through the anti-inflammatory property by reducing expression levels of NFκB p65, TNF-α and IL-1β. It also prevented the tissue damage from caspase-3 expression, an apoptotic marker in the hippocampus and cerebral cortex of diabetic rats [60].

### 2.3. Diabetic Eye

Oculopathy in diabetic patients is closely associated with microvascular complications, which lead to blindness, also called diabetic retinopathy. Based on ophthalmoscopically visible vascular lesions, diabetic retinopathy is divided into proliferative, non-proliferative, and diabetic macular oedema [61]. In proliferative, the occurrence of characteristic fragile new aberrant vessels is visible whereas, symptoms in non-proliferative include retinal haemorrhages, lipid exudates and microaneurysms vascular tortuosity. Diabetic macular oedema associate with the accumulation of fluid in the neural retina, thickening the retina and cystoid macula oedema [62]. The prevalence of diabetic retinopathy from 2.6 million people in 2015 to 3.2 million people in 2020 poses an unprecedented global burden [63]. Diabetic retinopathy occurs in many pathways but, NF-κB activation and resulted cascade of events are playing a crucial role. Hyperglycemic condition in diabetic patients increases the accumulation of AGEs and ROS. These activate the NF-κB p65, which, in turn, is responsible for the production of pro-inflammatory cytokines (IL-6, IL-1β), chemokines, and acute-phase proteins. All these substances are accountable for the inflammatory response in the eye by recruiting monocytes and leukocytes [64]. A pleiotropic cytokine TNFα has multiple roles in cellular functions. In retinal pathology, it is associated with diabetic macular oedema, neovascular age-related macular degeneration, diabetic retinopathy, and retinal venous occlusion [65-67]. Ca2+/calmodulin dependant protein kinase II (CaMKII) is a threonine/serine kinase that synchronizes damage of retinal ganglion cells and also releases inflammatory mediators through the mediators of the NF-κB pathway. The most common symptoms in diabetic retinopathy are inflammation and microvascular complications of retinal cells, which correlate with the release of ICAM-1, iNOS, and vascular endothelial growth factor (VEGF) by activated CaMKII / NF-kB [68]. Excess generation of free radicals in different parts of the eye leads to oxidative stress. The cellular antioxidant enzyme system involves the transfer of electrons from the substrate to free radicals. The most important antioxidants present and protect the eye from ROS is SOD, CAT, and GSH content of cell [69].

#### *2.3.1. Diabetic Eye Protection by Plant Compounds*

Catechin, flavan-3-ol, a type of natural phenol and antioxidant, was examined for anti-diabetic retinopathy in STZ induced diabetic rats. Downregulation of NF-κB p65 and p-NF-κB p65 and TNF-α, IL-1β, and IL-6 in catechin treated diabetic rats conformed that catechin prevented retinal inflammation by inhibiting NF-κB pathway [70]. TNFα is a cytokine induces pro-inflammatory changes in diabetic retinopathy. Chebulagic acid, chebulinic acid, and gallic acid were tested for TNFα induced pro-inflammatory changes in retinal-choroid microvascular endothelial cells (RF/6A). These

compounds were inhibited TNFα induced pro-inflammatory changes in RF/6A cells by preventing phosphorylation on NFκB [67]. Curcumin's anti-inflammatory activity prevented the complications of the diabetic retinopathy associated pathway, such as CaMKII / NF-kB and its downstream proteins VEGF, iNOS and ICAM-1in alloxan-induced diabetic male spargue–dawley rats [68]. The protective role of naringin on diabetic retinopathy complications was proved in male experimental rats and muller cell lines (rMC1). STZ induced diabetic rats and high glucose-induced rMC1 treated with naringin exhibited decrease diabetic retinopathy complications through its antioxidant property by up-regulating GSH, SOD and CAT; and down-regulating anti-inflammatory markers, such as TNF-α, IL-1β, IL-6 and NF-κB p65 [71]. Resveratrol is a polyphenolic phytoalexin, which is abundant in many fruits. It exhibited inhibition of diabetic retinopathy in streptozotocin-nicotinamide induced diabetic male wistar rats. Resveratrol showed this property by scavenging free radicals induced oxidative stress by modulating SOD, Glutathione disulphide (GSSG)/GSH ratio and 8-isoprostane; and anti-inflammatory action through decreasing NF-κB p65 expression in retina [72].

### 2.4. Diabetic Liver

Insulin and its counter-regulatory hormones are targeting the liver. The most important thing to notice is that chronic liver disease coincided with glucose intolerance and diabetes. Chronic liver injury is acquaintance with inflammation and its promotion for a long time leads to hepatic fibrosis and hepatocellular carcinoma. In the mouse model, removal of NF-κB regulators causes unstructured liver injury, fibrosis and liver cancer [73]. In insulin resistance diabetes, IkB kinase complex (IKKα and IKKβ) is essential to control the stimulated activation of NF-κB p50/p65. A previous study reported that activated IL-6 and TNF-α by NF-κB p50/p65 again activate the insulin receptor substrate 1 (IRS-1) to withstand the development of insulin resistance [74]. In diabetic patients, several pathways have been identified that cause liver damage. The causative factors of liver damage are hyperglycemia and compensatory hyperinsulinemia. Among insulin-sensitive tissues, the liver is the one affected by the hyperglycemia-induced oxidative tissue damage. Oxidative stress decreases the activity of antioxidant enzymes such as SOD and CAT, also increases lipid peroxidation in the liver [75]. TLR4 is one of the receptors involved in inflammatory diseases, which leads to macrophage infiltration contributing to liver damage in experimental models of diabetes. TLR4 activates the NF-κB pathway through an intermediate MyD88, which results in the production of pro-inflammatory cytokines like IL-1β, IL-6 and TNF-α. Downregulation of TLR4/ MyD88/NF-κB genes in diabetic animal models exhibited a remarkable reduction of liver damage and fibrosis [76-78]. The farnesyl X receptor (FXR) is a member of nuclear receptor family present ubiquitously in all tissues but highly existent in the liver. FXR maintains levels of bile acids, glucose, cholesterol and lipids by promoting bile acids released from the liver, inhibiting bile acids synthesis and intestinal absorption [79]. It regulates energy homeostasis, insulin sensitivity and lipid metabolism, which are closely associated with diabetes. FXR activation increases hepatic glycogen synthesis, glycogen content and suppresses hepatic gluconeogenic expression through a mechanism involving enhanced insulin sensitivity [80]. Also, it regulates many downstream genes responsible for liver cirrhosis, toxic liver damage and hepatitis. FXR interacts and suppresses the activity of the NF-κB, which results in prevention of liver damage from inflammation [81, 82].

#### *2.4.1. Diabetic Liver Protection by Plant Compounds*

Han *et al.* (2016) attempted to elucidate the liver-protective role of celastrol in T2D caused by a high-fat diet. Real-time polymerase chain reaction (RT-PCR) analysis found that up-regulation of TLR4, MyD88, NF-κB, IL-1β, and TNF α in diabetic conditions. Whereas, all expression levels of the above said the treatment with celastrol downregulated inflammatory markers in the liver. It is clear that celastrol prevented liver damage by inhibition of TLR4/MyD88/NF-κB signaling pathway [78]. Luo *et a.l* (2015) had been designed to test whether or not kaempferol could minimize insulin resistance by inhibiting inflammatory cascade in hepatic tissue of diabetic rats. STZ induced diabetic rats fed with high-fat diet were treated with kaempferol revealed the inhibition of phosphorylation of IRS-1, NF-κB p65, IKKα, IKKβ, TNF-α and IL-6 levels. It is clear that kaempferol induces down-regulation of IKK and subsequent inhibition of NF-κB pathway in diabetes conditions [74]. Leonurine /SCm-198 is an alkaloid found in Herba *leonuri* plant reduced T2D in db/db mice at 200 mg/kg of body weight. After 3 weeks of treatment, leonurine reduced diabetes complications in the liver by inhibiting the NF-κB/IKK pathway [83]. Diabetic liver in STZ-induced wistar strain male albino rats was protected by hesperidine and quercetine through elevating the SOD and CAT levels. They also decreased lipid peroxidation (MDA content) and NF-κB expression in diabetic conditions [42]. In C57BL/6 mice liver and HepG2 (ATCC) cells, silymarin, a natural compound that nullifies high-fat diet, caused complications, such as obesity, hyperglycemia, insulin resistance and fatty liver through FXR/NF-κB pathway. High-fat diet complications associated closely with inflammation. FXR signal modulates the inflammation by NF-κB in these conditions [82]. A high-fat diet and a low dose of STZ induced diabetic rats treated with swertiamarin were protected by decreasing NF-κB p65 in the liver tissue, whereas expression of pro-inflammatory genes such as IL-6, TNF-α and IL-1β in both tissues and plasma were suppressed [46].

### 2.5. Diabetic Heart

Cardiomyopathy and heart failure are the main causes of two-thirds of diabetic patient deaths. Diabetic cardiomyopathy leads to systolic and diastolic dysfunction due to decreased compliance, excessive relaxation and diminished contractility of the heart [5]. Increased ROS results in the production of inflammatory cytokines. In myocardial injury, the up-regulation of IL-6, IL-1β, and TNF-α takes place [84]. Patients with heart failure for various reasons revealed the activation of NF-κB p65 and its regulated genes. In diabetic patients, a high amount of circulating glucose, low-density lipoproteins and very-low-density lipoproteins stimulate the NF-κB activation [85]. Cardiac inflammation in diabetes is preceded by the augmented expression of VCAM-1 and ICAM-1. These molecules facilitate the transendothelial movement of immunocompetent cells into heart tissue due to its particular counter receptors, such as macrophage integrins and leukocyte integrins. These invading cells and also cardiomyocytes produce pro-inflammatory cytokines like TNF-α, IL-18 and IL-1β [86]. During chronic hyperglycemia, AGEs are produced extra and intracellularly. AGEs interact with RAGEs, which leads to a cascade of events, such as extracellular matrix accumulation, oxidative stress, and increased inflammation, which promote the myocardial tissue damage [87]. Hyperglycemia induced superoxide radicals favour augmented expression of iNOS through the activation of NF-κB. iNOS involves excess production of NO; consequently, its active products attack biomolecules of the myocardium, leading to cardiovascular dysfunction [88]. Nrf2 is a transcription factor essential for the activation of HO-1, NQO-1 and SOD. These enzymes play an important role in the attenuation of free radicals generated by oxidative stress in the heart by diabetic inducers [89]. Hyperglycemia in STZ rats increases the apoptotic protein Bcl-2 associated X (Bax) and decreases the Bcl-2 suggesting that the toxicity of glucose in the heart causes tissue damage by apoptosis [90].

#### *2.5.1. Diabetic Heart Protection by Plant Compounds*

High glucose supplemented human coronary artery endothelial cells (HCAECs) are used as diabetic experimental cell lines. HCAECs are treated with cannabidiol exhibited anti-glycaemic property. This compound protected the cardiac cells by inhibiting

the genes associated with hyperglycemic complications such as ICAM-1, VCAM-1, IκB-α, NF-κB-p65 and iNOS; also reduced the monocyte adhesion to the endothelial cells, disrupted endothelial barrier function, mitochondrial superoxide radical and 3-NT formation [91]. Luteolin, a flavonoid was examined for the cardioprotective role in STZ induced diabetic mice and H9C2 cells in *in-vitro*. Luteolin reduced the cardiac dysfunction, hypertrophy, fibrosis, inflammation by modulation of Nrf2 mediated oxidative stress (Nrf2, HO-1, NQO-1 and SOD), and inflammatory responses mediated by NF-κB (IκBα, TNF-α, VCAM, iCAM, IL-6, IL-1β and MCP-1) in diabetic cardiomyopathy [92]. Mangiferin exhibited a cardioprotective role in high-fat diet and low dose STZ induced diabetic rats due to its anti-inflammatory, anti-diabetic properties. Mangiferin declined the inflammatory mediators (TNF-α, IL-1β, NF-κB p65), reduced AGEs formation by inhibiting RAGE and prevention of ROS production [93]. Piceatannol is a resveratrol analogue improved the myocardial function in diabetic cardiomyopathy in both hyperglycaemic H9C2 cardiac myoblasts cell lines and STZ induce diabetic male Sprague–Dawley rats. Piceatannol reduced the inflammatory cascade markers TNF-α, IL-6, Nrf2, HO-1 and NF-κB p65 and also inhibited the apoptosis by decreasing Bax and Bcl-2 proteins levels in cardiac cell lines. Similarly, piceatannol also exhibited cardiac protection in animal models by declining oxidative stress, inflammation and apoptosis, as mentioned in hyperglycaemic H9C2 [92]. Diabetic male Sprague–Dawley rats induced by STZ were treated with triptolide reduces the complication accompanying with diabetic cardiomyopathy. Western blotting and RT-PCR analysis explored that triptolide reverses the expression of STZ induced inflammatory markers, such as TNF-α, IL-1β, iCAM-1, VCAM-1, NF-κB-p65 in cardiac tissue of diabetic rats. In hyperglycemic H9C2 rat cardiac cell lines, triptolide also decreased the expression levels of TNF-α and NF-κB p65 [94].

### 2.6. Diabetic Skeletal Muscle

Diabetic patients regularly suffer from muscle atrophy, are caused by increasing molecular events like contractile protein degradation by caspase-3 mediated apoptosis, activation of lysosomal-proteasome and ubiquitin-proteasome. Much scientific evidences indicate that inflammation-sensitive NF-κB pathway leads to muscle atrophy in diabetes. It has been demonstrated that free fatty acids activate NF-κB and its nuclear translocation. This has impaired the sensitivity to insulin in skeletal muscle cells [95].

#### *2.6.1. Diabetic Skeletal Muscle Protection by Plant Compounds*

An experiment with *Astragalus* polysaccharide (APS) was tested for anti-diabetic property in palmitate prompted insulin resistance in C2C12 skeletal muscle myotubes. In Palmitate induced insulin resistance model, APS regulated the NF-κB pathway by inhibiting expression of NF-κB p65, activation of stress kinase IKKα/β and the restoration of IκBα [96].

### 2.7. Diabetic Endothelial Cells

Diabetic endothelial dysfunction is associated with adhesion of leukocytes to the endothelium and expression of cell adhesion molecules (CAMs). Endothelial selectin (E-selectin) and VCAM-1 are CAMs that are over-expressed by endothelial cells under hyperglycemia. Owing to the large number of leucocytes adhering to vascular endothelium, the endothelium transmigration, and dysfunction can occur [97, 98]. An apoptosis warning due to mitochondrial damage was observed in endothelial cells treated with high glucose [99]. A previous study reported decreased concentration of anti-apoptotic protein Bcl-2 whereas, increased concentration of apoptotic proteins such as bax, cytochrome c and caspase-3 in endothelial cells under high glucose condition. It also found that the hyperglycemic state increased the development of ROS, which regulates the inflammatory marker proteins IκB-α and P65 in endothelial cells [100].

#### *2.7.1. Diabetic Endothelial Cells Protection by Plant Compounds*

Wang *et al*. (2010) conducted an experiment with human umbilical vein endothelial cells (HUVECs) induced by high glucose and treated with geniposide. Geniposide inhibited the cell adhesion, expression of E-selectin, and VCAM-1 by reducing ROS production and NF-κB pathway under hyperglycemia [101]. High glucose-mediated inflammation of the endothelial cells and apoptosis is significantly reduced by pre-treatment of the alkaloid neferine in HUVECs. Neferine decreased apoptosis by cleavage of caspase-3 and increasing the expression of Bcl-2 protein; decreasing Bax and cytochrome C. It also suppressed the endothelial cells' inflammation by decreasing IκB-α and p65 protein expression [100].

### 2.8. Diabetic Adipose Tissue

Adipose tissue is not only the tissue that stores fats and regulation of lipid metabolism but also involved in immune functions [102]. Adipocytes secrete mediators such as TNF-α, IL-1β, IL-6 and MCP-1 and many others [103]. Systemic diabetic insulin resistance can induce the production of pro-inflammatory cytokines in adipose tissue. An increased level of MCP-1 was observed in the adipose tissue of diabetic patients. MCP-1 functionally induces monocyte infiltration in adipose tissue, which in turn promotes pro-inflammatory cytokines release from adipocytes and invasive macrophages [104]. Increased levels of TNF-α, IL-1β were identified in Vietnamese patients with T2D [105]. Nitrosative stress in adipose tissue by iNOS enzyme produced NO acts with ROS playing an important role in the impairment of adipocyte function [106]. NF-κB and c-Jun N-terminal Kinase (JNK) are very critical pathways under insulin resistance which are involved in inflammation of adipocytes. JNK and IKKβ activities are both increased in high fat diet-induced obese mice and humans with inflamed adipose tissue. In addition, knockout of IKKβ or JNK in immune cells protect mice from the insulin resistance in adipose tissue caused by a high-fat diet [107-109]. Treatment of inflamed adipose tissue under hyperglycemia with plant compounds upregulates the anti-inflammatory agents such as IL-10, C-Type Lectin Domain Containing 7A (Clec7a), Macrophage galactose-type lectin 1 (MGL1) and arginase 1 [110]. Peroxisome proliferator-activated receptor (PPAR) is primarily localized highly in the brown adipose tissue and liver, whereas, it is the present to a lesser extent in kidney, heart and skeletal muscle. Based on the distinct distribution of PPARs that can be divided into three isoforms such as α, β and γ, PPARγ again divided into two subforms such as PPARγ1 and PPARγ2. PPARs are type II nuclear hormone receptors that contribute to the regulation of carbohydrate and fatty acid metabolism. PPARs also regulate the activity of nuclear factors belonging to inflammatory and immune-modulatory responses [111]. In diabetes, PPARα exhibits anti-inflammatory property by negatively regulating NF-κB and activator protein-1 (AP-1) and upregulating IκBα, an NF-κB inhibitor. PPARα is also reducing adipose tissue inflammation and fat-beta oxidation genes expression. In addition to this, it also regulates the COX-2, VCAM-1 and IL-6 as a part of anti-inflammatory activity. Besides, the anti-inflammatory action of PPARβ is carried via NF-κB by suppressing COX-2 and iNOS. On the other hand, PPARγ also exhibits the anti-inflammatory property by inhibiting cytokines, chemokines via NF-κB [112, 113]. In T1D rats, mice and humans isolated macrophages and monocytes exhibited overexpression of long-chain acyl-CoA synthetase 1 (ACSL1), an enzyme that involved in thioesterification of fatty acids [114].

#### *2.8.1. Diabetic Adipose Tissue Protection by Plant Compounds*

Takimoto *et al*. (2014) isolated 4β-Hydroxywithanolide E (4βHWE) compound from *Physalis pruinosa calyx* and its anti-diabetic ability was examined in adipocyte culture and db/db mice with emphasize on inflammation. The NF-κB activity was inhibited by the compound by blocking NF-κB translocation into the nucleus. In addition, 4βHWE reduced the pro-inflammatory cytokines IL-6,

**Table 1. Representation of anti-diabetic plant compounds targeting NF-κB.**

| S.No | Compound Name | Compound class | Dose studied | Pubchem Id | Source of plant | Reference |
|---|---|---|---|---|---|---|
| **Kidney protective compounds** | | | | | | |
| 1 | Astragaloside IV | Terpenoid | 10 mg/kg/b.w rats | 13943297 | *Astragalus membranaceus,* | [33] |

**Fig. (2).** Schematic representation of the proposed mechanism in which NF-κB acts as a central agent responsible for tissue damage in diabetes through inflammation and apoptosis. (*A higher resolution / colour version of this figure is available in the electronic copy of the article*).

TNF-α and MCP-1 in diabetic conditions [115]. Catalpol exhibited hypoglycemic property in high-fat diet-induced diabetic male C57BL/6J mice. Catalpol reversed the adipose tissue inflammation through decreasing macrophage infiltration, IL6, IL-1β, iNOS, MCP-1, and TNF-α. On the other hand, catalpol increased the expression level of anti-inflammatory genes such as IL-10, Clec7a, MGL1 and arginase 1 in adipose tissue. Catalpol also inhibited NF-kB and JNK pathways by suppressing NF-κB subunit p50, phos-

phorylation of both JNK and IKKβ [110]. Anti-hyperlipidemic, anti-diabetic and anti-inflammatory properties of tilianin were found in non-insulin-dependent diabetes mellitus and 3T3-L1 adipose cell lines. Tilianin exhibited hyperlipidemic activity by diminishing triacylglycerides and cholesterol; anti-inflammatory nature due to decreasing IL-1β and IL-18, NF-κB expressions in diabetic condition. In 3T3-L1 cells, tilianin increased PPARα and ACSL1 expression levels, given clarity that it has anti-hyper lipidic property [116].

### 2.9. Diabetic Pancreas

Diabetes mellitus is a progressive disease induced by chronic hyperglycemia and insulin resistance in which the pancreas is the organ most affected. The size of the pancreas decreased in T1D and T2D due to the loss of beta islets and next to apoptosis [117,118]. Caspase-3 is an apoptotic protein. Caspase-3 knocked mice supplemented with diabetic inductive agent STZ showed no diabetes complications in beta islets of the pancreas. Hence, caspase-3 is obvious to be the most important protein in pancreatic islet apoptosis [119]. Bcl-2 is a pro-survival protein of apoptosis, indicating that increased Bcl-2 decreases apoptosis. At the same time, bax is a pro-apoptotic protein that increases cell death by promoting caspase cascade [120]. There has been scientific evidence that damage the viability of beta-cells is caused by the infiltration of immune cells and inflammatory cytokines resulted in oxidative stress and endoplasmic reticulum stress. In the initial stages of diabetes, inflammatory cell infiltration encourages cytokines to release such as IL-1β, interferon γ (IFN γ) and TNF α through the NF-κB pathway. In addition, the combination of IL-1β/IFN or IL-1β/TNF α or IL-1β alone activates the iNOS enzyme that induces NO production in the beta islets of the diabetic pancreas [121-124]. Excessive production of NO causes insulin secretion impairment and triggers β cell death due to protein modification, mitochondrial metabolism dysfunctions and DNA damage [125]. SIRT1is a member of histone/protein deacetylases involved in the inhibition of inflammation. Its expression has been observed in endocrine cells of the Langerhans islets. It prevents the inflammation in β-islets by inhibiting NF-κB by deacetylating p65. In the diabetic pancreas, overproduction of ROS causes declined antioxidant enzyme SOD and increased lipid peroxidation [126, 127].

#### 2.9.1. Diabetic Pancreas Protection by Plant Compounds

INS-1, a rat insulinoma cell lines, were supplemented with IL-1β for the induction of cell apoptosis. INS-1 treated with formononetin significantly prevented the apoptosis induced by IL-1β by reducing the Caspase-3 and Bax / Bcl-2 ratios. It also protected the pancreatic cells by preventing the NO production through inhibition of NF-κB, which is essential for the production of iNOS [128]. Genistein was tested for the anti-inflammatory agent in ovariectomized diabetic rats induced by STZ. Pancreatic tissue inflammation was observed in diabetic rats, but the same was declined in genistein-treated diabetic rats due to reduced expression of inflammatory agents such as IL-1β, NF-κB and increased SIRT1 [129]. In another experiment, cytokines IL-1β and IFN-γ stimulated inflammation in RINm5F cells were abrogated by the natural flavonoid compound icariin. Destruction of insulin-producing pancreatic β cells occurs in T1D due to the action of autoimmune cells. Icariin inhibited cytokines induced inflammatory pointers such as NO production, caspase-3, cleavage of PARP and NF-κB p65 [130]. In an experiment with male Wistar strain albino rats induced to diabetes by fed with a high-fat diet and a low dose of STZ treated with swertiamarin was protected by decreasing NF-κB p65 in the pancreas whereas, expression of pro-inflammatory genes such as IL-6, TNF-α and IL-1β in both tissues and plasma were suppressed [46]. Tetrandrine reduces diabetes mellitus in allaxon induced rats. This compound exhibited ant-diabetic property by decreasing oxidative stress (SOD, MDA, and ROS), downregulating TNF-α ,NF-κB, and upregulating IκBα in pancreatic islets [127].

## CONCLUSION

By having gathered all information, we conclude that diabetes is the metabolic disorder that causes alterations in the homeostasis of cells in association with hyperglycemia and insulin resistance. Oxidative stress, inflammation, and apoptosis are the major culprits in organs, such as kidney, brain, eye, liver, heart, skeletal muscle, endothelium, adipose tissue, and pancreas of diabetic patients. NF-κB plays a crucial role because of its link in the expression of genes that are responsible for tissue damage of organs by inflammation, apoptosis and oxidative stress in the development of diabetic complications. Activation of PPAR-α, SIRT3/1, and FXR through many cascades by the chemical classes of plant compounds, such as terpenoids, iridoids, flavonoids, alkaloids, phenols, tannins, carbohydrates, and phytocannabinoids in different experimental diabetic models proved their anti-diabetic property. Alongside, compounds of chemical classes of plants exhibit prevention of NF-κB translocation into the nucleus by inhibiting NF-κB activators, such as VEGFR, RAGE and TLR4 receptors, which in turn, prevent the activation of many genes which are responsible for tissue damage. Hence, plant compounds are the best choice to find potential anti-diabetic drugs by targeting therapeutic components of the NF-κB activators and inhibitors. In addition, plant compounds have exhibited anti-diabetic properties by reducing blood glucose levels and modulating insulin resistance. Therefore, it is advisable to choose the plant natural resources as alternative medicine in treating diabetes. Current knowledge on the treatment of diabetes by targeting NF-κB is limited. Hence, further research on this aspect is to be focused by scientists both in pre-clinical to clinical studies.

## AUTHORS' CONTRIBUTION

The first and second authors played a substantial role in data acquisition, analysis, interpretation and manuscript preparation. The other co-authors contributed their efforts equally towards acquiring additional data for making the script in a good way. The corresponding author critically revised and finalized the manuscript for publication.

## CONSENT FOR PUBLICATION

Not applicable.

## FUNDING

University Grants Commission (UGC), New Delhi, India for the financial assistance, especially to Sahukari Ravi and Punabaka Jyothi in the form of RGNF (No: F117.1/2012-13/RGNF-2012-13-SC-AND 34335 and F1-17.1/2015-16/RGNF-2015-17-SC-AND-17449 respectively) and to the corresponding author Kesireddy Sathyavelu Reddy through BSR-Faculty Fellowship (No: F.18-1/2011 (BSR), Dated 24-11-2017).

## CONFLICT OF INTEREST

The authors declare no conflict of interest, financial or otherwise.

## ACKNOWLEDGEMENTS

The authors express their sincere gratitude to the University Grants Commission (UGC), New Delhi, India for the financial assistance, especially to Sahukari Ravi and Punabaka Jyothi in the form of RGNF (No: F117.1/2012-13/RGNF-2012-13-SC-AND 34335 and F1-17.1/2015-16/RGNF-2015-17-SC-AND-17449 respectively) and to the corresponding author Kesireddy Sathyavelu Reddy through BSR-Faculty Fellowship (No: F.18-1/2011 (BSR), Dated 24-11-2017).

**ABSTRACT:** Charles Dickens (1812 to 1870) is a foremost representative novelist of the Victorian Era, a great story teller and a social reformer. Dickens was not only the first great urban novelist in England, but also one of the most important social commentators who used fiction effectively to criticize economic, social, and moral abuses in the Victorian era. Dickens showed compassion and empathy towards the vulnerable and disadvantaged segments of English society, and contributed to several important social reforms. A Tale of Two Cities is set in London and Paris before and after French Revolution. The novel depicts the plight of the French Peasantry demoralized by the French aristocracy in the year leading up to the revolution. It has always been one of his best loved novels. The novel is about the Identity and reunion of father DoctorManatee and a daughter lucie Manatee after 18 years. The novel consists of two heroes Charles Draney and Sydney Carton having the same identical features and both of them love one girl Lucie.In the novel there exhibits an admirable honesty to reveal Doctor Manatee his true identity as a member of the infamous evermonde family

**Key words:** Charles Dickens,Identity and A Tale of Two cities

**INTRODUCTION:**Charles Dickens is remembered today as one of the greatest and most popular writers of the novel ever to have lived in Victorian period. All the important people of the day read at least one of his novels. Queen Victoria was a great fan of him.Dickens captured the spirit of his age in both a profound and entering way.He wrote with wit and humour,he also wrote about every day tragedies he saw around him.He put all this in the context of Victorian society.

**Representation of Identity: A Tale of Two Cities**

The novel opens with the opening lines "It was the Best of times, it was the worst of times, it was the age of wisdom, it was the age of foolishness". This novel takes place during French Revolution. Mr. Jarvis Lorrie working in Telson bank in London is a good friend of Mr. Alexander Manatee. Lorrie came to know about his friend Manatee living in Paris was alive and safe with his old servantMonsieur defarge in Paris who was a vendor of wine, as Manatee was imprisoned by evermonde family for a small mistake for 16 years.

Mr.Lorrie along with Lucie Manatee and Pros reaches Paris and met Alexander Manatee and decides to take Manatee along with them to England.At the same time Charles Draney ,who belongs to Evermonde family of nobles, one of the hero in the novel,advices ll the nobles to stop slavery on people,otherwise there would be a revolution from people.Mr.Charles Darney decides to leave France and move to England to make his on living by his own labour.While leaving to England Draney promises to his old servant that he would help him in any trouble.

Mr.charles Draney leaves all his properties and move to England. All the people from Paris Mr.Lorrie, Mr. Manatee,Miss Lucie and Mr.Darney travels in the same ship to reach England.In the travel for the first time Mr.Darney and Miss Lucie met one another.Mr .Darney also helps Manattee in the travel.But,few months later Mr.Darney was imprisoned in a case as a spy. Mr. Manatee and Lucie were called as the witness for Darney case.Darney was declared as a spy moving from England to France, but the witness of Lucie and Manatee was not accepted as there was strong witness named Mr.Barsad who was the real spy,but he accepts Darney as the spy.

"Barsad,was a hired Spy and traitor,an unblushing trafficker in blood,and one of the greatest scoundrels upon the earth since accursed Judas-Which he certainly did look rather like"(TTC.P.62)

For the first time two identical figures were seen in the court.Mr.Sydney Cartoon, another hero of the novel,enters the court with another witness and proves Charles Darney was innocent in the case.As he resembles same to Darney,he save Darney by presenting himself in the court.All the three people fell in love.Charles Darney loves Lucie ,Sydney Cartoon loves lucie but Lucie loves Charles Darney.But all the three never expressed their love to one another.

"Charles Darney loved Lucie Manatee from the hour of his danger.He had never heard a sound as sweet and dear as the sound of her compassionate voice; with his own on the edge of the grave that had been dug for him.But he had not yet spoken to her on the subject; the assassination at the deserted chateaufar away beyond the heaving water and the long, tong ,dusty roads the solid stone chateau which had itself become the mere mist of a dream had been done a year,and he had never yet, by so much as a single spoken word,disclosed to her the state of his heart"(TTC.P.104)

Lucie father accepts the love of Darney and decides to marry them.At that time Darney reveals him the truth that he belongs to Evermonde family and his actual name was Charles Evermonde Darney.Lucie father without knowing that darney belongs to Evermonde family accepted their love and marriage.At the same time Sydney Cartoon enters the house of lucie to propose his love for her.But the engagement is announced for Lucie and Darney by Manatee.

Sydney never revealed his love for Lucie.Lucie was married to Darney and they had a baby girl.On one occasion Darney reveals the secret to lucie that Sydney also loved her so deeply.After 5 years of period,Sydney meets Lucie family and spends his time happily with them.At that occasion Lucie requests Sydney to marry another girl and lead a happy life.But Sydney refuses to marry, and on the same situation Sydney promises lucie that He would do any sacrifice to her in this world and indeed,he would give his life for her sake

"No man ever really loved a woman ,lost her ,and knew her with a blameless though an unchanged mind, when she was a wife and a mother, but her children had a strange sympathy with him an instinctive delicacy of pity for him"(TTC.P.164)

A few days later,revolution started in France for republic of the people against Evermondes.People were against the slavery. All the Nobles of Evermonde family were imprisoned and decided to cut down their heads on the republic day.Sydney receives a letter from his old servant and came to know about the revolution in France and the help needed to him from Darney,as he already promised.

"Cannon,muskets,fire and smoke; but,still the deep ditch,the single drawbridge, the massive stone walls and the eight greattowers. Slight displacements of the raging sea,made by the falling wounded.Flashing weapons,blazing torches,smoking wagonloads of wet straw,hard work at neighbouring barricades in all rections,hrieks,volleys,xecrations,bravery without stint,boom smash and rattle and the furious sounding of the living sea"(TTC.P.167)

Charles move to France to help the servant and release him as he promised without informing his family.Charles was imprisoned in France as he belongs to Evermonde family,his uncle Mr. Manatee was helpless and was not able to help Darney though, he is a citizen of France.Sydney Cartoon come to know France and learns about the incident happend .Sydney decided to help Darney and save his life,as he promised to lucie that he would sacrifice his life for her sake.

Darney and Sydney had same identical features.Sydney took the help of Barsad a spy in France and entered into the prison of Darney and escaped Darney from the prison by making him unconscious with a medicine and replaced his place as Charles Darney by exchanging his dress,as they have identical features no one guessed of it or came to know about this incident.The day came for his sacrifice.Charles and his family were sent safely to England with the help of Mr.Lorrie and Miss. Pros.

The last words spelled by Sydney Cartoon were:

"It is a far, far better thing that Ido, thanI have ever done; it is a far, far better rest that I go to than I have ever known"(TTC.P288)

Mr. Sydney carton was made to cut down his head in the place of Darney.Lucie came to know about the real fact happened and remembered about the promise given by Sydney to her.

# రాయలసీమ కరువుసంస్కృతి

## (మొలకల పున్నమి - వింజమూరుగారికి)

[redacted]

మానవ జీవన విధానం లోని విస్మరణలే సంస్కృతి. ఇది ఒక్కో సమూహానికి ఒక్కో విధంగా వుంటుంది . మానవాళికి ప్రపంచ,దేశ,ప్రాంతీయ సంస్కృతులున్నాయి. ప్రపంచ సంస్కృతి మానవజీవన విధానాన్ని తెలుపుతుంది. దేశ సంస్కృతి మానవ ధర్మాన్ని విస్తరిస్తుంది. ప్రాంతీయ సంస్కృతి మానవ జీవన విధానం నుంచి ఉద్భవిస్తుంది.మనిషి పుట్టుక,గిట్టుక, ఆహారం,విహారం, పండుగలు అయా సందర్భాల్లో మనం అనుసరించే సంప్రదాయాలన్నీ శాస్త్రీయతను ముడివేసుకొని మానవుడు ఆనందంగా, ఆరోగ్యంగా, శాంతియుతంగా జీవించే ధర్మాన్ని బోధిస్తుంటాయి. ఇది దేశసంస్కృతి .

ప్రాంతీయ సంస్కృతుల్లోని పండుగలు, ఆచారాలు, విశ్వాసాలు వాని ఔచిత్యాసంగతుల నుంచి ఉద్భవిస్తాయి.దీనిని భారతదేశంలో వీళ్ళు పుష్కలంగా ఉన్న కోస్తా ప్రాంతం ఆరోగ్యంగా, శాంతియుతంగా,కళలు కళాత్మకంగా కన్పిస్తుంది. వారి ప్రతి సంప్రదాయం లోనూ ఆ పుష్కలత్వం కన్పిస్తుంది. కరువు అనగానే మనకు గుర్తుకొచ్చే ప్రాంతం రాయలసీమ. వీళ్లు కరువై, భూమి చీలలు వారి అన్నిటి ప్రాంతం వారి కళ్ళన్నీ వానమ్మ కోసం ఆకాశంవైపు ఆశగా, అలా ఎదురుచూస్తూవుంటాయి. వీరుపే ప్రతి పనిలోనూ, వీరు ఆచరించే ప్రతి విశ్వాసంలోనూ, జానపద కళల్లోనూ ,జానపదగేయాల్లోనూ,ఊరేగింపుల్లోనూ కరువుదర్శనంనుంచి బయటపడ్డ ఆశ, ప్రయత్నము కన్పిస్తుంది. అదే ఆ ప్రాంత సంస్కృతిగా వెలసింది.

పాపికొండలు సోమశిలదర్శనం,తుంగభద్రగుణ వచ్చిన వందలాది,వేలాది రచనల్లో వింజమూరుగారి రచనలకు ప్రముఖ స్థానం కరువుసీమ వనితయిన అక్కన్నని రచయిత్రి. ఆమె రచన లోపెనుగొండ 8,2014 నుంచి పెనుగొండ 26,2014 వరకు అంతర్జాల పత్రికలో తొలి

పాఠశాల్లో ప్రైవేట్ ట్రావెల్ ట్రావెల్ బోర్డు ద్వారా విక్రయించే టెండర్లలో 150 ని ఇయుంచి పురస్కరించుకొని ఏప్రిల్, 27, 2011 నుంచి మే 7,2011 వరకు అంబేద్కర్ లో పర్యటించారు. వీరి పదవులన్నీ రాయలసీమ పంచ్యాతీని ప్రపంచస్థాయి అక్కడి మర్యాదలన్నీ ముగించుకున్నాయి.ఈ వేదిక నుంచి వచ్చి 2011లో లో కేంద్రపాలిత యుపుంచ్యాంచాన్ని అందుకున్న 13వరు సంపుటి మొలకలుచున్నవి. అన్ని టివిలోనూ అరణ్య, అక్షరాపాలుటాయన్ని గుంటూరి తొంగ మాటలకు ఈ కథలు అవసరాయి. ఈ యుద్ధంలో గెలుపుకోసం కథను ఉన్నంత వాతావరణంలా కన్నంత దేవుడుకోసం; అవిర్భ అక్షరం కారణం కన్నంత పాపాత్ర శక్తులకోసం దిని పొరాడుతూని ఉంటారు.ఈ పొరాటంలా రాయలసీమ పంచ్యాతీలా వినిపిచోయింది . ఈ పొరాటంలని వచ్చిన పంచ్యాతీని ,పాత్రల పేరుచ్యాన్ని పరిశీలించడమే ఈ వ్యాస లక్ష్యం.

**జానపదుల విశ్వాసాలు:**

**యుమాలుస్వామి గుర్తం – జానపద కళారూపం :**

ప్రకృతి విస్మయాన్ని చూసినప్పుడు ,తన మనుగడకోసం దేవుడుమీద భారంనిని అలు ప్రకృతిని , అలు శక్తులను పూజిస్తూ అనేకరకాలైన పండుగలాలు అయుంచి అవి అప్పాంచ్యు పంచ్యాతీలా వినిపిచోయాయి. అందులోది యుమాలుస్వామి గుర్తం.

రాయలసీమలో ప్రసిద్ధిగాంచిన విశ్వాసం కథను చుట్టూ పరిభ్రమిస్తూఉంటుంది. ఏ ఊరులోనే యుమాలుస్వామి గుర్తం తిరుగుతుంటే ఆ ఊరులో కథను ఊడదని ,ఆ పైంటి మంచిది గా ఉంటుందని ఆ పైంటిని వాసుల విశ్వాసం. ఈ జానపద కళారూపాన్ని ప్రదర్శించేవారు పథను బట్టలు ధరించి పెద్దటలుపాగా చుట్టుకొని బలిష్టమైన గుర్రపు ఊరూ తిరుగుతూ విన్యాసాలు చేస్తుంటారు.వారిలో కొన్ని.

1.గుర్రాన్ని తొడుతీయిస్తూ దానిపై మంచి ఇనుకలో మన్ను తూపాయని అందులోవడం.

2.రెండు బాళ్ళను ప్రేక్షకులి పిల్లలు చేయించడం.

3. విప్పులగుండ్ని దాటించడం

4. పెద్దపెద్ద బాధ్యతలను అవది ఉందని తెలిసేలా దాటించడం. ఇక్కడ విన్యాసానికి ప్రాధాన్యత ఇస్తారు. ఈ విషయాన్ని కథారచయిత యామలపల్లి గుర్తు కథలో హృద్యంగా వివరించారు.

**జానపద సంస్కృతి :**

**మానుసంస్కృతి – శిలలండి:**

జానపద సంస్కృతిలో గ్రామదేవతలను పూజించడం. పూజావిధానంలో భాగంగా జాతరలు చేయడం,మ్రొంతులను లలి ఇవ్వడం,ఆ సందర్భంగా వారికథలను వినిపించడం అనాయితీ.ఒక్కో దేవత వెనుక ఒక్కో కథ దాగి ఉంటుంది.కొన్ని జానపద ఇతివృత్తాలైతే, కొన్ని చారిత్రక నేపథ్యం కలవి.ఇందులో అంకాళమ్మకు జరిగే శిలలండి ఉత్సవానికి,నేడు విజయనగరంలో జరిగే పైడితల్లి ఉత్సవాలకు సామ్యత ఉంది.ఈ రెండు అమ్మవారుల చరిత్ర వెనుక చారిత్రక నేపథ్యం కలదు. అంకాళమ్మ వెనుక విజయనర సామ్రాజ్యపు దొరతనం కనిపిస్తుంది.ప్రజల కష్టాలు చూడలేక ఆ ప్రాంతపు సామంతపు ప్రభువు వీరదర్జారెడ్డి రాయల వారసులకు కప్పం కట్టకుండా దండకారుణ్యం నుంచి పిన్నానపికి పోరంగం తప్పించి వీటి ఊరును మర్థించాడు.ఈ నాడు భూగర్భజల పంపిణీ వ్యవస్థ ద్వారా ప్రతి ఇంటికి నీళ్ళు అందించాలన్నది భగీరథమిషన్.నాడి ఇలాంటి వ్యవస్థ ఉందని ఈ కథ వివరిస్తుంది.కప్పం కట్టని కారణంగా వీరభద్రారెడ్డిని బంధించి చంద్రగిరిలోని చెరసాలకు తరలిస్తుండగా, అతని భార్య అంకమ్మ గ్రామస్థులతో కలసి ప్రభువులను ఎదిరిస్తుంది. అపేం పట్టలేక ప్రభువులు వీరభద్రారెడ్డి తలను నరికి చెట్టుకు వేలాడదీసారు. అతని భార్య కూడా అక్కడి తలను వదుక్కుంటుంది. గ్రామం కోసం అసువులు బాసిన అమకు ఆ అరణ్యమధ్యలోనే గుడికట్టించి,ప్రతి పది సంవత్సరాలకు ఒకసారి జాతర నిర్వహిస్తారు. ఆజాతరలో మ్రొక్కుబడి శిలలండి.

7 / 12

ఎర్రబండిపై ఎక్కిన తరిమానును నిలిపి దాని వివరణ మేకపోతును కొయ్యానికి వేలాడదీసి, ఉరిగించి మూడోరోజు దాన్ని లలి ఇచ్చి ,దానిరక్తంతో శిలను తడుపుతారు. ఈ సందర్భంగా

దున్నపోతుల బలి కూడా జరుగుతుంది. ఇవి సంస్కృతి పల్లేరు బళ్లారి కలుపాయమ్మ జాతర లో కూడా జరుగుతుంది. ఈ ఉత్సవాన్ని 12 మంది ఆ కోమటి జరుపుతారు.ఉత్తరాంధ్ర లోని విజయనగరంలో పైడితల్లి ఉత్సవాల్లో పిరమిడ్‌నిర్మాణం ప్రసిద్ధి. ఇక్కడ చిన్నగా పిరమిడ్‌ను పూజారిని కూర్చోబెడతారు.బలులు లేని ఈ ఉత్సవం సంస్కృతి అదుపెరగకుండు ప్రతీక.

అత్యాధునికమైన స్త్రీదేవతల ఆరాధనలో ఈ మాను సంస్కృతి కన్పిస్తుంది.ఈ మానును పల్లారు బళ్లా,కలుపాయిలో గుడిమాను, విజయనగరం లో పిరిమను,కడపలో తెలుగుడి అని పిలుస్తున్నారు. ఈ మానుకు క్రమంగా నేవ,చింత,తాటి మానులను ఉపయోగించారు. ఈ దేవతల గుడులన్నీ అరణ్య ప్రాంతాల్లోని మిరప పొలమధ్యలో ప్రత్యేకత.

జంతువులను బలివ్వడం అనాదిగానున్నా వేటికి ఈ ఆచారం గ్రామక్షేమాల శాంతి కోసం ఈ మూఢ విశ్వాసం కొనసాగుతూనే ఉంది. జంతుబలులో కాదు బలిదానాల సంస్కృతి కన్పిస్తోంది. " ఫలాలు కష్టాలు పోవాలి.. పాపాలు పోవాలి..కన్నీళ్లు పోవాలి..పిల్ల ... పిల్ల...కు 68 / 350 నిలుపా తడవాలి,పెరుగు నిండాలి,పంటలు పండాలి.. కరువుపోవాలి..మాండుసిరి పాలు, ఎన్ని నా అమ్మ బలిదానం పిచ్చో..పిచ్చో.. అన్ని." అని 'మాండవ్యం' కథలో ఊరిలాగు కోసం, వాని కోసం పార్వతి బలిదానం కన్పిస్తుంది.

**చారిత్రక సంస్కృతి :**

చారిత్రాత్మక కట్టడాలు, చరిత్రకు సాక్ష్యాలైన కట్టడాలు అయా దేశ ప్రాంత చరిత్రను తెలియజేస్తుంటాయి.తాతమాలే మనదేశ సంస్కృతికి చిహ్నం. అలాగే ఏడు లాంతర్ల సెంటరు', 'దీపమాను' (కథలు)లు రాయలసీమ చరిత్రకు చిహ్నాలు.

**ఏడు లాంతర్ల సెంటరు:**

దొరల అత్యాచారాలకు, దేశ ప్రజల స్వాతంత్ర్య కాంక్షకు ఈ సెంటరు ప్రత్యక్ష సాక్ష్యం.దొరల మాటనని వారి వరలలులు,ఉరిశిక్షలు, గాంధీజీ దేశభక్తి ప్రసంగాలకు ఇది నిదర్శన సాక్ష్యం. స్వాతంత్ర్యోద్యమ కాలంలో వెల్లదొర గుర్రపు బండిని వదిలేసాడు వీరనాయుడు. గాంధీజీ ప్రసంగాలతో స్ఫూర్తిని నింపుకున్న వీరనాయుడు శ్వేత ఇండియా అంటూ దొరలండిపై నుంచే భారతదేశ జాతీయతాభావాన్ని ఏడులాంతర్ల సెంటరుపై గుర్తించము. అతనిని దొర కాల్చడముజరిగిపోయాయి. దీనికి ప్రత్యక్ష

8 / 12

పాశ్చాత్యం ఇది విడిచి పోయింది. భారతీయుడి అహింసా సిద్ధాంతానికి, వ్యవహార హింసావాదానికి ఇది ప్రతీక. వీరాయుడికి దొరను చంపే అవకాశమున్నా చంపలేదు. భారతీయుడు బానిసత్వాన్ని చంపి స్వాతంత్ర్యాయువులు పీల్చాలనుకున్నాడు .కాని వ్యవహారం మనుషులను చంపాలనుకున్న హింసావాది. భారతీయ శాంతి సంస్కృతికి ఇది చిహ్నం.

**దీపమాను:**

లేనివాడికి అన్నం పెట్టడం, చిలువ పిదలనివాడికి పిడకల్నించడం,కష్టం లో ఉన్నవాడిని కాపాడడం, భారతీయ సంస్కృతిలో భాగం.కొన్ని సంవత్సరాల క్రితం కూడా పల్లెల్లో ఉన్న కుటుంబాలు పిల్లలకు పాలుమార్చి పోయడం, పిడ్డలువ్య పెట్టడం,ఇ సంస్కృతిలో భాగాలుగా కన్పిస్తుంటాయి. ఇలాంటి ఔదార్యాన్ని తెలిపే కథ లో ఇంత సంగతేది పెట్టి గండి పోసింది ఆ రాతిమడ. ప్రజల సంక్షేమం కోసం తనను తాను కూల్చుకున్న ఇనివృక్షం రాతిమడది. దీని యజమాని పీర శివారెడ్డి.అపరకర్ణుడు. ఎడ్డల పందెం లో గెలిచిన అరుగూర్ల పుట్ట పడ్డను పీదలకు పంచిన మహానీయుడు. కరువు రక్కసి మంచి తన ఊరి కాపాడడం కోసం ప్రాణత్యాగం కాలవ తవ్వించిన మహనీయుడు. చివరకు తనకు పంతాదారుగా వచ్చిన రాతిమడను పీదల ఆకలి తీర్చడానికి కూల్చి, కూలిన వ్యక్తి వీరశివారెడ్డి. అవ్యక్తి కి గుర్తుగా ఆ వ్యక్తి సమాధిని కోవెలగా, ఆ తీపుని సంకేతంగా ఆ సమాధిలో దీపం ఎప్పుడూ ఆరి పోకుండా చూసుకుంటూ ఉంటారు. అది వెలుగొంది ఆ సమాధి దీపమానుగా ప్రసిద్ధికెక్కింది.

**ఆధునిక సంస్కృతి:**

ఎన్ని మార్పులు వచ్చి పోతి తరాల్లో కరువులో ఎండి పీలలు వారిన వారి జీవితాన్ని చదువు వెక్కిరించే దిగులిను దేనుకోవాలన్న వారి ఆశలపై ఆధునికతనాగరికత పీడుతో విష సంస్కృతి నేటి యువతపై కోరలు చాచి ఎలా విషం చిమ్ముతుందో మూడు పదన్ల వాన దృశ్యమానం చేస్తోంది. ఈ కథ భూమిమ్మి పీజాల కోసం, ఖర్చుల కోసమని తనకు వచ్చే కోడుకు నిరంజన్ దారి చూసి నివ్వెరపోయాడు "జలపాలు చెవుల మీద నుండి మెడలు మీద నుండి దుజాలను తాకి గాలికి వినుడుగా కదులుతున్నాయి. ఎడమ చెవి తమ్మకు బంగారు కమ్మకు తళుక్కుమంది. అంతేకాక

69 / 350

మనసు కళ్ళుక్కుమంది. తొడలదాక గోర్లోల మాదిరి చేతులులేని మందం చొక్కా చేతిలో పిల్లోనీ.. వేర్లలో ఏ గుల్కా లాంటిదో నములు కళ్ళముందు విరంజనీ'.

మారిపోయిన కొడుకును చూసి తన ఆశలన్నీ ఎటుపోతుయాయో తెలియని నాన్నతో ఇలా లేక పోతే ఎక్కడి సమాజము అలగీకరించాడదు అన్న కొడుకుది మరో సమస్య. మారుతున్న సమాజంలో ఏది మంచో, ఏది చెడో తెలుసుకోలేక తప్పు దోవ పడుతున్న యువత కథే ఇది. ప్రతిదకు గుర్తింపును, అందుకోవాల్సిన సాంకేతికపరిజ్ఞానాన్ని అందుకోకుండా, లాభా పొందడానికి ప్రాధాన్యత ఇవ్వడం, చెడు అలవాట్లకు బానిసలు కావడం, మొదలైన అంశాలను కథా రచయిత చర్చించాడు.

తనకున్నదంతా అమ్మి కూతురి పెళ్లిచేసి, కొడుకును అమెరికా పంపడానికి పెచ్చిస్తే, కొడుకు ఇతరుల చేతిలో మోస పోయి మోసపోయిన కొడుకు వృత్తాంతం. నేటి ఆధునిక విష సంస్కృతి అమాయకులైన కాయలసీమ విద్యార్థులను ఎలా ఆకర్షించి మోసంచేస్తుందో తెలియవస్తుంది.

**పండుగ సంస్కృతి – మొలకల పున్నమి:**

ఈ కథా సంపుటి మొత్తం లో కదువుతో వానతో సంబంధం లేకుండా కనిపించే కథ మొలకల పున్నమి' . ప్రేమ కథ ఇవ్వగ్రాంతంతో పాటు మొలకల పున్నమి పండుగను వివరించాడు కథా రచయిత . గోదమ్మ ర్యాడం, కోలన్నకర్రాలాట(కోలాటం),చెక్కభజనలు ,కులుకరజనులు . ఇవన్నీ కానవిదుల వరలంతా ఏనిమిది రాత్రి వినోదం కోసం వేస్తుకునే కళారూపాలు . వీటన్నింటిని పండుగ వాతావరణంలో ఆనందంగా ప్రదర్శించే కళారూపాలు.

మొలకల పున్నమి పెద్దలాని అడపిల్ల చేసే పండుగ . పుట్టమట్టినిచ్చి నవధాన్యాలతో మొలకలు తెప్పించి,వాటిని గంగమ్మ దేవాలయంలోనికి తెస్తారు. వానలిచ్చిన దియ్యంలో వళ్ల నూగులు,బియ్యం కలిపి ప్రసాదంగా పంచుకుంటారు. మర్థి ప్రమిదల్లో దీపాలు వెలిగించి ఇష్టమైన వారితో వివాహం వివాహం జరగాలని వాటిని నీటిలో వదులుతారు.ఈ సందర్భం లో అనేక జానపద గీతాలను ఆలపిస్తూఉంటారు. ఇదే మొలకల పున్నమి.

**ABSTRACT**

*In this paper I studied usage of library and information resources of in Government and Aided Degree Colleges in SPSR Nellore District in Andhra Pradesh, distributed 2000 questionnaires in colleges and collected 1862 questionnaires. I found in this study the library information resources, services (electronic & print), and library expressed their opinion about library working hours, physical facility, library information resources and services excellent and good.*

**KEYWORDS:** Academic libraries, Government and Aided Degree Colleges, Library and Information resources, Library physical facilities.

## INTRODUCTION

Libraries and information centres play a major role in information transfer cycle. The role of the college libraries is not any limited to the presentation of reading materials but also to ensure that the information needs of the users are met by its own traditional as well as electronic resources and services.

In order to know to what extent the information needs are met by Degree college libraries it is necessary to have a continuous feedback from the students can be obtained by conducting user surveys. The surveys examine the awareness of the students about library resources and services, the use of these resources and services and either satisfaction with them. They also examine to what extent the information needs or the students are met by Degree college libraries. The feedback obtained form them can be used to develop the library collection, to improve the

existing library services, to innovate new services and a plan for future. It is also helpful to orient library and information services to user requirements and to evaluate the resources and service.

## ROLE OF LIBRARIES IN EDUCATION

Recent changes in Educational Philosophy, widening curricula, reforms in examination system, Knowledge explosion and the developments in Information Technology have given an increased awareness of the role of libraries in higher education. College libraries are now to be considered an important resource existing to support the teaching-learning process. So, college libraries should collect and organize relevant information recorded in various print and non-print media and should provide right information to the users at the right time in the educational process. If the colleges are to take maximum possible advantage of the developments in library profession to the greatest benefit of the teachers and students, it is to be ensured that colleges have efficient library systems and qualified and experienced librarians capable of interactions with teachers and students effectively to direct the policies and regulate resources of the library towards the needs of teaching – learning process in the college (Raman Nair, 1996).

**Information Resources and Services:** Information is an important and key resource and an essential input for all. Types of organizations libraries have limited resources with which they have to satisfy the information needs of the users. Therefore, libraries have to build their collections and facilities to meet the requirement s of the users.

The present era is an era of information. Good learning is based upon adequate information. Libraries provide information through their resources and services. Hence libraries particularly academic libraries are playing vital role in shaping a future generation of students by providing required information to them.

## CATEGORIES OF INFORMATION SOURCES

**Primary:** Primary publications are those in which the author for the first--time supplies evidence, describes a discovery, makes or drives a new proposition or brings forward new evidence about previous proposition.

**Secondary:** A document concerning a particular subject of inquiry which is derived from or based on the study and analysis of the primary source of information is called the secondary source of information.

**Tertiary:** Report information that are last to appear and mostly do not contain subject knowledge. It is designed to provide information about information and so acts as a guide to the primary and secondary sources of information.

**Information Needs:** The term information and information needs requires a carful definition. The satisfaction of information seeds however does relate such effect in terms of the individuals receiving and processing of transmitted and previously potentials communication to his needs. However the concept of information need has provided to be exclusive one to define isolate and to measure. Research have been used inter or changeable although they may not be identical. “Krisheals” has defined it as the “recognition of the existence of uncertainty “based on information seeking behavior needs have been categorized as immediate needs or deferred needs.

## LITERATURE OF REVIEWS

**Tripathi (2018)** paper, attempts have been made to identify the Information sources used, for writing thesis or research papers by research scholars. Moreover, this study also examined the researcher’s dependency on Internet, for writing their thesis or research papers. For the study, the survey method was followed by using a well-structured questionnaire. It was identified that, respondents utilizing Information sources namely “E-resources or Internet”

were 62.8%, other's dissertations or thesis were 58.7% and depended on textbooks were 41.5 %. The study concluded that, the there is no significant difference in the researcher's dependency on the Internet for writing thesis/research paper on the respective status of the university.

## Objectives of the Study

The following are the specific objectives of the study.

- To study the extent of use of library resources and services by the students
- To know the purpose of visit to library.
- To examine the students awareness about library resources and services.
- To identify the frequency of use of the library resources and services.
- To find out which library resources are more used between manual and electronic resources.

## SCOPE AND LIMITATIONS OF THE STUDY

This study cover Degree college libraries and students of the Degree colleges, in SPSR Nellore District is Andhra Pradesh. Hence the study has been restricted to Government and Aided Degree College of Nellore District located in the Coastal Andhra Region. As a comprehensive study covering all 9 Government Degree Colleges and 7 Aided Degree are considered for the present study which is presented.

## METHODOLOGY

The basic research method adopted in the present study was the survey method. the present study used questionnaire method to collect data from the Government & Aided Degree Colleges Libraries located in Nellore District. structured questionnaires were developed by the researcher in consultation with the research supervisor for the purpose of this study. I have prepared 2000 questionnaires and personally distributed to the library users of the respective universities and 1862 questionnaires were received from the library users of respected colleges.

### Table-1 Gender-wise distribution of Students

| S.No. | Gender | Students | | Total |
|---|---|---|---|---|
| | | Govt | Aided | |
| 1. | Male | 417(22.39) | 460(24.70) | 877(47.09) |
| 2. | Female | 519(27.87) | 466(25.02) | 985(52.1) |
| **Total** | | **936(50.26)** | **926(9.73)** | **1862(100)** |

It is obvious from Table -1 Out of the total 1862 respondents, 985(52.91%) are female respondents and the remaining 877(47.09%) are female. The proportion of the female respondents was much higher than that of the male.

### Table-2 Branch wise distribution

| S.No. | Branch wise | Students | | Total |
|---|---|---|---|---|
| | | Govt | Aided | |
| 1. | BA | 209(11.22) | 211(1133) | 420(22.56) |
| 2. | BCOM | 323(17.34) | 270(14.50) | 593(31.84) |
| 3. | BSC | 404(21.69) | 445(23.89) | 849(45.59) |
| **Total** | | **936(50.26)** | **926(49.73)** | **1862(100)** |

2021 © IJRLS All Rights Reserved 

From the above table it can be observed that 849(45.59%) are having BSC students, 593(31.84%) are having B. Com students and the remaining 420(22.56%)are having B.A students.

**Table-3: Age Group (years)**

| Age Group | Govt. | | | Aided | | | Total |
|---|---|---|---|---|---|---|---|
| | **B.A** | **B.Com** | **B.Sc.** | **B.A** | **B.Com** | **B.Sc.** | |
| Below 18 | 26(1.39) | 38(2.04) | 50(2.86) | 32(1.71) | 30(1.61) | 63(3.38) | 239(12.83) |
| 18-19 | 68(3.65) | 84(4.51) | 154(8.27) | 48(2.57) | 56(3.00) | 78(4.18) | 488(26.21) |
| 20-21 | 72(3.86) | 136(7.30) | 138(7.41) | 106(5.69) | 118(6.33) | 142(7.62) | 712(38.23) |
| Above 21 | 43(2.31) | 65(3.49) | 62(3.32) | 25(1.34) | 66(3.54) | 162(8.71) | 423(22.71) |
| **Total** | **209(11.22)** | **323(17.34)** | **404(21.69)** | **211(11.33)** | **270(14.50)** | **445(23.89)** | **1862(100)** |

It is evident from Table-3 that the age group of the respondents is are categorized into four groups. A majority of the respondents (students) i.e. 712(38.23) belong to the age group 20-21 years, whereas 488(26.21%) respondents are in the 18-19 years age group, 423(22.71) are students above 21 years and the remaining 239(12.83) respondents are below 18 years. Hence, it can be concluded that majority of the respondents are below 20-21 years age group.

**Table-4: Frequency of visit to the Library for Internet usage**

| visit the Library | Govt. | | | Aided | | | Total |
|---|---|---|---|---|---|---|---|
| | **B.A** | **B.Com** | **B.Sc.** | **B.A** | **B.Com.** | **B.Sc.** | |
| **Daily** | 18(0.96) | 36(1.93) | 86(4.61) | 46(2.47) | 46(2.47) | 64(3.43) | **272(14.61)** |
| **Once in a week** | 35(1.87) | 92(4.94) | 104(5.58) | 56(3.00) | 68(3.65) | 126(6.76) | **481(25.83)** |
| **Twice in a week** | 42(2.25) | 78(4.18) | 118(6.33) | 64(3.43) | 72(3.86) | 96(5.15) | **470(25.24)** |
| **Once in a fortnight** | 24(1.24) | 63(3.38) | 60(3.22) | 42(2.25) | 38(2.04) | 62(3.33) | **289(15.52)** |
| **Once in month** | 58(3.11) | 30(1.61) | 20(1.07) | 18(0.96) | 28(1.50) | 54(2.90) | **208(11.17)** |
| **Occasionally** | 32(1.71) | 14(0.75) | 16(0.85) | 09(0.48) | 18(0.96) | 43(2.31) | **132(7.08)** |
| **Total** | **209(11.22)** | **323(17.34)** | **404(21.69)** | **211(11.33)** | **270(14.50)** | **445(23.89)** | **1862(100)** |

Table-4 shows that 481(25.83) visiting the library once in a week, followed by 470(25.24%) are visiting twice in a week, 289(15.52%) visiting the library Once in a fortnight, 272(14.61%) users who are visiting the library daily and remaining 208(11.17%)of the users visiting the library once in a month.

**Table-5: Time spent in the library**

| Time spent | Govt. | | | Aided | | | Total |
|---|---|---|---|---|---|---|---|
| | B.A | B.Com | BSc | B.A | B.Com | BSc | |
| less than 1 hour | 42(2.25) | 46(2.47) | 86(4.61) | 56(3.00) | 62(3.32) | 174(9.34) | 466(25.02) |
| 1 to 2 hours | 76(4.08) | 132(7.08) | 154(8.27) | 68(3.65) | 82(4.40) | 136(7.30) | 648(34.80) |
| 2 to 3 hours | 54(2.90) | 84(4.51) | 112(6.01) | 32(1.71) | 68(3.65) | 89(4.7) | 439(23.57) |
| 3 to 4 hours | 25(1.34) | 43(2.30) | 28(1.50) | 25(1.34) | 42(2.25) | 28(1.50) | 191(10.25) |
| More than 4 hours | 12(0.64) | 18(0.96) | 24(1.28) | 30(1.61) | 16(0.85) | 18(0.96) | 118(6.33) |
| **Total** | **209(11.22)** | **323(17.34)** | **404(21.69)** | **211(11.33)** | **270(14.50)** | **445(23.89)** | **1862(100)** |

The duration of visit is taken as less than one hour, 1 to 2 hours, 2 to 3 hours, more than 3 hours. From the above table-5 shows that 648(34.80%) of respondents spent time 1 to 2 hours per day in the library, followed by 466(25.02%) spent time less than 1 hour in the library, 439(23.57%) spent time 2 to 3 hours, 191(10.25%) spent time 2 to 3 hours and the remaining 118(6.33) spent time more than 4 hour in the library.

**Table-6: Purpose of visit to library**

| Purpose of visit to library | Govt. | | | Aided | | | Total |
|---|---|---|---|---|---|---|---|
| | B.A | B.Com | B.Sc. | B.A | B.Com. | B.Sc. | |

| **Total** | **209(11.22)** | **323(17.34)** | **404(21.69)** | **211(11.33)** | **270(14.50)** | **445(23.89)** | **1862(100)** |

Table-8 indicates that majority of the respondents 384(20.62%) of the respondents use e-journals followed by 354(19.01%) of the respondents using full-text databases, 304(16.32%) of the respondents using open access materials, 290(15.7%) of the respondents using e-books, 266(14.28%) of the responds using Bibliographical Databases and the remaining respondents using 264(14.17%) of the respondents E-Learning Resources. Hence it can be concluded that one by fourth of the respondents 384(20.62%) of the respondents e-journals using frequently.

## FINDINGS

1. Majority of the users 985(52.91%) are female respondents and the remaining 877(47.09%) are male. The proportion of the female respondents was much higher than that of the male.
2. observed that 849(45.59%) are having BSC students, 593(31.84%)
3. A majority of the respondents (students) i.e. 712(38.23) belong to the age group 20-21 years, whereas 488(26.21%) respondents are in the 18-19 years age group,
4. Majority of the users 481(25.83) visiting the library once in a week , followed by 470(25.24%) are visiting twice in a week, 289(15.52%) visiting the library Once in a fortnight.
5. Majority of the users 648(34.80%) of respondents spent time 1 to 2 hours per day in the library, followed by 466(25.02%) spent time less than 1 hour in the library, 439(23.57%) spent time 2 to 3 hours.
6. Majority of the users 544(29.21%) of respondents were borrow/return books purpose, followed by 414(22.23%) of respondents purpose of read Newspaper/magazines.
7. majority of the respondents 476(25.56%) of the respondents are books use information sources in Library , 382(20.51%) of the respondents using Newspapers/Magazines.
8. majority of the respondents 384(20.62%) of the respondents use e-journals followed by 354(19.01%) of the respondents using full-text databases, 304(16.32%) of the respondents using open access materials.

## SUGGESTIONS

- To improve for reading, Internet facility, journal and bibliography details.
- More computers required with internet facility in users.
- Training the User for necessary digital literacy skills can bring about knowledge in the use of ICT.
- The libraries are expected to introduce new services like Remote Access, Discovery tools to access to e-resources remotely.

## CONCLUSION

The survey highlighted availability and use of the library information resources and services of the selected degree college libraries in Nellore district, Andhra Pradesh, India and what will be somewhat helpful to the students in communicate realistic education to their present generation for a better tomorrow. In this study majority of library users satisfied on library resources and services of degree college libraries. It provides access to various e-journals, full-text databases, bibliographic databases, etc to the colleges. These resources will provide information in many disciplines for learning, teaching and research in the educational institutions. The following are recommended based on the results of the study.

‡bcjphysics@gmail.com

Received 19 October 2020; Accepted 11 December 2020; Published 9 January 2021

A series of $SrAl_2O_4$: $xSm^{3+}$ ($x$ = 0, 0.1, 0.5, 1.0 and 2.0 mol.%) nanophosphors were synthesized by the conventional solid-state reaction method and characterized. The structural and morphological properties were analyzed through powder X-ray diffraction (PXRD), Fourier transform infrared, Fourier transform Raman, scanning electron microscopy and transmission electron microscopy studies. The fluorescence features were examined through photoluminescence-excitation and emission studies. The investigated phosphor materials show intense orange–red fluorescence at 400 nm excitation. For intense and effective fluorescence, the $Sm^{3+}$ -doping concentration was optimized as 1.0 mol.%. The cross-relaxation mechanism responsible for fluorescence quenching beyond the optimum concentration was discussed. The color perception of emitted fluorescence was analyzed by evaluating Commission International de I'Eclairage (CIE) 1931 coordinates. The experimental results confirmed the candidature of orange–red emitting $SrAl_2O_4$: 1.0 $Sm^{3+}$ nanophosphor for various lighting applications.

## 1. Introduction

Currently, the lighting technology is a rapidly growing field that is progressively replacing the old technologies such as incandescent lamps, halogen lamps, fluorescent lamps, discharge lamps, etc. Replacing old technologies with novel and advanced solid-state lighting (SSL) devices could reduce the energy needed for the upcoming generations. The luminescent materials such as crystals, glasses and phosphors based on *f–f* transitions of trivalent rare earth (RE) ions play a significant role in lighting technology. In recent years, single phase phosphors at nanoscale have drawn much attention in the field of SSL technology due to reduction in internal light scattering.[1,2] Such ultra-fine nanophosphors have the potential to improve the efficiency of luminescent displays, fluorescent lamps, etc. The RE ions activated single phase nanophosphors play a crucial role in the design of light emitting diodes (LEDs), field emission displays (FEDs), plasma display panels (PDPs), gas sensors, etc.[3–5]

The synthesis of phosphors by traditional solid-state reaction methods at low sintering temperatures and relatively short calcining time results in considerable mass production. It is known that the fluorescence efficiency could remain very high when the quality of crystalline phase of nanophosphors is certain. Unluckily, most of the techniques that currently fabricate nanophase phosphors, for example, sol–gel, solvothermal, precipitation techniques, etc., are not much efficient for considerable mass production. Compared to borate, silicate, molybdate, vanadate, tungstate, phosphate phosphors, the $SrAl_2O_4$ phosphors show outstanding fluorescence properties due to their excellent ultra-violet (UV) absorption, greater thermo-mechanical behavior, good chemical durability and eco-friendly behavior.[6–8] The importance of $SrAl_2O_4$ nanophosphors crystallized into monoclinic structure for diverse lighting applications has been explored in our previous work.[9,10]

Depending upon the host environment, the $Sm^{3+}$ ions emit intense orange and/or orange–red fluorescence under suitable near UV excitation. In most of the hosts, the fluorescence spectra of $Sm^{3+}$ ions reveal $^4G_{5/2} \rightarrow {}^6H_{5/2}$, $^4G_{5/2} \rightarrow {}^6H_{7/2}$, $^4G_{5/2} \rightarrow {}^6H_{9/2}$ and $^4G_{5/2} \rightarrow {}^6H_{11/2}$ transitions. $Sm^{3+}$-doped $GdAl_3(BO_3)_4$, $Na_2Gd(PO_4)_2$ and $YAl_3(BO_3)_4$ phosphors have been fabricated for orange and/or orange–red fluorescence sources.[11–13] Many other researchers also reported the $Sm^{3+}$-doped $NaGd(MoO_4)(WO_4)$, $Ba_3Y(PO_4)_3$, $CaAl_4O_7$, $CaY_{0.5}Ta_{0.5}O_3$ phosphors, etc., for the red emitting light sources.[14–17] Hingwe *et al.* synthesized $SrAl_2O_4$: Sm phosphor by solution combustion

method and optically analyzed for red light emitting source.[18] However, it is crucial to develop new class of orange–red exhibiting phosphor materials with superior fluorescence efficiency to meet the needs of current lighting technology. This research paper reports the basic study of fluorescent features of orange–red emitting $SrAl_2O_4:Sm^{3+}$ nanophosphor based on *f–f* transitions of $Sm^{3+}$ ions through structural, morphological and concentration dependent studies for various lighting applications in different fields like scientific research, electronic industry, etc.

## 2. Experimental Techniques

### 2.1. *Materials and method of synthesis*

New class of orange-red emitting $Sr_{(1-x)}Al_2O_4$: $xSm^{3+}$ ($x$ = 0, 0.1, 0.5, 1.0 and 2.0 mol.%) nanophosphors were synthesized by conventional solid-state reaction method. These materials were prepared using stoichiometric ratios of $SrCO_3$ (99%, Sigma), $Al_2O_3$ (99.9%, Himedia) and $Sm_2O_3$ (99.99%, Aldrich) including 2.0 wt.% of $H_3BO_3$ (99.5%, Merck) as a flux material. The homogeneous powders of the starting materials were heat treated at 200 °C for 3 h and then calcined at 1050 °C for 3 h with intermediate grinding to produce milky-white $SrAl_2O_4$: $xSm^{3+}$ nanophosphors. These materials were labeled as SAOSm0, SAOSm01, SAOSm05, SAOSm10 and SAOSm20 for $x$ = 0, 0.1, 0.5, 1.0 and 2.0 mol.%, respectively.

### 2.2. *Characterizations*

The phase purity of SAOSm$x$ nanophosphors was confirmed with X′ Pert-Pro Materials-Research-diffractometer provided with CuK$\alpha$ emission of wavelength 1.5406 Å. The functional groups present were examined by Fourier-transform infra-red (FT-IR) spectral profile recorded with Perkin Elmer Spectrum One: FT-IR spectrometer in the wave length range of 400–4000 $cm^{-1}$ following the KBr pellet method. The Raman analysis was carried out with Bruker RFS27 FT-Raman spectrometer ($\lambda_{Nd:YAG}$ = 1064 nm). The scanning electron microscopy and energy dispersive X-ray (SEM-EDX) investigations were carried out with Hitachi SU-70 scanning electron microscope equipped with Bruker Nano GmbH EDX device. The morphology was studied with FEI TECNAI G2 F20 high-resolution transmission electron microscope (HR-TEM). The photoluminescence excitation and emission studies were carried out with JOBIN YVON FLUOROLOG-3 spectrophotometer equipped with xenon flash lamp (300 < $\lambda$ < 1300 nm). All the characterizations were recorded at room temperature.

## 3. Results and Discussions

The phase purity of SAOSm$x$ nanophosphors has been confirmed by powder X-ray diffraction (PXRD) studies.

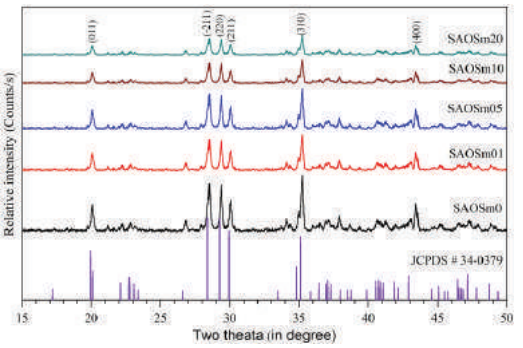

Fig. 1. PXRD patterns for SAOSm$x$ ($0 \le x \le 2.0$ mol.%) nanophosphors.

The studied PXRD patterns shown in Fig. 1 are well matched with JCPDS No. 34-0379.

The synthesized materials are crystallized into monoclinic phase with unit cell parameters, $a$ = 8.4424 Å, $b$ = 8.8221 Å and $c$ = 5.1607 Å.[19] In our previous work, the unit cell parameters have been obtained by Rietveld refinement program (Fullprof software) and they are found to be $a$ = 8.4419 Å, $b$ = 8.8217 Å and $c$ = 5.1592 Å.[20] A schematic representation of packing arrangement of monoclinic SAOSm0 nanophosphor is described in Fig. 2.

As seen from Fig. 1. one can note that the addition of small amounts of $Sm_2O_3$ results a quenching in intensity of PXRD peaks. A detailed explanation for the quenching of intensity of PXRD patterns was presented in our earlier work on $SrAl_2O_4$: $Tb^{3+}/Bi^{3+}$ nanophosphors.[21] The size of SAOSm$x$ crystallites has been predicted as ~58 nm using the Scherrer's equation, $D_{hkl} = 0.9\lambda/\beta \cos\theta$, where $\lambda$ represents the wavelength of X-rays used, $\beta$ represents the full-width at half maximum (FWHM) and $\theta$ represents the angle of diffraction.

The FT-IR spectral profile of SAOSm0 shown in Fig. 3 reveals 13 IR bands at around 3440, 2918, 1713, 1631, 1441, 1365, 1222, 895, 850, 785, 646, 500 and 446 $cm^{-1}$. A broad

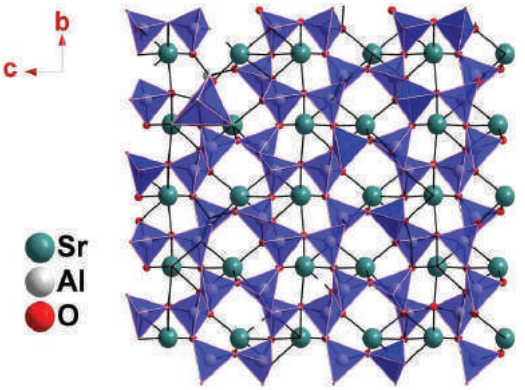

Fig. 2. Packing arrangement of monoclinic SAOSmo.

by Bungala Chinna Jamalaiah on 03/30/21. Re-use and distribution is strictly not permitted, except for Open Access articles.

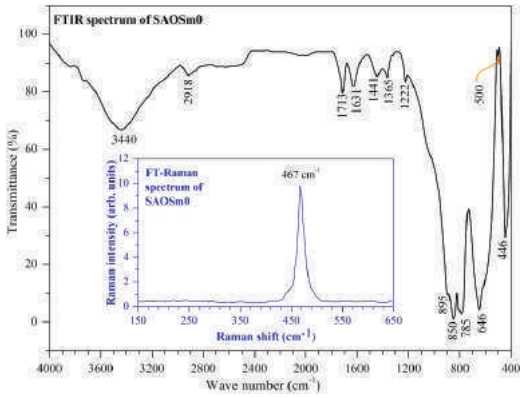

Fig. 3. FT-IR and FT-Raman profiles of SAOSm0.

IR absorption band noticed at 3440 $cm^{-1}$ with a sub-peak at 2918 $cm^{-1}$ has been ascribed to the symmetric stretching vibrations of $OH^{-1}$ group. Two sharp and less intense IR bands at 1713 $cm^{-1}$ and 1631 $cm^{-1}$ have been attributed to the deformation mode of $H_2O$ molecules get absorb in compaction of SAOSm0 with KBr.[22] The IR bands around 1441, 1365 and 1222 $cm^{-1}$ have been assigned to the B-O stretching vibrations.[23] The IR bands noticed at 895 $cm^{-1}$ and 850 $cm^{-1}$ represent the formation of $SrAl_2O_4$, while the band at 785 $cm^{-1}$ belongs to the aluminate ($AlO_4$) group.[24,25] The FT-IR bands located at 646, 500 and 446 $cm^{-1}$ are assigned to the Sr–O, Al–O and O–Al–O vibrations, respectively.[26]

The inset of Fig. 3. represents the FT-Raman spectrum of SAOSm0 and it is analogous to the Raman profile of $SrAl_2O_4$ nanoparticles.[27] The FT-Raman spectrum consists of a sharp band positioned at ~467 $cm^{-1}$ which confirms the monoclinic phase of SAOSm0 nanophosphor. The Raman selection rules explore that nearly 81 active vibrational modes are feasible for $SrAl_2O_4$ monoclinic phase.[28] In this research, the FT-Raman profile of SAOSm0 exhibits nearly ten fever bands in addition to an intense FT-Raman band at 467 $cm^{-1}$ which belongs to O–Al–O bending vibrations.[29] The FT-Raman observations support the FT-IR observations described above. These experimental results confirm the monoclinic phase of SAOSm*x* nanophosphors.

The distribution of particles and the elemental analysis of SAOSm*x* nanophosphors have been examined by SEM-EDX studies of SAOSm10 and it is shown in Fig. 4. The SEM analysis make known a grain like morphology with agglomerated particles distributed homogeneously. The EDX profile make known the presence of oxygen (72.34 atm. wt.%), aluminum (10.53 atm. wt.%), strontium (12.76 atm. wt.%) and samarium (4.37 atm. wt.%) confirming the composition of SAOSm*x* nanophosphors.

The surface morphology of SAOSm0 powder has been investigated by TEM analysis and is shown in Fig. 5. As examined from the TEM image illustrated in Fig. 5(a), the

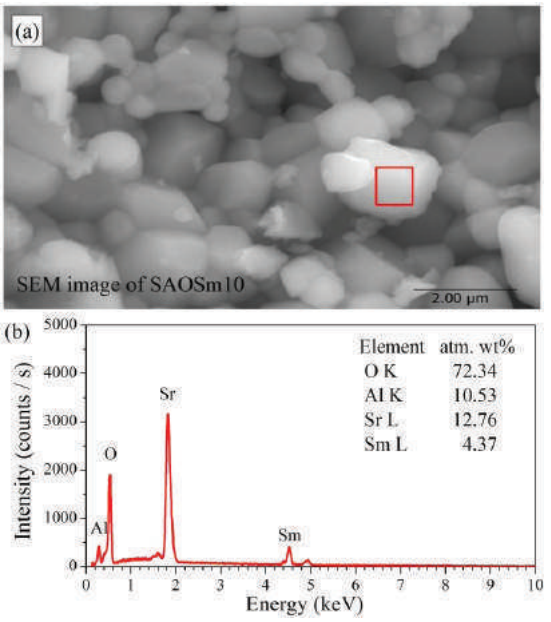

Fig. 4. SEM image (a) and EDX spectrum (b) of SAOSm10 nanophosphor.

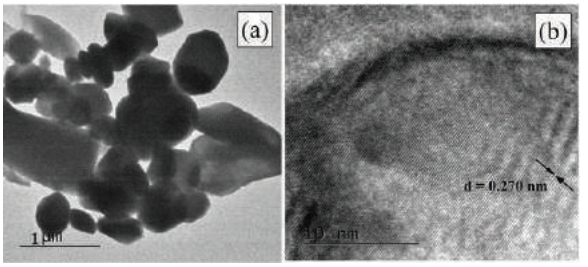

Fig. 5. TEM (a) and HRTEM (b) images of SAOSm0.

average size of the crystallite is estimated to be in the order of hundred nanometers. These results confirm that the studied phosphors have been crystallized into nanoscale. The HR-TEM image shown in Fig. 5(b) provides further insight into the structure of SAOSm*x* nanophosphors. The observed lattice fringes reveal that the distance between the adjacent fringes is estimated to be 0.270 nm which corresponds to the (310) crystal plane of $SrAl_2O_4$ nanophosphors.

The fluorescence features of $Sm^{3+}$ ions in SAOSm*x* nanophosphors have been investigated through photoluminescence excitation (PLE) and emission studies. The PLE spectra monitoring the emission at 603 nm corresponding to $^4G_{5/2} \rightarrow {}^6H_{7/2}$ transition of $Sm^{3+}$ ions reveal thirteen excitation bands owing to $^6H_{5/2} \rightarrow {}^4G_{7/2}$ (334 nm), $^6H_{5/2} \rightarrow {}^4K_{15/2}$ (347 nm), $^6H_{5/2} \rightarrow {}^4F_{9/2}$ (364 nm), $^6H_{5/2} \rightarrow {}^4D_{1/2}$ (377 nm), $^6H_{5/2} \rightarrow {}^4L_{15/2}$ (390 nm), $^6H_{5/2} \rightarrow {}^4L_{13/2}$ (400 nm), $^6H_{5/2} \rightarrow {}^4M_{19/2}$ (419 nm), $^6H_{5/2} \rightarrow {}^4G_{9/2}$ (442 nm), $^6H_{5/2} \rightarrow {}^4I_{18/2}$ (464 nm), $^6H_{5/2} \rightarrow {}^4I_{11/2}$ (471 nm), $^6H_{5/2} \rightarrow {}^4M_{15/2}$ (475 nm), $^6H_{5/2} \rightarrow {}^4I_{9/2}$ (487 nm) and $^6H_{5/2} \rightarrow {}^4G_{7/2}$ (493 nm) transitions.[30] Since

Funct. Mater. Lett. 2021.14. Downloaded from www.worldscientific.com
by Bungala Chinna Jamalaiah on 03/30/21. Re-use and distribution is strictly not permitted, except for Open Access articles.

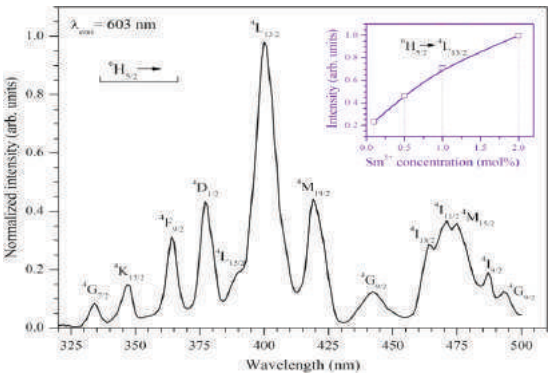

Fig. 6. Excitation spectrum ($\lambda_{emi}$ = 603 nm) of SAOSm10 nanophosphor. Inset is the variation of intensity of $^6H_{5/2} \rightarrow {}^4L_{13/2}$ transitions as a function of $Sm^{3+}$ concentration.

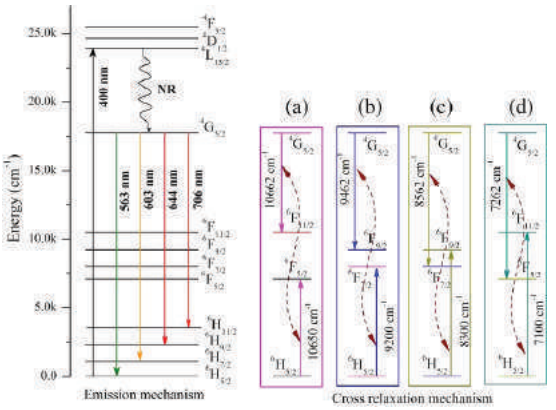

Fig. 8. Partial energy level diagram showing the emission and cross-relaxation mechanisms of $Sm^{3+}$ ions in SAOSm*x* nanophosphors.

the environment around the $Sm^{3+}$ ions and the experimental conditions are the same, the excitation profiles are identical for all the samples under investigation. However, considerable change in intensity of observed excitation bands is noticed. Figure 6 describes the excitation spectral profile of SAOSm10 nanophosphor along with the assignment of excitation bands.

The intensity of excitation bands enhances with the increase of concentration of $Sm^{3+}$ ions. The inset figure described in Fig. 6 shows the deviation of intensity of $^6H_{5/2} \rightarrow {}^4L_{13/2}$ (400 nm) transition versus $Sm^{3+}$ ions concentration. As observed from the PLE profiles, the intensity of $^6H_{5/2} \rightarrow {}^4L_{13/2}$ (400 nm) transition is found to be more prominent than other transitions. Thus, the wavelength related to this PLE transition is more suitable to produce intense and efficient fluorescence from the SAOSm*x* nanophosphors.

The fluorescence spectral features of SAOSm*x* nanophosphors have been studied by exciting at 400 nm wavelength of xenon flash lamp. The emission spectra in the spectral range from 525 nm to 725 nm shown in Fig. 7 exhibit four characteristics transitions of $Sm^{3+}$ ions. The observed emission transitions with peak maximum at around 563, 603, 644 and 706 nm have been ascribed to $^4G_{5/2} \rightarrow {}^6H_{5/2}$, $^4G_{5/2} \rightarrow {}^6H_{7/2}$, $^4G_{5/2} \rightarrow {}^6H_{9/2}$ and $^4G_{5/2} \rightarrow {}^6H_{11/2}$ transitions, respectively.[30]

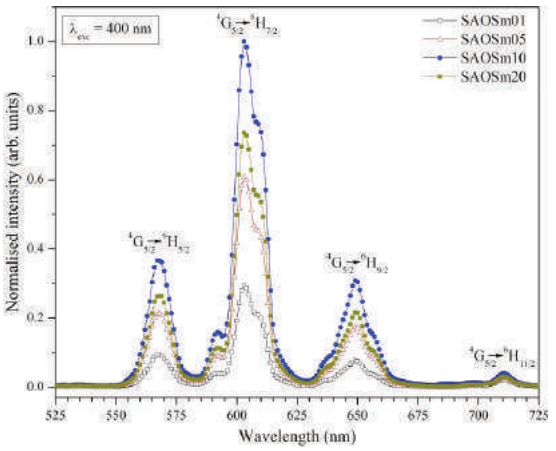

Fig. 7. Emission spectra ($\lambda_{exc}$ = 400 nm) of SAOSm*x* nanophosphors.

Upon 400 nm excitation, the incident light photons stimulate the ground state $Sm^{3+}$ ions resulting to excite them to $^6H_{5/2} \rightarrow {}^4L_{13/2}$ (400 nm) energy level. These excited ions decays quickly to $^4G_{5/2}$ meta-stable level via non-radiative (NR) process. Initially, one of the $Sm^{3+}$ ions at meta-stable level de-excites radiatively to lower energy levels releasing photons via spontaneous emission. The emitted photons trigger the other $Sm^{3+}$ ions at meta-stable level causing stimulated emission through $^4G_{5/2} \rightarrow {}^6H_J$ ($J$ = 5/2, 7/2, 9/2 and 11/2) transitions. The emission mechanism of SAOSm*x* nanophosphors at 400 nm excitation is described in Fig. 8.

The emission spectra of SAOSm*x* nanophosphors are similar to $GdAl_3(BO_3)_4$:$Sm^{3+}$, $Na_2Gd(PO_4)_2$:$Sm^{3+}$, $YAl_3(BO_3)_4$:$Sm^{3+}$ and $CaAl_4O_7$: $Sm^{3+}$ phosphors.[11–13, 15] When compared to $SrAl_2O_4$: Sm phosphor prepared by solution combustion method, this work explores more details on structural and concentration-dependent optical analysis.[18]

The color perception of SAOSm*x* nanophosphors has been investigated by evaluating the Commission International de I'Eclairage (CIE) 1931 coordinates using the emission spectral profiles shown in Fig. 7 and they are found to be (0.598, 0.359), (0.601, 0.360), (0.605, 0.362) and (0.603, 0.365) for SAOSm01, SAOSm05, SAOSm10 and SAOSm20 nanophosphors, respectively. The evaluated chromaticity coordinates of SAOSm10 (0.605, 0.362) are found close to those reported for $Ca_{2.96}Sm_{0.02}Na_{0.02}B_2O_6$ (0.608, 0.365) and $NaSrPO_4$:$Sm^{3+}$ (0.60, 0.39) phosphors.[31, 32]

Figure 9 shows the location of CIE chromaticity coordinates of SAOSm*x* nanophosphors. The CIE-1931 chromaticity diagram of SAOSm*x* nanophosphors shows that the chromaticity coordinates are well located in the orange–red region. The color of emitted fluorescence vary from orange

Funct. Mater. Lett. 2021.14. Downloaded from www.worldscientific.com
by Bungala Chinna Jamalaiah on 03/30/21. Re-use and distribution is strictly not permitted, except for Open Access articles.

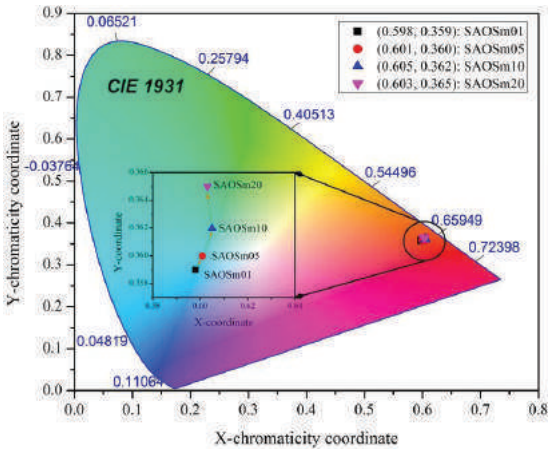

Fig. 9. CIE -1931 chromaticity diagram of SAOSm*x* nanophosphors. Inset shows the tuning of emitted color with $Sm^{3+}$ ions concentration.

for low concentrations i.e. $x = 0.1$ and 0.5 mol.% to orange–red for higher concentrations i.e. $x = 1.0$ and 2.0 mol.%. The inset of Fig. 9 shows the tuning of emitted fluorescence from orange to orange–red region with $Sm^{3+}$ ions concentration. Thus, the SAOSm10 nanophosphor emits intense orange–red fluorescence than the other studied materials.

In order to confirm the orange–red fluorescence of SAOSm10 nanophosphor, its CIE chromaticity coordinates together with the CIE chromaticity coordinates of National Television Standard Committee (NTSC) (0.67, 0.33) and commercial red emitting phosphor $Y_2O_3$:$Eu^{3+}$ (0.655, 0.345) are located in Fig. 10. As seen in CIE 1931 chromaticity diagram, it is clear that compared to the CIE chromaticity coordinates of NTSC and commercial red phosphor, the CIE chromaticity coordinates of SAOSm10 nanophosphor are located in the orange–red region. Thus, the SAOSm10 nanophosphor is more desirable to develop a new class of orange–red emitting phosphors for lighting applications.

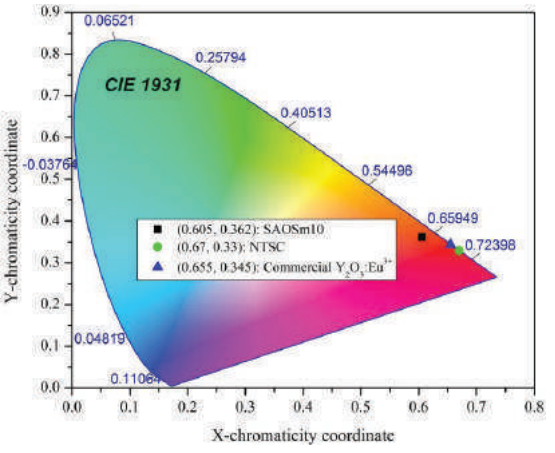

Fig. 10. Location of CIE-1931 chromaticity coordinates of SAOSm10, NTSC and commercial red phosphor.

As seen, the emission spectra shown in Fig. 7, the fluorescence intensity of observed transitions enhance with the addition of concentration of $Sm^{3+}$ ions reaches maximum and then decreases for further increase in concentration leading to fluorescence quenching. In case of SAOSm*x* nanophosphors excited at 400 nm wavelength, fluorescence quenching has been noticed beyond $x = 1.0$ mol.%. In general, for lowest concentrations ($x \leq 0.1$ mol.%), no transfer of energy takes place among the $Sm^{3+}$ ions as the active ions are dispersed at relatively large distances. As long as the concentration of $Sm^{3+}$ ions increases (for example, $0.5 \leq x \leq 1.0$ mol.%), the population of metastable level becomes high enough resulting in intense fluorescence. At higher concentrations ($x > 1.0$ mol.%), the $Sm^{3+}$ ion density ($Sm^{3+}$ ions per unit volume) increases causing NR transitions through exchange or dipole–dipole or dipole–quadrupole or quadrupole–quadrupole interactions among the excited $Sm^{3+}$ ions. These NR transitions are responsible for fluorescence quenching.

The fluorescence quenching at higher $Sm^{3+}$ ions concentration ($x > 1.0$ mol.%) in SAOSm*x* nanophosphors could be due to the transfer of energy among the excited $Sm^{3+}$ ions. One of the possible reasons for the transfer of energy is NR transitions through cross-relaxation mechanism. In case of $Sm^{3+}$ ions, the most promising cross-relaxation channels responsible for fluorescence quenching in SAOSm*x* nanophosphors are shown below and they are illustrated in Fig. 8.

$$\text{(a)}: [{}^4G_{5/2}, {}^6H_{5/2}] \rightarrow [{}^6F_{11/2}, {}^6F_{5/2}],$$

$$\text{(b)}: [{}^4G_{5/2}, {}^6H_{5/2}] \rightarrow [{}^6F_{9/2}, {}^6F_{7/2}],$$

$$\text{(c)}: [{}^4G_{5/2}, {}^6H_{5/2}] \rightarrow [{}^6F_{7/2}, {}^6F_{9/2}],$$

$$\text{(d)}: [{}^4G_{5/2}, {}^6H_{5/2}] \rightarrow [{}^6F_{5/2}, {}^6F_{11/2}].$$

## 4. Conclusions

The $Sm^{3+}$-doped SAOSm*x* ($x = 0, 0.1, 0.5, 1.0$ and 2.0 mol.%) nanophosphors have been synthesized by solid-state reaction method and characterized for lighting applications. The morphological studies show homogeneous distribution of particles that are agglomerated. The HR-TEM results show that the distance between the adjacent fringes is ~0.270 nm corresponding to (310) plane of SAOSm0 nanophosphor. The studied phosphors have been excited effectively at 400 nm wavelength to generate intense orange–red fluorescence. The CIE 1931 chromaticity coordinates of SAOSm10 nanophosphor are found to be (0.605, 0.362) which corresponds to orange–red fluorescence. The experimental results conclude that the SAOSm10 nanophosphor emitting orange–red fluorescence at 400 nm excitation has more potentiality for various lighting applications.

## ABSTRACT

***In this paper, we introduce and study the concept of Co-fuzzy sub ordered finite $\Gamma$ - near rings and L-fuzzy sub ordered finite $\Gamma$ - near rings with maximum and infimum conditions, where L stands for a complete lattice satisfying the infinite meet distributive law. We discuss the concept of intersection and union of co-fuzzy sub ordered finite $\Gamma$ - near rings. We also prove theorems on homomorphism of finite $\Gamma$ - near rings.***

***Keywords***— *Fuzzy set, L – Fuzzy set, co-fuzzy sub ordered finite $\Gamma$ - near ring, homomorphism of finite $\Gamma$ - near rings.*

## 1. INTRODUCTION

We know the importance of fuzzy sets. It is being used in different areas like physics, Electronics, Robotics, Computer Languages, Military control, Artificial intelligence, Law, Psychology, Economics and Medical sciences.

The notion of fuzzy set was introduced by Zadeh L.A [12] in 1965 as function from a nonempty set $X$ into $[0,1]$.Goguen[5] further generalized Zadeh definition of a fuzzy subset of $X$ as a mapping of $X$ into a Lattice L. Further more so many authors introduced the fuzzy set concept in algebraic structures, like groups, semi groups, rings and $\Gamma-$near rings etc. The concept of a Gamma – ring, a generalization of a ring was introduced by Nobusawa[4] and was generalized by Barnes. The concept of near ring was introduced by Pilz.G[6]. The common generalization of concepts of Near ring and $\Gamma-$near ring, namely $\Gamma-$near ring was introduced by Satyanarayana. Bh[9][10] and the ideal theory of $\Gamma-$near rings was studied by Satyanarayana.Bh and Booth.G.L[2]. Fuzzy ideals in rings were introduced by Liu.W and they have been studied by several authors.

In this paper, we define Co-Fuzzy sub ordered finite $\Gamma-$near ring. We prove the intersection and union of two Co-Fuzzy sub ordered finite $\Gamma-$near rings theorems. We also prove the homomorphic image and pre-image of Co-Fuzzy sub ordered finite $\Gamma-$near ring is again a Co-Fuzzy sub ordered finite $\Gamma-$near rings. We also prove some necessary and sufficient conditions for a Fuzzy set to be Co-Fuzzy sub ordered finite $\Gamma-$near ring. Throughout this chapter $\mathcal{N}$ stands for finite $\Gamma-$near ring.

## 2. PRELIMINARIES

In this section we recall some of the fundamental definitions, which are necessary for this paper.

**Definition 2.1:** A triplet $(\mathcal{N},+,\cdot)$ is said to be a near ring if

1. $(\mathcal{N},+)$ is a group (Not necessarily abelian group)
2. $(\mathcal{N},\cdot)$ is a semi-group
3. $(a+b)\cdot c = a\cdot c + b\cdot c \;\forall\; a,b,c \in \mathcal{N}$ (Right distribution law).

**Definition 2.2:** A near ring $(\mathcal{N},+,\cdot)$ is said to be finite near ring if $\mathcal{N}$ has finite Number of elements.

**Definition 2.3:** Let $\mathcal{N}$ be a non-empty finite set. If

1. $(\mathcal{N},+)$ is a group. (Not necessarily abelian group)
2. $\Gamma$ is the set of binary operations such that $(\mathcal{N},+,\alpha)$ is a near ring.

Where $\alpha \in \Gamma$.

© 2021, www.IJARIIT.com All Rights Reserved 

3. $a\alpha(b\beta c) = (a\alpha b)\beta c, \forall\ a,b,c \in \mathcal{N}$ and $\alpha,\beta \in \Gamma$.

Then $(\mathcal{N}, +, \Gamma)$ is a finite $\Gamma$ - near ring.

**Example 2.4:** Let G be any finite non-abelian group and $X(\neq \phi)$ be any finite set.

Let N $= \{f / f : X \to G \text{ is a function}\}$

Then $(\mathcal{N}, +)$ is a group with respect to point wise addition of functions, but $(\mathcal{N}, +)$ is not commutative. Let us choose $a, b \in G$ such that $a + b \neq b + a$.

Define $f_a : X \to G$ and

$f_b : X \to G$ such that

$f_a(x) = a$ & $f_b(x) = b\ \forall x \in X$.

$$Then\ (f_a + f_b)(x) = f_a(x) + f_b(x)$$
$$= a + b \ldots\ldots\ldots\ldots\ldots\ldots\ldots (2.4.1)$$

But

$$(f_b + f_a)(x) = f_b(x) + f_a(x)$$
$$= a + b \ldots\ldots\ldots\ldots\ldots\ldots\ldots (2.4.2)$$

From the equations (2.4.1) and (2.4.2),

$$(f_a + f_b)(x) \neq (f_b + f_a)(x)$$
$$f_a + f_b \neq f_b + f_a$$

Thus $(\mathcal{N}, +)$ is a not commutative group.

Now take $\Gamma = \{g / g : G \to X \text{ is a function}\}$

Then by defining $\Gamma : \mathcal{N} \times \mathcal{N} \to \mathcal{N}$ by $f_1 g f_2$ as composition of mappings. Then $(\mathcal{N}, +, \Gamma)$ is a finite $\Gamma$ - near ring.

Clearly,

$$((f_1 + f_2)gf_3)(x) = (f_1 + f_2)(g(f_3(x)))$$
$$= f_1(g(f_3(x))) + f_2(g(f_3(x)))$$
$$= (f_1 g f_3)(x) + (f_2 g f_3)(x)$$
$$= (f_1 g f_3 + f_2 g f_3)(x)$$

$\forall x \in X, f_1, f_2, f_3 \in \mathcal{N}$ and $g \in \Gamma$

i.e., $(f_1 + f_2)gf_3 = f_1 g f_3 + f_2 g f_3$

i.e., the right distribution law hold in $\mathcal{N}$.

But left distribution law is not satisfied in $\mathcal{N}$.

Let us take $z_0(\neq 0) \in G$

Define $f_1 : X \to G$ such that $f_1(x) = z_0, \forall x \in X$ *and* $g : G \to X$ *such that* $g(x) = u, \forall x \in G$

Where $u \in X$

Now $(f_1 g(f_2 + f_3))(x) = z_0 \ldots\ldots (2.4.3)$

But

$$(f_1 g f_2 + f_1 g f_3)(x) = (f_1 g f_2)(x) + (f_1 g f_3)(x)$$
$$= f_1(g(f_2(x))) + f_1(g(f_3(x)))$$
$$= f_1(u) + f_1(u) = z_0 + z_0 ----------- (2.4.4)$$

From equations (2.4.3) and (2.4.4),

$(f_1 g(f_2 + f_3))(x) \neq (f_1 g f_2 + f_1 g f_3)(x)$.

Clearly

$f_1 g_1 (f_2 g_2 f_3) = (f_1 g_1 f_2) g_2 f_3$ holds in $\mathcal{N}$ with respect to composition of functions

Hence $(\mathcal{N}, +, \Gamma)$ is a finite $\Gamma$ – near ring.

**Definition 2.5 :** Let $(\mathcal{N}, +, \Gamma)$ is a finite $\Gamma$ –near ring. Then a subset S of $\mathcal{N}$ is said to be sub $\Gamma$ –

*© 2021, www.IJARIIT.com All Rights Reserved* 

near ring of $(\mathcal{N}, +, \Gamma)$, if

1. $x + y \in S$
2. $x\alpha y \in S, \forall x, y \in S \text{ and } \alpha \in \Gamma$

**Definition 2.6:** A non-empty set P is said to be POSET (partial ordering set), if there exists a relation $\leq$ on P such that

1. $a \leq a$
2. $a \leq b \text{ and } b \leq a \Rightarrow a = b$
3. $a \leq b, b \leq c \Rightarrow a \leq c \ \forall a, b, c \in P$

**Definition 2.7 :** Finite $\Gamma$ - near ring $\mathcal{N}$ is said to be finite ordered $\Gamma$ - near ring , if $(\mathcal{N}, \leq)$ is a POSET.

**Definition 2.8: A** POSET L is said to be a lattice if every two elements $a, b \in L$ have suprimum and infimum. Generally, we denote

$$\sup\{a, b\} = a \vee b$$

$$Inf\{a, b\} = a \wedge b$$

Where $\vee, \wedge$ are respectively called join and meet.

**Definition 2.9:** If every non empty sub set of lattice L has suprimum and inifimum then L is called complete lattice.

**Definition 2.10:** If X be a non-empty set and $f : X \to [0,1]$ is a mapping then the pair $(X, f)$ is called fuzzy set and $f$ is called fuzzy sub set of X.If $[0,1] = L$ where L stands for lattice then $f$ is called L - fuzzy sub set of X. It is denoted by $f_L$.

**Definition 2.11:** Let X be a non empty set and L is a lattice. If $f_L : X \to L$ is a mapping then $f_L$ is Called L-fuzzy sub set of X.

**Definition 2.12:** Let $f_L$ be a L - fuzzy sub set of X. The set $\{x \in X / f_L(x) < s\}$.Where $s \in L$ is called level sub set of $f_L$. It is denoted by $f_s$.

This $f_s$ is called $s$ - cut of $f_L$.

$$\therefore f_s = \{x \in X / f(x) < s\}$$

**Definition 2.13:** Let $f_L \text{ and } g_L$ be two L-fuzzy sub sets of X. If $f_L(x) \leq g_L(x)$, $\forall x \in X$ then $f_L$ is said to be contained in $g_L$. It is denoted by $f_L \subseteq g_L$.

## 3. CO-FUZZY SUB ORDERED FINITE $\Gamma$ - NEAR RING

In this section we define the intersection and union of co-fuzzy sub sets of non-empty set $X$. We prove the intersection of two co-fuzzy sub ordered finite $\Gamma$ - near rings is also co-fuzzy sub ordered finite $\Gamma$ - near ring. But the union of two co-fuzzy sub ordered finite $\Gamma$ - near rings need not be co-fuzzy sub ordered finite $\Gamma$ - near ring and also, we give suitable illustrations.

**Definition 3.1:** Let $f \text{ and } g$ be two fuzzy sub sets of $X$. Then their intersection and union are denoted by $f \cap g \text{ and } f \cup g$ respectively and defined as follows

$$(f \cap g)(x) = \min\{f(x), g(x)\}$$

and

$$(f \cup g)(x) = \max\{f(x), g(x)\}$$

**Definition 3.2:** For any sub set A of a set $X$, the co-fuzzy characteristic set $\delta_A$ is defined as follows

$$\delta_A = \begin{cases} 0 & if \ x \in A \\ 1 & if \ x \notin A \end{cases}$$

**Definition 3.3:** Let $M_1 \text{ and } M_2$ be two non-empty sets and $\mu : M_1 \to M_2$ is a mapping. If $f$ is a fuzzy sub set of $M_1$ then $g$ be a fuzzy sub set of $M_2$ defined by

$$g(y) = \begin{cases} \underset{z \in \mu^{-1}(y)}{Inf} f(z) & if \ \mu^{-1}(y) \neq \phi \\ 0 & if \ \mu^{-1}(y) = \phi \end{cases}$$

*© 2021, www.IJARIIT.com All Rights Reserved* 

Where $\mu^{-1}(y)=\{x\in M_1 / \mu(x)=y\}$

If $g$ is fuzzy sub set of $M_2$ then $f$ be a fuzzy sub set of $M_1$ defined by

$$f(x)=g(\mu(x)),\ \forall x\in M_1$$

**Definition 3.4:** Let $f$ be a fuzzy sub set of finite ordered $\Gamma$ - near ring $(\mathcal{N},+,\Gamma)$. Then $f$ is said to be co-fuzzy sub ordered finite $\Gamma$ - near ring of $(\mathcal{N},+,\Gamma)$, if

1. $f(x+y)\le \max\{f(x),f(y)\}$
2. $f(x\alpha y)\le \max\{f(x),f(y)\}$
3. $x\le y\Rightarrow f(x)\le f(y),\ \forall x,y\in\mathcal{N}$ and $\alpha\in\Gamma$

**Definition 3.5:** Let $f_L$ be a L-fuzzy sub set of a finite ordered $\Gamma$ - near ring $(\mathcal{N},+,\Gamma)$. Then $f_L$ is Said be a co-fuzzy sub ordered finite $\Gamma$ - near ring of $(\mathcal{N},+,\Gamma)$, If

1. $f_L(x+y)\le f_L(x)\vee f_L(y)$
2. $f_L(x\alpha y)\le f_L(x)\vee f_L(y)$
3. $x\le y\Rightarrow f_L(x)\le f_L(y)$ , $\forall x,y\in\mathcal{N}$ and $\alpha\in\Gamma$.

**Example 3.6:** Let $S=\{1,2,3,4\}$ and $\mathcal{N}=P(S)$ is the power set of $S$ .Then $\mathcal{N}$ is a group with respect to symmetric difference of two sets.
Where the symmetric difference of two sets A and B is defined as

$$A\Delta B=(A\cup B)-(A\cap B)$$

Let us take $L=\Gamma=\{\{1\},\{2\},\{1,2\},\{1,2,3\}\}$

Define the mapping $\mathcal{N}\times\Gamma\times\mathcal{N}\to\mathcal{N}$, by $A\alpha B$ is the intersection of the sets $A,\alpha,B$. Where $A,B\in\mathcal{N}$ and $\alpha\in\Gamma$.
It is clear that 1. $(\mathcal{N},\Delta,\Gamma)$ is finite $\Gamma$ –near ring.
2. $(\mathcal{N},\subseteq)$ is a poset and $(L,\subseteq)$ is lattice.

Then $(\mathcal{N},\Delta,\Gamma)$ is finite ordered $\Gamma-$ near ring.

Now define $f_L:\mathbf{N}\to L$ such that

$$f_L(A)=\begin{cases}\{1,2,3\} & if\ \ A\neq\phi\\ \phi & if\ \ A=\phi\end{cases}$$ Where $A\in\mathcal{N}$.

Let us take $A,B\in\mathcal{N}$ and $\alpha\in\Gamma$

*Case* $(i)$: *Let* $A\neq\phi,B\neq\phi,A\Delta B\neq\phi,$ *and* $A\alpha B\neq\phi$

$f_L(A)=\{1,2,3\}$ *and* $f_L(B)=\{1,2,3\}$

*and* $f_L(A\Delta B)=\{1,2,3\}$

$f_L(A\alpha B)=\{1,2,3\}$ *and* $f_L(A)\vee f_L(B)=\{1,2,3\}$.

*Case* $(ii)$: *Let* $A\neq\phi,B=\phi$ *then* $A\Delta B=A,$ *and* $A\alpha B=\phi$

$f_L(A)=\{1,2,3\}$ *and* $f_L(B)=\phi$

$f_L(A\Delta B)=\{1,2,3\}$

$f_L(A\alpha B)=\phi$ *and* $f_L(A)\vee f_L(B)=\{1,2,3\}$

*Case* $(iii)$: *Let* $A\neq\phi,B\neq\phi$ *and* $A\Delta B=\phi,$ *and* $A\alpha B\neq\phi$

$f_L(A)=\{1,2,3\}$ *and* $f_L(B)=\{1,2,3\}$

$\therefore f_L(A\Delta B)=\phi,f_L(A\alpha B)=\{1,2,3\}$ *and* $f_L(A)\vee f_L(B)=\{1,2,3\}$

© 2021, www.IJARIIT.com All Rights Reserved 

$Case\ (iv): Let\ A=\phi, B=\phi, Then\ A\Delta B=\phi,\ and\ A\alpha B=\phi$

$f_L(A)=\phi\ and\ f_L(B)=\phi$

$\therefore f_L(A\Delta B)=\phi, f_L(A\alpha B)=\phi\ and\ f_L(A)\vee f_L(B)=\phi.$

$Case\ (v): Let\ A\neq\phi, B\neq\phi\ and\ A\Delta B=\phi, A\alpha B=\phi$

$\therefore f_L(A)=\{1,2,3\}\ and\ f_L(B)=\{1,2,3\}$

$\therefore f_L(A\Delta B)=\phi, f_L(A\alpha B)=\phi\ and\ f_L(A)\vee f_L(B)=\{1,2,3\}$

$Case\ (vi): Let\ A\neq\phi, B\neq\phi\ then\ A\Delta B\neq\phi,\ and\ A\alpha B=\phi$

$f_L(A)=\{1,2,3\}\ and\ f_L(B)=\{1,2,3\}$

$\therefore f_L(A\Delta B)=\{1,2,3\} f_L(A\alpha B)=\phi\ and\ f_L(A)\vee f_L(B)=\{1,2,3\}$

In above all the cases,

1. $f_L(A\Delta B)\leq f_L(A)\vee f_L(B)$
2. $f_L(A\alpha B)\leq f_L(A)\vee f_L(B)$

and it is clear that $A\subseteq B\Rightarrow f_L(A)\subseteq f_L(B)$

Hence $f_L$ is a L - fuzzy sub ordered finite $\Gamma$ - near ring of $(\mathcal{N}, \Delta, \Gamma)$.

Now, we prove a necessary and sufficient condition for $f$ to be a co-fuzzy sub ordered finite $\Gamma-$ near ring.

**Theorem3.7:** Let $f$ be a fuzzy sub set of finite ordered $\Gamma$ - near ring $(\mathcal{N}, +, \Gamma)$. Then $f$ is a co-fuzzy sub ordered finite $\Gamma$ - near ring of $\mathcal{N}$ if and only if for each $\delta\in(0,1]$, the $\delta$ -cut $f_\delta=\{x\in\mathcal{N}\ /f(x)<\delta\}$ is a sub ordered $\Gamma$ - near ring of $\mathcal{N}$.

**Proof:**

Let $f$ be a co-fuzzy sub ordered $\Gamma$ - near ring of $\mathcal{N}$. We need to prove that the $\delta$ - cut $f_\delta=\{x\in\mathcal{N}\ /f(x)<\delta\}$ is a sub ordered $\Gamma$ - near ring of $\mathcal{N}$.

$Let\ x, y\in f_\delta$

$\therefore f(x)<\delta\ and\ f(y)<\delta$

$Now\ f(x+y)\leq\max\{f(x), f(y)\}<\delta$

$\therefore x+y\in f_\delta$

$Let\ x, y\in f_\delta\ and\ \alpha\in\Gamma$

$\therefore f(x\alpha y)\leq\max\{f(x), f(y)\}<\delta$

$\therefore x\alpha y\in f_\delta$

Thus $f_\delta$ is a sub ordered $\Gamma$ - near ring of $\mathcal{N}$.

Conversely assume that $f_\delta$ is a sub ordered $\Gamma$ - near ring of $\mathcal{N}$. for all $\delta\in(0,1]$

We have to prove that $f$ is co-fuzzy sub ordered finite $\Gamma$ - near ring of $\mathcal{N}$.

If possible, let $\exists\ x_0, y_0\in\mathcal{N}$ ∋

$f(x_0+y_0)>\max\{f(x_0), f(y_0)\}$

$Choose\ \delta=\dfrac{f(x_0+y_0)+\max\{f(x_0), f(y_0)\}}{2}$

$\therefore f(x_0+y_0)>\delta\ and\ \max\{f(x_0) f(y_0)\}<\delta$

$\therefore x_0, y_0\in f_\delta\ and\ x_0+y_0\notin f_\delta$

This is a contradiction to the fact that $f_\delta$ is a sub ordered $\Gamma$ - near ring.

$\therefore f(x+y)\leq\max\{f(x), f(y)\}\ \ \forall x, y\in\mathcal{N}$.

© 2021, www.IJARIIT.com All Rights Reserved 

Again, if possible let $\exists\ x_0, y_0 \in \mathcal{N}$. ∋

$$f(x_0 \alpha y_0) > \max\{f(x_0), f(y_0)\} \text{ for some } \alpha \in \Gamma$$

$$\text{Choose } \delta = \frac{f(x_0 \alpha y_0) + \max\{f(x_0), f(y_0)\}}{2}$$

$$\therefore f(x_0 \alpha y_0) > \alpha \text{ and } \max\{f(x_0), f(y_0)\} < \delta$$

$$\therefore x_0 \alpha y_0 \notin f_\delta \text{ and } x_0, y_0 \in f_\delta$$

Which is a contradiction

$\therefore f(x\alpha y) \le \max\{f(x), f(y)\}\ \forall x, y \in \mathcal{N}$ and $\alpha \in \Gamma$

Let $x, y \in \mathcal{N}$ and $x \le y$

If possible, let $f(x) > f(y)$

$\therefore$ choose a $\delta \in (0,1)$ such that $f(x) > \delta > f(y)$

$\therefore x \notin f_\delta$ *and* $y \in f_\delta$

Which is a contradiction

Hence $x \le y \Rightarrow f(x) \le f(y)$

$\therefore\ f$ is a co-fuzzy sub ordered finite $\Gamma$ - near ring of $\mathcal{N}$.

**Theorem3.8:** The intersection of two co-fuzzy sub ordered finite $\Gamma$ - near rings of a finite ordered $\Gamma$ - near ring $(\mathcal{N}, +, \Gamma)$ is a co-fuzzy sub ordered finite $\Gamma$ - near ring of $\mathcal{N}$.

**Proof:**

Let $f$ and $g$ are two co-fuzzy sub ordered finite $\Gamma$ - near rings of finite ordered $\Gamma$ - near ring $(\mathcal{N}, +, \Gamma)$.

We have to show that $(f \cap g)$ is a co-fuzzy sub ordered finite $\Gamma$ - near ring of $\mathcal{N}$.

Let $x, y \in \mathcal{N}$ and $\alpha \in \Gamma$.

$$i.\ (f \cap g)(x+y) = \min\{f(x+y), g(x+y)\}$$
$$\le \min\{\max\{f(x), f(y)\}, \max\{g(x), g(y)\}\}$$
$$= \max\{(f \cap g)(x), (f \cap g)(y)\}$$
$$\therefore (f \cap g)(x+y) \le \max\{(f \cap g)(x), (f \cap g)(y)\}$$

$$ii.\ (f \cap g)(x\alpha y) = \min\{f(x\alpha y), g(x\alpha y)\}$$
$$\le \min\{\max\{f(x), f(y)\}, \max\{g(x), g(y)\}\}$$
$$= \max\{(f \cap g)(x), (f \cap g)(y)\}$$
$$\therefore (f \cap g)(x+y) \le \max\{(f \cap g)(x), (f \cap g)(y)\}$$

*iii. Let* $x, y \in$ N and $x \le y$

$$\therefore f(x) \le f(y) \text{ and } g(x) \le g(y)$$
$$\text{Now } (f \cap g)(x) = \min\{f(x), g(x)\}$$
$$\le \min\{f(y), g(y)\}$$
$$= (f \cap g)(y)$$

Hence $f \cap g$ is a co-fuzzy sub ordered finite $\Gamma$ - near ring of $\mathcal{N}$.

**Theorem 3.9:** The union of two co-fuzzy sub ordered finite $\Gamma$ - near rings of a finite ordered $\Gamma$ - near rings $\mathcal{N}$ is a co-fuzzy sub ordered finite $\Gamma$ - near ring if one is contained in other.

**Proof:** Let $f$ and $g$ be two co-fuzzy sub ordered finite $\Gamma$ - near rings of $\mathcal{N}$ such that $f \subseteq g$ or $g \subseteq f$.

With out less of generality, assume that $f \subseteq g$

i. Let $x, y \in \mathcal{N}$

*© 2021, www.IJARIIT.com All Rights Reserved* 

$\therefore f(x) \le g(x)$ *and* $f(y) \le g(y)$

$$Now\ (f \cup g)(x+y) = \max\{f(x+y), g(x+y)\}$$
$$\le \max\{\max\{f(x), f(y)\}, \max\{g(x), g(y)\}\}$$
$$\le \max\{\max\{f(x), g(x)\}, \max\{f(y), g(y)\}\}$$
$$= \max\{(f \cup g)(x), (f \cup g)(y)\}$$

ii. Let $x, y \in \mathcal{N}$ and $\alpha \in \Gamma$

$$\therefore (f \cup g)(x\alpha y) = \max\{f(x\alpha y), g(x\alpha y)\}$$
$$\le \max\{\max\{f(x), f(y)\}, \max\{g(x), g(y)\}\}$$
$$\le \max\{\max\{f(x), g(x)\}, \max\{f(y), g(y)\}\}$$
$$= \max\{(f \cup g)(x), (f \cup g)(y)\}$$

iii. let $x, y \in \mathcal{N}$ and $x \le y$

$$\therefore (f \cup g)(x) = \max\{f(x), g(x)\}$$
$$\le \max\{f(y), g(y)\}$$
$$= (f \cup g)(y)$$

Hence $f \cup g$ is a co-fuzzy sub ordered finite $\Gamma$ - near ring of $\mathcal{N}$.

**Note 3.10:**

The converse of the above theorem need not be true, i.e., even if the union of two co-fuzzy sub ordered finite $\Gamma$ - near rings of finite ordered $\Gamma$ - near ring $\mathcal{N}$ is a co-fuzzy sub ordered finite $\Gamma$ - near rings of $\mathcal{N}$, one may not contained in the other.

**Example 3.11:** Let $S = \{1,2,3,4\}$ then $(P(S), \Delta, \Gamma)$ is a finite ordered $\Gamma$ - near ring. Where $\Gamma = \{\{1\}, \{1,2\}\}$

Define $f : P(S) \to [0,1]$ and $g : P(S) \to [0\ 1]$ such that

$$f(A) = \begin{cases} 0.5 & if \quad A \neq \phi \\ 0.4 & if \quad A = \phi \end{cases}$$

and

$$g(A) = \begin{cases} 0.6 & if \quad A \neq \phi \\ 0.3 & if \quad A = \phi \end{cases}$$ are two co-fuzzy sub ordered finite $\Gamma$ - near rings of $(P(S), \Delta, \Gamma)$.

Then clearly $(f \cup g)$ is a co-fuzzy sub ordered finite $\Gamma$ - near ring of $(P(S), \Delta, \Gamma)$. But one is not contained in the other.

i.e., $f \not\subset g$ and $g \not\subset f$.

**Theorem 3.12:**

The necessary and sufficient condition for two level subsets $f_{\delta_1}$ and $f_{\delta_2}$ of a finite ordered $\Gamma$ - near ring $(\mathcal{N}, +, \Gamma)$ are equal is there exists, no $x \in \mathcal{N}$ such that $\delta_1 \le f(x) < \delta_2$.

Where $0 < \delta_1 < \delta_2 \le 1$

**Proof:**

Let the two level subsets $f_{\delta_1}$ and $f_{\delta_2}$ are equal.

Suppose, let $\exists x \in \mathcal{N}$ ,ə $\delta_1 \le f(x) < \delta_2$

$\therefore x \notin f_{\delta_1}$ *and* $x \in f_{\delta_2}$

This is a contradiction to $f_{\delta_1} = f_{\delta_2}$

$\therefore \exists$ no $x \in \mathcal{N}$ ə $\delta_1 \le f(x) < \delta_2$

Conversely assume that $\therefore \exists$ no $x \in \mathcal{N}$ ə $\delta_1 \le f(x) < \delta_2$

Suppose let $f_{\delta_1} \neq f_{\delta_2}$

$\therefore f_{\delta_1} \subset f_{\delta_2}$

*© 2021, www.IJARIIT.com All Rights Reserved* 

$\Rightarrow$ There exist $x \in f_{\delta_2}$ such that $x \notin f_{\delta_1}$

$\Rightarrow \delta_1 \le f(x) < \delta_2$

This is a contradiction to our assumption

Hence $f_{\delta_1} = f_{\delta_2}$. □

## 4. HOMOMORPHISM OF FINITE ORDERED $\Gamma-$ NEAR RINGS

In this section we define homomorphism between two finite ordered $\Gamma-$ near rings and prove that homomorphic image and pre image of co-fuzzy sub ordered finite $\Gamma-$ near rings are also co-fuzzy sub ordered finite $\Gamma-$ near rings.

**Definition 4.1:** Let $(\mathcal{N}_1, +, \Gamma)$ and $(\mathcal{N}_2, +, \Gamma)$ be two finite ordered $\Gamma$ - near rings and $f: \mathcal{N}_1 \to \mathcal{N}_2$ be a mapping. Then $f$ is said to be homomorphism if

1. $f(a+b) = f(a) + f(b)$
2. $f(a\gamma b) = f(a)\gamma f(b)$
3. $a \le b \Rightarrow f(a) \le f(b)$ , $\forall a,b \in \mathcal{N}_1$ and $\gamma \in \Gamma$

**Definition 4.2:** Let $(\mathcal{N}_1, +, \Gamma_1)$ and $(\mathcal{N}_2, +, \Gamma_2)$ be two finite ordered $\Gamma$ - near rings. $f: \mathcal{N}_1 \to \mathcal{N}_2$ and $g: \Gamma_1 \to \Gamma_2$ be two mappings. Then $(f, g)$ is said to be homomorphism from $\mathcal{N}_1$ to $\mathcal{N}_2$ if

1. $f(a+b) = f(a) + f(b)$
2. $f(a\gamma b) = f(a)g(\gamma)f(b)$
3. $a \le b \Rightarrow f(a) \le f(b)$ , $\forall a,b \in \mathcal{N}_1$ and $\gamma \in \Gamma_1$

**Definition 4.3:** Let $(\mathcal{N}_1, +, \Gamma)$ and $(\mathcal{N}_2, +, \Gamma)$ be two finite ordered $\Gamma$ - near rings and the function $f: \mathcal{N}_1 \to \mathcal{N}_2$ is a homomorphism from $\mathcal{N}_1$ to $\mathcal{N}_2$. If $\mu$ is a fuzzy subset of $\mathcal{N}_1$. Then $f(\mu)$ is a fuzzy subset of $N_2$ defined by

$$(f(\mu))(y) = \begin{cases} \inf_{z \in f^{-1}(y)} \mu(z) & \text{if } f^{-1}(y) \neq \phi \\ 0 & \text{if } f^{-1}(y) = \phi \end{cases} \quad \forall y \in \mathcal{N}_2$$

**Definition 4.4 :** Let $(\mathcal{N}_1, +, \Gamma)$ and $(\mathcal{N}_2, +, \Gamma)$ be two finite ordered $\Gamma$ - near rings and the function $f: \mathcal{N}_1 \to \mathcal{N}_2$ is a homomorphism from $\mathcal{N}_1$ to $\mathcal{N}_2$. If $\sigma$ is a fuzzy subset of $\mathcal{N}_2$, then its inverse image $f^{-1}(\sigma)$ is a fuzzy subset of $\mathcal{N}_1$ defined by

$$(f^{-1}(\sigma))(x) = \sigma(f(x)) \ \forall x \in \mathcal{N}_1$$

Now, we prove some theorems related to homomorphism.

**Theorem 4.5:** Let $(\mathcal{N}_1, +, \Gamma)$ and $(\mathcal{N}_2, +, \Gamma)$ be two finite ordered $\Gamma$ - near rings. The function $f: \mathcal{N}_1 \to \mathcal{N}_2$ is a homomorphism. If $\sigma$ is a co-fuzzy sub ordered finite $\Gamma$ - near ring of $\mathcal{N}_2$, then its inverse image $f^{-1}(\sigma)$ is a co-fuzzy sub ordered finite $\Gamma$ - near ring of $\mathcal{N}_1$.

**Proof:**

Given $f: \mathcal{N}_1 \to \mathcal{N}_2$ is a homomorphism and $\sigma: \mathcal{N}_2 \to [0,1]$ is a co-fuzzy sub ordered finite $\Gamma$ - near ring of $\mathcal{N}_2$.

We have to prove that $f^{-1}(\sigma)$ is a co-fuzzy sub ordered finite $\Gamma$ - near ring of $\mathcal{N}_1$.

Let $x, y \in \mathcal{N}_1$ and $\alpha \in \Gamma$.

$$i.\ (f^{-1}(\sigma))(x+y) = \sigma(f(x+y))$$
$$= \sigma(f(x) + f(y))$$
$$\le \max\{\sigma(f(x)), \sigma(f(y))\}$$
$$= \max\{(f^{-1}(\sigma))(x), (f^{-1}(\sigma))(y)\}$$

$$(f^{-1}(\sigma))(x+y) \le \max\{(f^{-1}(\sigma))(x), (f^{-1}(\sigma))(y)\}$$

© 2021, www.IJARIIT.com All Rights Reserved 

*ii.* $\left(f^{-1}(\sigma)\right)(x\alpha y)=\sigma\left(f(x\alpha y)\right)$

$=\sigma\left(f(x)\alpha f(y)\right)$

$\le \max\left\{\sigma\left(f(x)\right),\sigma\left(f(y)\right)\right\}$

$=\max\left\{\left(f^{-1}(\sigma)\right)(x),\left(f^{-1}(\sigma)\right)(y)\right\}$

$\left(f^{-1}(\sigma)\right)(x\alpha y)\le \max\left\{\left(f^{-1}(\sigma)\right)(x),\left(f^{-1}(\sigma)\right)(y)\right\}$

*iii.* $x\le y \Rightarrow f(x)\le f(y)$

$\Rightarrow \sigma\left(f(x)\right)\le\sigma\left(f(y)\right)$

$\Rightarrow \left(f^{-1}(\sigma)\right)(x)\le\left(f^{-1}(\sigma)\right)(y)$

$x\le y \Rightarrow \left(f^{-1}(\sigma)\right)(x)\le\left(f^{-1}(\sigma)\right)(y)$

Hence $f^{-1}(\sigma)$: $\mathcal{N}_1\to[0,1]$ is a co-fuzzy sub ordered finite Γ - near ring of $\mathcal{N}_1$.

**Theorem 4.6:** Let ( $\mathcal{N}_1$ ,+, Γ ) and ( $\mathcal{N}_2$ ,+, Γ ) be two finite ordered Γ - near rings. The function $f:\mathcal{N}_1\to\mathcal{N}_2$ is an onto homomorphism. If $\mu$ is a co-fuzzy sub ordered finite Γ - near ring of $\mathcal{N}_1$ then it's image $f(\mu)$ is a co-fuzzy sub ordered finite Γ - near ring of $\mathcal{N}_2$.

**Proof:**

Given $f:\mathcal{N}_1\to\mathcal{N}_2$ is an onto homomorphism and $\mu:\mathcal{N}_1\to[0\ 1]$ is a co-fuzzy sub ordered finite Γ - near ring of $\mathcal{N}_1$.

Now we have to prove that $f(\mu)$ is a co-fuzzy sub ordered finite Γ - near ring of $\mathcal{N}_2$ defined by

$$\left(f(\mu)\right)(y)=\begin{cases}\inf\limits_{z\in f^{-1}(y)}\mu(z) & \text{if } f^{-1}(y)\neq\phi\\ 0 & \text{if } f^{-1}(y)=\phi\end{cases}\quad \forall y\in \mathcal{N}_2.$$

Let $x,y\in\mathcal{N}_2$ and $\alpha\in\Gamma$

Since $f$ is onto from $\mathcal{N}_1$ to $\mathcal{N}_2$, $\exists$ $x^1,y^1\in\mathcal{N}_1$, such that $f(x^1)=x$ and $f(y^1)=y$

i. $\left(f(\mu)\right)(x+y)=\inf\limits_{z\in f^{-1}(x+y)}\mu(z)$

*Let* $\mu(x_0)=\inf\limits_{z\in f^{-1}(x)}\mu(z)$ *and* $\mu(y_0)=\inf\limits_{z\in f^{-1}(y)}\mu(z)$

$\therefore f(x_0)=x$ *and* $f(y_0)=y$

*Now* $f(x_0+y_0)=f(x_0)+f(y_0)=x+y$

$x_0+y_0\in f^{-1}(x+y)$

$\therefore \left(f(\mu)\right)(x+y)=\inf\limits_{z\in f^{-1}(x+y)}\mu(z)$

$\le \mu(x_0+y_0)$

$\le \max\left\{\mu(x_0),\mu(y_0)\right\}$

$=\max\left\{\inf\limits_{z\in f^{-1}(x)}\mu(z),\inf\limits_{z\in f^{-1}(y)}\mu(z)\right\}$

$=\max\left\{\left(f(\mu)\right)(x),\left(f(\mu)\right)(y)\right\}$

ii. $\left(f(\mu)\right)(x\alpha y)=\inf\limits_{z\in f^{-1}(x\alpha y)}\mu(z)$

$\le \mu(x_0\alpha y_0)$

$\le \max\left\{\mu(x_0),\mu(y_0)\right\}$

$=\max\left\{\inf\limits_{z\in f^{-1}(x)}\mu(z),\inf\limits_{z\in f^{-1}(y)}\mu(z)\right\}$

$=\max\left\{\left(f(\mu)\right)(x),\left(f(\mu)\right)(y)\right\}$

*© 2021, www.IJARIIT.com All Rights Reserved* 

iii. $x \le y \Rightarrow f(x) \le f(y)$

$\Rightarrow \inf_{z \in f^{-1}(x)} \mu(z) \le \inf_{z \in f^{-1}(y)} \mu(z)$

$\Rightarrow (f(\mu))(x) \le (f(\mu))(y)$

Hence $f(\mu): \mathcal{N}_2 \to [0,1]$ is a co-fuzzy sub ordered finite $\Gamma-$ near ring of ( $\mathcal{N}_2$, +, $\Gamma$ ). □

**5. CONCLUSION AND FUTURE SCOPE**

In the paper, we proved that the homomorphic image and its pre-image of a co-fuzzy sub ordered finite $\Gamma-$ Near ring is also a co-fuzzy sub ordered finite $\Gamma-$ Near ring. Also the intersection and union of two co-fuzzy sub ordered finite $\Gamma-$ Near rings are co-fuzzy sub ordered finite $\Gamma-$ Near rings under certain conditions. Using this idea we have a scope to develop co-fuzzy ideals in ordered $\Gamma-$ Near rings.

***Abstract*:** In this paper we introduce and study the concepts of co-fuzzy bi-ideals of a finite $\Gamma$ - near ring and co-fuzzy prime ideals of a finite $\Gamma$ - near ring. We also define normal co-fuzzy bi-ideal and prove its properties. Further we establish a relation between co-fuzzy bi-ideal and principal ideal.

***Keywords***: Fuzzy set, Finite $\Gamma$ - near ring, Bi-ideal, Co-fuzzy bi-ideal, Prime ideal, Co-fuzzy prime ideal, Principal ideal.

## 1. INTRODUCTION:

We know that the concept of fuzzy set was introduced by Zadeh.L.A[1] in 1965 as a function from a non-empty set $X$ into closed interval [0,1]. Later Atanassov.K.T [1,2,3] Gangnen [5] and many mathematicians studied and developed the fuzzy concept. Later it had been introduced in algebraic structures like semi groups, groups, rings and near rings etc. In 1981 Satyanarayana.Bh [7] introduced $\Gamma$ - near rings and introduced the fuzzy set concept in $\Gamma$ - near rings. Swamy.K.L.N and Swamy.U.M [0] studied fuzzy prime ideals of rings. Later Syamprasad.K and Satyanarayana.B[8,9] introduced fuzzy prime ideal in $\Gamma$ - near ring. Further Meenakumari.N and T.Tamizh Chelvam.J [6] introduced the concept of fuzzy bi-ideals in $\Gamma$ - near rings.

Taking the above as origin, in this paper we have introduced co-fuzzy bi-ideal and normal co-fuzzy bi-ideal concepts in finite $\Gamma$ - near ring. We also defined co-fuzzy prime ideal in finite $\Gamma$ - near ring and studied their properties.

## 2. PRELIMINARIES:

In this section we recall some of the fundamental definitions, which are necessary for this paper.

**Definition 2.1:** If $X$ is any non empty set, then a mapping $f : X \to [0,1]$ is called a fuzzy subset of $X$.

**Definition 2.2:** Let $f$ and $g$ be two fuzzy subsets of $X$. If $f(x) \le g(x)$ $\forall x \in X$, then we say that $f$ is contained in $g$ and is denoted by $f \subseteq g$.

**Definition 2.3:** A triplet $(\mathcal{N}, +, .)$ is said to be a near ring, if

1. $(\mathcal{N}, +)$ is a group (Not necessarily abelian)
2. $(\mathcal{N}, .)$ is a semi group
3. $(a+b).c = ab + ac \qquad \forall a, b, c \in \mathcal{N}$.

**Definition 2.4:** Let $\mathcal{N}$ be a finite non-empty set such that

1. $(\mathcal{N}, +)$ is a group (Not necessarily abelian)
2. $\Gamma$ is the set of all binary operations on $\mathcal{N}$. So that $(\mathcal{N}, +, \alpha)$ is a near ring, where $\alpha \in \Gamma$
3. $a\alpha(b\beta c) = (a\alpha b)\beta c \quad \forall a, b, c \in \mathcal{N}$ and $\alpha, \beta \in \Gamma$.

Then the triplet $(\mathcal{N}, +, \Gamma)$ is called a finite $\Gamma$ - near ring.

## 3. CO - FUZZY BI-IDEALS:

In this section we introduce the concept of co-fuzzy bi-ideals and bi-ideals in finite $\Gamma$ - near ring and develop some of their related properties. Also, we introduce normal co-fuzzy bi-ideals in finite $\Gamma$ - near rings and establish related theorems.

**Definition 3.1 :** Let $(\mathcal{N},+,\Gamma)$ is a finite $\Gamma$ - near ring and $f$ is a fuzzy subset of $\mathcal{N}$. Then $f$ is said to be a co-fuzzy bi-ideal of $\mathcal{N}$ if

1. $f(x+y) \le \max\{f(x), f(y)\}$
2. $f(x\alpha y\beta z) \le \max\{f(x), f(z)\} \quad \forall x, y, z \in \mathcal{N}$ and $\alpha, \beta \in \Gamma$

**Definition 3.2 :** Let $A(\neq \phi) \subseteq \mathcal{N}$ is said to be bi-ideal of $\mathcal{N}$ if

1. $x+y \in A \qquad \forall x, y \in A$
2. $x\alpha y\beta z \in A \qquad \forall x, z \in A, y \in \mathcal{N}, \alpha, \beta \in \Gamma$

**Definition 3.3:** If $f$ is a fuzzy subset of a finite $\Gamma$ - near ring $\mathcal{N}$, then the set

$f_t = \{x \in \mathcal{N} / f(x) < t \in [0,1]\}$ is called a level cut of $f$ .

**Definition 3.4 :** Let $f$ be a fuzzy subset of a finite $\Gamma$ - near ring $\mathcal{N}$, then the complement of $f$ is denoted by $f^1$ and defined as $f^1(x) = 1 - f(x), \forall x \in \mathcal{N}$.

**Definition 3.5 :** Let $(\mathcal{N},+,\Gamma)$ be a finite $\Gamma$ - near ring. Then the fuzzy set $f : \mathcal{N} \to [0,1]$ is said to be normal co- fuzzy bi-ideal of $\mathcal{N}$ . If

1. $f(x+y) \le \max\{f(x), f(y)\}$
2. $f(x\alpha y\beta z) \le \max\{f(x), f(z)\} \quad \forall x, y, z \in \mathcal{N}$ and $\alpha, \beta \in \Gamma$
3. $f(0) = 0$

**Definition 3.6:** Let $S = \{1,2,3,4\}$ and $\mathcal{N} = P(S) =$ The power set of $S$ . Then $(\mathcal{N},\Delta,\cap)$ is a finite $\Gamma$ - near ring. Define $f : \mathcal{N} \to [0,1]$ such that

$$f(A) = \begin{cases} 0.7 & if \quad A \neq \phi \\ 0.3 & if \quad A = \phi \end{cases}$$

Then $f$ is a co-fuzzy bi-ideal of $\mathcal{N}$.

**Theorem 3.7:**

Let A be a bi-ideal of a finite $\Gamma$ - near ring $\mathcal{N}$. Then for any $t \in (0,1)$ there exists a co-fuzzy bi-ideal $f$ of $\mathcal{N}$ such that $f_t = A$

**Proof:**

Given A is a bi-ideal of $\mathcal{N}$. Define $f : \mathcal{N} \to [0,1]$ such that

$$f(x) = \begin{cases} 0 & if \quad x \in A \\ t & if \quad x \notin A \end{cases}$$

Now, we prove that $f$ is a co-fuzzy bi-ideal of $\mathcal{N}$.

Let $x, y, z \in \mathcal{N}$ and $\alpha, \beta \in \Gamma$

*I* *i. Let* $x, y \in A$

Then $x+y \in A$ and $f(x) = f(y) = f(x+y) = 0$

$\therefore f(x+y) \le \max\{f(x), f(y)\}$

*ii. Let* $x, y \notin A$

Suppose let $x+y \in A$

Then $f(x+y) = 0, f(x) = f(y) = t$

$\therefore f(x+y) \le \max\{f(x), f(y)\}$

Suppose let $x+y \notin A$

Then $f(x+y)=f(x)=f(y)=t$

$\therefore f(x+y)\le \max\{f(x),f(y)\}$

*iii.* $x\in A$ & $y\notin A$

Then $x+y\notin A$ *and* $f(x+y)=t, f(x)=0, f(y)=t$

$\therefore f(x+y)\le \max\{f(x),f(y)\}$

*II* *i. Let* $x,z\in A$

Then $x\alpha y\beta z\in A$ *and* $f(x)=f(z)=f(x\alpha y\beta z)=0$

$\therefore f(x\alpha y\beta z)\le \max\{f(x),f(z)\}$

*ii. Let* $x,z\notin A$

If suppose $x\alpha y\beta z\notin A$ Then

$f(x\alpha y\beta z)=f(x)=f(z)=t$

$\therefore f(x\alpha y\beta z)\le \max\{f(x),f(z)\}$

If suppose $x\alpha y\beta z\in A$ Then

$f(x\alpha y\beta z)=0$ *and* $f(x)=f(z)=t$

$\therefore f(x\alpha y\beta z)\le \max\{f(x),f(z)\}$

Hence f is a co-fuzzy bi-ideal of $\mathcal{N}$.

Now

$f_t=\{x\in \mathcal{N} / f(x)<t\}$

$=\{x\in \mathcal{N} / f(x)=0\}$

$=A$

**Theorem 3.8:**

The necessary and sufficient condition for a non-empty subset A of a finite $\Gamma$ - near ring $\mathcal{N}$ to be bi-ideal of $\mathcal{N}$ is the fuzzy set $f$ defined by

$f(x)=\begin{cases}0 & if\ x\in A\\ 1 & if\ x\notin A\end{cases}$ is co-fuzzy bi-ideal of $\mathcal{N}$.

**Proof:**

Let A be a bi-ideal of $\mathcal{N}$.

Then by the above theorem (3.7), it is clear that $f$ is a co-fuzzy bi-ideal of $\mathcal{N}$.

Conversely, assume that $f$ is co-fuzzy bi-ideal of $\mathcal{N}$.

We now prove that A is bi-ideal of $\mathcal{N}$.

Let $x,y\in A$

$\therefore f(x)=f(y)=0$

*Now* $f(x+y)\le \max\{f(x),f(y)\}=0$

$\Rightarrow f(x+y)=0$

$\therefore x+y\in A$

Let $x,z\in A, y\in \mathcal{N}$ and $\alpha,\beta\in\Gamma$

$\therefore f(x)=f(z)=0$

*Now* $f(x\alpha y\beta z)\le \max\{f(x),f(z)\}=0$

$\Rightarrow f(x\alpha y\beta z)=0$

$\therefore x\alpha y\beta z\in A$

Thus $A$ is a bi-ideal of $\mathcal{N}$.

**Theorem 3.9:**

Let $f$ be a co-fuzzy bi-ideal of a $\Gamma$ - near ring $\mathcal{N}$. Then $\mathcal{N}_f = \{x \in \mathcal{N} / f(x) = f(0)\}$ is a bi-ideal of $\mathcal{N}$.

**Proof:**

$$Let\ x, y \in \mathcal{N}_f$$

$$\therefore f(y) = f(0), f(x) = f(0)$$

$$Now\ f(x+y) \le \max\{f(x), f(y)\} = f(0)$$

$$f(x+y) \le f(0)$$

$$f(x+y) = f(0)$$

$$\therefore x+y \in \mathcal{N}_f$$

$$Let\ x, z \in \mathcal{N}_f,\ y \in \mathcal{N} \text{ and } \alpha, \beta \in \Gamma$$

$$\therefore f(x) = f(z) = f(0)$$

$$Now\ f(x\alpha y\beta z) \le \max\{f(x), f(z)\} = f(0)$$

$$f(x\alpha y\beta z) = f(0)$$

$$\therefore x\alpha y\beta z \in \mathcal{N}_f$$

Thus $\mathcal{N}_f$ is a bi-ideal of $\mathcal{N}$.

**Theorem 3.10:**

Let $A(\neq \phi) \subseteq \mathcal{N}$, where $\mathcal{N}$ is a finite $\Gamma$ - near ring and a fuzzy set $f_A$ defined by

$$f_A(x) = \begin{cases} p & if\ \ x \in A \\ q & if\ \ x \notin A \end{cases} \quad \forall x \in \mathcal{N}$$

where $p, q \in [0\ 1]$ such that $p < q$. Then $f_A$ is a co-fuzzy bi-ideal of $\mathcal{N}$ iff A is a bi-ideal of $\mathcal{N}$. More over $\mathcal{N}_f = A$

**Proof:**

Let $f_A$ is a co-fuzzy bi-ideal of $\mathcal{N}$.

We have to prove that A is bi-ideal of $\mathcal{N}$

Let $x, y \in A$

$$\therefore f_A(x) = f_A(y) = p$$

Now $f_A(x+y) \le \max\{f_A(x), f_A(y)\} = p$

Since the range of $f_A$ consists only two elements p and q, $f(x+y) \neq p$

$$\therefore f(x+y) = p$$

$$\therefore x+y \in A$$

Let $x, z \in A,\ y \in \mathcal{N}$ and $\alpha, \beta \in \Gamma$

we have $f_A(x) = f_A(z) = p, f_A(y) = q$

Now $f_A(x\alpha y\beta z) \le \max\{f(x), f(z)\} = p$

$$\therefore f_A(x\alpha y\beta z) = p$$

$$\therefore x\alpha y\beta z \in A$$

Thus $A$ is a bi-ideal of $\mathcal{N}$.

Conversely, assume that A is a bi -ideal of $\mathcal{N}$.

In order to prove $f_A$ is a co-fuzzy bi-ideal of $\mathcal{N}$, let as take $x, y, z \in \mathcal{N}$ and $\alpha, \beta \in \Gamma$

**Case I**:

Let $x, y \in A$. Then $x+y \in A$ and $x\alpha z\beta y \in A$

$\therefore f_A(x) = f_A(y) = f_A(x+y) = f_A(x\alpha z\beta y) = p$

$\therefore f_A(x+y) \le \max\{f(x), f(y)\}$

$f_A(x\alpha z\beta y) \le \max\{f_A(x), f_A(y)\}$

**Case II**:

Let $x, y \notin A$ and $x+y \in A$, $x\alpha z\beta y \in A$

Then $f_A(x) = f_A(y) = q$ *and* $f_A(x+y) = f_A(x\alpha z\beta y) = p$

$\therefore f_A(x+y) \le \max\{f_A(x), f_A(y)\}$ and

$f_A(x\alpha z\beta y) \le \max\{f_A(x), f_A(y)\}$

**Case III:**

Let $x, y \notin A$ and one of $x+y \notin A$ and $x\alpha z\beta y \notin A$

$\therefore f_A(x+y) \le \max\{f_A(x), f_A(y)\}$ and

$f_A(x\alpha z\beta y) \le \max\{f_A(x), f_A(y)\}$

**Case IV:**

Let $x, y \notin A$ and $x+y \notin A$, $x\alpha z\beta y \in A$

Then $f_A(x+y) \le Max\{f_A(x), f_A(y)\}$ and

$f_A(x\alpha z\beta y) \le Max\{f_A(x), f_A(y)\}$

**Case V:**

Let $x, y \notin A$ and $x+y \in A$, $x\alpha z\beta y \notin A$

Then $f_A(x+y) \le Max\{f_A(x), f_A(y)\}$ and

$f_A(x\alpha z\beta y) \le Max\{f_A(x), f_A(y)\}$

Thus $f_A$ is a co-fuzzy bi-ideal of $\mathcal{N}$.

Finally $\mathcal{N}_f = \{x \in \mathcal{N} / f(x) = f(0)\}$

Since A is bi-ideal of $\mathcal{N}$, $o \in A$ and Hence $f(0) = p$

$\therefore \mathcal{N}_f = \{x \in \mathcal{N} / f(x) = p\}$

$= A$ □

**Theorem 3.11:**

Let A and B two bi-ideal of $\mathcal{N}$. Then $A \subseteq B$ iff $f_A \supseteq f_B$. Where

$$f_A(x) = \begin{cases} 0 & if \quad x \in A \\ 1 & if \quad x \notin A \end{cases}$$

And

$$f_B(x) = \begin{cases} 0 & if \quad x \in B \\ 1 & if \quad x \notin B \end{cases} \quad for\ all\ x \in \mathcal{N}$$

**Proof:**

Let $A \subseteq B$

Let $x \in \mathcal{N}$

**Case I:** If $x \in A$, then $x \in B$ and $f_A(x) = f_B(x) = 0$

**Case II:** if $x \notin A$, then $x \in B$ *or* $x \notin B$

$\therefore f_A(x) = 1$ and $f_B(x) = 0$ *or* $f_B(x) = 1$

$\therefore f_A \supseteq f_B$

Conversely assume that $f_A \supseteq f_B$

We have to prove that $A \subseteq B$

Let $x \in A$

$\Rightarrow f_A(x) = 0$

$\Rightarrow f_B(x) = 0 \ (\because f_A \geq f_B)$

$\therefore x \in B$

$\therefore A \subseteq B$

Hence the theorem is proved. □

**Theorem 3.12:**

Let $f$ be a fuzzy set of a finite $\Gamma$ - near ring $\mathcal{N}$. Then $f$ is co-fuzzy bi-ideal of $\mathcal{N} \Leftrightarrow$ each level cut $f_s, s \in \mathrm{Im}(f)$ of $f$ is bi-ideal of $\mathcal{N}$.

**Proof:**

Let $f$ be a co-fuzzy bi-ideal of $\mathcal{N}$. We have to prove that $f_s = \{x \in \mathcal{N} / f(x) < s\}$ is bi-ideal of $\mathcal{N}$.

Let $x, y \in f_s$

$\therefore f(x) < s$ and $f(y) < s$

Now $f(x+y) \leq \max\{f(x), f(y)\} < s$

$\therefore x + y \in f_s$.

$\therefore f(x) < s$ and $f(y) < s$

Now $f(x\alpha z\beta y) \leq \max\{f(x), f(y)\} < s$

$\therefore x\alpha z\beta y \in f_s$

Thus $f_s$ is a bi-ideal of $\mathcal{N}$.

Conversely assume that $f_s$ is a bi-ideal of $\mathcal{N}$ for each $s \in \mathrm{Im}(f)$.

To prove $f$ is co-fuzzy bi-ideal of $\mathcal{N}$, let us take $x, y, z \in \mathcal{N}$ and $\alpha, \beta \in \Gamma$

Suppose, let $\exists\ p_0, q_0 \in \mathcal{N}$ such that

$f(p_0 + q_o) > \max\{f(p_0), f(q_0)\}$

Take $s = \dfrac{f(p_0+q_0) + \max\{f(p_0), f(q_0)\}}{2}$

$\therefore s < \dfrac{f(p_0+q_0) + f(p_0+q_0)}{2} = f(p_0+q_0)$ and

$s > \max\{f(p_0), f(q_0)\}$

$\therefore p_0 + q_0 \notin f_s$ and $p_0, q_0 \in f_s$

Which is contradiction

$\therefore f(x+y) \leq \max\{f(x), f(y)\}$

Suppose, let $\exists\ p_0, q_0, r_0 \in \mathcal{N}$ and $\alpha_0, \beta_0 \in \Gamma$ such that

$f(p_0\alpha_0 q_0\beta_0 r_0) > \max\{f(p_0), f(r_0)\}$

Take $s = \dfrac{f(p_0\alpha_0 q_0\beta_0 r_0) + \max\{f(p_0), f(r_0)\}}{2}$

$s < f(p_0\alpha_0 q_0\beta_0 r_0)$ *and* $f(p_0) < s, f(r_0) < s$

$\therefore p_0\alpha_0 q_0\beta_0 r_0 \notin f_s$ *and* $p_0, r_0 \in f_s$

Which is contradiction

$\therefore f(x\alpha y\beta z) \leq \max\{f(x), f(z)\}$

Thus $f$ is co-fuzzy bi-ideal of $\mathcal{N}$.

Hence the theorem is proved. □

**Theorem 3.13:**

If $(\mathcal{N},+,\Gamma)$ is a finite $\Gamma$ - near ring and $f$ is a co-fuzzy bi-ideal of $\mathcal{N}$. Then $f^1$ is also co-fuzzy bi-ideal of $\mathcal{N}$.

**Proof:**

Let $x,y,z \in \mathcal{N}$ and $\alpha,\beta \in \Gamma$ and $f$ is a co-fuzzy bi-ideal of $\mathcal{N}$.

$$(i)\ f^1(x+y) = 1 - f(x+y)$$
$$\leq 1 - \max\{f(x), f(y)\}$$
$$\leq \max\{1-f(x), 1-f(y)\}$$
$$= \max\{f^1(x), f^1(y)\}$$

$$(ii)\ f^1(x\alpha y\beta z) = 1 - f(x\alpha y\beta z)$$
$$\leq 1 - \max\{f(x), f(z)\}$$
$$\leq \max\{1-f(x), 1-f(z)\}$$
$$= \max\{f^1(x), f^1(z)\}$$

Hence $f^1$ is a co-fuzzy bi-ideal of $\mathcal{N}$. □

**Theorem 3.14:**

Let A be a bi-ideal of a finite $\Gamma$ - near ring $\mathcal{N}$. Then the fuzzy set defined by $f_A(x) = \begin{cases} 0 & if \quad x \in A \\ 1 & if \quad x \notin A \end{cases}$ is normal co-fuzzy bi-ideal of $\mathcal{N}$ and $\mathcal{N}_{f_A} = A$.

**Proof:**

By theorem (3.8), $f_A$ is a co-fuzzy bi-ideal of $\mathcal{N}$.

Since $A$ is bi-ideal of $\mathcal{N}$, $0 \in A$

$\therefore$ By the definition of $f_A$, it is clear that $f_A(0) = 0$

$\because$ $f_A$ is normal co-fuzzy bi-ideal of $\mathcal{N}$.

Further more $\mathcal{N}_{f_A} = \{x \in \mathcal{N} / f_A(x) = f_A(0)\}$
$$= \{x \in \mathcal{N} / f_A(x) = 0\}$$
$$= \{x \in \mathcal{N} / x \in A\}$$
$$= A$$

## 4. CO-FUZZY PRIME IDEALS

In this section, we define prime ideal and co-fuzzy prime ideal of a finite $\Gamma$ - near ring and principal ideal and its characteristics. We also prove some theorems related to co-fuzzy prime ideals.

**Definition 4.1:** A sub set $S$ of a finite $\Gamma$-near ring $(\mathcal{N}$ is said to be a left ideal of $\mathcal{N}$ if

1. $x+y \in S, \quad \forall x,y \in S$
2. $y+x-y \in S, \quad \forall x \in S$ and $y \in \mathcal{N}$
3. $a\alpha(x+b) - a\alpha b \in S, \quad \forall x \in S, a,b \in \mathcal{N}$ and $\alpha \in \Gamma$.

**Definition 4.2:** A sub set $S$ of a finite $\Gamma$-near ring $(\mathcal{N},+,\Gamma)$ is said to be a right ideal of $\mathcal{N}$ if

1. $x+y \in S, \quad \forall x,y \in S$
2. $y+x-y \in S, \quad \forall x \in S$ and $y \in \mathcal{N}$
3. $x\alpha a \in S, \quad \forall x \in S, a \in \mathcal{N}$ and $\alpha \in \Gamma$

**Definition 4.3:** A sub set $S$ of a finite $\Gamma$-near ring $(\mathcal{N},+,\Gamma)$ is said to be an ideal of $\mathcal{N}$ if

1. $x+y \in S, \quad \forall x,y \in S$
2. $y+x-y \in S, \quad \forall x \in S$ and $y \in \mathcal{N}$
3. $a\alpha(x+b) - a\alpha b \in S, \forall x \in S, a,b \in \mathcal{N}$ and $\alpha \in \Gamma$
4. $x\alpha a \in S, \quad \forall x \in S, a \in \mathcal{N}$ and $\alpha \in \Gamma$

**Definition 4.4:** A fuzzy sub set $f$ of a finite Γ-near ring $(\mathcal{N},+,\Gamma)$ is said to e a co- fuzzy left ideal of $\mathcal{N}$ if

1. $f(x+y) \le \max\{f(x), f(y)\}$
2. $f(y+x-y) \le f(x)$
3. $f(a\alpha(xb)-a\alpha b) \le f(x), \quad \forall x,y,a,b \in \mathcal{N}$ and $\alpha \in \Gamma$

**Definition 4.5:** A fuzzy sub set $f$ of a finite Γ-near ring $(\mathcal{N},+,\Gamma)$ is said to be a co- fuzzy right ideal of $\mathcal{N}$ if

1. $f(x+y) \le \max\{f(x), f(y)\}$
2. $f(y+x-y) \le f(x)$
3. $f(x\alpha a) \le f(x), \quad \forall x,y,a,b \in \mathcal{N}$ and $\alpha \in \Gamma$

**Definition 4.6:** A fuzzy sub set $f$ of a finite Γ-near ring $(\mathcal{N},+,\Gamma)$ is said to be a co- fuzzy ideal of $\mathcal{N}$ if

1. $f(x+y) \le \max\{f(x), f(y)\}$
2. $f(y+x-y) \le f(x)$
3. $f(a\alpha(x+b)-a\alpha b) \le f(x)$
4. $f(x\alpha a) \le f(x), \quad \forall x,y,a,b \in \mathcal{N}$ and $\alpha \in \Gamma$

**Definition 4.7:** Let $(\mathcal{N},+,\Gamma)$ be a finite $\Gamma$ - near ring. For any two subsets $A$ and $B$ of $\mathcal{N}$, the set $\{x\alpha y / x \in A, y \in B \text{ and } \alpha \in \Gamma\}$ is called product of A and B and is denoted by $A\alpha B$ $(or)$ $AB$.

**Definition 4.8:** Let $(\mathcal{N},+,\Gamma)$ is a finite $\Gamma$ - near ring. An ideal $I$ of $\mathcal{N}$ is said to be prime ideal of $\mathcal{N}$, If for any ideals $A,B \subseteq \mathcal{N}$, $A\gamma B \subseteq I \Rightarrow A \subseteq I$ or $B \subseteq I$, $\forall \gamma \in \Gamma$

**Definition 4.9:** Let $(\mathcal{N},+,\Gamma)$ be a finite $\Gamma$ - near ring and $a \in \mathcal{N}$. An ideal $I$ of $\mathcal{N}$ is said to be principal ideal generated by 'a' if

1. $a \in I$
2. For any ideal $U \subseteq \mathcal{N}$ and $a \in U \Rightarrow I \subseteq U$

The principal ideal generated by 'a' is denoted by $\langle a \rangle$.

**Definition 4.10:** Let $(\mathcal{N},+,\Gamma)$ be a finite $\Gamma$ - near ring. A co-fuzzy ideal ' $f$ ' of $\mathcal{N}$ is said to be co-fuzzy prime ideal of $\mathcal{N}$ if for any co-fuzzy ideals $g$ and $h$, $g\alpha h \subseteq f \Rightarrow g \subseteq f$ $or$ $h \subseteq f$.

$goh : \mathcal{N} \to [0,1]$ is defined as $(goh)(x) = \underset{x=y\alpha z}{Sup\ Inf}\{g(y), h(z)\}$ $\forall x \in \mathcal{N}$.

**Theorem 4.11:**

If $(\mathcal{N},+,\Gamma)$ is a finite $\Gamma$ - near ring and $a \in \mathcal{N}$. Then $\langle a \rangle = \bigcup_{i=0}^{\infty} U_i$, where

$U_0 = \{0\}$ $and$ $U_{k+1} = U_k^{+} \cup U_k^{0} \cup U_k^{++} \cup U_k^{00}$ $\forall k \ge 0$.

And

$U_k^{+} = \{x+y / x,y \in U_k\}$

$U_k^{0} = \{x\alpha p / x \in U_k, p \in \mathcal{N}, \alpha \in \Gamma\}$

$U_k^{++} = \{y+x-y / x \in U_k, y \in \mathcal{N}\}$

$U_k^{00} = \{p\alpha(x+b) - p\alpha b / p,b \in \mathcal{N}, x \in U_k, \alpha \in \Gamma\}$

**Proof:**

First, we prove that $\langle a \rangle = \bigcup_{i=0}^{\infty} U_i$ is an ideal of $\mathcal{N}$

*i.* Let $x, y \in \langle a \rangle$

$\therefore x, y \in U_k$ for some $k$

$\Rightarrow x + y \in U_k^+$

$\Rightarrow x + y \in U_{k+1}$

$\Rightarrow x + y \in \langle a \rangle$

*ii.* Let $x \in \langle a \rangle$ and $y \in \mathcal{N}$

$\therefore x \in \bigcup_k$ for some $k$

$\Rightarrow y + x - y \in U_k^{++}$

$\Rightarrow y + x - y \in U_{k+1}$

$\Rightarrow y + x - y \in \langle a \rangle$

*iii.* Let $x \in \langle a \rangle$ and $p, b \in \mathcal{N}$, $\alpha \in \Gamma$

$x \in \langle a \rangle \Rightarrow x \in U_k$

$p\alpha(x+b) - p\alpha b \in U_k^{00}$

$p\alpha(x+b) - p\alpha b \in U_{k+1}$

$p\alpha(x+b) - p\alpha b \in \langle a \rangle$

*iv.* Let $x \in \langle a \rangle$ and $p \in \mathcal{N}$, $\alpha \in \Gamma$

$\therefore x \in U_k$ for some $k$

$x\alpha p \in U_k^0$

$x\alpha p \in U_{k+1}$

$x\alpha p \in \langle a \rangle$

Thus $\langle a \rangle$ is an ideal of $\mathcal{N}$.

Now, we prove that $\langle a \rangle$ is a principal ideal of $\mathcal{N}$. By the definition of $\langle a \rangle = \bigcup_{i=0}^{\infty} U_i$, it is clear that

$a \in U_0 \Rightarrow a \in \langle a \rangle$

Let $I$ be an ideal of $\mathcal{N}$ such that $a \in I$.

Let $x \in \langle a \rangle$, Then we can easily prove that

$\langle a \rangle \subseteq I$

$\therefore \langle a \rangle$ is a principal ideal in $\mathcal{N}$ generated by 'a'.

**Theorem 4.12:**

If $f$ is a co-fuzzy ideal of a finite $\Gamma$ - near ring $\mathcal{N}$ then $f(x) \le f(a)$ $\forall x \in \langle a \rangle$

**Proof:**

By the theorem(4.11), we know that

$\langle a \rangle = \bigcup_{i=0}^{\infty} U_i$ where $U_0 = \{0\}, U_{k+1} = U_k^+ \cup U_k^0 \cup U_k^{++} \cup U_k^{00}$, and

$U_k^+ = \{x + y / \forall x, y \in U_k\}$

$U_k^0 = \{x\alpha p / \forall x \in U_k, p \in \mathcal{N}, \alpha \in \Gamma\}$

$U_k^{++} = \{y + x - y / \forall x \in U_k, y \in \mathcal{N}\}$

$U_k^{00} = \{p\alpha(x+b) - p\alpha b / p, b \in \mathcal{N} \ \ x \in U_k, \alpha \in \Gamma\}$

Now, let $x \in \langle a \rangle$. We have to prove that

$f(x) \le f(a)$

$$x \in \langle a \rangle \Rightarrow x \in \bigcup_i \ (i \geq 0)$$

We prove the result by mathematical induction.
It is obvious for $i = 0$.
Assume that the result is true for $i = k$.
i.e., $f(x) \leq f(a) \ \ \forall x \in U_k$
We have to prove that the result is true for all $x \in U_{k+1}$

*Case* $(i)$: *Let* $x \in U_k^+$

$$\therefore x = u + v \text{ where } u, v \in U_k,$$

$$\text{Then } f(u) \leq f(a) \text{ and } f(v) \leq f(a)$$

$$\therefore f(x) = f(u+v) \leq \max\{f(u), f(v)\} \leq f(a)$$

$$\Rightarrow f(x) \leq f(a)$$

*Case* $(ii)$: *Let* $x \in U_k^0$

$$\therefore x = u \alpha p \text{ where } u \in U_k \text{ and } p \in \mathcal{N},$$

$$\text{Then } f(u) \leq f(a)$$

$$\therefore f(x) = f(u \alpha p) \leq f(u) \leq f(a)$$

$$\Rightarrow f(x) \leq f(a)$$

*Case* $(iii)$: *Let* $x \in U_k^{++}$

$$\therefore x = y + u - y \text{ where } y \in \mathcal{N} \text{ and } u \in U_k,$$

$$\text{Then } f(u) \leq f(a)$$

$$\therefore f(x) = f(y + u - y) \leq f(u) \leq f(a)$$

$$\Rightarrow f(x) \leq f(a)$$

*Case* $(iv)$: *Let* $x \in U_k^{00}$

$$\therefore x = p\alpha(u+b) - p\alpha b \text{ where } p, b \in \mathcal{N}, u \in U_k \text{ and } \alpha \in \Gamma$$

$$\text{Then } f(u) \leq f(a)$$

$$\therefore f(x) = f(p\alpha(u+b) - p\alpha b) \leq f(u) \leq f(a)$$

$$\Rightarrow f(x) \leq f(a)$$

By the above four cases
$\therefore f(x) \leq f(a) \ \ \forall x \in \langle a \rangle$
Hence by mathematical induction $f(x) \leq f(a) \ \ \forall x \in \langle a \rangle$ □

**Theorem 4.13:**

Let ' $f$ ' be a co-fuzzy ideal of a finite $\Gamma$ - near ring $\mathcal{N}$ and $I$ is an ideal of $\mathcal{N}$ such that $I = \langle a \rangle = \langle b \rangle$ for some $a, b \in \mathcal{N}$. Then $f(a) = f(b)$

**Proof:**

Given $I = \langle a \rangle = \langle b \rangle$
We know that $a \in \langle a \rangle$

$$\Rightarrow a \in \langle b \rangle$$

$$\Rightarrow f(a) \leq f(b) \text{ (By Theorem 4.12) ----------(4.13.1)}$$

Similarly

$$\Rightarrow b \in \langle b \rangle$$

$$\Rightarrow b \in \langle a \rangle$$

$$\Rightarrow f(b) \leq f(a) \text{ (By Theorem 4.12) ----------(4.13.2)}$$

From (4.13.1) & (4.13.2),

$$f(a) = f(b)$$

**Theorem 4.14:**

If $f$ is a co-fuzzy prime ideal of a finite $\Gamma$ - near ring $\mathcal{N}$, Then $f(0)=0$.

**Proof:**

Given $f$ is co-fuzzy prime ideal of $\mathcal{N}$. If possible assume that $f(0)>0$

Since $f$ is not constant function $\exists\ a\in[0,1]$, such that

Let us take $k\in(0,1)$ such that $f(0)<k<f(a)$

Now, define two fuzzy sets $\sigma$ and $\mu$ such that $\sigma(x)=f(a)\ \forall x\in\mathcal{N}$ and $f(0)<f(a)$

$$\mu(x)=\begin{cases} k & if \quad f(x)=f(0) \\ f(0) & if \quad otherwise \end{cases}$$

Since $\sigma$ is a constant function, it is a co-fuzzy ideal we can prove that $\mu$ also a co-fuzzy ideal.

Also

$\sigma(0)=f(a)>f(0)$ *and*

$\mu(0)=k>f(0)$

$\therefore \sigma\not\subseteq f$ and $\mu\not\subseteq f$

Now, Let $p\in\mathcal{N}$

By the definition of $\sigma\alpha\mu$, we have

$$(\sigma\alpha\mu)(p)=\underset{p=x\alpha y}{Sup}\ \min\{\sigma(x),\mu(y)\}$$

*Case I* : *Let* $\mu(y)=k$

$$(\sigma\alpha\mu)(p)=\underset{p=x\alpha y}{Sup}\ \min\{f(a),k\}$$
$$=\underset{p=x\alpha y}{Sup}\ \{k\}$$
$$=k<f(0)\le f(p)$$

($\because$ since $\mathcal{N}$ is zero symmetric finite $\Gamma$ - near ring, $f(x\alpha 0)\le f(x)\Rightarrow f(0)\le f(x)\ \forall x\in\mathcal{N}$)

*Case II* : *Let* $\mu(y)=f(0)$

$$(\sigma\alpha\mu)(p)=\underset{p=x\alpha y}{Sup}\ \min\{f(a),f(0)\}$$
$$=f(0)\le f(p)$$

$\therefore$ By Case I and Case II, $\sigma\alpha\mu\subseteq f$

Since $f$ is co-fuzzy prime ideal, either $\sigma\subseteq f$ *or* $\mu\subseteq f$

This is a contradiction.

$\therefore$ our assumption $f(0)>0$ is wrong.

Hence $f(0)=0$.

## 5. SCOPE AND CONCLUSION:

In this paper we have introduced co-fuzzy bi-ideal and co-fuzzy prime ideals of a finite $\Gamma-$ near ring. We also defined normal co-fuzzy bi-ideal of a finite $\Gamma-$near ring. We established some necessary and sufficient conditions for a fuzzy set $f$ to be co-fuzzy bi-ideal of a finite $\Gamma-$near ring. Having this knowledge, we can develop Dual co-fuzzy bi-ideals of a finite $\Gamma-$near rings.

*(Received On: 03-03-21; Revised & Accepted On: 12-04-21)*

***ABSTRACT***

*In this paper we introduce and study the concept of ideals of finite Γ-near rings, co-fuzzy ideals of finite Γ-near rings and related theorems. We prove intersection of two co-fuzzy ideals is always a co-fuzzy ideal but union of two co-fuzzy ideals need not be a co-fuzzy ideal of finite Γ-near ring and it is explained by a suitable example. We also introduce homomorphic image and homomorphic pre image of co-fuzzy ideals of finite Γ-near rings and related theorems.*

***Key Words** : finite Γ-near ring, fuzzy set, level subset, union of fuzzy sets, intersection of fuzzy sets, co-fuzzy ideals and homomorphism of co-fuzzy ideals.*

## 1. INTRODUCTION

The fuzzy set theory was developed by Zadeh.L.A. [12] in 1965. The fuzzification of algebraic structure was introduced by Rosenfield.A[7] and he introduced the notation of fuzzy of subgroups in 1971. Swamy K.L.N and Swamy U.M [8] studied fuzzy prime ideals [4,6] Later Satyanarayana. Bh [9] defined Γ-near rings and also he studied ideal theory in Γ-near rings. The notation of fuzzy ideals and its properties were applied to various areas like semi groups [11, 10, 5] and semi rings [1,2] Jun.Y.B [3] considered the fuzzification of ideals of Γ-near rings and investigated the related properties.

In this paper, we have defined co-fuzzy ideal concept of finite $\Gamma-$near ring with less than or equal and maximum conditions and also investigated several properties with the new definitions. Throughout this chapter $\mathcal{N}$ stands for zero symmetric finite $\Gamma-$ near ring.

## 2. PRELIMINARIES

In this section we recall some of the fundamental definitions, which are necessary for this paper.

**Definition 2.1:** A triplet $(\mathcal{N},+,\cdot)$ is said to be a near ring if

1. $(\mathcal{N},+)$ is a group
2. $(\mathcal{N},\cdot)$ is a semi-group
3. $(a+b)\cdot c = a\cdot c + b\cdot c$ (Right distribution law) $\forall\ a,b,c \in \mathcal{N}$.

**Definition 2.2:** A near ring $(\mathcal{N},+,\cdot)$ is said to be finite near ring if $\mathcal{N}$ has finite number of elements.

**Definition 2.3:** Let $\mathcal{N}$ be a non-empty finite set. If

1. $(\mathcal{N},+)$ is a group. (Not necessarily abelian group)
2. Γ is the set of binary operations on $\mathcal{N}$ such that $(\mathcal{N},+,\alpha)$ is a near ring. Where $\alpha \in \Gamma$.
3. $a\alpha(b\beta c) = (a\alpha b)\beta c, \forall\ a,b,c \in \mathcal{N}$ and $\alpha,\beta \in \Gamma$. Then $(\mathcal{N},+,\Gamma)$ is called finite Γ-near ring.

***Corresponding Author: P. Venkatrao*[2],***
***[2]Department of Mathematics, S. V. University, Tirupati - (A.P.), India.***

**Definition 2.4:** If $X$ be a non empty set and $f : X \to [0, 1]$ is a mapping then the pair $(X, f)$ is called fuzzy set and $f$ is called fuzzy sub set of $X$.

**Definition 2.5:** Let $f$ be a fuzzy sub set of the set $X$.Then the set $\{x \in X/f(x) < s\}$ Where $s \in [0,1]$ is called level sub set of $f$ .It is denoted by $f_s$.This $f_s$ is also $s$-cut of $f$ .

$$\therefore f_s = \{x \in X/f(x) < s\}$$

**Definition 2.6:** Let $f$ and $g$ be two fuzzy sub sets of the set $X$. If $f(x) \leq g(x),\ \forall\, x \in X$ then $f$ is said to be contained in $g$.It is denoted by $f \subseteq g$.

**Definition 2.7:** Let $f$ and $g$ be two fuzzy sub sets of the set $X$.Then their intersection and union are denoted by $f \cap g$ and $f \cup g$ respectively and defined as follows,

$$(f \cap g)(x) = Min\{f(x), g(x)\},\ \forall x \in X.$$

and

$$(f \cup g)(x) = Max\{f(x), g(x)\},\ \forall x \in X.$$

**Definition 2.8:** Let $M_1$ and $M_2$ be two non empty sets and $\mu: M_1 \to M_2$ is a mapping. If $f$ is a fuzzy sub set of $M_1$ then $g$ be a fuzzy sub set of $M_2$ defined by

$$g(y) = \begin{cases} \underset{z \in \mu^{-1}(y)}{Inf}\ f(z) \ if\ \mu^{-1}(y) \neq \phi \\ 0 \qquad if\ \mu^{-1}(y) \neq \phi \end{cases}$$

Where $\mu^{-1}(y) = \{x \in M_1/\mu(x) = y\}$

If $g$ is a fuzzy sub set of $M_2$ then $f$ be a fuzzy sub set of $M_1$ defined by

$$f(x) = g(\mu(x)),\ \forall\, x \in M_1.$$

**Definition 2.9:** For any sub set $A$ of the set $X$, the co-fuzzy characteristic set $\delta_A$ is defined as follows,

$$\delta_A(x) = \begin{cases} 0 & if\ x \in A \\ 1 & if\ x \notin A \end{cases}$$

## 3. CO - FUZZY IDEALS OF FINITE Γ-NEAR RINGS

In this section we define ideals and co-fuzzy ideals of a finite Γ-near rings. We prove the intersection of two co-fuzzy ideals of a finite Γ-near ring is always a co-fuzzy ideal. But, the union of two co-fuzzy ideals of a finite Γ-near ring need not be a co-fuzzy ideal and it is explained by a suitable example. We also prove some of related theorems on ideals and co-fuzzy ideals of a finite Γ-near rings.

**Definition 3.1:** A sub set $S$ of a finite Γ-near ring $(\mathcal{N}, +, \Gamma)$ is said to be a left ideal of $\mathcal{N}$ if

1. $x + y \in S, \qquad \forall\, x, y \in S$
2. $y + x - y \in S, \qquad \forall\, x \in S$ and $y \in \mathcal{N}$
3. $a\alpha(x + b) - a\alpha b \in S,\ \forall\, x \in S, a, b \in \mathcal{N}$ and $\alpha \in \Gamma$.

**Definition 3.2:** A sub set $S$ of a finite Γ-near ring $(\mathcal{N}, +, \Gamma)$ is said to be a right ideal of $\mathcal{N}$ if

1. $x + y \in S, \qquad \forall\, x, y \in S$
2. $y + x - y \in S,\ \forall\, x \in S$ and $y \in \mathcal{N}$
3. $x\alpha a \in S, \qquad \forall\, x \in S, a \in \mathcal{N}$ and $\alpha \in \Gamma$.

**Definition 3.3:** A sub set $S$ of a finite Γ-near ring $(\mathcal{N}, +, \Gamma)$ is said to be an ideal of $\mathcal{N}$ if

1. $x + y \in S, \qquad \forall\, x, y \in S$
2. $y + x - y \in S, \qquad \forall\, x \in S$ and $y \in \mathcal{N}$
3. $a\alpha(x + b) - a\alpha b \in S,\ \forall\, x \in S, a, b \in \mathcal{N}$ and $\alpha \in \Gamma$.
4. $x\alpha a \in S, \qquad \forall\, x \in S, a \in \mathcal{N}$ and $\alpha \in \Gamma$.

**Definition 3.4:** A fuzzy sub set $f$ of a finite Γ-near ring $(\mathcal{N}, +, \Gamma)$ is said to be a co-fuzzy left ideal of $\mathcal{N}$ if

1. $f(x + y) \leq \text{Max}\{f(x), f(y)\}$,
2. $f(y + x - y) \leq f(x)$,
3. . $f(a\alpha(x + b) - a\alpha b) \leq f(x), \forall\, x, y, a, b \in \mathcal{N}$ and $\alpha \in \Gamma$.

*© 2021, IJMA. All Rights Reserved* 

**Definition 3.5:** A fuzzy sub set $f$ of a finite Γ-near ring $(\mathcal{N}, +, \Gamma)$ is said to be a co-fuzzy right ideal of $\mathcal{N}$ if

1. $f(x+y) \leq \text{Max}\{f(x), f(y)\}$,
2. $f(y+x-y) \leq f(x)$,
3. $f(x\alpha a) \leq f(x)$, $\forall\, x, y, a \in \mathcal{N}$ and $\alpha \in \Gamma$.

**Definition 3.6:** A fuzzy sub set $f$ of a finite Γ-near ring $(\mathcal{N}, +, \Gamma)$ is said to be a co-fuzzy ideal of $\mathcal{N}$ if

1. $f(x+y) \leq \text{Max}\{f(x), f(y)\}$,
2. $f(y+x-y) \leq f(x)$,
3. $f(a\alpha(x+b) - a\alpha b) \leq f(x)$,
4. $f(x\alpha a) \leq f(x)$, $\forall\, x, y, a, b \in \mathcal{N}$ and $\alpha \in \Gamma$.

**Definition 3.7:** A $L$-fuzzy sub set $f_L$ of a finite Γ-near ring $(\mathcal{N}, +, \Gamma)$ is said to be $L$-fuzzy ideal of $\mathcal{N}$ if

1. $f_L(x+y) \leq \text{Max}\{f_L(x), f_L(y)\}$
2. $f_L(y+x-y) \leq f_L(x)$
3. $f_L(a\alpha(x+b) - a\alpha b) \leq f_L(x)$
4. $f_L(x\alpha a) \leq f_L(x)$ $\forall\, x, y, a, b \in \mathcal{N}$ and $\alpha \in \Gamma$.

Here L is a complete lattice satisfying infinite distribute laws.

**Definition 3.8:** A finite Γ-near ring $(\mathcal{N}, +, \Gamma)$ is said to be zero symmetric if $x\alpha 0 = 0\alpha x = 0 \;\; \forall x \in \mathcal{N}$

**Note 3.9:**

1. $f(x+y) \leq \text{Max}\{f(x), f(y)\}$
2. $f(x-y) \leq \text{Max}\{f(x), f(-y)\}$
3. $f(0) \leq \text{Max}\{f(x), f(-x)\}$
4. $f(0) = f(x\alpha 0) \leq f(x)$, $\forall x, y \in \mathcal{N}$

**Example 3.10:** Let $S = \{1,2,3,4\}$ and $\mathcal{N}$ = P(S) is the power set of $S$.

Let $\Gamma = \{\{1\}, \{2,3\}\}$

Define $f$: $\mathcal{N} \to [0,1]$ such that $f(A) = \begin{cases} \frac{1}{2} & if \quad A \neq \phi \\ \frac{1}{3} & if \quad A = \phi \end{cases}$

Here $f$ is both co-fuzzy left and co-fuzzy right ideal of finite Γ-near ring $(\mathcal{N}, \Delta, \Gamma)$.

Hence $f$ is co-fuzzy ideal of finite Γ-near ring $(\mathcal{N}, \Delta, \Gamma)$.

**Example 3.11:** Let $\mathcal{N}$ be the set of all $2 \times 2$ matrices defined over $Z_5$.Where $Z_5 = \{\bar{0}, \bar{1}, \bar{2}, \bar{3}, \bar{4}\}$ is the set of all residue classes modulo 5 and $\Gamma = \{\bar{1}, \bar{2}, \bar{3}\}$.Then $(\mathcal{N}, +, \Gamma)$ is finite Γ-near ring.

Define $f$: $\mathcal{N} \to [0,1]$ such that $f(A) = \begin{cases} 0.3 & if \quad A = \begin{bmatrix} a & b \\ 0 & 0 \end{bmatrix} \\ 0.5 & if \quad other\ wise \end{cases}$

Then $f$ is a co-fuzzy right ideal of $\mathcal{N}$. But not co-fuzzy left ideal of $\mathcal{N}$.

Define $f$: $\mathcal{N} \to [0,1]$ such that $f(A) = \begin{cases} 0.2 & if\ A = \begin{bmatrix} 0 & a \\ 0 & b \end{bmatrix} \\ 0.6 & otherwise \end{cases}$

Then $f$ is a co-fuzzy left ideal of $\mathcal{N}$. But not co-fuzzy right ideal of $\mathcal{N}$.

Now, we prove some important theorems on co-fuzzy ideals.

**Theorem 3.12:** A fuzzy sub set $f$ of a finite Γ-near ring $(\mathcal{N}, +, \Gamma)$ is a co-fuzzy ideal of $\mathcal{N}$ if and only if for each $\delta \in Im(f)$, the level set $f_\delta$ of $f$ is an ideal of $\mathcal{N}$.

**Proof**: Let $f$ be a co-fuzzy ideal of a finite Γ-near ring $(\mathcal{N}, +, \Gamma)$.

*© 2021, IJMA. All Rights Reserved* 

Now, we have to prove that the level set $f_\delta$ of $f$ is an ideal of $\mathcal{N}$ $\forall \delta \in im(f)$

By the definition of the level set $f_\delta = \{X \in \mathcal{N},\ f(x) < \delta\}$

1. Let $x, y \in f_\delta$
   Then $f(x) < \delta$ and $f(y) < \delta$
   Now $f(x+y) \leq \text{Max}\{f(x), f(y)\} < \delta$
   $\therefore f(x+y) < \delta$
   $\Rightarrow x+y \in f_\delta$
2. Let $x \in f_\delta$ and $y \in \mathcal{N}$
   Then $f(x) < \delta$
   Now $f(y+x-y) \leq f(x) < \delta$
   $\therefore f(y+x-y) < \delta$
   $\Rightarrow y+x-y \in f_\delta$
3. Let $x \in f_\delta$, $a, b \in \mathcal{N}$ and $\alpha \in \Gamma$
   Then $f(x) < \delta$
   Now $f(a\alpha(x+b) - a\alpha b) \leq f(x) < \delta$
   $\therefore f(a\alpha(x+b) - a\alpha b) < \delta$
   $\Rightarrow a\alpha(x+b) - a\alpha b \in f_\delta$
   Then the level set $f_\delta$ of $f$ is a left ideal of $\mathcal{N}$, $\forall\ \delta \in Im(f)$
4. Let $x \in f_\delta$, $a \in \mathcal{N}$ and $\alpha \in \Gamma$
   Then $f(x) < \delta$
   We have $f(x\alpha a) \leq f(x) < \delta$
   $\therefore f(x\alpha a) < \delta$
   $\Rightarrow x\alpha a \in f_\delta$
   Then the level set $f_\delta$ of $f$ is a right ideal of $\mathcal{N}$.
   Hence the level set $f_\delta$ of $f$ is a ideal of $\mathcal{N}$, $\forall \delta \in \text{Im}(f)$
   Conversely assume that $f_\delta$ is an ideal of $\mathcal{N}$
   Now we prove that $f$ is a co-fuzzy ideal of a finite Γ-near ring $(\mathcal{N}, +, \Gamma)$

1. Let $x, y \in \mathcal{N}$
   If possible, let there exists $x_0, y_0 \in \mathcal{N}$ such that
   $f(x_0 + y_0) > Max\{f(x_0), f(y_0)\}$
   Let $\delta = \frac{1}{2}\{f(x_0+y_0) + Max\{f(x_0), f(y_0)\}\}$
   Then $\delta < \frac{1}{2}\{f(x_0+y_0) + f(x_0+y_0)\}$
   $\Rightarrow \delta < f(x_0+y_0)$
   $\Rightarrow x_0 + y_0 \notin f_\delta$
   And $\delta > \frac{1}{2}\{2\ Max\{f(x_0), f(y_0)\}\}$
   $\Rightarrow \delta > Max\{f(x_0), f(y_0)\}$
   $\Rightarrow \delta > f(x_0)$ and $\delta > f(y_0)$
   $\Rightarrow x_0, y_0 \in f_\delta$
   $\therefore x_0 + y_0 \notin f_\delta$ and $x_0, y_0 \in f_\delta$
   This is a contradiction to $f_\delta$ is an ideal of $\mathcal{N}$
   Then our assumption is wrong.
   Hence $f(x+y) \leq \text{Max}\{f(x), f(y)\}$, $\forall\ x, y \in \mathcal{N}$

*© 2021, IJMA. All Rights Reserved* 

2. Let $x, y \in \mathcal{N}$
   If possible, let there exists $x_0, y_0 \in \mathcal{N}$ such that
   $f(y_0 + x_0 - y_0) > f(x_0)$
   Let $\delta = \frac{1}{2}\{f(y_0 + x_0 - y_0) + f(x_0)\}$
   Then $\delta < \frac{1}{2}\{2f(y_0 + x_0 - y_0)\}$ and $\delta > \frac{1}{2}\{2f(x_0)\}$
   $\Rightarrow \delta < f(y_0 + x_0 - y_0)$ and $\delta > f(x_0)$
   $\Rightarrow y_0 + x_0 - y_0 \notin f_\delta$ and $x_0 \in f_\delta$
   This is a contradiction to $f_\delta$ is an ideal of $\mathcal{N}$
   Then our assumption is wrong and hence $f(y + x - y) \leq f(x)$,
   $\forall\, x, y \in \mathcal{N}$
3. Let $x, a, b \in \mathcal{N}$ and $\alpha \in \Gamma$
   If possible, let there exists $x_0, a_0, b_0 \in \mathcal{N}$ and $\alpha \in \Gamma$ such that
   $f(a_0\alpha(x_0 + b_0) - a_0\alpha b_0) > f(x_0)$
   $Let\ \ \delta = \frac{1}{2}\{f(a_0\alpha(x_0 + b_0) - a_0\alpha b_0) + f(x_0)\}$
   Then $\delta < \frac{1}{2}\{2f(a_0\alpha(x_0 + b_0) - a_0\alpha b_0)\}$ $and$ $\delta > \frac{1}{2}\{2f(x_0)\}$
   $\Rightarrow \delta < f(a_0\alpha(x_0 + b_0) - a_0\alpha b_0)$ and $\delta > f(x_0)$
   $\Rightarrow a_0\alpha(x_0 + b_0) - a_0\alpha b_0 \notin f_\delta$ and $x_0 \in f_\delta$
   This is a contradiction to $f_\delta$ is an ideal of $\mathcal{N}$
   Then our assumption is wrong and hence
   $f(a\alpha(x + b) - a\alpha b) \leq f(x)$ ,$\forall\, x, a, b \in \mathcal{N}$ and $\alpha \in \Gamma$.
   Then $f$ is a co-fuzzy left ideal of a finite Γ-near ring $(\mathcal{N}, +, \Gamma)$.
4. Let $x, a \in \mathcal{N}$ and $\alpha \in \Gamma$
   If possible, let there exists $x_0, a_0 \in \mathcal{N}$ and $\alpha \in \Gamma$ such that
   $f(x_0\alpha a_0) > f(x_0)$
   Let $\delta = \frac{1}{2}\{f(x_0\alpha a_0) + f(x_0)\}$
   Then $\delta < f(x_0\alpha a_0)$ and $\delta > f(x_0)$
   $\Rightarrow x_0\alpha a_0 \notin f_\delta$ and $x_0 \in f_\delta$
   This is a contradiction to $f_\delta$ is an ideal of $\mathcal{N}$:
   Then our assumption is wrong and hence $f(x\alpha a) \leq f(x)$ ,$\forall\, x, a \in \mathcal{N}$ and $\alpha \in \Gamma$
   Then $f$ is a co- fuzzy right ideal of a finite Γ-near ring $(\mathcal{N}, +, \Gamma)$
   Hence $f$ is a co-fuzzy ideal of a finite Γ-near ring $(\mathcal{N}, +, \Gamma)$.

**Theorem 3.13:** Let $S(\neq \phi)$ be a non empty sub set of a finite Γ-near ring $(\mathcal{N}, +, \Gamma)$. Then the fuzzy set $f_S$: $\mathcal{N} \to [0,1]$ defined by $f_S(x) = \begin{cases} 0 & if\ x \in S \\ 1 & if\ x \notin S \end{cases}$ is a co-fuzzy ideal of $\mathcal{N}$ if and only if $S$ is an ideal of $\mathcal{N}$.

**Proof**: Let $S(\neq \phi)$ be a non empty sub set of a finite Γ-near ring $(\mathcal{N}, +, \Gamma)$
Define $f_S$: $\mathcal{N} \to [0,1]$ such that $f_S(x) = \begin{cases} 0 & if\ x \in S \\ 1 & if\ x \notin S \end{cases}$
Let $f_S$ be a co-fuzzy ideal of a finite Γ-near ring $(\mathcal{N}, +, \Gamma)$

Now we prove that $S$ is an ideal of $\mathcal{N}$

1. Let $x, y \in S$
   Then $f_S(x) = 0$ and $f_S(y) = 0$
   Now $f_S(x + y) \leq \text{Max}\{f_S(x), f_S(y)\} = 0$
   $\therefore f_S(x + y) = 0$
   $\Rightarrow x + y \in S$

*© 2021, IJMA. All Rights Reserved* 

2. $x \in S$ and y $\in \mathcal{N}$
   Then $f_S(x) = 0$
   Now $f_S(y + x - y) \leq f_S(x) = 0$
   $\therefore f_S(y + x - y) = 0$
   $\Rightarrow y + x - y \in S$
3. Let $x \in S,\ a, b \in \mathcal{N}$ and $\alpha \in \Gamma$
   Then $f_S(x) = 0$
   Now $f_S(a\alpha(x + b) - a\alpha b) \leq f_S(x) = 0$
   $\therefore f_S(a\alpha(x + b) - a\alpha b) = 0$
   $\Rightarrow a\alpha(x + b) - a\alpha b \in S$
   Then $S$ is a left ideal of $\mathcal{N}$
4. Let $x \in S,\ a \in \mathcal{N}$ and $\alpha \in \Gamma$
   Then $f_S(x) = 0$
   We have $f_S(x\alpha a) \leq f_S(x) = 0$
   $\therefore f_S(x\alpha a) \leq 0$
   $\Rightarrow f_S(x\alpha a) = 0$
   $\Rightarrow x\alpha a \in S$
   Then $S$ is a right ideal of $\mathcal{N}$
   Hence $S$ is an ideal of $\mathcal{N}$

Conversely assume that $S$ is an ideal of $\mathcal{N}$

We prove that $f_S$ is a co-fuzzy ideal of a finite Γ-near ring $(\mathcal{N}, +, \Gamma)$

1. Let $x, y \in \mathcal{N}$

   $(i)$ *Let* $x, y \in S$

   *Then* $f_s(x) = 0$ *and* $f_s(y) = 0$ *and* $x + y \in S$

   $\Rightarrow f_s(x + y) = 0 \leq \max\{f_s(x), f_s(y)\}$

   $\therefore f_s(x + y) \leq \max\{f_s(x), f_s(y)\}$

   $(ii)$ *Let* $x, y \notin S$ *and* $x + y \in S$

   *Then* $f_s(x) = f_s(y) = 1$ *and* $f_s(x + y) = 0$

   *Now* $f_s(x + y) = 0 \leq \max\{f_s(x), f_s(y)\}$

   $\therefore f_s(x + y) \leq \max\{f_s(x), f_s(y)\}$

   $(iii)$ *Let* $x, y \notin S$ *and* $x + y \notin S$

   *Then* $f_s(x) = f_s(y) = f_s(x + y) = 1$

   *Now* $f_s(x + y) = 1 \leq \max\{f_s(x), f_s(y)\}$

   $\therefore f_s(x + y) \leq \max\{f_s(x), f_s(y)\}$

2. Let $x, y \in \mathcal{N}$

   (i) Let $x \in S$ and $y \in \mathcal{N}$
   Then $f_s(x) = 0$ and $y + x - y \in S$
   $\Rightarrow f_S(y + x - y) = 0 \leq f_S(x)$
   $\therefore f_S(y + x - y) \leq f_S(x)$

   (ii) Let $x \notin S$ and $y \in \mathcal{N}$
   Then $f_S(x) = 1$
   Now $f_S(y + x - y) \leq 1 \leq f_S(x)$
   $\therefore f_S(y + x - y) \leq f_S(x)$

3. Let $x, a, b \in \mathcal{N}$ and $\alpha \in \Gamma$

   (i) Let $x \in S, a, b \in \mathcal{N}$ and $\alpha \in \Gamma$
   Then $f_S(x) = 0$ and $a\alpha(x + b) - a\alpha b \in S$
   $\Rightarrow f_S(a\alpha(x + b) - a\alpha b) = 0$
   Now $f_S(a\alpha(x + b) - a\alpha b) = 0 \leq f_S(x)$
   $\therefore f_S(a\alpha(x + b) - a\alpha b) \leq f_S(x)$

*© 2021, IJMA. All Rights Reserved* 

(ii) Let $x \notin S$, $a, b \in \mathcal{N}$ and $\alpha \in \Gamma$
Then $f_S(x) = 1$
Now $f_S(a\alpha(x+b) - a\alpha b) \leq 1 = f_S(x)$
$\therefore f_S(a\alpha(x+b) - a\alpha b) \leq f_S(x)$
Thus $f_S$ is a co-fuzzy left ideal of a finite Γ-near ring $(\mathcal{N}, +, \Gamma)$

4. Let $x, a \in \mathcal{N}$ and $\alpha \in \Gamma$

(i) Let $x \in S$, $a \in \mathcal{N}$ and $\alpha \in \Gamma$
Then $f_S(x) = 0$ and $x\alpha a \in S$
$\Rightarrow f_S(x\alpha a) = 0$
Now $f_S(x\alpha a) = 0 \leq f_S(x)$
$\therefore f_S(x\alpha a) \leq f_S(x)$

(ii) Let $x \notin S$, $a \in \mathcal{N}$ and $\alpha \in \Gamma$
Then $f_S(x) = 1$
Now $f_S(x\alpha a) \leq 1 \leq f_S(x)$
$\therefore f_S(x\alpha a) \leq f_S(x)$

Thus $f_S$ is a co-fuzzy right ideal of a finite Γ-near ring $(\mathcal{N}, +, \Gamma)$

Hence $f_S$ is a co-fuzzy ideal of a finite Γ-near ring $(\mathcal{N}, +, \Gamma)$

**Theorem 3.14:** If $f$ is a co-fuzzy ideal of a finite Γ-near ring $(\mathcal{N}, +, \Gamma)$ then the set $S = \{x \in \mathcal{N} / f(x) = f(0)\}$ is an ideal of $\mathcal{N}$

**Proof:** Let $f$ is a co-fuzzy ideal of a finite Γ-near ring $(\mathcal{N}, +, \Gamma)$
Given that $S = \{x \in \mathcal{N} / f(x) = f(0)\}$
We know that $f(0) \leq f(x)$, $\forall x \in \mathcal{N}$
Now we prove that $S$ is an ideal of $\mathcal{N}$

1. Let $x, y \in S$
Then $f(x) = f(0)$ and $f(y) = f(0)$
Since $f$ is a fuzzy ideal, $f(x+y) \leq \text{Max}\{f(x), f(y)\} = f(0)$
$f(x+y) \leq f(0)$
$\Rightarrow f(x+y) = f(0)$
$\Rightarrow x + y \in S$
2. Let $x \in S$ and $y \in \mathcal{N}$
Then $f(x) = f(0)$
Since $f$ is a fuzzy ideal, $f(y+x-y) \leq f(x) = f(0)$
$\therefore f(y+x-y) \leq f(0)$
$\Rightarrow f(y+x-y) = f(0)$
$\Rightarrow y + x - y \in S$
3. Let $x \in S, a, b \in \mathcal{N}$ and $\alpha \in \Gamma$
Then $f(x) = f(0)$
Since $f$ is a fuzzy left ideal, $f(a\alpha(x+b) - a\alpha b) \leq f(x) = f(0)$
$\therefore f(a\alpha(x+b) - a\alpha b) \leq f(0)$
$\Rightarrow f(a\alpha(x+b) - a\alpha b) = f(0)$
$\Rightarrow a\alpha(x+b) - a\alpha b \in S$
Thus $S$ is a left ideal of $\mathcal{N}$.
4. Let $x \in S$, $a \in \mathcal{N}$ and $\alpha \in \Gamma$
Then $f(x) = f(0)$
Since $f$ is a fuzzy right ideal, $f(x\alpha a) \leq f(x) = f(0)$
$\therefore f(x\alpha a) \leq f(0)$
$\Rightarrow f(x\alpha a) = f(0)$
$\Rightarrow x\alpha a \in S$
Thus $S$ is a right ideal of $\mathcal{N}$.
Hence $S$ is an ideal of a finite Γ-near ring $(\mathcal{N}, +, \Gamma)$.

**Theorem 3.15:** Let $S(\neq \phi)$ is an ideal of a finite Γ-near ring $(\mathcal{N}, +, \Gamma)$. Then for all $t \in (0, 1]$ there exists a co-fuzzy ideal $f$ of $\mathcal{N}$ Such that $\mathcal{N}_f = S$, Where $\mathcal{N}_f = \{x \in \mathcal{N} / f(x) = f(0)\}$.

*© 2021, IJMA. All Rights Reserved* 

**Proof:** Given that $S(\neq \phi)$ is an ideal of $\mathcal{N}$.Define $f$: $\mathcal{N} \to [0,1]$ such that $f(x) = \begin{cases} 0 & if\ x \in S \\ t & if\ x \notin S \end{cases}$

We prove that $f$ is a co-fuzzy ideal of a finite Γ-near ring $(\mathcal{N}, +, \Gamma)$

1. Let $x, y \in \mathcal{N}$
   (i) Let $x, y \in S$
   Then $f(x) = f(y) = 0$
   Since $S$ is an ideal of $\mathcal{N}$, $x + y \in S$
   $\Rightarrow f(x + y) = 0$
   $\Rightarrow f(x + y) = 0 \leq \text{Max}\{f(x), f(y)\}$
   $\therefore f(x + y) \leq \text{Max}\{f(x), f(y)\}$
   (ii) Let $x, y \notin S$ and $x + y \in S$
   Then $f(x) = f(y) = t$ and $f(x + y) = 0$
   Now $f(x + y) = 0 \leq \text{Max}\{f(x), f(y)\}$
   $\therefore f(x + y) \leq \text{Max}\{f(x), f(y)\}$
   (iii) Let $x, y \notin S$ and $x + y \notin S$
   Then $f(x) = f(y) = t$ and $f(x + y) = t$
   Now $f(x + y) = t \leq \text{Max}\{f(x), f(y)\}$
   $\therefore f(x + y) \leq \text{Max}\{f(x), f(y)\}$
2. Let $x, y \in \mathcal{N}$
   (i) Let $x \in S$ and $y \in \mathcal{N}$
   Then $f(x) = 0$
   Since $S$ is an ideal of $\mathcal{N}$, $y + x - y \in S$
   $\Rightarrow f(y + x - y) = 0 \leq f(x)$
   $\Rightarrow f(y + x - y) \leq f(x)$
   (ii) Let $x \notin S$ and $y \in \mathcal{N}$
   Then $f(x) = t$ and $y + x - y \notin S$
   $\Rightarrow f(y + x - y) = t \leq f(x)$
   $\Rightarrow f(y + x - y) \leq f(x)$
3. Let $x, a, b \in \mathcal{N}$ and $\alpha \in \Gamma$
   (i) Let $x \in S$, $a, b \in \mathcal{N}$ and $\alpha \in \Gamma$
   Then $f(x) = 0$ and $a\alpha(x + b) - a\alpha b \in S$
   $\Rightarrow f(a\alpha(x + b) - a\alpha b) = 0 \leq f(x)$
   $\Rightarrow f(a\alpha(x + b) - a\alpha b) \leq f(x)$
   (ii) Let $x \notin S$ and $a\alpha(x + b) - a\alpha b \in S$
   Then $f(x) = t$ and $f(a\alpha(x + b) - a\alpha b) = 0$
   $\Rightarrow f(a\alpha(x + b) - a\alpha b) = 0 \leq t = f(x)$
   $\Rightarrow f(a\alpha(x + b) - a\alpha b) \leq f(x)$
   (iii) Let $x \notin S$ and $a\alpha(x + b) - a\alpha b \notin S$
   Then $f(x) = t$ and $f(a\alpha(x + b) - a\alpha b) = t$
   $\Rightarrow f(a\alpha(x + b) - a\alpha b) = t = f(x)$
   $\Rightarrow f(a\alpha(x + b) - a\alpha b) \leq f(x)$
   Thus $f$ is a co-fuzzy left ideal of a finite Γ-near ring $(\mathcal{N}, +, \Gamma)$.
4. Let $x, a \in \mathcal{N}$ and $\alpha \in \Gamma$
   (i) Let $x \in S$, $a \in \mathcal{N}$ and $\alpha \in \Gamma$
   Then $f(x) = 0$ and $x\alpha a \in S$
   $\Rightarrow f(x\alpha a) = 0$
   $\Rightarrow f(x\alpha a) = 0 \leq f(x)$
   $\Rightarrow f(x\alpha a) \leq f(x)$
   (ii) Let $x \notin S$ and $x\alpha a \in S$
   Then $f(x) = t$ and $f(x\alpha a) = 0$
   $\Rightarrow f(x\alpha a) = 0 \leq t = f(x)$
   $\Rightarrow f(x\alpha a) \leq f(x)$
   (iii) Let $x \notin S$ and $x\alpha a \notin S$
   Then $f(x) = t$ and $f(x\alpha a) = t$
   $\Rightarrow f(x\alpha a) = t = f(x)$
   $\Rightarrow f(x\alpha a) \leq f(x)$
   Thus $f$ is a co-fuzzy right ideal of a finite Γ-near ring $(\mathcal{N}, +, \Gamma)$.
   Hence $f$ is a co-fuzzy ideal of a finite Γ-near ring $(\mathcal{N}, +, \Gamma)$.

*© 2021, IJMA. All Rights Reserved* 

Finally, $\mathcal{N}_f = \{x \in \mathcal{N} / f(x) = f(0)\}$
$= \{x \in \mathcal{N} / f(x) = 0\}$
$= S$
$\therefore \mathcal{N}_f = S$

**Theorem 3.16:** If $f$ and $g$ are two co-fuzzy ideals of a finite Γ-near ring $(\mathcal{N}, +, \Gamma)$, then their intersection $(f \cap g)$ is also co- fuzzy ideal of $\mathcal{N}$.

**Proof:** Given that $f$ and $g$ are two co-fuzzy ideals of a finite Γ-near ring $(\mathcal{N}, +, \Gamma)$

Now we prove that $(f \cap g)$ is co-fuzzy ideal of $\mathcal{N}$.

Let $x, y, a, b \in \mathcal{N}$ and $\alpha \in \Gamma$

1. $(f \cap g)(x+y) = Min\{f(x+y), g(x+y)\}$
$\leq Min\{\text{Max}\{f(x), f(y)\}, \text{Max}\{g(x), g(y)\}\}$
$\leq Max\{\text{Min}\{f(x), g(x)\}, \text{Min}\{f(y), g(y)\}\}$
$= Max\{(f \cap g)(x), (f \cap g)(y)\}$
$\therefore (f \cap g)(x+y) \leq Max\{(f \cap g)(x), (f \cap g)(y)\}$
2. $(f \cap g)(y+x-y) = Min\{f(y+x-y), g(y+x-y)\}$
$\leq Min\{f(x), g(x)\}$
$= (f \cap g)(x)$
$\therefore (f \cap g)(y+x-y) \leq (f \cap g)(x)$
3. $(f \cap g)(a\alpha(x+b) - a\alpha b) = Min\{f(a\alpha(x+b) - a\alpha b), g(a\alpha(x+b) - a\alpha b)\}$
$\leq Min\{f(x), g(x)\}$
$= (f \cap g)(x)$
$\therefore (f \cap g)(a\alpha(x+b) - a\alpha b) \leq (f \cap g)(x)$
Thus $(f \cap g)$ is a co-fuzzy left ideal of $\mathcal{N}$
4. $(f \cap g)(x\alpha a) = Min\{f(x\alpha a), g(x\alpha a)\}$
$\leq Min\{f(x), g(x)\}$
$= (f \cap g)(x)$
$\therefore (f \cap g)(x\alpha a) \leq (f \cap g)(x)$
Thus $(f \cap g)$ is a co-fuzzy right ideal of $\mathcal{N}$.
Hence $(f \cap g)$ is a co-fuzzy ideal of $\mathcal{N}$.

**Remark 3.17:** The union of two co-fuzzy ideals of a finite Γ-near ring $(\mathcal{N}, +, \Gamma)$ need not be a co-fuzzy ideal of $\mathcal{N}$. Now, we prove a sufficient condition for the union of two co-fuzzy ideals of a finite Γ-near ring $(\mathcal{N}, +, \Gamma)$ to be a co-fuzzy ideal of $\mathcal{N}$.

**Theorem 3.18:** If $f$ and $g$ are two co-fuzzy ideals of a finite Γ-near ring $(\mathcal{N}, +, \Gamma)$, then their union$(f \cup g)$ is fuzzy ideal of $\mathcal{N}$ if $f \subseteq g$ or $g \subseteq f$.

**Proof:** Given that $f$ and $g$ are two co-fuzzy ideals of a finite Γ-near ring $(\mathcal{N}, +, \Gamma)$ such that $f \subseteq g$ or $g \subseteq f$, Without loss of generality, We assume that $f \subseteq g$
Now we prove that $(f \cup g)$ is co-fuzzy ideal of $\mathcal{N}$.
Let $x, y, a, b \in \mathcal{N}$ and $\alpha \in \Gamma$

1. $(f \cup g)(x+y) = Max\{f(x+y), g(x+y)\}$
$\leq Max\{\text{Max}\{f(x), f(y)\}, \text{Max}\{g(x), g(y)\}\}$
$\leq Max\{\text{Max}\{f(x), g(x)\}, \text{Max}\{f(y), g(y)\}\}$
$= Max\{(f \cup g)(x), (f \cup g)(y)\}$
$\therefore (f \cup g)(x+y) \leq Max\{(f \cup g)(x), (f \cup g)(y)\}$
2. $(f \cup g)(y+x-y) = Max\{f(y+x-y), g(y+x-y)\}$
$\leq Max\{f(x), g(x)\}$
$= (f \cup g)(x)$
$\therefore (f \cup g)(y+x-y) \leq (f \cup g)(x)$
3. $(f \cup g)(a\alpha(x+b) - a\alpha b) = Max\{f(a\alpha(x+b) - a\alpha b), g(a\alpha(x+b) - a\alpha b)\}$
$\leq Max\{f(x), g(x)\}$
$= (f \cup g)(x)$
$\therefore (f \cup g)(a\alpha(x+b) - a\alpha b) \leq (f \cup g)(x)$
Thus $(f \cup g)$ is a co-fuzzy left ideal of $\mathcal{N}$

4. $(f \cup g)(x\alpha a) = Max\{f(x\alpha a), g(x\alpha a)\}$
$\leq Max\{f(x), g(x)\}$
$= (f \cup g)(x)$
$\therefore (f \cup g)(x\alpha a) \leq (f \cup g)(x)$
Thus $(f \cup g)$ is a co-fuzzy right ideal of $\mathcal{N}$
Hence $(f \cup g)$ is a co-fuzzy ideal of $\mathcal{N}$

**Remark 3.19:** The converse of the above theorem need not be true. i.e, even if $(f \cup g)$ is a co-fuzzy ideal of a finite Γ-near ring, either one may not contained in other.

**Example:** Let $S = \{1,2,3,4\}$ and $\mathcal{N} = P(S)$, Where $P(S)$ is the power set of $S$.
Then $(\mathcal{N}, \Delta, \cap)$ is a finite near ring.
Let us take $\Gamma = \{\{1\},\{1,2,3\}\}$, then $(\mathcal{N}, \Delta, \Gamma)$ is a finite Γ-near ring.
Define $f$: $\mathcal{N} \to [0,1]$ such that $f(A) = \begin{cases} 0.6 & if\ A \neq \phi \\ 0.3 & if\ A = \phi \end{cases}$
and define $g$: $\mathcal{N} \to [0,1]$ such that $g(A) = \begin{cases} 0.7 & if\ A \neq \phi \\ 0.2 & if\ A = \phi \end{cases}$

Then $(f \cup g)$: $\mathcal{N} \to [0,1]$ such that $(f \cup g)(A) = \begin{cases} 0.7 & if\ A \neq \phi \\ 0.3 & if\ A = \phi \end{cases}$ is a co-fuzzy ideal of a finite Γ-near ring $(\mathcal{N}, \Delta, \Gamma)$. But $f \not\subseteq g$ and $g \not\subseteq f$.

## 4. CO-FUZZY HOMOMORPHISM OF FINITE Γ-NEAR RINGS

In this section, we define co-fuzzy homomorphism between two finite Γ-near rings and we prove that the homomorphic image of co-fuzzy ideal is a co-fuzzy ideal and inverse image of a co-fuzzy ideal is also a co-fuzzy ideal.

**Definition 4.1:** Let $(\mathcal{N}_1, +, \Gamma)$ and $(\mathcal{N}_2, +, \Gamma)$ be two finite Γ-near rings. Then the function $f$: $\mathcal{N}_1 \to \mathcal{N}_2$ is said to be a homomorphism from $\mathcal{N}_1$ to $\mathcal{N}_2$ if

1. $f(a+b) = f(a) + f(b)$
2. $f(a\alpha b) = f(a)\alpha f(b),\ \forall\ a, b \in \mathcal{N}_1$ and $\alpha \in \Gamma$

**Definition 4.2:** Let $(\mathcal{N}_1, +, \Gamma_1)$ be a finite $\Gamma_1$-near ring and $(\mathcal{N}_2, +, \Gamma_2)$ be a finite $\Gamma_2$-near ring, and $f$: $\mathcal{N}_1 \to \mathcal{N}_2$ and $g$: $\Gamma_1 \to \Gamma_2$ be two functions. Then the pair $(f, g)$ is said to be a homomorphism from $\mathcal{N}_1$ to $\mathcal{N}_2$ if

1. $f(a+b) = f(a) + f(b)$
2. $f(a\alpha b) = f(a)g(\alpha)f(b), \forall\ a, b \in \mathcal{N}_1$ and $\alpha \in \Gamma_1$

**Definition 4.3:** Let $(\mathcal{N}_1, +, \Gamma)$ and $(\mathcal{N}_2, +, \Gamma)$ be two finite Γ-near rings and $f$: $\mathcal{N}_1 \to \mathcal{N}_2$ is a homomorphism from $\mathcal{N}_1$ to $\mathcal{N}_2$. If $\mu$ is a fuzzy sub set of $\mathcal{N}_1$ then its image $f(\mu)$ is a fuzzy sub set of $\mathcal{N}_2$ is defined by

$$\big(f(u)\big)(y) = \begin{cases} \inf_{z \in f^{-1}(y)} \mu(z) & if \quad f^{-1}(y) \neq \phi \\ 0 & if \quad f^{-1}(y) = \phi \end{cases} \quad \forall y \in N_2$$

**Definition 4.4:** Let $(\mathcal{N}_1, +, \Gamma)$ and $(\mathcal{N}_2, +, \Gamma)$ be two finite Γ-near rings. The function $f$: $\mathcal{N}_1 \to \mathcal{N}_2$ is a homomorphism from $\mathcal{N}_1$ to $\mathcal{N}_2$. If $\sigma$ is a co-fuzzy sub set of $\mathcal{N}_2$ then its inverse image $f^{-1}(\sigma)$ is a fuzzy sub set of $\mathcal{N}_1$ defined by $\big(f^{-1}(\sigma)\big)(x) = \sigma\big(f(x)\big),\ \forall\ x \in \mathcal{N}_1$.

*© 2021, IJMA. All Rights Reserved* 

**Theorem 4.5:** Let $\left(\mathcal{N}_1,+,\Gamma\right)$ and $\left(\mathcal{N}_2,+,\Gamma\right)$ be two finite Γ-near rings. The function $f$: $\mathcal{N}_1 \to \mathcal{N}_2$ is a homomorphism from $\mathcal{N}_1$ to $\mathcal{N}_2$. If $\sigma$ is a co-fuzzy ideal of $\mathcal{N}_2$ then its inverse image $f^{-1}(\sigma)$ is a co-fuzzy ideal of $\mathcal{N}_1$.

**Proof:** Let $f$: $\mathcal{N}_1 \to \mathcal{N}_2$ is a homomorphism from the finite Γ-near rings $\left(\mathcal{N}_1,+,\Gamma\right)$ to $\left(\mathcal{N}_2,+,\Gamma\right)$ and $\sigma$: $\mathcal{N}_2 \to [0,1]$ is a co-fuzzy sub set of $\mathcal{N}_2$.

Let $\sigma$ be a co-fuzzy ideal of $\mathcal{N}_2$

Now we prove that $f^{-1}(\sigma)$ is a co-fuzzy ideal of $\mathcal{N}_1$

Let $x, y, a, b \in \mathcal{N}_1$ and $\alpha \in \Gamma$

1. $$\begin{aligned}\left(f^{-1}(\sigma)\right)(x+y) &= \sigma\left(f(x+y)\right)\\ &= \sigma\left(f(x)+f(y)\right)\\ &\le Max\left\{\sigma\left(f(x)\right),\sigma\left(f(y)\right)\right\}\\ &= Max\left\{\left(f^{-1}(\sigma)\right)(x),\left(f^{-1}(\sigma)\right)(y)\right\}\end{aligned}$$
$$\therefore \left(f^{-1}(\sigma)\right)(x+y) \le Max\left\{\left(f^{-1}(\sigma)\right)(x),\left(f^{-1}(\sigma)\right)(y)\right\}$$

2. $$\begin{aligned}\left(f^{-1}(\sigma)\right)(y+x-y) &= \sigma\left(f(y+x-y)\right)\\ &= \sigma\left(f(y)+f(x)-f(y)\right)\\ &\le \sigma(f(x))\\ &= \left(f^{-1}(\sigma)\right)(x)\end{aligned}$$
$$\therefore \left(f^{-1}(\sigma)\right)(y+x-y) \le \left(f^{-1}(\sigma)\right)(x)$$

3. $$\begin{aligned}\left(f^{-1}(\sigma)\right)(a\alpha(x+b)-a\alpha b) &= \sigma\left(f(a\alpha(x+b)-a\alpha b)\right)\\ &= \sigma\left(f(a)\alpha\left(f(x)+f(b)\right)-f(a)\alpha f(b)\right)\\ &\le \sigma(f(x))\\ &= \left(f^{-1}(\sigma)\right)(x)\end{aligned}$$
$$\therefore \left(f^{-1}(\sigma)\right)(a\alpha(x+b)-a\alpha b) \le \left(f^{-1}(\sigma)\right)(x)$$

Thus $\left(f^{-1}(\sigma)\right)$ is a co-fuzzy left ideal of $\mathcal{N}_1$

4. $$\begin{aligned}\left(f^{-1}(\sigma)\right)(x\alpha a) &= \sigma\left(f(x\alpha a)\right)\\ &= \sigma\left(f(x)\alpha f(a)\right)\\ &\le \sigma(f(x))\\ &= \left(f^{-1}(\sigma)\right)(x)\end{aligned}$$
$$\therefore \left(f^{-1}(\sigma)\right)(x\alpha a) \le \left(f^{-1}(\sigma)\right)(x)$$

Thus $\left(f^{-1}(\sigma)\right)$ is a co-fuzzy right ideal of $\mathcal{N}_1$

Hence $\left(f^{-1}(\sigma)\right)$ is a co-fuzzy ideal of $\mathcal{N}_1$.

**Theorem 4.6:** Let $\left(\mathcal{N}_1,+,\Gamma\right)$ and $\left(\mathcal{N}_2,+,\Gamma\right)$ be two finite Γ-near rings. The function $f$: $\mathcal{N}_1 \to \mathcal{N}_2$ is a onto homomorphism from $\mathcal{N}_1$ to $\mathcal{N}_2$. If $\mu$ is a co-fuzzy ideal of $\mathcal{N}_1$ then its image $f(\mu)$ is a co-fuzzy ideal of $\mathcal{N}_2$.

**Proof:** Let $f$: $\mathcal{N}_1 \to \mathcal{N}_2$ is an onto homomorphism from the finite Γ-near rings $\left(\mathcal{N}_1,+,\Gamma\right)$ to $\left(\mathcal{N}_2,+,\Gamma\right)$ and $\mu$: $\mathcal{N}_1 \to [0,1]$ is a fuzzy sub set of $\mathcal{N}_1$

Let $\mu$ be a co-fuzzy ideal of $\mathcal{N}_1$

Now we prove that $f(\mu)$ is a co-fuzzy ideal of $\mathcal{N}_2$

We have

$$\left(f(u)\right)(y) = \begin{cases}\inf_{z\in f^{-1}(y)}\ \mu(z) & if \quad f^{-1}(y) \neq \phi\\ 0 & if \quad f^{-1}(y) = \phi\end{cases} \quad \forall y \in N_2$$

Let $x, y, a, b \in \mathcal{N}_2$ and $\alpha \in \Gamma$

Since $f$ is onto from $\mathcal{N}_1$ to $\mathcal{N}_2$ then there exists $x_0, y_0, a_0, b_0 \in \mathcal{N}_1$ such that

$f(x_0) = x, f(y_0) = y, f(a_0) = a$ and $f(b_0) = b$

*© 2021, IJMA. All Rights Reserved* 

1. $\big(f(\mu)\big)(x+y) = \text{Inf}_{z\in f^{-1}(x+y)}\,\mu(z)$ (1)

Let $\mu(x_0) = \text{Inf}_{z\in f^{-1}(x)}\,\mu(z)$ and $\mu(y_0) = \text{Inf}_{z\in f^{-1}(y)}\,\mu(z)$

$\Rightarrow f(x_0) = x$ and $f(y_0) = y$

Now $f(x_0 + y_0) = f(x_0) + f(y_0) = x + y$

$\Rightarrow x_0 + y_0 \in f^{-1}(x+y)$

From equation (1), $\big(f(\mu)\big)(x+y) = \text{Inf}_{z\in f^{-1}(x+y)}\,\mu(z)$

$\leq \mu(x_0 + y_0)$

$\leq Max\,\{\mu(x_0), \mu(y_0)\}$

$= Max\,\{\text{Inf}_{z\in f^{-1}(x)}\,\mu(z)\,, \text{Inf}_{z\in f^{-1}(y)}\,\mu(z)\}$

$= Max\,\{\big(f(\mu)\big)(x), \big(f(\mu)\big)(y)\}$

$\therefore (f(\mu))(x+y) \leq Max\,\{(f(\mu))(x), (f(\mu))(y)\}$

2. $\big(f(\mu)\big)(y+x-y) = \text{Inf}_{z\in f^{-1}(y+x-y)}\,\mu(z)$ (2)

Now $f(y_0 + x_0 - y_0) = f(y_0) + f(x_0) - f(y_0) = y + x - y$

$\therefore y_0 + x_0 - y_0 \in f^{-1}(y+x-y)$

From equation (2), $\big(f(\mu)\big)(y+x-y) = \text{Inf}_{z\in f^{-1}(y+x-y)}\,\mu(z)$

$\leq \mu\,(y_0 + x_0 - y_0)$

$\leq \mu(x_0)$

$= \text{Inf}_{z\in f^{-1}(x)}\,\mu(z)$

$= \big(f(\mu)\big)(x)$

$\therefore (f(\mu))(y+x-y) \leq (f(\mu))(x)$

3. $\big(f(\mu)\big)(a\alpha(x+b) - a\alpha b) = \text{Inf}_{z\in f^{-1}(a\alpha(x+b)-a\alpha b)}\,\mu(z)$ (3)

Now $f(a_0\alpha(x_0 + b_0) - a_0\alpha b_0) = f(a_0)\alpha\big(f(x_0) + f(b_0)\big) - f(a_0)\alpha f(b_0)$

$= a\alpha(x+b) - a\alpha b$

$\therefore a_0\alpha(x_0 + b_0) - a_0\alpha b_0 \in f^{-1}(a\alpha(x+b) - a\alpha b)$

From equation (3), $\big(f(\mu)\big)(a\alpha(x+b) - a\alpha b) = \text{Inf}_{z\in f^{-1}(a\alpha(x+b)-a\alpha b)}\,\mu(z)$

$\leq \mu(a_0\alpha(x_0 + b_0) - a_0\alpha b_0)$

$\leq \mu(x_0)$

$= \text{Inf}_{z\in f^{-1}(x)}\,\mu(z)$

$= \big(f(\mu)\big)(x)$

$\therefore (f(\mu))(a\alpha(x+b) - a\alpha b) \leq (f(\mu))(x)$

Thus $\big(f(\mu)\big)$: $N_2 \to [0,1]$ is a co-fuzzy left ideal of $\mathcal{N}_2$

4. $\big(f(\mu)\big)(x\alpha a) = \text{Inf}_{z\in f^{-1}(x\alpha a)}\,\mu(z)$ (4)

Now $f(x_0\alpha a_0) = f(x_0)\alpha f(a_0) = x\alpha a$

$\therefore x_0\alpha a_0 \in f^{-1}(x\alpha a)$

From equation (4), $\big(f(\mu)\big)(x\alpha a) = \text{Inf}_{z\in f^{-1}(x\alpha a)}\,\mu(z)$

$\leq \mu(x_0\alpha a_0)$

$\leq \mu(x_0)$

$= \text{Inf}_{z\in f^{-1}(x)}\,\mu(z)$

$= \big(f(\mu)\big)(x)$

$\therefore (f(\mu))(x\alpha a) \leq (f(\mu))(x)$

Then $\big(f(\mu)\big)$: $\mathcal{N}_2 \to [0,1]$ is a co-fuzzy right ideal of $\mathcal{N}_2$

Hence $\big(f(\mu)\big)$: $\mathcal{N}_2 \to [0,1]$ is a co-fuzzy ideal of $\mathcal{N}_2$.

## 5. CONCLUSION

In this article, we inspected the idea of co-fuzzy ideals of a finite $\Gamma$ – near ring. We proved some necessary and sufficient conditions for a fuzzy subset of finite $\Gamma$ – near ring to be co-fuzzy ideal of the ring. The intersection and union of co-fuzzy ideals and homomorphism theorems have been proved. This concept may be extended to Bipolar co-fuzzy ideals in finite $\Gamma$ – near rings.

**Abstract:** In our in vitro and in vivo studies, we used *Acalypha indica* root methanolic extract (AIRME), and investigated their free radical scavenging/antioxidant and anti-inflammatory properties. Primarily, phytochemical analysis showed rich content of phenols (70.92 mg of gallic acid/g) and flavonoids (16.01 mg of rutin/g) in AIRME. We then performed HR-LC-MS and GC-MS analyses, and identified 101 and 14 phytochemical compounds, respectively. Among them, ramipril glucuronide (1.563%), antimycin A (1.324%), swietenine (1.134%), quinone (1.152%), oxprenolol (1.118%), choline (0.847%), bumetanide (0.847%) and fenofibrate (0.711%) are the predominant phytomolecules. Evidence from in vitro studies revealed that AIRME scavenges DPPH and hydroxyl radicals in a concentration dependent manner (10–50 µg/mL). Similarly, hydrogen peroxide and lipid peroxidation were also remarkably inhibited by AIRME as concentration increases (20–100 µg/mL). In vitro antioxidant activity of AIRME was comparable to ascorbic acid treatment. For in vivo studies, carrageenan (1%, sub-plantar) was injected to rats to induce localized inflammation. Acute inflammation was represented by paw-edema, and significantly elevated ($p < 0.05$) WBC, platelets and C-reactive protein (CRP). However, AIRME pretreatment (150/300 mg/kg bodyweight) significantly ($p < 0.05$) decreased edema volume. This was accompanied by a significant ($p < 0.05$) reduction of WBC, platelets and CRP with both doses of AIRME. The decreased activities of superoxide dismutase, catalase, glutathione reductase and glutathione peroxidase in paw tissue were restored ($p < 0.05$ / $p < 0.01$) with AIRME in a dose-dependent manner. Furthermore, AIRME attenuated carrageenan-induced neutrophil infiltrations and vascular dilation in paw tissue. For the first time, our findings demonstrated the potent antioxidant and anti-inflammatory properties of AIRME, which could be considered to develop novel anti-inflammatory drugs.

## 1. Introduction

Inflammation is a complex biological immune response to harmful stimuli of irritant chemicals, pathogens and damaged local injury cells in the tissue. Inflammatory system plays an important role in life-threatening diseases including COVID-19, cancer, diabetes and cardiovascular dysfunction [1,2]. Leukocyte activation such as macrophages, neutrophils, eosinophils and monocytes may occur during inflammation in order to protect the tissue, and simultaneously trigger the production of reactive oxygen species (ROS) or free radicals [3]. These ROS, include superoxide anion ($O_2^-$), hydrogen peroxide ($H_2O_2$), and hydroxyl radical ($^{\bullet}OH$) are highly reactive in nature, which counteract with adjacent

polyunsaturated fatty acids, proteins and DNA, and leading to cause lipid peroxidation, protein degradation, and DNA damage, respectively [4,5]. In order to combat this oxidative stress, cells are equipped with endogenous antioxidant enzymes and non-enzymatic defense systems. The antioxidant enzymes, mainly superoxide dismutase (SOD), catalase (CAT), glutathione reductase (GR) and glutathione peroxidase (GPx) however reach insufficient during inflammation and/or oxidative stress [4,6]. C-reactive protein is an acute phase inflammatory marker that remarkably elevates in various inflammatory diseases, including COVID-19, cancer, cardiovascular diseases (CVDs) and diabetes [7,8]. Oxidative stress can trigger various genes involved in inflammatory pathways, including nuclear factor kappa B (NF-κB), and intrinsically involved in the progression of chronic diseases [2,4]. It is therefore necessary to supplement anti-inflammatory and/or antioxidant compounds to assist the impaired immune and antioxidant defense systems.

Various plant-derived or synthetic antioxidant and anti-inflammatory compounds have been used to treat oxidative insult and inflammation, as these substances are capable in scavenging of ROS and inflammatory mediators [9,10]. However, the synthetic compounds have been claimed to cause mild to severe adverse effects. On the other hand, usage of herbal medication has been increased over the past three decades, and ~80% of the world's population living in the developing nations are rely on plant-based medicinal products as the primary source of healthcare [11]. Although several herbal compounds have been widely used as antioxidant or anti-inflammatory substances, many of them are yet to be investigated and their molecular mechanism needs to be disclosed. Therefore, identification of novel and effective therapeutic substances from medicinal plants with low or no side effects became prioritized research. The phenolic compounds and flavonoids are a family of bioactive constituents have been demonstrated as promising source for new medications to treat inflammation and related chronic painful diseases [12]. Phytol, a diterpene constituent of chlorophyll has been shown to suppress pro-inflammatory cytokines release through downregulation of NF-κB signalling pathway [13]. Methanolic extracts *Sideritis bilgeriana* reported to suppress tumour necrosis factor alpha (TNF-α), interleukin-1β (IL-1β) and leukocyte migration in carrageenan-induced pleurisy model. These pharmacological effects are due to the presence of phenolic and flavonoids content detected by HPLC-DAD-UV analysis [14].

*Acalypha indica* also known as 'Indian copperleaf' or 'Indian mercury' is a medicinal plant that belongs to *Euphorbiaceae* family. *A. indica* is widely distributed throughout the Asia and Africa. In folk medicine, the whole plant and leaves of *A. indica* have been used to treat asthma, pneumonia, stomach discomforts, skin injuries and snake bites [15,16]. Leaves of *A. indica* have been scientifically tested for their anti-bacterial [17], anti-inflammatory [18] and antioxidant [19] properties. Few studies isolated and identified the phytochemical constituents from the leaf extracts of *A. indica* [16,19]. Stems of *A. indica* are also reported to have antioxidant, glucose lowering and hepato-protective properties in experimental diabetic rats [20].

Nevertheless, the pharmacological properties of *A. indica* root methanolic extract (AIRME) have not been demonstrated. Furthermore, isolation and characterization of phytochemical compounds in AIRME is yet to be performed. We assume that roots of *A. indica* may also contain various phytochemical constituents that could exhibits pharmacological efficacies. Therefore, we aimed to perform HR-LC-MS and GC-MS techniques to identify the bioactive compounds in AIRME. In vitro studies were performed to investigate the free radical scavenging activity of AIRME. Subsequently, in vivo studies were conducted on rats to evaluate the antioxidant and anti-inflammatory activities of AIRME in carrageenan-induced acute inflammatory model.

## 2. Results

### *2.1. Phytochemicals in A. indica Root Extract*

Qualitative estimation of phytochemicals based on color intensity in the AIRME revealed that it has several phytochemical compounds such as phenols, flavonoids, saponins,

tannins, reducing sugars, alkaloids, terpenoids, coumarins, anthraquinones and anthocyanins. We then quantified major phytochemicals, phenols and flavonoids based on qualitative analysis, which aided in further fractionation, isolation and biological assessment. Quantitative estimations revealed total phenolic content in AIRME was 70.92 mg of gallic acid equivalent/g extract, and flavonoids content was 16.01 mg of rutin/g extract.

### *2.2. Phytochemical Profile of A. indica Root Methanolic Extract*

After quantification of phytochemicals, the AIRME was subjected to GC-MS and HR-LC-MS for profiling their individual chemical constituents. GC-MS analysis revealed that the extract contains a significant amount of lipid soluble constituents (volatile) and their metabolites. To be specific, GC-MS results showed 14 volatile compounds whereas HR-LC-MS explored 101 semi volatile and non-volatile phytochemicals in AIRME. The details of each phytochemical constituent, including molecular formula, mass, PubChem CID and percentage were presented in Table 1. The predominant phytomolecules in AIRME through HR-LC-MS were, retusoquinone (1.694%), ramipril glucuronide (1.563%), antimycin A (1.324%), propionylglycine methyl ester (1.18%), swietenine (1.134%), quinone (1.152%), oxprenolol (1.118%), choline (0.847%), bumetanide (0.847%) and fenofibrate (0.711%). Similarly, the major phytochemical constituents by GC-MS were piperidine-2,5-dione (3.73%), cephalotaxine, 3-deoxy-3,11-epoxy-,(3a,11a)- (2.66%) and octadecanoic acid (2.053%). Most of these compounds displayed a higher number of hydrogen bond donor/acceptor counts. The chromatograms obtained from GC-MS and HR-LC-MS analyses (Supplementary Materials Figures S1 and S2) and chemical structures of all compounds identified in AIRME (Figures S3 and S4) were provided as Supplementary Materials.

Computational calculations for the adverse effect descriptors of AIRME compounds showed that many compounds may not possess mutagenicity, tumorigenicity, reproductive toxicity and irritation (Table 1). These predictive non-toxic effects of the compounds need to be further confirmed through laboratory studies.

### *2.3. A. indica Root Extract Scavenges DPPH and Hydroxyl Radicals*

In vitro free radical scavenging activity of AIRME was determined by measuring the inhibition of DPPH and $^{\bullet}$OH. The results revealed that AIRME (10–50 µg/mL) significantly scavenges the DPPH radical in a concentration dependent manner with a $IC_{50}$ of 15.85 µg/mL, whereas the $IC_{50}$ with ascorbic acid treatment was 5.71 µg/mL (Table 2). Hydroxyl radical-induced deoxyribose sugar damage was significantly decreased by AIRME in a concentration-dependent manner with $IC_{50}$ of 14.74 µg/mL (Table 2). These findings signify the potent free radical scavenging activity of AIRME.

### *2.4. A. indica Root Extract Suppress Hydrogen Peroxide and Lipid Peroxidation In Vitro*

We found that the AIRME (20–100 µg/mL) effectively converted the hydrogen peroxide into water with $IC_{50}$ value of 65.40 µg/mL whereas ascorbic acid converted at $IC_{50}$ of 33.31 µg/mL. Furthermore, anti-lipid peroxidation activity of AIRME (20–100 µg/mL) was evidenced by a substantial suppression of lipid peroxides in egg homogenate. Inhibition of lipid peroxidation was proportionate with AIRME concentrations, and $IC_{50}$ was 79.70 µg/mL. The efficacy of AIRME against hydrogen peroxide and lipid peroxidation propagation was comparable to the potency of ascorbic acid (Table 2).

**Table 1.** Phytochemical profile of AIRME using chromatography techniques (HR-LC-MS and GC-MS), antioxidant descriptors (Hbds—Hydrogen bond donor count and Hbas—Hydrogen bond acceptors count) and adverse properties (Mut—mutagenicity, Tum—tumarogenicity, Irri—irritant and RepTox—reproductive toxicology) predicted using Marvin sketch, a computational tool.

### 2.5. *A. indica* Root Extract Decreases Paw Edema Volume in Rats

Carrageenan induced acute inflammation was evidenced by the appearance of paw edema in rats. Carrageenan-induced rat paw edema is a well-established animal model to evaluate the anti-inflammatory properly of phytochemicals [10,21]. The edema volume was sharply increased 1 h after injection (38%) and reached maximum size by 5/6 h (52%) (Figure 1). However, edema volume was significantly decreased with ARIME (150 and 300 mg/kg b.w.) pretreatment. Although both doses of AIRME significantly inhibited the edema growth against carrageenan, the high-dose of AIRME (300 mg/kg b.w.) is more effective in inhibiting ($p < 0.05$) the edema development. The edema volume with AIRME high-dose at 1, 2, 3, 4, 5 and 6 h after injection was 24, 32, 34, 29, 21 and 7%, respectively, which is significantly lower compared to carrageenan group at all time points (Figure 1). Our results further emphasized that the decreased edema volume with AIRME was parallel with the standard anti-inflammatory drug, diclofenac treatment. Physical observations of paw further revealed that carrageenan-induced inflammatory edema was smaller in AIRME pretreated rats than that of their disease controls (Figure 2).

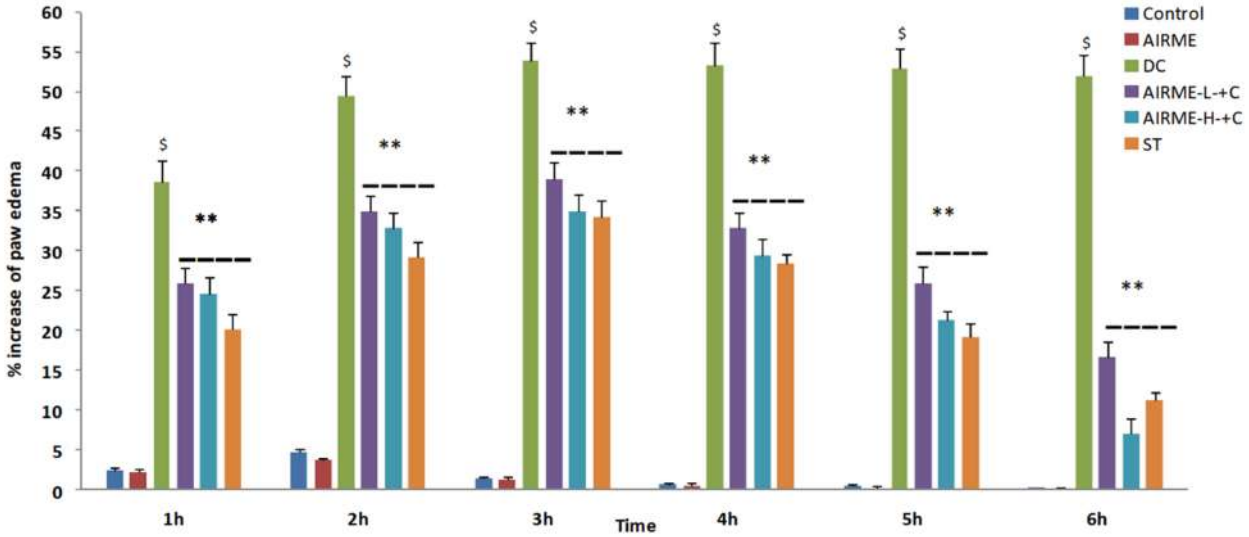

**Figure 1.** Percent changes in paw volume during the time course of 6 h after carrageenan injection (acute inflammation) in control and AIRME pretreated groups. Values are significant compared with control (\$ $p < 0.05$) and compared with carrageenan-injected group (** $p < 0.01$). NC, normal control; DC, disease control; AIRME, *A. indica* root methanolic extract; AIRME-L+C, AIRME-low-dose plus carrageenan; AIRME-H+C, AIRME-high-dose plus carrageenan; ST, standard treatment.

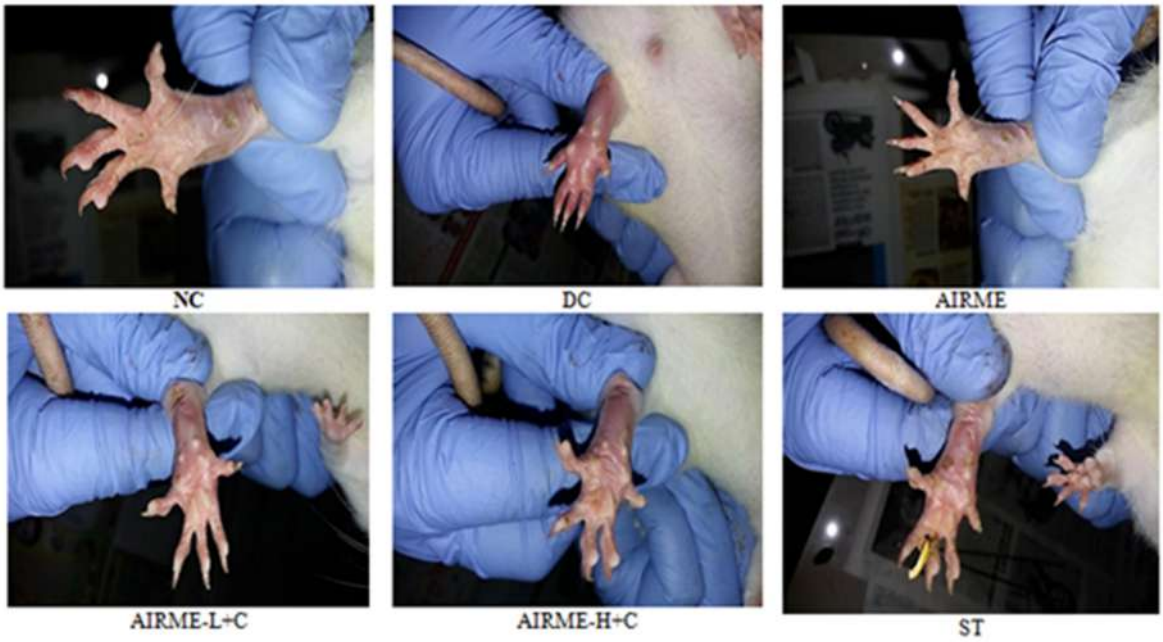

**Figure 2.** Physiological changes in rat paw tissue following carrageenan injection (1%) in different groups with or without AIRME 150. mg/kg), AIRME-H+C (300 mg/kg) and diclofenac (ST) pretreated rats. NC, normal control; DC, disease control; AIRME, *A. indica* root methanolic extract; AIRME-L+C, AIRME-low-dose plus carrageenan; AIRME-H+C, AIRME-high-dose plus carrageenan; ST, standard treatment.

### *2.6. A. indica Root Extract Attenuates Acute Inflammatory Response in Rats*

Hematological analyses showed a significant rise in white blood cells and platelets in carrageenan injected group compared with normal control ($p < 0.05$), which indicates acute inflammation in rats. The surge in WBC count and platelets in inflammatory rats was not seen in AIRME pretreated rats. This was represented by a remarkably less number of WBC and platelets with low-dose (150 mg/kg; $p < 0.05$) and high-dose (300 mg/kg; $p < 0.01$) of AIRME treatment (Table 3). Similarly, elevated CRP level (55.94 ± 4.86 ng/mL) with carrageenan injection was substantially decreased in AIRME treated groups (low-dose 36.98 ± 3.24; high-dose 31.84 ± 3.09 ng/mL). The dose-dependent decrease of CRP with AIRME was statistically significant ($p < 0.05$ and $p < 0.01$) compared with disease control group (Table 3).

**Table 3.** Effect of AIRME on white blood cells (WBC) and platelets count, and changes in serum C-reactive protein (CRP) in rats. Values represented as mean ± SD ($n = 6$). $ denotes significant at $p < 0.05$ compared with normal control (NC). Results are significant at $p < 0.05$ (*) and $p < 0.01$ (**) compared with disease control (DC).

| Groups | WBC ($10^9$/L) | Platelets ($10^9$/L) | CRP (ng/mL) |
|---|---|---|---|
| NC | 3.95 ± 2.06 | 320 ± 4.94 | 28.93 ± 2.95 |
| DC | 14.48 ± 4.76 $ | 1025 ± 8.67 $ | 55.94 ± 4.86 $ |
| AIRME | 4.02 ± 2.14 | 343 ± 5.07 | 30.32 ± 3.06 |
| AIRME-L+C | 9.76 ± 2.75 * | 765 ± 6.06 * | 36.98 ± 3.24 * |
| AIRME-H+C | 4.89 ± 2.43 ** | 366 ± 5.51 ** | 31.84 ± 3.095 ** |
| ST | 4.37 ± 2.14 ** | 337 ± 5.06 ** | 30.94 ± 3.065 ** |

NC—normal control; DC—disease control (carrageenan); AIRME—*Acalypha indica* roots methanolic extract; AIRME-L+C—AIRME-low dose plus carrageenan; AIRME-H+C—AIRME-high dose plus carrageenan and ST—standard treatment (diclofenac).

### *2.7. A. indica Root Extract Restores Antioxidant Enzyme Activities in Paw Tissue*

We then studied the response of antioxidant system with AIRME treatment against acute inflammation. Carrageenan-induced impaired antioxidant homeostasis in paw

tissue was represented by a significant reduction ($p < 0.05$) of SOD, CAT, GR and GPx enzyme activities. It is worth to note that carrageenan-induced loss of antioxidant enzyme activities was not seen in AIRME pretreated groups (150 and 300 mg/kg body weight). The dose-dependent preservation of antioxidant enzyme activities with AIRME was significant compared to the disease control group. To be specific, antioxidant property of the high-dose of AIRME is more effective ($p < 0.01$) and almost similar to the standard anti-inflammatory drug, diclofenac (Figure 3).

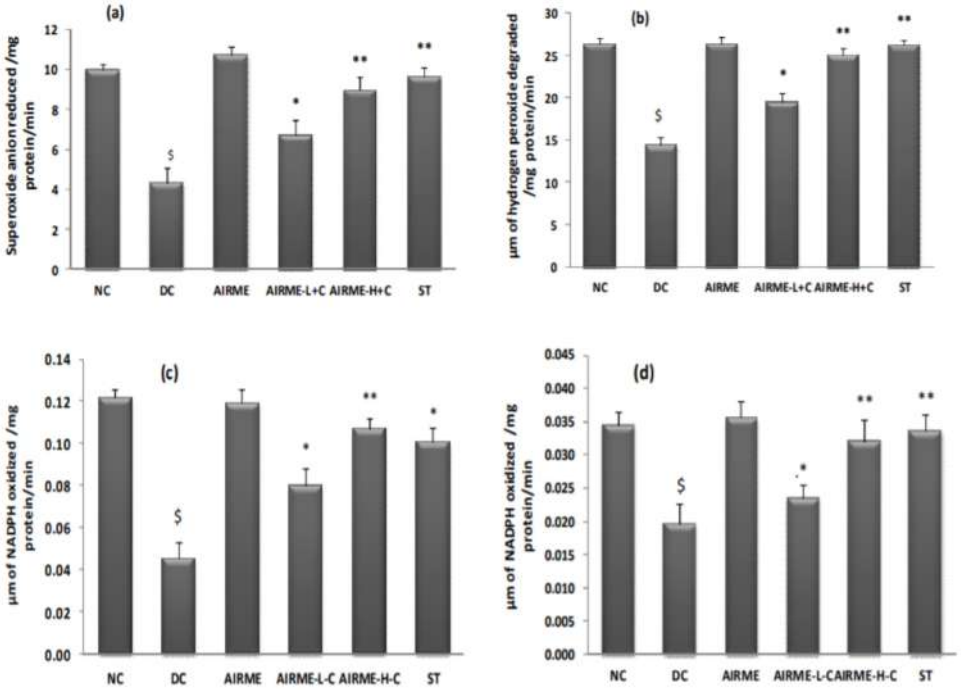

**Figure 3.** Changes in antioxidant enzyme (superoxide dismutase (**a**), catalase (**b**), glutathione reductase (**c**), glutathione peroxidase (**d**)) activities in paw tissues of different groups of rats. NC, normal control; DC, disease control (carrageenan); AIRME, *Acalypha indica* root methanolic extract; AIRME-L+C (AIRME low dose plus carrageenan); AIRME-H+C (AIRME high dose plus carrageenan), and ST (standard treatment, diclofenac). All values represented as mean ± SD ($n = 6$). $ indicates significant ($p < 0.05$) difference with NC. * ($p < 0.05$) and ** ($p < 0.01$) indicates significant difference with DC.

### *2.8. A. indica Root Extract Prevent Tissue Architectural Damage*

Tissue architectural derangements that occurred upon carrageenan injection, and tissue protective effects with AIRME pretreatment against inflammatory damage were examined through histopathological studies. Images from normal control and AIRME control groups showed normal architecture of the paw tissue with normal muscle around decalcified bone (DB) without vascular dilation and neutrophil infiltration. Carrageenan-induced acute inflammation was visualized by redness and swelling of paw, and tissue derangements were represented by edema, vascular dilation and accumulation of neutrophil infiltration in disease control group (Figure 4). Nevertheless, AIRME pretreatment (150 and 300 mg/kg b.w.) confined the paw tissue architectural damage through preventing the neutrophil infiltration, vascular dilation and suppressing edema (Figure 4). The anti-edematous activity of AIRME against acute localized inflammation was comparable with diclofenac treatment.

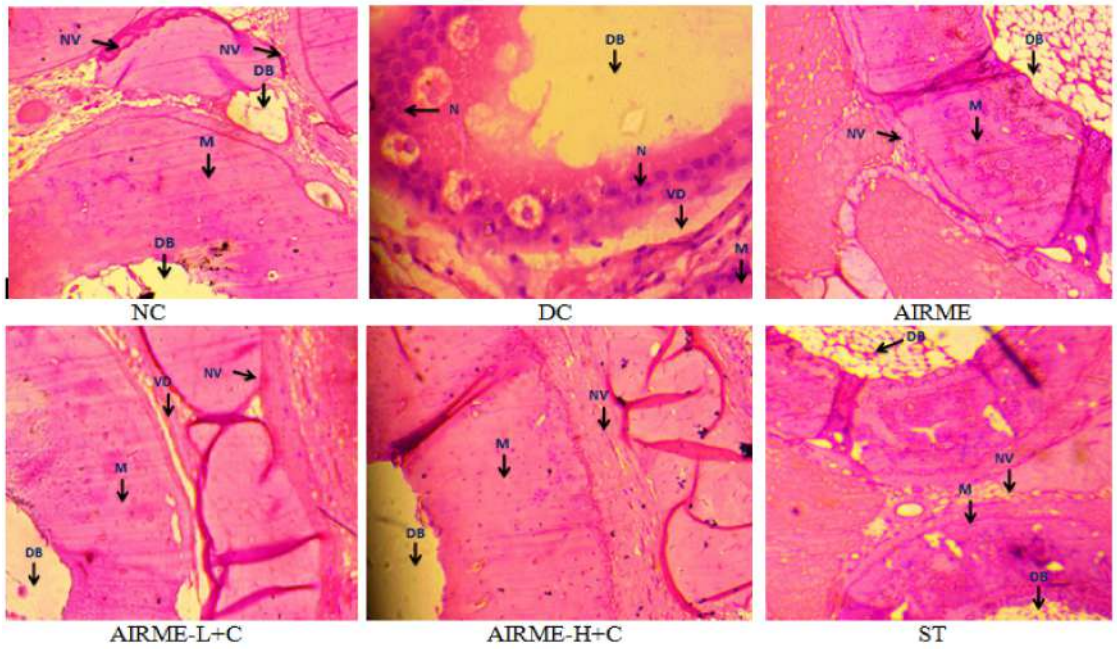

**Figure 4.** Histopathological study of inflamed paw tissue treated with AIRME. Paw tissue in NC and AIRME groups showed normal appearance of muscle (M) around the decalcified bone (DB), no vascular dilation (NV) and no infiltrate.

## 3. Discussion

Previous studies have shown the antioxidant, anti-inflammatory and tissue protective properties of *A. indica* leaf and stem extracts [18–20], but not the root extract. Besides, no study has identified the phytochemical constituents in *A. indica* root methanolic extract (AIRME) yet. For the first time, we screened the phytochemical constituents in AIRME, and reported 101 and 14 compounds from HR-LC-MS and GC-MS techniques, respectively. The major phytomolecules in AIRME were ramipril glucuronide (1.563%), antimycin A (1.324%), swietenine (1.134%), quinone (1.152%), oxprenolol (1.118%) choline (0.847%), bumetanide (0.847%) and fenofibrate (0.711%). Then, we demonstrated the antioxidant and anti-inflammatory properties of AIRME through in vitro and in vivo studies. In vitro free radical scavenging activity of AIRME was evidenced by a potent inhibition of DPPH and $^{\bullet}$OH radicals and substantial suppression of $H_2O_2$ and lipid peroxidation. Evidence from in vivo studies revealed that carrageenan-induced paw edema was significantly decreased (volume) in AIRME pretreated rats. The surge in WBC and platelets with response to acute inflammation was significantly suppressed in AIRME pretreated groups. Furthermore, elevated CRP levels with carrageenan injection were not seen in AIRME pretreated rats, which indicates potent anti-inflammatory activity of AIRME. Most importantly carrageenan-induced impaired antioxidant homeostasis in paw tissue was attenuated with AIRME treatment. This was represented by a significant conservation of SOD, CAT, GPx and GR activities against carrageenan-induced loss. Histopathological studies further emphasize the tissue protective effect of AIRME against carrageen-induced tissue derangements, accumulation of neutrophil infiltration and vascular dilation.

Oxidative stress is an imbalance between pro-oxidants and antioxidants that is typically involved in the progression of many diseases, including cancer, CVDs, diabetes and atherosclerosis [22]. Natural antioxidant compounds, such as plant-based phenols and flavonoids can give protection against oxidative stress by scavenging the highly reactive free radicals, and inhibiting the lipid peroxidation [23]. In this study, naturally occurred large quantities of phenols (70.92 mg of gallic acid/g) and flavonoids (16.01 mg of rutin/g) in AIRME could potentially scavenge the free radicals, and thereby prevent the oxidative stress. HR-LC-MS is a chromatography technique that examines the polar (phenols and flavonoids) and semi-polar compounds in plant extract [19]. Furthermore, GC-MS analysis

reported 14 compounds wherein non-polar/volatile phytochemicals are found in the root extract. Hydroxyl groups play an important role as a donor of hydrogen bonds, which is necessary for free radical scavenging, reduction of metals and molecular interaction with biomolecules [24]. In this study, we counted the hydrogen bond donors for all the identified phytochemicals through HR-LC-MS and GC-MS. The results showed that the majority of the compounds identified by HR-LC-MS exhibited these groups; while the number of compounds identified by GC-MS was lower (Table 1). These findings revealed that AIRME is a good source of antioxidant compounds, which could effectively eradicate the free radicals and/or prevent the oxidative stress.

Free radicals, and free radical source $H_2O_2$, is a well-known weak oxidizing agent, rapidly cross the cell membrane, reacts with ions such as $Fe^{2+}/Cu^{2+}$ and resulting in the generation of highly toxic hydroxyl radicals [25]. The cellular antioxidant defense system plays a significant role in quenching the toxic free radicals, and thereby protects the biomolecules from oxidative modification. In addition to the cellular antioxidant mechanism, the exogenous antioxidants from natural medicinal plants can enhance the protection against disease or stress [26,27]. The free radical scavenging activity of AIRME in this study was revealed by efficient scavenging of $H_2O_2$, $^{\bullet}OH$ and DPPH radicals, which is comparable to the scavenging ability of the standard ascorbic acid (Table 2). The existence of phenols and flavonoids with HBDC, such as Bumetanide, Bussein's hydrolysis product, Coproporphyrin II, Dihydrodeoxystreptomycin, Ramipril glucuronide and Trandolapril glucuronide further strengthen the free radical scavenging or antioxidant activity of AIRME.

Identification and developing of natural medicinal compounds without adverse effects is critical for pharmaceutical companies in order to promote the medicinal values and to gain final marketing approval. Toxicity evaluation of the plant compounds is typically a laborious process with several complexities, and includes the requirement of animal models, cell lines, expenditure, man power and a long duration of time. To overcome these difficulties, computational calculation is an alternative approach to assess the adverse effects of newly identified plant compounds [28]. Therefore, we used computational calculation, and measured the potential adverse effects, such as mutagenicity, tumorigenicity, irritant and reproductive toxicity of the compounds that were identified in AIRME. The predictions showed that most of the compounds in AIRME may not have mutagenicity, tumorigenicity, irritant and reproductive toxicity. These toxicity assessments are predictive, and laboratory studies are necessary to confirm the toxicity of individual phytomolecules of AIRME.

Acute inflammatory response is mainly represented by an increased vascular permeability and neutrophil infiltration, which leads to edema formation. In the cellular events, extravasation of fluids and proteins is accompanied with excessive accumulation of leukocytes at the inflammatory site [29,30]. Carrageenan, a highly sulfated polysaccharide is widely used as food additive due to its capability to enhance the food structure [31]. Carrageenan (non-antigenic phlogistic agent)-induced rat paw edema is a well-established and widely used model to evaluate the anti-inflammatory properly of plant and synthetic compounds [10,21]. Carrageenan-induced edema development is a biphasic acute inflammatory response [29]. In the first phase from 0 to 2.5 h, carrageenan triggers the release of acute phase mediators, mainly serotonin, histamine and kinins, which influence the vascular permeability [32]. Then, prostaglandins are the key players in the second phase of inflammation that occurs around 3 h after carrageenan injection [33]. These events provoke the release of several pro-inflammatory mediators, where inhibition terminates the inflammatory process [34]. Local inflammation is associated with oxidative burst and increased production of pro-inflammatory cytokines, such as TNF-$\alpha$, IL-1$\beta$, IL-6 and nitric oxide [35].

The carrageenan-induced inflammation in our study was witnessed by increased CRP levels and elevated WBC and platelet count. Platelets usually gathered at the injured site, adhere to the WBCs and release cytokines and chemokines that are chemotactic

for neutrophils and monocytes. These events subsequently increase inflammation [36]. CRP is an acute phase inflammatory marker that increases rapidly and dramatically in response to acute inflammation [37]. It has been shown that CRP can enhance the platelet-activating factor (PAF)-induced inflammation via binding to PAF and its precursor [38]. One of our key findings is that AIRME received rats exhibited lower levels of CRP as well as decreased WBC and platelet count, which implies potent anti-inflammatory activity. In the phytochemical screening, we reported several pharmacological compounds, like oxtriphylline (0.677%), choline (0.847%), bumetanide (0.847%), swietenine (1.13%) and fenofibrate (0.711%) in the root extract. A previous study has shown that choline and aspirin together can suppress the pro-inflammatory mediators against acute inflammation induced by carrageenan and lipopolysaccharide [39]. Other phytochemicals, bumetanide [40], fenofibrate [41] and swietenine [42] are also reported to possess anti-inflammatory activity via downregulation of pro-inflammatory cytokines. Another study documented that methanolic extract *Sideritis bilgeriana* suppressed TNF-α, IL-1β and leukocyte migration in carrageenan-induced pleurisy model, which is due to the presence of f phenolic and flavonoids content [14]. It is persuaded that existence of these pharmacological compounds in AIRME could act as anti-inflammatory agents, and thereby suppress inflammation and edema in carrageenan-injected rats. The anti-inflammatory property of AIRME was comparable to the diclofenac, a nonselective non-steroidal anti-inflammatory drug.

ROS or free radicals at low concentrations act as signaling molecules; however, they are deleterious to cells at high concentrations. Due to their highly reactive nature, ROS reacts with vital biomolecules, proteins, lipids and DNA and can cause irreversible damage. To prevent such oxidative damage, cells have evolved an array of defense systems, including antioxidant enzymes that scavenge excessive ROS. Cells experienced oxidative stress when the balance tipped between antioxidants and free radicals [4,5]. All antioxidant enzymes, including SOD, CAT, GPx and GR estimated in paw edema were significantly decreased after carrageenan injection, which reflects impaired antioxidant homeostasis and state of oxidative stress. Carrageenan injection has been reported to trigger intracellular ROS production, decrease antioxidant capacity and cause inflammation [31,43]. Excessive production of oxygen free radicals in the extracellular space and relatively low activities of SOD and CAT in the inflammatory state increase the vulnerability of extracellular components to ROS and stimulate chemotaxis for other inflammatory cells [44].

However, pretreatment of AIRME restored the SOD, CAT, GPx and GR activities against carrageenan-induced loss. In vivo antioxidant property of AIRME is corroborates with in vitro DPPH radical scavenging activity, and suppressed $H_2O_2$ and lipid peroxidation. Similar to our findings, oral administration of amiodarone, an anti-arrhythmic agent to carrageenan-injected rats has been shown to decrease the paw edema volume and inflammation in association with increased antioxidant enzyme activities [45]. The anti-inflammatory property of *Pistacia lentiscus* fruit oil is accompanied by the increased activities of SOD, CAT and GPx and decreased lipid peroxidation in rat paw tissue after carrageenan injection [46]. Another study showed that cashew nuts supplementation ameliorated the carrageenan-induced diminution of SOD and CAT activities and GSH concentrations. Cashew nuts further suppressed the release of pro-inflammatory cytokines and prevent the oxidative stress [47]. These findings imply that the anti-inflammatory property of natural compounds is associated with antioxidant property against carrageenan-induced oxidative stress. The increased antioxidant enzyme activity or free radical scavenging capacity of AIRME in our study might be due to the presence of various phytochemicals in the root extract. AIRME phytochemical screening represented with high HBDC and HBAC, including ramipril glucuronide (1.563%), antimycin A (1.324%), dihydrodeoxystreptomycin (1.021%), swietenine (1.134%), hydrolysis product of bussein (1.145%), terbinafine metabolite (1.098), oxprenolol (1.118%) and 3-*O*-methylrimiterol (1.118%).

The antioxidant activity of AIRME was further confirmed by tissue protective effect against carrageenan-induced architectural damage to paw tissue. From the histopathological studies, it is visible that the inflamed area appears with edema, congestion, vascular

dilation and neutrophil infiltration. These morphological changes in paw tissue are the typical events of local inflammation caused by carrageenan injection. However, AIRME treatment prior to carrageenan injection decreased edema and prevented vascular dilation and a surge in neutrophil infiltration, which reveals an anti-inflammatory property. Suppressed paw edema and neutrophil recruitment in paw tissue have been reported as a key anti-inflammatory property of crocin (an active constituent of saffron) against histamine injection in rats [48]. Naik and colleagues reported that pathological changes, including hepatic steatosis with severe swelling of hepatocytes and fat accumulation in obese rats were partially attenuated with *A. indica* leaf extracts. However, this study not revealed the phytochemical composition in the leaf extracts of *A. indica* [49]. Another study showed that quinone alkaloid pretreatment significantly inhibited carrageenan-induced paw edema in rats [50]. Astragalin, a naturally existing flavonoid in plants alleviated epithelial hyperplasia, severe leukocyte infiltration and sub epidermal edema induced by carrageenan injection [51]. AIRME also possesses flavonoids, quinine, phenols and other active ingredients which may contribute for the tissue protective effects. To our knowledge, this is the first evidence to demonstrate the tissue protective effect of AIRME against carrageenan-induced tissue damage.

## 4. Materials and Methods

### *4.1. Chemicals*

The chemicals used in this research were obtained from the following scientific companies: Sigma (St. Louis, MO, USA), TCI (Shanghai, China), Merck (Mumbai, India), SRL (New Delhi, India) and Fisher (Pittsburgh, PA, USA).

### *4.2. Collection and Preparation of A. indica Root Extract*

*A. indica* whole plant was collected from the campus garden of Sri Venkateswara University, Tirupati, India. Plant specimen was authenticated by the Taxonomist, Department of Botany, Sri Venkateswara University, Tirupati and herbarium was deposited with a voucher no: SVU-BOT-926. The roots were separated from the plant, and washed with running tap water to remove soil, then washed again with fresh water and shade dried. The dried root material was powdered using blender, and 100 g of the powder was transferred into amber color bottle containing 500 mL of methanol (1:5). The mixture was incubated with occasional stirring for 3 days, and the solvent was filtered with non-absorbent cotton, muslin cloth and Whatman no 1 filter paper finally. The filtrate was concentrated in rotary evaporator (BUCHI 036576, Roskilde, Denmark) and lyophilized (VIRTIS:Model BT4KZL-105, Midland, Canada) to obtain *A. indica* root methanolic extract (AIRME).

### *4.3. Qualitative Estimation of Phytochemicals*

We have primarily tested for the phytochemicals of phenols, flavonoids, saponins, tannins, reducing sugars, alkaloids, terpenoids, coumarins anthraquinones and anthocyanins in the AIRME according to the protocols stated by Shukla and colleagues [52].

### *4.4. Quantitative Estimation of Phytochemicals*

#### 4.4.1. Determination of Total Phenolic Content

According to Gutierrez and Navarro [53], the total phenolic content of AIRME was measured using the Folin Ciocalteu (FC) method. Briefly, 0.5 mL (5 mg) of extract at different concentrations (5–50 µg/mL) and same concentrations of standard gallic acid was added to 1 mL of FC (10%) reagent. For this reaction, 2.5 mL of sodium carbonate solution was added and incubated at room temperature for 30 min. Using a UV-Vis spectrophotometer (Shimadzu UV-1800, Kyoto, Japan) the resulting reaction was measured at 760 nm. The gallic acid standard graph was used to calculate the phenolic content of the extract, and expressed as mg of gallic acid equivalent per g of extract.

#### 4.4.2. Determination of Total Flavonoids Content

Total flavonoid content in AIRME was quantified by following aluminum chloride method [54]. Briefly, 1.0 mL of extract (10 mg/mL) was added to 4 mL of distilled water. To this, 0.3 mL of 5% $NaNO_2$ and 0.3 mL of 10% aluminum chloride ($AlCl_3$) solutions were added and incubate for 6 min. Then, 2 mL of 1 M NaOH solution was added and made up to 10 mL with distilled water. The reaction mixture was incubated for another 15 min and the flavonoid content was measured at 510 nm. Rutin was used as standard for calculating flavonoid content in AIRME, and content was expressed as mg of rutin equivalent per g of extract.

#### 4.4.3. Phytochemical Profiling and Gas Chromatography-Mass Spectrometry (GC-MS) analysis of AIRME

GC-MS analysis for AIRME was achieved by JEOL GC MATE II (GC model, Agilent Technologies 6890N Network GC system, Santa Clara, CA, USA) equipped with HP 5 MS column. High pure helium as carrier gas at a constant flow rate of 1 mL/min was used for GC separation. Injector temperature was set at 220 °C and oven temperature was set as 50 °C raised to 250 °C at 10 °C/min. Total GC running time was 30 min. A highly sensitive quadruple double focusing mass analyzer was used and equipped with photon multiplier tube as the detector; mass range of 50 to 600 amu; and ionization voltage (Electron impact ionization) 70 eV was used. This protocol was also explained in our previous study [19]. Mass of each peak was obtained from mass spectroscopy while the proposed structures of compounds were predicted from the screening library of National Institute of Standard and Technology (NIST, Gaithersburg, MD, USA).

#### 4.4.4. Phytochemicals Profiling and HR-LC-MS Analysis of AIRME

The AIRME was then analyzed in HR-LC-MS (Model: Agilent 1290 Infinity UHPLC System, Santa Clara, CA, USA) in order to identify the finger prints of other hidden phyto moieties. For this assessment we followed procedure described by Ravi et al., [19]. Briefly, an auto sampler injected a 3 µL volume of the sample into a C18 column (ZORBAX 2.1 9. 50 mm 1.8 Micron). The auto sampler has a 100 µL/mL auxiliary pull and ejects the sample quickly. Two binary pumps (G4220B) are integrated in one housin and deliver desired mobile phase gradient ratios (solvent A: 0.1% Formic Acid (FA) in water and B: 90% Acetonitrile + 10% $H_2O$ + 0.1% FA). The total run time was 30 min, during which the solvent A-95% + B-5% was initiated at 2 min, the solvent A gradient ratio changed to 5% at 20 min, and the solvent A 95% was maintained from 26 to 30 min. The binary pump pressure was kept stable at 1200 bar, and the flow rate was 0.300 mL/min. The Mass Hunter workstation program was used to gain an edge in identifying correct MS and MS/MS for the extract's LC profile.

#### 4.4.5. Computational Calculations for the Identified Phytochemicals

The resulted phytochemicals from analytical techniques were structurally drawn and their chemical descriptors, such as hydrogen bond donor count (HBDC) and hydrogen bond acceptor count (HBAC) were predicted using Marvin Sketch 16.3.21 version (https://chemaxon.com/products/marvin, (accessed on 8 June 2021)), a chemo informatics tool. In addition, the pharmacological properties of these compounds include tumorigenic, mutagenic, irritant and reproductive effects were assessed using DataWarrior V4.7.2 software (http://www.openmolecules.org/datawarrior/, (accessed on 8 June 2021)).

### *4.5. In Vitro Studies*

Free Radical Scavenging and Anti-Lipid Peroxidation Activities of AIRME

In vitro free radical scavenging activity of AIRME was carried out by incubating different concentrations of extract (10–50 µg/mL) with 0.6 mM DPPH. The resulting reaction optical density (OD) was read at 517 nm against ethanol blank [55]. Hydroxyl radical ($^{\bullet}OH$) scavenging ability of AIRME was assayed by adopting the deoxyribose

method as described by Nagai et al., [56]. The •OH radicals of Fentons reagent degrade the deoxyribose sugar, whereas prevention of such degradation of sugar by AIRME was studied with different concentrations (10–50 µg/mL). The OD of samples was read at 520 nm against blank containing total reaction mixture with absence of AIRME.

The hydrogen peroxide ($H_2O_2$) inhibition/reduction property of AIRME was carried out by incubating different concentration of extract (20–100 µg/mL) with $H_2O_2$ for 30 min. Retained $H_2O_2$ after incubation was read at 230 nm against phosphate buffer blank [57] in UV-VIS spectrophotometer (Shimadzu UV-1800, Kyoto, Japan). Next, anti-lipid peroxidation property of AIRME was determined using egg homogenate treated with Fentons reagent for 1 h incubation as described by Upadhyay et al. [58]. Prevention of lipid peroxidation by various concentrations of AIRME (20–100 µg/mL) was read at 532 nm using total reaction without extract as a blank.

### *4.6. In Vivo Studies*

#### 4.6.1. Experimental Design and Treatment

Anti-inflammatory and antioxidant activity of AIRME was studied in 1% carrageenan induced paw edema in rats. Thirty-six male adult rats of Wistar strain were purchased from the Indian Institute of Science (IISc), Bangalore. Rats were kept in cages, allowed to acclimatize for a week with conditions of 25–28 °C temperature, 50–55% humidity, with regular light/dark cycle (7:00 AM to 7:00 PM). Strict ethical guidelines for the maintenance and care of experimental animals were followed. The entire study design and protocols used in this study were reviewed and approved by the Institutional Animal Ethics Committee (09/(i)/a/CPCSEA/IAEC/SVU/ZOOL/KSR/Dt.08/07/2012) of Sri Venkateswara University, Tirupati, India. After acclimatization, rats (190 gm ± 10 gm bodyweight) were divided into six experimental groups with six rats in each as mentioned below:

- Group I—Normal control (NC): Rats in this group received 50 µL normal saline by sub-plantar injection (SPI);
- Group II—Disease control (DC): Carrageenan (1%, 100 µL) was injected (SPI) into the rat paw to induce acute localized inflammation;
- Group III—AIRME control (AIRME): Rats in this group received only AIRME (300 mg/kg bodyweight) by oral gavage;
- Group IV—AIRME low-dose plus carrageenan (AIRME-L+C): Rats were orally administered with low dose of AIRME (150 mg/kg body weight) through oral gavage 1 h prior to carrageenan injection.;
- Group V—AIRME high-dose plus carrageenan (AIRME-H+C): Rats in this group received high dose of AIRME (300 mg/kg body weight) 1 h prior to carrageenan injection, as described in group IV;
- Group VI—Standard treatment (ST): Rats in this group received diclofenac (20 mg/kg body weight) by oral gavage one hour before carrageenan injection.

Carrageenan-induced rat paw edema is a well-established and widely used model to evaluate the anti-inflammatory properly of plant and synthetic compounds [10,21,59]. The AIRME doses (150 and 300 mg/kg body weight) used in this study were based on our preliminary dose-dependent studies, where we found various doses of AIRME (100, 150, 200, 250 and 300 mg/kg bodyweight) did not produce any physiological or behavioral changes in normal rats. Besides Sathya and colleagues documented no adverse with different doses of *A. indica* ethanolic extracts ranges from 5 to 2000 mg/kg b.w. [60].

#### 4.6.2. Measurement of Paw Volume

The perimeter of the inflamed and AIRME treated paws of experimental animals was measured using digital screw gauge (model: Insize-3109-25s-digital outside micrometer) as described by Killari and team (2019) [61]. The paw volume was measured for every

hour until 6 h following carrageenan injection. The percent increase in paw thickness was calculated using the formula (Equation (1)):

$$\frac{Y_t - Y_0}{Y_0 x \times 100} \quad (1)$$

where:

- $Y_t$—thickness of paw at different time intervals (1, 2, 3, 4, 5 and 6 h) (after carrageenan induction);
- $Y_0$—thickness of paw at 0 h (before injection of carrageenan).

Resulted final value for every group at every hour was obtained through calculated mean.

#### 4.6.3. Blood Collection and Analyses

After treatment period, rats were subjected to chloroform anesthesia and sacrificed with cervical dislocation. On the experiment day, the blood samples (approximately 5 mL) were immediately collected through heart puncture into tubes that contain anti-coagulant (EDTA). In blood, white blood cells (WBC) and platelets were counted using a haemogram. For the CRP assay, blood samples were centrifuged at 4000× *g* rpm for 15 min, and serum was collected. Then C-reactive protein (CRP) levels were measured in the serum using kit provided by Aspen Laboratories (Himachal Pradesh, India). The changes in CRP in different groups were expressed as ng/mL. The blood collection procedures and assay protocols were approved Institutional Animal Ethics Committee.

#### 4.6.4. Determination of Antioxidant Enzyme Activities in Paw Tissue

Paw tissue was separated, cleaned with normal saline and stored at −40 °C for further biochemical analysis. Antioxidant status of paw tissue was measured by assessing the primary antioxidant enzyme activities. The activity of superoxide dismutase (SOD) in the paw homogenates was measured using the Misra and Fridovich [62] method at 480 nm for 4 min on a Shimadzu UV-1800 spectrophotometer. The activity was measured as the quantity of enzyme that prevents epinephrine from being oxidized by 50%, which was equal to 1 U per mg of protein. Catalase (CAT) activity was evaluated using Aebi, [63] procedure, and the sample's absorbance was recorded using a UV spectrophotometer at 240 nm for 1 min. The moles of hydrogen peroxide (0.066 M) decomposed per mg of protein each minute equals to one unit activity. The GR activity was measured at 340 nm for 3 min in spectrophotometer. The GR activity was expressed in micromoles of NADPH oxidized per mg of protein per minute [64]. GPx activity of paw tissue was measured using a reaction mixture composed of GSH (0.01 M), 12 mM *t*-butyl-hyroperoxide, 1.5 mM NADPH, and GR (0.24 units). The mM of NADPH oxidized/mg protein/min was measured at 340 nm for 180 s to determine enzyme activity [65].

#### 4.6.5. Histopathology

The paw tissue biopsy of rats from all experimental groups were taken and fixed in 10% formalin to prevent autolysis, which permanently cross-links and stabilizes their proteins. Then, the paw tissue was decalcified with weak formic acid before trimming to acquire the proper size and orientation of tissue (10%). The tissue sample was also infiltrated with paraffin to obtain its water content before being embedded in paraffin. Then the tissue embedded in paraffin was sliced into 6–8 µm section cuttings in a microtome as described by Slaoui and Fiette [66]. Further, tissue sections were stained with hematoxylin and eosin (H&E) on glass slide. The histopathological changes in paw tissue sections were observed under the microscope (Trinocular BX53, Olympus, Singapore) and the changes were recorded at 40× magnification.

### *4.7. Statistical Analysis*

We used SPSS (Version 15, SPSS Inc., Chicago, IL, USA) and Excel for statistical analyses. The data expressed as means ± standard deviation (SD). One-way analysis of variance (ANOVA), followed by Duncan's multiple comparison tests were performed for group comparison and significance. Statistical significance was set at $p < 0.05$.

## 5. Conclusions

For the first time, we demonstrated that *A. indica* root extract is rich in various phytochemical constituents without adverse effect descriptors. The major phytomolecules are ramipril glucuronide, antimycin A, swietenine, quinone, oxprenolol, choline, bumetanide and fenofibrate. AIRME showed potent free radical scavenging activity (DPPH and $^{\bullet}$OH) and inhibition of lipid peroxidation ability. AIRME pretreatment diminished carrageenan-induced paw edema, and decreased WBC, platelets and CRP levels in rats. Improved antioxidant status with AIRME was further confirmed by its tissue protective effects against acute inflammatory damage. Owing to the potent antioxidant and anti-inflammatory properties of AIRME, our findings suggest considering of AIRME in developing and preparation of novel anti-inflammatory drugs. However, further studies are necessary to explore in-depth molecular mechanism with specific known compounds of *A. indica* root extract.

**Supplementary Materials:** The following are available online, Figure S1: Chromatogram obtained for AIRME from HR-LC-MS, Figure S2: Chromatogram obtained for AIRME from GC-MS and Figure S3: Chemical structures of AIRME obtained from both HR-LC-MS and GC-MS.

**Author Contributions:** Conceptualization, R.S., S.R.K. and M.K.; methodology and analyses, R.S., J.P., S.B. and V.S.G.; data curation and visualization, S.K.R., W.Y. and R.S.; writing—original draft preparation, R.S. and J.P.; writing—review, editing and finalizing, S.R.K., W.Y. and M.K.; supervision, S.R.K. and M.K.; project administration and funding acquisition, R.S. and S.R.K. All authors have read and agreed to the published version of the manuscript.

**Funding:** This study was supported by the University Grants Commission (UGC), New Delhi, India in the form of RGNF with grant numbers F117.1/2012-13/RGNF-2012-13-SC-AND 34335 (R.S.) and F1-17.1/2015-16/RGNF-2015-17-SC-AND-17449 (J.P.). This study was further supported by BSR-Faculty Fellowship with grant number F.18-1/2011 (BSR), dated 24-11-2017 (S.R.K).

**Institutional Review Board Statement:** This study was performed in accordance with the institutional animal care and use committee, Sri Venkateswara University, India. The study design and protocols used in this study were reviewed and approved by the Institutional Animal Ethical Committee (09/(i)/a/CPCSEA/IAEC/SVU/ ZOOL/KSR/Dt.08/07/2012).

**Data Availability Statement:** The data presented in this study are available from the corresponding authors on request.

**Acknowledgments:** Authors are thankful to the Sophisticated Analytical Instrument Facility (SAIF), Indian Institute of Technology (IIT), Madras (Chennai) and IIT Bombay (Mumbai), India for helping to run the HR-LC-MS and GC-MS analyses.

**Conflicts of Interest:** All authors declared that there are no conflict of interest.

**Sample Availability:** Samples of the plant extract with phytochemical composition are available from the authors.

**ARTICLE HISTORY**

Received: March 11, 2020
Accepted: August 09, 2020

*DOI:*
*10.2174/1381612826666200928160357*

**Abstract:** ***Background*:** Diabetes is a major public health problem in the world. It affects each and every part of the human body and also leads to organ failure. Hence, great progress is made in the field of herbal medicine and diabetic research.

***Objectives*:** Our review will focus on the effect of bioactive compounds of medicinal plants which are used to treat diabetes in India and other countries.

***Methods*:** Information regarding diabetes, oxidative stress, medicinal plants and bioactive compounds was collected from different search engines like Science direct, Springer, Wiley online library, Taylor and francis, Bentham Science, Pubmed and Google scholar. Data was analyzed and summarized in the review.

***Results*:** Anti-diabetic drugs that are in use have many side effects on vital organs like heart, liver, kidney and brain. There is an urgent need for alternative medicine to treat diabetes and their disorders. In India and other countries, herbal medicine was used to treat diabetes. Many herbal plants have antidiabetic effects. The plants like ginger, phyllanthus, gymnea, aswagandha, aloe, hibiscus and curcuma showed significant anti-hyperglycemic activities in experimental models and humans. The bioactive compounds like Allicin, azadirachtin, cajanin, curcumin, querceitin, gingerol possess anti-diabetic, antioxidant and other pharmacological properties. This review focuses on the role of bioactive compounds of medicinal plants in the prevention and management of diabetes.

***Conclusion*:** Moreover, our review suggests that bioactive compounds have the therapeutic potential against diabetes. However, further *in vitro* and *in vivo* studies are needed to validate these findings.

**Keywords:** Diabetes, medicinal plants, bioactive compounds, drug discovery.

## 1. INTRODUCTION

Diabetes is the single most important endocrine disorder, widely recognized as one of the leading causes of death and disability in the world. Diabetes is a metabolic syndrome which affects more than 15% of the population in the world, which could jump up to 55% by 2035. It is predicted that by 2030, India, China and the United States will have the largest number of diabetic peoples [1] (Fig. **1**).

The prevalence of diabetes is expected to increase to 9.9% by the year 2045. Diabetes causes about 5% of all deaths globally each year, and diabetic deaths are likely to increase by more than 50% in the next 10 years. Therefore, developing novel drugs or new therapies to combat diabetes has become an urgent need.

The World Health Organization (WHO) estimated the global prevalence of diabetes among adults over 18 years of age was 8.5% in 2014. In India, there are about 69.2 million cases of diabetes in the adult population. The prevalence in urban areas ranges between 10.9% and 14.2% and prevalence in rural India was 3.0-7.8% among the population aged 20 years and above with a much higher prevalence among individuals aged over 50 years (INDIAB Study). The prevalence of diabetes in India has remained at 11.8% in the last four years (Fig. **2**).

Statistical projections for India suggest that the number will rise from 19.4 million in 1995 to 65.1 million in the year 2035, making India the country with the highest number of diabetics in the world. One in six people with diabetes in the world is from India. China is in second place by having 16 million peoples in 1995 and more than 38 million peoples by 2025. India is at the top of the table [2]. The diabetes burden in India results from various factors like sedentary life, dietary habits, lack of physical activity, lifestyle habits, obesity, hypertension all together contribute to the rapid rise of diabetes in India (Table **1**).

Diabetes mellitus, the most common metabolic disease in the world, is a group of disorders characterized by hyperglycemia, which results from defects in insulin secretion or insulin action. Diabetic complications include retinopathy, nephropathy, micropathy, cardiomyopathy, renal deterioration and cerebrovascular diseases [3]. The control and treatment of diabetes and its complications mainly depend on the chemical or biochemical agents, pharmacological compounds or diet therapy.

Therefore, understanding the mechanisms and the biological consequence of diabetes is essential for the development of novel therapeutic drugs. Cellular senescence may be one mechanism contributing to diabetes.

## 2. OXIDATIVE STRESS AND DIABETES

Diabetes is one of the stress related disorders. Diabetes mellitus has been shown to be a state of increased free radical formation. The existence of oxidative stress resulting from increased free radicals has been postulated in diabetes. Oxidative stress induced by chronic hyperglycemia has been associated with dysfunction and apoptosis of several cell types, including pancreatic β cells, endothelial cells, neurons and glial cells. These evidences indicate that hyperglycemia and oxidative stress promote the progression and complications of diabetes [4]. (Table **2**).

Oxidative stress results from overproduction of reactive oxygen species (ROS) coupled with insufficient antioxidant capacity. Oxidative stress is currently suggested as one of the mechanisms underlying diabetes mellitus, which affects carbohydrate, lipid and protein metabolism. Several alterations in diabetic individuals are oxidative in nature and may depend on increased oxidative stress. Glycation and hyperglycemic pseudohypoxia can generate a redox imbalance inside the cells, especially in the liver. Furthermore, lipid peroxidation plays a role in the production of free radicals and oxidative stress during diabetes [5, 6].

In a diabetic condition, mitochondria play an important role in the production of toxic free radicals. During oxidative metabolism in mitochondria, a component of the utilized oxygen is reduced to water, and the remaining oxygen is transformed into oxygen free radical (OFR), which is an important reactive oxygen species that is converted to other reactive species such as hydroxyl radical, hydrogen peroxide [7]. Insulin signaling is modulated by reactive oxygen species and reactive nitrogen species (RNS) in two ways. On one side, in response to insulin, the ROS/RNS are produced to exert its full physiological function and on the other side, the ROS and RNS have got negative regulation on insulin signaling, interpreting them to develop insulin resistance, which is a risk factor for diabetes [8].

Under normal conditions, reactive oxygen species are neutralized by the antioxidative defense system, which, however, is severely altered during the diabetic condition. Antioxidant enzymes are proteins involved in the catalytic transformation of reactive oxygen species and their byproducts into stable, nontoxic molecules, therefore representing the most important defense mechanism against oxidative stress induced cell damage. A precise balance between ROS concentrations and antioxidants must be maintained inside the cells and tissues to ensure a proper redox state that guarantees the required control of metabolism and organic homeostasis. Antioxidant enzymes catalyze mainly three different reaction mechanisms: dismutation, peroxidise reactions and thiol reductions.

Antioxidant enzymes such as Superoxide dismutase (SOD), Catalase (CAT), Glutathione peroxidase (GPx), Glutathione reductase (GR), Glutathione –s– transferase (GST) activities and Glutathione (GSH) levels are decreased in liver, heart, kidney and brain of diabetic subjects [3, 4]. Lipid peroxidation levels increased in diabetic subjects. Oxidative stress is proposed to be a potential contributor to the development of complications in diabetes. Increased free radical production or decreased antioxidant defense system enzymes may give rise to increased oxidative stress. Consequences of oxidative stress are cell injury, *i.e*., alteration in antioxidant enzyme system, disruption in cellular homeostasis and accumulation of damaged molecules. The observed decrease in SOD activity in diabetic rats could result from the inactivation of $H_2O_2$ and inefficient scavenging of reactive oxygen species, which might be implicated in oxidative inactivation of enzymes and especially the deleterious effects due to the accumulation of superoxide radicals in diabetic subjects. Reduced activity of CAT has been observed in diabetic rats and this may result in a number of deleterious effects due to the accumulation of $H_2O_2$ [3, 4].

Decreased activities of GPx have been well documented in STZ-induced diabetic rats. The activity of GPx is also responsible for metabolizing lipid peroxides. Many reports reported the GPx activity was decreased in diabetic rats due to the action of GPx on lipid hydroperoxidases [3, 4]. The decrease in GR activity may reflect the decline in the production and availability of GSH to overcome $H_2O_2$. A decrease in GST activity in diabetic rats might indicate reduced detoxification or free radical scavenging capacity in diabetes. This decrease in GST activity may result from decreased enzyme production or enzyme inactivation. Many investigations reported that GSH levels are reduced in diabetic rats. Depletion of tissue GSH levels enhances cellular damage caused by oxidative stress. Significant depletion of GSH in diabetic rats suggests its increased utilization against reactive oxygen species. The depletion of GSH in the tissue of diabetic subjects may be due to the utilization of GSH enzyme by two antioxidant enzymes, GPx and GST. Increased lipid peroxidation under diabetic conditions can be due to increased oxidative stress in the cell as a result of the depletion of antioxidant enzymes [3, 4].

The coordination and synchronized activities of SOD, catalase, and glutathione metabolism enzymes avoid the production of the highly reactive hydroxyl radical and peroxynitrite (ONOO-), therefore preventing cell damage in diabetic conditions.

Nuclear Factor-kβ (NF-kβ), Transforming Growth Factor β (T-GF-β), Poly ADP-Ribose Polymerase (PARP), İnterleukin-6 (IL-6), İnterleukin-1beta (IL-1β), Mitogen-Activated Protein Kinase (MAPK), Vascular Endothelial Growth Factor (VEGF) play a crucial role in the progression of diabetic complications [9]. Untreated diabetes is an important risk factor for macrovascular complications such as heart attack and stroke as well as common microvascular complications such as retinopathy, nephropathy, neuropathy and amputations [10, 11].

In spite of having all the advanced treatments in allopathic medicine, diabetes remains one of the prominent causes of death in the world. Drugs that increase insulin production by the pancreas are chlorpropamide, glimepiride, glipizide, glyburide, nateglinide,

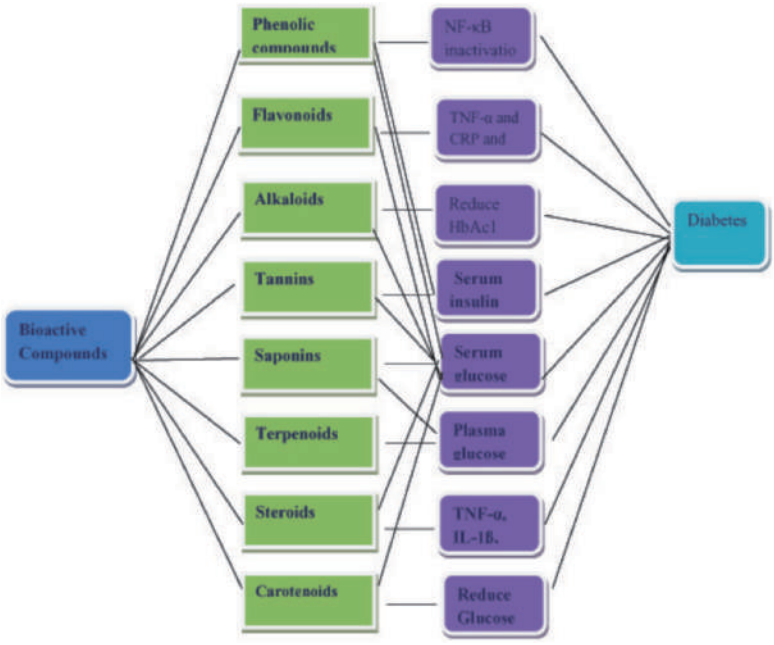

**Fig. (3).** Effect of bioactive compounds on diabetic subjects. (*A higher resolution/colour version of this figure is available in the electronic copy of the article*).

repaglinide. The drug that decreases sugar production by the liver and improves insulin resistance is metformin. Drugs that increase insulin production by the pancreas or its blood levels and reduce sugar production from the liver are galogliptin, dulaglutide, exenatide, linagliptin, liraglutide, lixisenatide, saxagliptin, semaglutide and sitgliptin. Drugs that block the reabsorption of glucose by the kidney and increase glucose excretions in urine are called sodium-glucose co-transporter 2 (SGLT2) inhibitors. They also trigger weight loss, which helps bring blood sugars back to normal; they are canaglifozin, dapagliflozin, empagliflozin, and ertugliflozin. These drugs have been used as monotherapy or in combination to treat diabetes. Continuous usage of these anti-diabetic drugs damages the kidney, liver, eyes, heart and brain. Thus, there is a need for search and investigation for more effective and safer treatment for diabetes. This leads to the origin of hypoglycemic agents from plant sources called herbal drugs [12].

## 3. MEDICINAL PLANTS AND THEIR BIOACTIVE COMPOUNDS

The earliest description of the curative properties of medicinal plants is found in Rigveda (2500 - 1800 BC). Charaka Samhita and Sushruta Samhita give an extensive description of various medicinal plants. Information on medicinal plants in India has been systematically organized. The World Health Organization also recommended that traditional methods for the treatment of diabetes should be further investigated. Medicinal plants and their active constituents play a role in the prevention and treatment of diabetes. Over 7500 plant species have been reported to be used to treat diabetes in the Indian traditional systems. A number of pharmacological studies of medicinal plants have been used to treat diabetes because of their antidiabetic, antioxidant and anti-insulin properties [3]. Several laboratories in India and across the globe are involved in isolating new herbal drugs from plants.

Bioactive substances are compounds that can modulate specific metabolic processes, providing health benefits and a positive impact on the function of the human body. Bioactive compounds have many pharmacological properties like antioxidant, antidiabetic, anti-cancer, antimicrobial, antiviral, antiulcer and anti bacterial activities. These bioactive compounds play a key role in clinical investigations. These bioactive compounds include phenolic compounds, flavonoids, alkaloids, tannins, saponins, terpenoids, glycosides, steroids, chalcones, carotenoids, peptides, lipids, glycopeptides, iridoids, ursolic acid and imidazoline. These bioactive compounds found in fruits, vegetables, herbs, tea, soy and spices are used to treat diabetes [13] (Fig. **3**).

### 3.1. Phenolic Compounds

Phenolic compounds are one of the most widely distributed groups of phytochemicals. They exhibit a great diversity of structures, ranging from simple phenolic molecules with one aromatic ring to larger and complex polymerized molecules such as lignans, coumarins, anthraquinones, tannins and flavonoids.

Phenols are present in several vegetables (cabbage, cauliflower), spices (ginger, garlic), herbs (terminalia, cassia), berries, grape, citrus fruits, and mango. The interest in phenols is mainly attributed to their contribution to human health through multiple biological effects, which include antioxidant, anti-inflammatory, anti mutagenic and anti-carcinogenic activities. Their physiological and pharmacological functions may originate from their free radical scavenging properties and functions of regulating detoxifying enzymes. Phenolic compounds may reduce the risk of development of several diseases due to their antioxidant power [14] (Table **3**).

Phenolic acids include hydroxybenzoic acids (*e.g.*, gallic acid, p-hydroxybenzoic acid, protocatechuic acid, vanillic acid, and syringic acid) and hydroxycinnamic acids (*e.g.*, ferulic acid, caffeic acid, p-coumaric acid, chlorogenic acid), and bioactive compounds like Curcumin, Eugenol, Carvacrol and many more compounds (Table **4**).

**Table 3. Medicinal plants which are used to treat Diabetes.**

| Sr. No. | Botanical Name | Common Name | Parts Used | References |
|---|---|---|---|---|
| 1. | *Acalypha indica* | Indian Copperleaf | Stem, Leaf | Priya & BhaskaraRao [55] |
| 2. | *Aerva lanata* | Wool Plant | Leaf | Akanji *et al.* [56] |
| 3. | *Allium cepa* | Onion | Bulb | Ribeiro *et al.* [57] |
| 4. | *Allium sativum* | Garlic | Bulb | Pantoja*et al.* [58] |
| 5. | *Aloe vera* | Indian Aloe | Whole plant | Al-Awadi *et al.* [59] |
| 6. | *Ananas comosus* | Pineapple | Root | Sripanidkulchai *et al.* [60] |
| 7. | *Arachis hypogaea* | Groundnut | Seed | Bilbis *et al.* [61] |
| 8. | *Argania spinosa* | Argan | Seeds | Hebi *et al.* [62] |
| 9. | *Artemisia pallens* | Wormwood | Fruits | Subramoniam *et al*. [63] |
| 10. | *Asparagus racemosus* | Shatavari, or Shatamull | Whole Plant | Ramachandran *et al.* [64] |
| 11. | *Azadirachta indica* | Nim or Neem | Leaf, Stem | Khosla *et al.* [65] |
| 12. | *Beta vulgaris* | Garden beet | Root | Tunali *et al.* [66] |
| 13. | *Bombax ceiba* | Cotton Tree | Leaves | Saleem *et al.* [67] |
| 14. | *Bouganville aspectabilis* | Great bougainvillea | Leaves | Chauhan *et al.* [68] |
| 15. | *Brassica oleracea* | Brassica | Leaves, Whole Plant | Kataya *et al.* [69] |
| 16. | *Cajanus cajan* | Red gram | Seeds | Amalraj & Ignacimuthu [70] |
| 17. | *Capsicum annuum* | Bell pepper | Seeds | Sanati *et al.* [71] |
| 18. | *Carica papaya* | Papaya | Root | Sripanidkulchai *et al.* [60] |
| 19. | *Carissa edulisVahl* | Natal Plum | Root | Nedi *et al.* [72] |
| 20. | *Catharanthus roseus* | Cape periwinkle Plant | Leaves | Nammi *et al.* [73] |
| 21. | *Cinnamomum zeylanicum* | Cinnamon | Bark | Ranasinghe *et al.* [74] |
| 22. | *Citrus limonum* | Risso Lemon | Fruit | Ribeiro *et al.* [57] |
| 23. | *Coccinia indica* | Kanduri | Whole plant | Hossain, *et al.* [75] |
| 24. | *Commiphora mukul* | Guggal | Whole plant | Sotoudeh *et al.* [76] |
| 25. | *Coriandrum sativum* | Coriander | Seed | Udupihille & Jiffry [77] |
| 26. | *Curcuma longa* | Curcumin | Whole Plant | Srinivasan *et al.* [78] |
| 27. | *Cymbopogon citrates* | Lemon grass | Root | Sripanidkulchai *et al.* [60] |
| 28. | *Cyperus esculentus* | Nut Sedge | Seeds | Oluwajuyitan *et al.* [79] |
| 29. | *Digitalis purpurea* | Common foxglove | Fruit | Navarro *et al.* [80] |
| 30. | *Emblica officinalis* | Indian gooseberry | Fruit | Variya *et al.* [81] |
| 31. | *Eucalyptus globules* | Safeda tree | Leaves | Gray & Flatt [82] |
| 32. | *Eugenia jambolana* | Jamun | Fruit, Seed | Achrekar *et al.* [83] |
| 33. | *Ficus bengalenesis* | Indian Banyan tree | Bark, Leaves | Augusti *et al.* [84] |
| 34. | *Ficus racemosa* | Indian fig tree | Bark | Sophia & Manoharan [85] |
| 35. | *Garcinia mangostana* | AsamGelugur | Leaves | Karim *et al.* [64] |
| 36. | *Ginkgo biloba* | Ginkgo | Whole Plant | Tian *et al.* [86] |
| 37. | *Glycine max* | Soybean | Seeds | Oluwajuyitan *et al.* [79] |
| 38. | *Gymnema sylvestre* | Gudmar or Merasingi | Leaves | Shanmugasundaram *et al.* [87] |
| 39. | *Hibiscus rosa-sinesis* | Rose Plant | Leaves, | DehghanShahreza [88] |
| 40. | *Hyptis verticillata* | Hyptis | Seeds | Ogar *et al.* [89] |
| 41. | *Lepidium latifolium* | Pepperweed | Seed | Maghrani *et al.* [90] |
| 42. | *Mangifera indica* | Mango | Leaves | Saleem *et al.* [91] |
| 43. | *Momordica charantia* | Bitter gourd | Fruits | Pugazhenthi & Murthy [92] |
| 44. | *Moringa oleifera Lam.* | Horseradish Bark | Leaf | Caceres *et al.* [93] |
| 45. | *Murraya koenigi* | Curry leaf | Leaves | Iyer & Mani [94] |
| 46. | *Musa sapientum* | Banana | Leaf | Ribeiro *et al.* [57] |
| 47. | *Nigella sativa* | Blackseed cumin | Seeds | Mohebbati *et al.* [95] |
| 48. | *Ocimum sanctum* | Tulasi Plant | Whole Plant | Husain *et al.* [96] |
| 49. | *Olea europaea* | Olive | Leaf | Somova *et al.* [97] |
| 50. | *Opuntia ficus-indica Mill.* | Cactus pear, | Fruit | Galati *et al.* [98] |
| 51. | *Panax ginseng* | Asian ginseng | Whole Plant | Amin *et al.* [99] |
| 52. | *Persea gratissima Gaertn.* | Avocado | Leaf | Ribeiro *et al.* [26] |
| 53. | *Phlebodium aureum* | Cabbage | Root | Cáceres etal [93] |
| 54. | *Phyllanthus amarus* | Bhuiamla | Whole Plant | Srividya & Periwal [100] |
| 55. | *Phyllanthus niruri* | Stonebreaker plant | Whole plant | Giribabu et [101] |

| Sr. No. | Botanical Name | Common Name | Parts Used | References |
|---|---|---|---|---|
| 56. | *Pimpinella tirupatiensis* | Forest coriander | Leaves | Saddala *et al.* [102] |
| 57. | *Piper betle* | Betel leaf | Leaf | Santhakumari *et al.* [103] |
| 58. | *Psidium guajava* | Guava | Fruit, Leaves | Shen *et al.* [104] |
| 59. | *Pterocarpus marsupium* Roxb | Indian kino tree | Wood | Manickam *et al.* [105] |
| 60. | *Pterocarpus santalinus* | Red sandalwood | Bark, Leaf | Kondeti *et al.* [106] |
| 61. | *Punica granatum* | Pomegranate | Leaf | Banihani *et al.* [107] |
| 62. | *Raphanus sativus* | Radish | Bark | Vargas *et al.* [108] |
| 63. | *Saccharum officinarum* | Sugarcane | Leaf | Ribeiro *et al.* [57] |
| 64. | *Salacia prenoids* | Saptrangi | Leaves and Stem | Vyas *et al.* [109] |
| 65. | *Solanum lycopersicum* | Tomoto | Leaves | Banihani [110] |
| 66. | *Solanum muricatum* | Sweet potato | Whole plant | Hsu *et al.* [111] |
| 67. | *Solanum nigrum* | Blackberry | Fruit | Umamageswari *et al.* [112] |
| 68. | *Syzygium cumini* | Black Plum | Bark | Perera *et al.* [113] |
| 69. | *Taraxacum officinale* | Weber Dandelion | Root | Hook *et al.* [114] |
| 70. | *Terminalia chebula* | Chebulic Myrobalan | Leaves, Seeds | Nalamolu *et al.* [115] |
| 71. | *Tinospora cordifolia* | Giloya | Stem | Sharma *et al.* [116] |
| 72. | *Tribulus terrestris* | Caltrop, | Leaf | Al Ali *et al.* [117] |
| 73. | *Tridax procumbens* | Coat buttons Plant | Whole Plant | Petchi *et al.* [118] |
| 74. | *Trigonella foenumgraecum* | Fenugreek | Seeds | Gupta *et al.* [119] |
| 75. | *Vernonia polyanthes* Less. | Chamarrita | Leaf | Ribeiro *et al.* [54] |
| 76. | *Vinca rosea* | Sadaphuli | Leaves | Ahmed *et al.* [120] |
| 77. | *Vitexagnus-castus* | Vitex | Whole Plant | Ahangarpour *et al.* [121] |
| 78. | *Vitis vinifera* | Grape | Leaves | Zunino [122] |
| 79. | *Withania somnifera* | Ashwagandha | Root | Andallu & Radhika [123] |
| 80. | *Zea mays* | Corn | Stigmata | Al Ali *et al.* [117] |
| 81. | *Zizyphus zujuba* | Common jujube | Seeds | Elbashir *et al.* [124] |
| 82. | *Zingiber officinale* | Ginger | Rhizome | Shanmugam *et al.* [3] |

Curcumin is a bioactive compound found in *Curcuma longa* L. and it shows anti-oxidant, anti-inflammatory, anti-diabetic, anti-viral, anti-bacterial, anti-fungal, and anti-cancer activities [15]. These modes of action are mediated by the regulation of various transcription factors, growth factors, inflammatory cytokines, protein kinases, and other enzymes. A recent study highlighted the ability of curcumin to modulate the destruction of β-cells by key immune cells. The mechanism of curcumin included reduction of oxidative stress, NF-κB inactivation, and increased SCF/Kit expression in STZ-treated rats. Curcumin also depleted pancreatic lipid peroxidation and serum TNF-a1β in diabetic subjects [16]. Al-Ali *et al.* [17] also reported that in diabetic rats, curcumin decreased the glucose concentrations, lipid profiles, enhanced insulin, and lowered the leptin, adiponectin, IL-6 (Table **3**).

Eugenol is a major bioactive compound found in Ocimum. It is used as a flavoring agent in various food and cosmetic industries. Several studies have shown the beneficial biological properties of eugenol, including antimicrobial, antifungal, antioxidant, anti-inflammatory, anti-diabetic antiviral, anticancer, analgesic, and antispasmodic activities [18, 19] (Table **4**).

### 3.2. Flavonoids

Flavonoids are the largest group of phenolic compounds present in almost all fruits and vegetables. Flavonoids are used in Chinese and Ayurvedic medicine. Flavonoids have different subclasses, including flavones, flavonols, flavanones, isoflavones, flavan-3-ols, tannins, anthocyanins, quercitin, luteolin, apigenin, kaempferol, trichostatin and resveratrol. It has skin protection, hypoglycemic, antioxidant, anti-diabetic and anti-inflammatory properties.

Quercetin is a bioactive compound found in vegetables, tea, apples, berries, broccoli, red onions and capers [20]. Inflammatory mediators can activate a number of receptors, which subsequently result in pancreatic β-cell dysfunction, insulin signaling impairment, endothelial dysfunction and altered vascular flow that lead to diabetic vascular complications. Quercetin administration protects against diabetes-induced exaggerated vasoconstriction. Quercetin treatment in diabetic subjects showed a reduction in serum levels of both TNF-α and CRP and inhibition of aortic NF-kβ [21].

Epicatechin is a bioactive compound found in cocoa, tea (*Camellia sinensis*), Phyllanthus, peanuts, apples, rapes and berries. Epicatechin is a flavonoid and it has diverse biological properties, out of which the major biological properties that they possess antioxidant, antimicrobial, anti-inflammatory, anti-diabetic, antitumor and cardioprotective activity [22]. Eng *et al.* [23] reported that dietary supplementation of Epicatechin (200 mg/kg diet) increased body weight and ameliorated insulin sensitivity in high fat-fed mice. In addition, Epicatechin (2-20 mg/kg of body weight) treatment elevated body weights, improvement in glucose tolerance and insulin sensitivity and lipid profiles in high fat-fed C57BL/6J mice and high-fructose fed rats. These results suggest that the capacity of Epicatechin improves insulin sensitivity in rodent models (Table **4**).

Resveratrol is a flavonoid isolated from several fruits, including berries, grapes and peanuts [24, 25]. In recent years, the use of Resveratrol has gained attention because of its therapeutic effects. This natural polyphenol has numerous pharmacological impacts, including anti-diabetic [26, 27], antioxidant [28], anti-inflammatory,

**Table 4. Activities of Bioactive compounds of Medicinal plants.**

| Sr. No. | Name of the Medicinal Plant | Bioactive compounds | Activity |
|---|---|---|---|
| 1. | *Allium cepa* | Quercetin,Cycloalliin, Alliuocide A | Antidiabetic, Antioxidant |
| 2. | *Allium sativum* | Allicin, Alliin, Ajoene, Allyl sulfide | Antidiabetic, Antibacterial |
| 3. | *Aloe vera* | Aloin, Lupeol, Acemannan | Antiseptic, Antidiabetic |
| 4. | *Azadirachta indica* | Azadirachtin, Nimbin, Nimbolide | Antiviral, Antidiabetic |
| 5. | *Beta vulgaris* | Betanin, β-carotene, Lutein | Anti-hypertensive Antidiabetic |
| 6. | *Bombax ceiba* | Bergenin, Lupeol, Vicenin 2, Linarin | Antioxidant, Antidiabetic |
| 7.. | *Cajanus cajan* | Cajanin, Cajanol, Pinostrobin | Antidiabetic |
| 8. | *Coriandrum sativum* | Quercetin, Kaempferol, Rhamnetin | Antibactetial, Antidiabetic |
| 9. | *Carica papaya* | Ascorbic Acid, Riboflavin, Lycopene | Anti- arthritis, Antidiabetic |
| 10. | *Curcuma longa* | Curcumin, Curlone, Curcuphenol | Anti-cancer, Antidiabetic |
| 11. | *Digitalis purpurea* | Digitoxin, Digitoxigenin, Gitoxigenin | Cardiovascular, Antidiabetic |
| 12. | *Emblica officinalis* | Chebulagic acid, Emblicanin A | Antipyretic, Antidiabetic |
| 13. | *Ficus benghalensis* | Kaempferol, Catechin, Rutin | Antioxidant, Antidiabetic |
| 14. | *Ginkgo biloba* | Ginkgolides, Bilolabide | Anti-inflammatory, Antidiabetic |
| 15. | *Lepidium latifolium* | Andrographolide, Berberine | Antidiabetic |
| 16. | *Momordica charantia* | Momordicines I, Momordicines II | Antibacterial |
| 17. | *Nigella sativa* | Nigellicine, Thymol, Thymoquinone | Antifungal, Antidiabetic |
| 18. | *Ocimum sanctum* | Carvacrol, Eugenol,Linalool | Antidiabetic, Antibactetial |
| 19. | *Olea europaea* | Catechin, p-Coumaric acid | Antioxidant, Antidiabetic |
| 20. | *Opuntia ficus-indica* | Betacyanins, Indicaxanthin | Antidiabetic |
| 21. | *Piper betle* | Chavibetol, Eugenol | Anti-malaria, Antidiabetic |
| 22. | *Phyllanthus amarus* | Phyllanthin, Catechin | Antidiabetic |
| 23. | *Phyllanthus niruri* | Epicatechin, Ellagic acid | Anti-tumor, Antidiabetic |
| 24. | *Pterocarpus santalinus* | Santalin, Lupeol, Pterocarpin | Antidiabetic |
| 25. | *Raphanus sativus* | Khellin, Visnagin, Luteolin | Antidiabetic, Antimicrobial |
| 26. | *Syzygium cumini* | Jambosine, Friedelin, Quercetin | Cardioprotective, Antidiabetic |
| 27. | *Tribulus terrestris* | Harmine, Oleic acid, Kaempferol | Antidiabetic |
| 28. | *Trigonella* | Trigonelline, Isoorientin, Pinitol | Antioxidant, Antidiabetic |
| 29. | *Withania somnifera* | Withanone, Withaferin A | Anti-inflammatory, Antidiabetic |
| 30. | *Zingiber officinale* | 6-Gingerol, Shogaols, Zingiberene | Anti-cancer, Antidiabetic |

cardioprotective and hypolipidemic properties. Resveratrol has been shown that it protects the β cell of the pancreas [29, 30]. These therapeutical effects are mainly due to its antioxidant effect.

Resveratrol has anti-diabetic properties and its treatments have been studied using different animal models. This compound was found to be effective in rodents with diabetes induced by streptozotocin. Many reports indicate that resveratrol ameliorates symptoms of diabetes induced by a high-energy diet [31]. This action is largely associated with the anti-inflammatory properties of resveratrol. This compound was shown to downregulate proinflammatory genes and proteins, such as TNF-α, IL-1β, interleukin 6 (IL-6), interleukin 4 (IL-4), interleukin 17 (IL-17), cyclooxygenase 2 (COX-2), intracellular adhesion molecule 1 (ICAM) and vascular cell adhesion protein 1 (VCAM-1) [31]. The therapeutic potential of resveratrol was also demonstrated in humans with type 2 diabetes. Results of many studies and clinical trials indicate that resveratrol may be useful to diabetes related therapies [32].

Kaempferol is a natural flavonol, relatively abundant in grape, tea, beans, spinach, broccoli, cruciferous vegetables and some edible berries [33]. Numerous preclinical studies have shown that kaempferol has many pharmacological activities like antioxidant, antidiabetic, anticancer, antiinflammatory, and antimicrobial activities. Kaempferol reduced IL-1β, TNF-α and also reported to significantly decrease the fasting blood glucose and improve insulin resistance. Anti-inflammatory and anti-diabetic effects of kaempferol are mediated by AMPK activation [34].

### 3.3. Tannins

Tannins are the polyphenolic biomolecules having a high molecular weight and are widely distributed in many species of plants, like coffee, tea, grapes, apricots, barley, peaches, dry fruits, mint, basil, rosemary, pomegranate, strawberries, amla, clove, rice, oat, rye *etc* [35]. Nowadays, tannins have gained more attention because of the health benefits associated with their antioxidant properties. Tannins have anti-bacterial [36], anti-viral [37] anti-diabetic [38], anti- hypercholesterolemic [39] activities. Tannins bind and precipitate proteins and various other organic compounds, including amino acids and alkaloids (Table **3**).

### 3.4. Terpenoids

Terpenoids are commonly found in many plants. This class of compounds includes oleanolic acid, glycyrrhizin, glycyrrhetinic acid, ursolic acid, betulin, betulinic acid, lupeol, *etc*. These compounds have multiple biological activities that act on glucose absorption, glucose uptake, and insulin secretion.

Linalool is an enantiomer of the natural bioactive compound present in Ocimum, Citrus and Coriandrum. It is aromatic monoterpene alcohol [40, 41]. Linalool exhibits antimicrobial, anti-inflammatory, antileishmanial, anti-atherogenic, anti-diabetic, antioxidant and anti-depressant effects [42-44] (Table **4**).

Carvacrol is a monoterpenoid compound that is found in essential oils of aromatic plants like Ocimum, Rose. It has a characteris-

tic odor and exhibits numerous biological and pharmacological activities, including anti-inflammatory, antioxidant, antidiabetic, antibacterial, antifungal, anticancer and vasorelaxant, both *in vitro* and *in vivo* [45]. It has been reported that diabetic rats showed a slight reduction in blood glucose levels and a marked reduction in total cholesterol, alanine aminotransferase, aspartate aminotransferase and lactate dehydrogenase levels after oral administration of carvacrol [46] (Table **3**).

### 3.5. Anthocyanins

Anthocyanins have gained the attention of the scientific community mostly due to their vast range of possible applications. Anthocyanins are natural pigments belonging to the flavonoid family. They are naturally occurring pigments in Blueberry, Raspberry, Black rice, Apples, Peaches [47]. Anthocyanins are polyhydroxy and polymethoxy derivatives of flavylium salt, possessing a characteristic C3–C6–C3 carbon structure. Anthocyanins have also gained considerable attention due to their purported health benefits and potent antioxidant, anti-diabetic properties [48].

### 3.6. Saponins

Saponins are phytochemicals which can be found in most of the plants like peas, soybeans, *Momordica, Garcinia, Solanum terminalia, Trigonella foenum-graecum*, saoproot, soapbark and soapberry. Studies have illustrated the beneficial effects on blood cholesterol levels, cancer, bone health and stimulation of the immune system. Saponins have antioxidant, anti-diabetic and immunity boosting activities. Saponin has been reported to possess antioxidant properties in both *in vivo* and *in vitro* models. The presence of many OH groups in the structure of saponin is responsible for the enhancement of antioxidant activity and this property is responsible for the prevention of ROS formation in diabetes [49, 50] (Table **3**).

Saponins capture free radicals and stimulate antioxidant enzymes. Saponins decrease blood glucose levels, augmenting serum insulin and glycogen contents by regulating PI3K/PKB pathways [51]. Saponins have insulin mimicking property [52].

### 3.7. Alkaloids

Alkaloids are a class of naturally occurring organic compounds that contain basic nitrogen atoms. Alkaloids are mostly found in Artocarpus, *Morus alba, Psium sativum, Desmodium gangeticum, Berberis vulgaris, Trigonella foenumgraecum*. 80% of alkaloids' are derived from amino acids. Alkaloids have diverse and important physiological effects on humans and other animals. Well-known alkaloids include morphine, strychnine, quinine, ephedrine, and nicotine. Alkaloids have a wide range of pharmacological activities, including antimalarial (*e.g.*, quinine), anticancer (*e.g.*, homoharringtonine), cholinomimetic (*e.g.*, galantamine), vasodilatory (*e.g.*, vincamine), antiarrhythmic (*e.g.*, quinidine) and antidiabetic [53]. Some are already in clinical trials to test their potential to lower plasma glucose concentration, reduction of serum HbAc1 levels and anti-dyslipidemia in diabetic subjects. Berberine and trigonelline have anti-diabetic potential against diabetic subjects [54]. There are so many outstanding contributions to therapeutics of plant origin. Hence, the role of medicinal plants in human life is immense (Table **3**).

## CONCLUSION

Diabetes alters carbohydrate, fat, protein, antioxidant enzymes metabolism and it diminished the production of insulin and its action. In India and other countries, medicinal plants and their drugs are used to treat diabetes. Scientific information regarding medicinal plants has proved that they reduce glucose levels and elevate insulin levels in diabetic subjects. The current review is intended to provide an overview of the current knowledge about herbal medicines and their bioactive compounds to treat diabetes. In this review, we reported 82 medicinal plants, their bioactive compounds and anti-diabetic effects. From the available research reports on their potential effectiveness against diabetes, it is assumed that the herbal medicine has a major role to play in the management of diabetes, which needs further exploration for the necessary development of anti-diabetic drugs. Many herbal drugs used today have not undergone careful scientific assessment and validation. Hence, there is a need to identify and elucidate the clinical applications of medicinal plants against diabetes.

## AUTHORS' CONTRIBUTION

The first and second authors played an important role in data collection, interpretation of the data, analysis of the data and preparation of the review. The other co-authors contributed their roles excellently in fine tuning of the review. The corresponding author is critically responsible for the revision of the review.

## CONSENT FOR PUBLICATION

Not applicable.

## FUNDING

University Grants Commission (UGC), New Delhi, India for the sanction of UGC Major Research Project UGC MR-Major-Zol 2013-36027 dated 15/10/2015 and Department of Science and Technology (DST), New Delhi, India for the sanction of Young Scientist Fast Track Project the No. SERC/LS-387/2012, dated 02/09/2014.

## CONFLICT OF INTEREST

The authors declare no conflict of interest, financial or otherwise.

## ACKNOWLEDGEMENTS

The authors express their sincere gratitude to the University Grants Commission (UGC), New Delhi, India. Department of Science andTechnology (DST), New Delhi, India read as The authors express their sincere gratitude to the University Grants Commission (UGC), New Delhi, India and Department of Science andTechnology (DST), New Delhi, India.

**ABSTRACT**

The aim of our study is to investigate the anti-hyperlipidemic effect of eugenol, a bioactive compound of *Ocimum sanctum* in the NaF intoxicated fluorosis induced albino male rats of wistar strain albino rats. *Ocimum sanctum* (OS) has been used in the Indian system of traditional medicine for the treatment of diabetes, liver disorders and heart problems. However, the bioactive compound of *Ocimum sanctum*, eugenol with reference to fluorosis was not carried out till date. Male rats were administered with eugenol for 60 days. The lipid metabolic profiles like MDA, TC, TG, LDL, VLDL and HDL are estimated in the plasma of all groups. The fluorosis markers calcium and phosphorus are also estimated. MDA, TC, TG, LDL, VLDL levels are elevated while HDL levels are depleted in NaF treated rats. Calcium levels decreased and phosphorus levels increased in NaF administered rats. However, eugenol supplementation for 60 days normalized all the lipid metabolic profiles in NaF rats. The fluorosis markers also came to near normalcy in eugenol treated rats. This shows the anti-lipidemic properties of eugenol.

**Keywords:** NaF, eugenol, lipids, rats.

## INTRODUCTION

Currently, fluoride pollution is a worldwide problem as the fluoride levels in drinking water above the tolerable limit in several countries such as China, Sri Lanka, West Indies, Holland, Italy, and India.[1]In India, fluoride levels in drinking water are also above the permissible limit in wide areas of the states of Andhra Pradesh, Tamil Nadu, Karnataka, Punjab, Bihar, Haryana, Kerala and West Bengal.[2] The international standard of permissible limit of fluoride in drinking water has been established at 1.[3] Fluoride is a common element in our daily life as it is natural mineral component of drinking water, tea, meat, beverages. It is often added to dental products because of its ability to prevent dental caries or cavities. However, excess intake of fluoride can result in fluorosis that causes not only dental and skeletal damage but also problems in the central nervous system such as brain damage, Alzheimer syndrome, thyroid disorder, DNA damage, gastro-intestinal irritation, and kidney function disorder.[4]

The most common manifestations that have been reported arising from chronic exposure of fluorides are skeletal, dental fluorosis, arthritic pain, osteosclerosis, and crippling fluorosis.[5] Fluoride intoxication results in neurologic damage, primarily in the impairment of both cognition and memory.[6] Fluoride intoxication also results in metabolic disorders, hepatitis, renal toxicity, muscular atrophy, decalcification and fragility of bone, and reproductive disorders.[7-9]

Numerous medicinal plants have been identified that exhibit anti-oxidative and anti-hyperglycemic activities. Among them, *Ocimum sanctum* L. has got paramount importance in folklore and traditional medicinal practices such as Ayurveda, Siddha and Unani. OS has been recommended for the treatment of a number of diseases.[10] Therapeutic value of *Ocimum sanctum* L. to treat a number of diseases including bronchitis, diarrhea and dysentery. OS has antioxidant, antibiotic, hypocholesterolemia, and hypoglycemic as well as hypotensive activities. [11]

The objective of the study was to investigate the anti-fluorosis, anti-lipidemic activity of eugenol, a bioactive compound of *Ocimum sanctum* in NaF induced fluorosis rats. This is the first reported data on the effect of eugenol in fluorosis induced rats.

## MATERIALS AND METHODS

### Chemicals and reagents

All chemicals used were of analytical grade and purchased from Sigma–Aldrich, Merck, India. All chemicals and reagents were used without further purification.

©Copyright protected. Unauthorised republication, reproduction, distribution, dissemination and copying of this document in whole or in part is strictly prohibited.

### Selection and collection of plant material

Leaves of OS were collected from Seshachalam hills of Tirupati, Andhra Pradesh, India and identified by the Dr. Madhav Chetty, Department of Botany, SV University, Tirupati. Voucher specimen of *Ocimum sanctum* No 1183 was deposited in the Botany department.

### Extraction of Eugenol from *Ocimum sanctum*

The extraction of eugenol was carried out with batch extraction setup. It consists of a 500 ml reactor in which extraction is to be carried out; a turbine type four blade agitator connected with motor (REMI, maximum speed of 1200 rpm) was used.

### Grouping of Animals

The study design was approved by the animal ethical committee (Resolution No.10/08/a/CPCSCA/IAEC/SVU/09-10/ZOOL/KRS/Dt.25.09.2009). After 7 days of acclimatization, the rats were divided into five groups of six rats in each group and treated as follows.

**Group I – Normal Control (NC):** Six rats received saline via orogastric tube for a period of 60 days.

**Group II – Eugenol Control (EGt):** Six rats received *Ocimum sanctum* bioactive compound (10mg/kgBW) for 60 days.

**Group III – NaF treatment (Na F):** Six rats received the sodium fluoride (10mg/kgBW) dissolved in water for 60 days.

**Group IV – NaF + Ocimum treatment (NaF+EGt):** Six rats received fluoride and eugenol as described in group 3 and group 2for a period of 60 days.

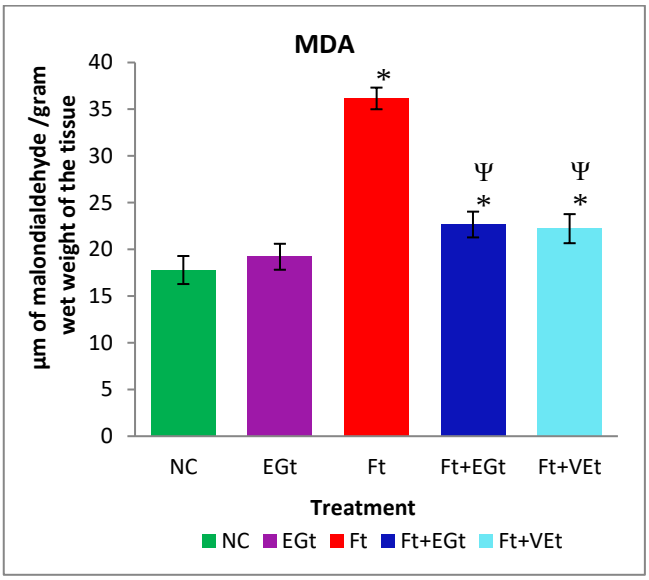
**Group V –Na F+ Vitamin E treatment (NaF+VitE)**: Six rats received fluoride and Vitamin E for a period of 60 days.

The animals were sacrificed by cervical dislocation and the blood was collected for biochemical investigations after completion of 60 days of treatment and with a 24 hrs. of brief time lapse of the last treatment.

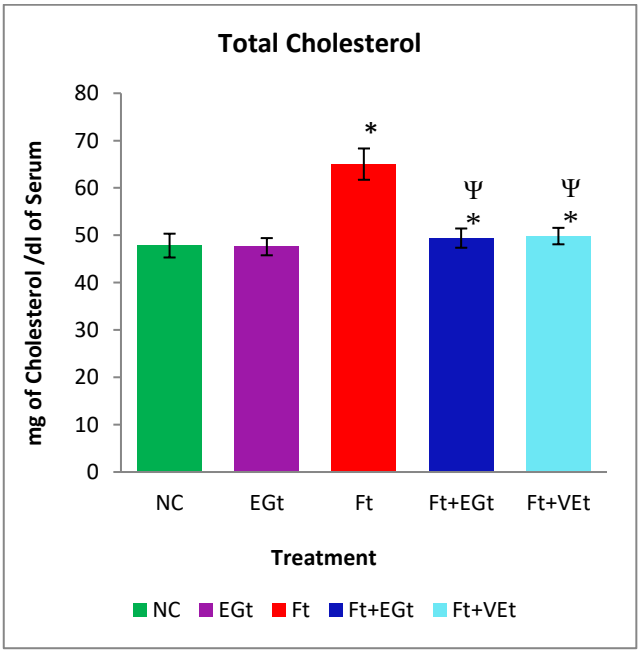
### Estimations of Lipid metabolic profiles

Blood was collected from the abdominal vein to determine lipid profile parameters such as total cholesterol (TC), triglyceride (TG), low-density lipoprotein cholesterol (LDL), very low-density lipoprotein cholesterol (VLDL) and high-density lipoprotein cholesterol (HDL). Fluorosis markers like calcium and phosphorus levels are estimated in the plasma all the groups of rats.

### Statistical analysis



The data are expressed as mean values with their Standard Deviation (SD). Readings of the five different groups were compared using one-way ANOVA analysis with Dunnett's multiple comparison Test. Statistical analysis was performed using SPSS (Version 13.5; SPSS Inc., Chicago, IL, USA). Using M.S. Office, excel software. The data has been analyzed for the significance of the main effects (factors) and treatments along with their interactions. Differences were considered significant at $p < 0.001$.



## RESULTS

### Effect of Eugenol on Lipid metabolic profiles in Sodium Fluoride intoxicated rats

In the present investigation, MDA, TC, TG, LDL, VLDL levels are significantly increased and HDL levels are decreased in Na F intoxicated rats, but eugenol supplementation could decrease all these lipid metabolic profiles except HDL cholesterol. This shows the anti-hyperlipidemic effect of eugenol (Figure 1).

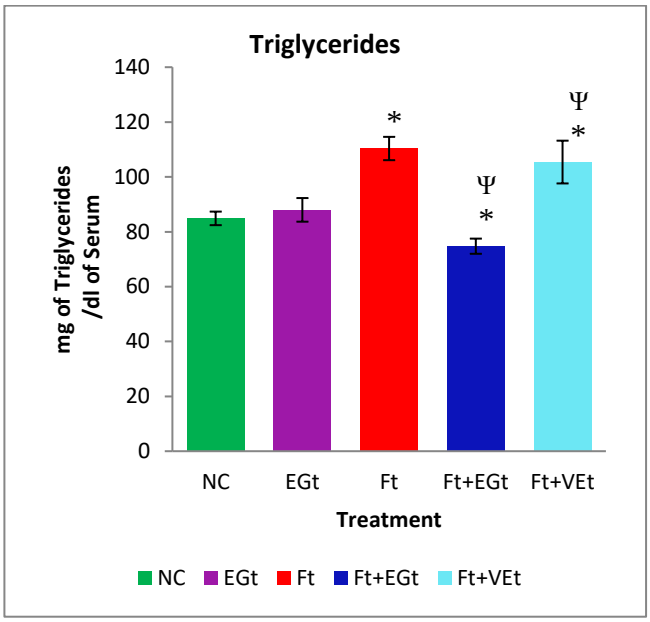


**Figure 1:** The Impact of Eugenol on Lipid metabolic profiles in NaF intoxicated rats. Data are expressed as means ± SD (n = 6). * The values are significant compared to the following: control (* p < 0.001), Fluorosis (Ψp < 0.01) (Dunnett's multiple comparison tests).

**Effect of Eugenolon fluorosis markers in NaFintoxicated rats**

In the current study, we observed that calcium levels are depleted and phosphorus levels are elevated influoride intoxicated rats. However, with eugenol treatment for 60 days modulated the fluorosis markers in all experimental treated rats.

## DISCUSSION

The present study was done to know the pharmacological action of eugenol in NaF intoxicated rats. Bioactive compounds of *Ocimum sanctum* reported to possess antitussive, hypoglycemic, antioxidant, antistress, anti-ulcerative, anti-inflammatory, antiasthmatic, immune stimulatory and neuroprotective effects.

Sufficient evidence has demonstrated that fluoride produces deleterious effects in skeletal, dental and soft tissues. There are documentary evidences concerned with the mechanism of bone and dentalfluorosis.[12] But it is not clear of how fluoride interferes with soft tissues. However, some of the following viewpoints may be very helpful for us to understand the mechanism of fluorosis in soft tissues.

Lipid related abnormalities are most common in toxicity subjects. Alterations in lipid metabolism have been reported in NaF intoxicated rats. In this study, we observed elevated levels of MDA, total cholesterol, LDL cholesterol, VLDL cholesterol, triglycerides in NaF rats. This may be due to the lipid peroxidation process that occur in plasma membrane, microsomes and mitochondrial membranes in fluorosis subjects.[13]Several studies declared that increased production of ROS is an important mechanism in fluoride-induced toxicity in experimental animals.

Exposure to fluoride has been reported to induce oxidative stress in vivo and in vitro. Oxidative stress is considered to play an important role in the pathogenesis of fluorosis and excess ROS production liberated from peroxisomes and mitochondria can directly inflict direct damage to structural polar lipid molecules of various cellular membranes. MDA, end product of lipid peroxidation in tissues, is also an indicator of oxidative stress. Lipid peroxidation is a free radical-mediated process that occurs following oxidative stress. Alterations in lipid metabolism maybe responsible for the altered MDA, TC and TG levels in fluorosis condition. It appears that enzymes inhibited by fluoride, such as triglyceride lipase, unspecific esterase and pyrophosphates. Also, the obtained results of hyperlipidemia may be attributed to an increase in the synthesis of fatty acids in the liver or possibility due to incidence of liver cholestasis 2000.[14]

Many reports suggested that the abnormal activities of lipase enzymes seem to be one of the chief factors responsible for the rise in plasma triglycerides and total cholesterol. However, with eugenol supplementation, TG an TC levels are depleted in NaF treated rats by preventing lipid peroxidation. This is attributed to the anti-lipidemic property and free radical scavenging activity of eugenol.

In our study, we reported that LDL, VLDL are elevated and HDL levels are depleted in NaF treated rats when compared to control. This dyslipidemia manifestations are due to decreased activity of lipoprotein lipase. Increased VLDL levels in NaF rats are due to increased concentration of free fatty acids.

Lipid disorders, most often encountered in fluorosis diseases also include increased levels of LDL and VLDL.[15] Eugenol supplementation may elevate the activity of lipoprotein lipase and decrease in LDL, VLDL in NaF treated rats. Moreover, with eugenol treatment HDL levels are increased in NaF rats. It could be understood rise in levels of lipoprotein lipase and HDL prevents the formation of coronary artery plaques and cardiac ischemia.[16]Hence, eugenol may be considered as a candidate for prevention of cardiovascular disorders since it promotes anti-lipidemic factors like HDL and LDL. In conclusion, our results revealed the hypolipidemic effect of (−)-eugenol that was evidenced by all the lipid metabolic profiles MDA, TC, TG, LDL, VLDL, HDL return to normalcy with eugenol supplementation in fluorosis rats.[15] (Figure 1).

In our study, we reported that calcium levels decreased and phosphorus levels increased in NaF rats. This may be due to alterations in metabolism of calcium and phosphorus. The calcium in the blood is transported to the intercellular fluid after which it is deposited in bones and teeth. However, with eugenol treatment for 60 days, these fluorosis markers normalized to near normal levels.

In our study, we reported that eugenol ameliorated the lipid metabolic profiles in sodium fluoride induced toxicity rats. Hence, we concluded that eugenol of *Ocimum sanctum* can be used as anti-lipid agents in many diseases.

## ABSTRACT

Eugenol is a medicinally important antioxidant phenolic compound. This plant compound has been used as ameliorative agent against variety of severe ailments. The aim of this research was to see whether the Eugenol has any cardio protective property. We tested eugenol on male albino rat's cardiac tissue suffering from fluoride toxicity with reference to antioxidant enzymes. The results showed that antioxidant enzymes such SOD, CAT, GPx and GR levels were considerably higher in the eugenol treated fluoride intoxicated group, but they were lower in the fluoride alone rat group. In conclusion, eugenol displays cardio protective effects in the cardiac tissue via boosting endogenous antioxidant enzymes. Future clinical study into the mechanism of action of eugenol under fluoride intoxication will confirm the current findings.

**KEYWORDS:** Antioxidant enzymes, cardio protective, fluoride intoxication, eugenol

## INTRODUCTION

Fluorine is an element that does not occur in the elemental state in nature because of its high reactivity. Many studies revealed that the long-term fluoride intake has damaging effects on the heart. Association between fluoride endemicity and prevalence of cardiac complications has been observed among adult males (Amini et.al.,2011). Diastolic dysfunction due to chronic fluoride exposure was observed in fluoride endemic areas and also noticed in elevation of the risk of heart failure (Varol et.al.,2010). Oxidative stress is known to be a key factor to heart failure and ischemic heart disease (Kiyuna et.al., 2018). Fluoride interacts with cellular systems and induce oxidative stress by induce the production of reactive oxygen species (ROS) and by modulating intracellular redox homeostasis, lipid peroxidation, and alteration of gene expressions were studied (Chattopadhyay et. al., 2011).

Eugenol (4-allyl-2-methoxy-phenol), the principle bioactive compound *of Syzygium aromaticum, Ocimum sanctum, Pimenta racemose* is an antioxidant, used as a food-flavouring agent and as an analgesic. Eugenol, a methoxyphenol with a short hydrocarbon chain, found in bay leaves, allspice, and the oil of cloves that originate from the Syzygium species (Kollmannsberger and Nitz, 1994). Eugenol antioxidant activity has been evidenced by the DPPH assay (Teresa *et.al.*, 2006). Eugenol possesses the antioxidant property by virtue of its phenolic hydroxyl group that donates electrons to quench free radicals. Hence it could preserve the enzymatic and nonenzymatic antioxidant systems in the myocardium and prevent lipid peroxidation. Eugenol could prevent electrophysical alterations and electrolyte imbalances and restore QT interval to normal (Binu *et.al.*,2017). Eugenol has attenuated isoproterenol-induced cardiac apoptosis by increasing intracellular calcium and oxidative stress (Choudhary *et.al.*,2006). Eugenol compounds have a methoxy phenolic structure

similar to capsaicinoids, inhibited iron-mediated lipid peroxidation and copper dependent LDL oxidation. The antioxidant action of eugenol compounds was analysed by its radical-scavenging activity and on the basis of the protective effect on metal-mediated lipid peroxidation. (Ito *et.al*.,2005). The antioxidant activity of eugenol was either equal to or better than the activities of TBHQ and BH. The presence of the 4-0H group in eugenol may be responsible for the antioxidant activity. Eugenol has shown good antioxidant activity at 10-μM concentration (Kelm *et.al*., 2000). Based on literature review, we aimed at identification of antioxidant activity of eugenol under fluoride intoxication, in the present study.

## MATERIAL AND METHODS

### Care and Maintenance of Experimental Albino Rats:

Thirty healthy adult male Wister strain albino rats (weighing 200±20g) were purchased from M/s. Sri Venkateswara Enterprises, Bangalore, India. The animals were kept in cages made up of Polypropylene with top stainless-steel grill. Six rats were accommodated in each cage and maintained under controlled laboratory conditions (Photoperiod of 12 hours light/ 12 hours dark cycle and Temperature 25±2 $^{0}$C). The rats were given a standard pellet diet (Purchased from Lipton Animal feed Ltd. Pune, India) and provided drinking water ad libitum during the complete experimental period. All the experiments were carried out according to the guidelines of the Institutional Animal Ethical Committee. (Resolution No: 09/ (i)/a/CPCSEA/IAEC/SVU/ZOOL/KSR/Dt. 08-07-2012).

### Selection of Age Group:

Based on the growth and physiology of the animal, four (4) months aged male Wister albino rats were considered as "Adults" and selected for the present experiment. A definite table regarding the age and life expectancy of various strains of laboratory animals was published in the book, entitled "International care and treatment of rabbits, mice, rats, guinea pigs and hamsters" by W.B. Saunders Co., Philadelphia, USA. Age-related changes in 2 weeks, 2.5, 10 and 23 months of Wistar strain rats were clearly explained by Jang.*et al*., (2001).

### Procurement of Chemicals:

All the chemicals used in the experiments were Analar Grade (AR) and purchased from Sigma Aldrich Corporation (St. Louise, Missouri, USA) Merck (Mumbai, India), Ranbaxy (New Delhi, India). "Barnstead Thermolyne" water purification plant was used to get nano-pure water. "Remi cooling high speed centrifuge" was used for centrifugation of the tissue homogenate. Shimadzu UV-1800 Spectrophotometer was used for measuring the optical density values and obtained results.

### Grouping of Animals:

The rats of same age were selected and segregated randomly into five groups of six rats and given treatment as follows:

**1.Group I**: **Normal Control (NC)**: Six rats received saline (0.9% NaCl) through orogastric tube for 60 days.

**2. Group II**: **Ocimum-Bio active compound, Eugenol Control (EGt)**: Six rats received Eugenol (10 mg/kg BW) for 60 days.

**3. Group III**: **Na F treatment (Ft)**: Six rats received the sodium fluoride (NaF) (10 mg/kg BW) dissolved in drinking water for 60 days.

**4. Group IV: NaF + Ocimum Bioactive compound (Eugenol) (Ft + EGt)**: Six rats received NaF (10 mg/kgBW) dissolved in drinking water and Eugenol (10 mg/kgBW) for 60 days.

**5. Group V**: **NaF + Vitamin E treatment (NaF + VEt)**: Six rats received NaF and Vitamin E (200 mg/kgBW) for 60 days.

### Isolation of heart:

After 60 days of treatment period was over, the animals were sacrificed by cervical dislocation. The heart tissue was excised and washed with ice-cold normal saline and stored in deep freezer at -80$^{0}$C for biochemical assay of antioxidant enzymes.

**Estimation of Antioxidant enzymes in Cardiac tissue:**

Superoxide dismutase (SOD) activity was evaluated by the method of Misra and Fridovich (1972) at 30$^0$C. The heart tissue was homogenized in chilled 50 mM phosphate buffer (pH 7.0) containing 0.1 mM EDTA to give 5% homogenate (w/v). The homogenates were centrifuged at 10,000 rpm for 10 min at -4$^o$C in cooling high-speed centrifuge. The supernatant part was segregated and used for enzyme assay in both standard and experimental tubes. 200µl of tissue sample was added to 1760µl of 0.05 M carbonate buffer which contains 0.1 mM EDTA at pH 10.2 at which SOD inhibits autooxidation of epinephrine. Then 40 µl of 30 mM epinephrine (in 0.05% acetic acid) was added to the above mixture and measured the OD values at 480 nm for 4 min on a Shimadzu UV-1800 Spectrophotometer. Activity expressed in terms of units and the amount of enzyme that inhibits the oxidation of epinephrine by 50%, which is equal to 1 unit.

Catalase activity was estimated by applying the method of Aebi (1984), with slight modifications. 5% homogenate (weight/volume) of cardiac tissue was prepared in ice cold 50 mM phosphate buffer (pH 7.0) containing 0.1 mM EDTA. The homogenates were centrifuged at 10,000 rpm for 10 min at -4 $^0$C. The supernatant part was separated and used as enzyme source. 200 µl of tissue homogenate was taken into a test tube and 20 µl of 100% Ethyl alcohol was added to it. The reaction mixture was kept in an ice bath for 30 minutes. Then the tubes were kept at room temperature till the reaction mixture attain normal room temperature and added 20 µl of Triton X-100 RS. In a cuvette containing 400µl of phosphate buffer and 100 µl of tissue extract was added 0.5 ml of 0.066 M Hydrogen Peroxide (in phosphate buffer) and decreases in optical density measured at 240 nm for 60s in a UV-Vis Double beam spectrophotometer. The molar extinction coefficient of 43.6 M cm-1 was used to determine the Catalase activity. One unit of activity is equal to the moles of $H_2O_2$ degraded / mg protein/min.

Se-dependant Glutathione peroxidase (Se-GSH-Px) activity was measured by the modified method of Flohe and Gunzler (1984). 5% (w/v) of cardiac tissue homogenate was prepared in 50 mM phosphate buffer (pH 7.0) containing 0.1 mM EDTA. The homogenate was centrifuged at 10,000 rpm for 10 min at -4 $^0$C in cooling high-speed centrifuge. The supernatant was used as an enzyme source. The reaction mixture contains of 0.5 ml of phosphate buffer, 0.1 ml of 0.01 MGSH (reduced form), 0.1 ml of 1.5 mM NADPH and 0.1 ml of glutathione reductase (0.24 units). 0.1 ml of tissue homogenate was added to the reaction mixture and incubated at 37 $^0$C for 10 min. Then 50 µl of 12 mM t-butyl hydroperoxide was added to 0.45 ml of the tissue reaction mixture and measured at 340 nm for 3 min. The molar extinction coefficient of 6.22 X $10^3$ M $cm^{-1}$ used to determine the activity of glutathione peroxidase. One unit of activity is equal to the mM of NADPH oxidized / mg protein / min. The activity of the enzyme was expressed in µ moles of NADPH oxidized / mg protein / min.

Glutathione reductase (GR) activity was assayed by the method of Carlberg and Mannervik (1985) with slight modifications. The cardiac tissue was homogenized (5% w/v) in 50 mM phosphate buffer (pH 7.0) containing 0.1 mM EDTA. The homogenates were centrifuged at 10,000 rpm for 10 min at -4$^0$C in cooling high speed centrifuge. The separated supernatant part was used as enzyme source. NADPH (50 µl, 2 mM) in 10 mM Tris buffer (pH 7.0) was added to the cuvette containing 50 µl of GSSG (20 mM) in phosphate buffer (0.5 M, pH 7.0 containing 0.1 mM EDTA) and 0.8 ml of phosphate buffer. The tissue extract (0.1 ml) was added to the NADPH – GSSG buffered solution and take OD values at 340 nm of 3 min. The molar extinction coefficient of 6.22 X $10^3$ M cm $^{-1}$ was used to determine glutathione reductase activity is equal to the mM of NADPH oxidized / mg protein / min. The activity of the enzyme was expressed in µ moles of NADPH oxidized / mg protein / min.

The data obtained was expressed as Mean values with their SD. Readings of the six different groups were compared using one-way ANOVA analysis with Dunnett's multiple comparison tests. Statistical analysis was performed using SPSS (Version 13.5; SPSS Inc., Chicago, IL, USA). Using M.S. Office, Excel Software the data has been analyzed for the significance of the main effects (factors) and treatments along with their interactions.

**RESULTS AND DISCUSSION**

In the present research work, SOD activity levels were measured in experimental animal rats. SOD levels were significantly lower in the Ft group than NC, while SOD levels were significantly higher in Ft+Egt rats when compare to Ft (Fig.1). Treatment of Eugenol to flouride rats confirmed a greater enhancement in SOD activity relative to Flouride intoxicated group and a slight decrement when compared to standard Vitamin E treatment. When compared to NC, there were no changes in the Egt group.

SOD plays a critical role in the body's antioxidant defense in contradiction of oxidative stress. The enzyme is an effective treatment for illnesses caused by reactive ROS by converting superoxide anion free radical (O2-) into oxygen and hydrogen peroxide (Kangralkar et al., 2010; Yasui and Baba, 2006). It was found that oxidative stress is linked to numerous cardiac disorders, including myocardial infarction, peripheral vascular disease, and stroke, while, these conditions were get normal with supplementation of antioxidants (Farías et al., 2017). These radicals target the cardiac antioxidant system as well as biomolecules (carbohydrates, lipids, proteins, and DNA), causing cardiac tissue damage. Generally, superoxide radical is produced in the heart tissue from the mitochondrial electron transport chain. To decrease reactivity, antioxidants in the mitochondria, such as SOD and glutathione are quickly breakdown or sequester superoxide radicals. High numbers of mitochondria in cardiac tissue are required for proper function, but cardiac dysfunction can arise from a reduction in mitochondrial antioxidant ability (Sánchez-Villamil et al., 2016; Rathore et al 2008).

In this study, fluoride intoxicated rats have been exhibited the reduced activity of SOD in heart tissue. Fluoride supplemented pigs had lower levels of SOD in their hepatic tissue in a previous research. In a separate research, mice given fluoride had a detrimental effect on the testes and epididymis via decreasing SOD levels (Zhan et al., 2006; Sun et al 2018). Wistar strain male albino rats exposed to high fluoride levels in their drinking water for two generations enhanced oxidative stress via lowering SOD levels in cardiac tissue (Basha et al 2011). Hence, fluoride is toxic in inducing oxidative stress by reducing SOD activity. Present study results also correlate with the all previous studies.

Increased levels of SOD were detected in the Ft+Egt experimental group of this study, compared to fluoride-intoxicated rats that eugenol compound treatment to the fluoride rats increased the SOD activity. It was discovered that rising quantities of free radicals reduce the antioxidant enzyme system in the body, but free radical scavengers reduce radicals, allowing the antioxidant enzyme system to increase. In an *in vitro* ABTS test, eugenol decreased free radical-induced lipid peroxidation and protected liver tissue against lipid peroxidation in CCl4-induced hepatotoxicity (Nagababu et al., 2010). It is obvious that eugenol reduces the number of free radicals in the body during sickness. Similarly, eugenol may scavenge free radicals generated by fluoride in the current research, therefore increasing the SOD activity. Similar results were observed in a study, cisplatin caused oxidative stress in the testicular tissue, which reduced SOD enzyme activity, but raised SOD levels in the cisplatin group when administered with eugenol (Ekinci Akdemir et al., 2019). In the same manner, Kumaravelu et al. (1996) discovered that eugenol has antioxidant action in CCl4-induced erythrocyte damage *in vivo*, and that eugenol enhanced SOD activity in red blood cells whereas CCl4 lowered it. Eugenol activity was somewhat lower than the standard vitamin E, in this study because vitamin E is potential antioxidant agent. It was proven by huge scientific reports (Rizvi et al 2014). It is positive entity that eugenol acted SOD acceleration property which is very near to the vitamin E.

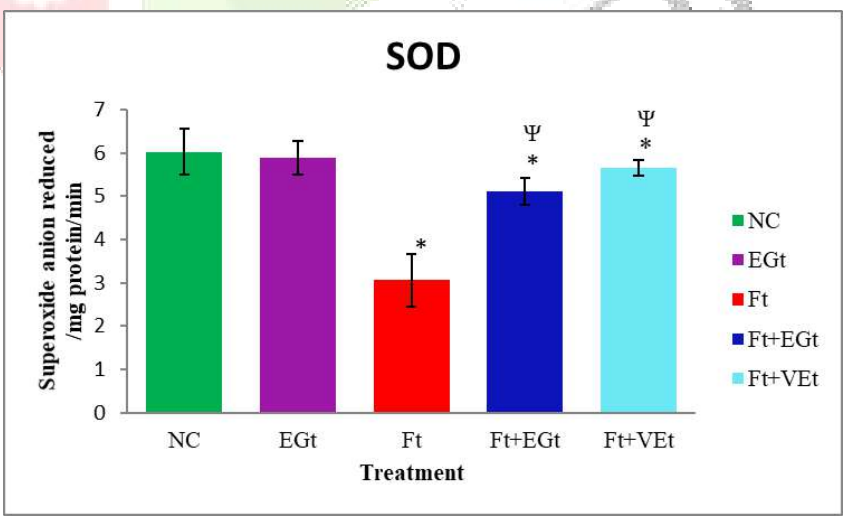

Fig.1. Effect of eugenol on SOD activity in the cardiac tissue of male albino rats. The values are significant compared with normal control (*p<0.05).

In addition to SOD, CAT activity levels were measured in experimental animal groups. CAT levels were significantly lower in the Ft group than NC, while CAT levels were significantly higher in Ft+Egt rats when compare to Ft (Fig.2). Treatment of Eugenol to fluoride rats confirmed a greater enhancement in CAT activity relative to fluoride intoxicated group and a slight decrement when compared to standard Vitamin E treatment. When compared to NC, there were no significant changes have been observed in the Egt group.

A variety of inhibitors including sulfide, hydroxyl amine, fluoride, cyanide, azide and acetate are decrease catalase's enzymatic activity. These chemicals are thought to substitute an aquo ligand in the prosthetic group that inhibits hydrogen peroxide catalysis (Schonbaum and Chance, 1976). Fluoride inhibited catalase activity *in vitro* at 1 mg/L, according to a Clark-type oxygen electrode sensor research (Stein and Hain, 1995). When ingested in abundance, fluoride is known for causing harm to key organs and systems, including the cardiac tissue, in addition to dental and skeletal fluorosis (Cicek et al., 2005). Fluoride interferes with soft tissues by blocking a variety of enzymes, ultimately resulting in the formation of free radicals. In the present study also, fluoride ingested rats exhibited changes in antioxidant enzyme CAT in heart tissue. Our findings were also consistent with a previous study that rat puffs exposed to 200 ppm NaF by the mother's milk throughout lactation and directly exposed through fluoride water in the post-suckling time frame for 3 months had lower antioxidant activity and decreased catalase enzyme in heart tissue (Basha and Sujitha, 2011).

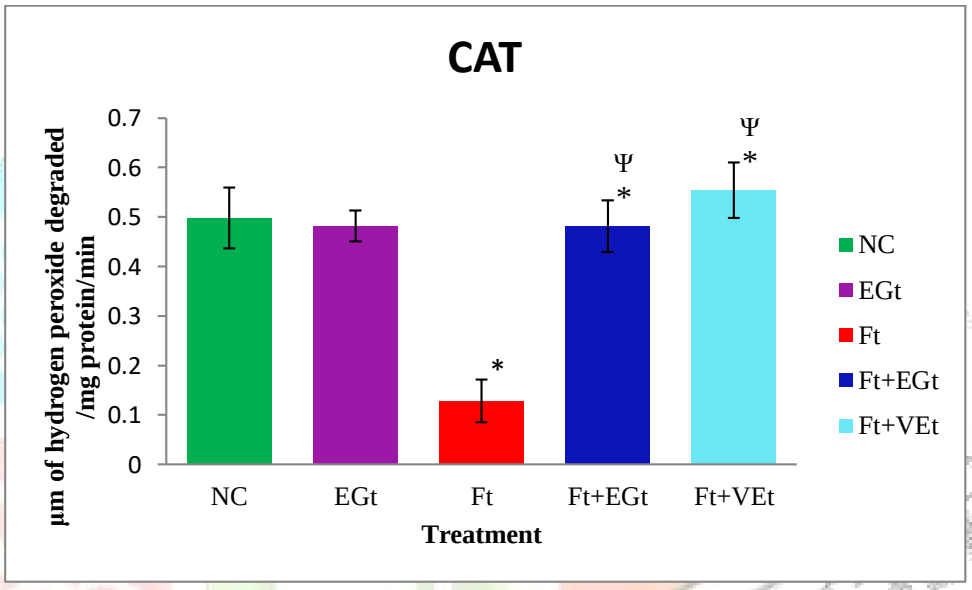

Fig.2. Effect of eugenol on the CAT under fluoride intoxicated condition. The values are significant compared with normal control (*p<0.05).

In the current study, CAT activity in cardiac tissues was significantly increased when sodium fluoride intoxicated rats were given eugenol. Treatment with eugenol for 21 days enhanced the antioxidant enzyme CAT activity of liver in carrageenan-induced arthritis, according to a previous study (Adefegha et al 2018). Rauscher et al (2001) were identified that antioxidant enzyme CAT enhancing capacity of isoeugenol in the tissue such as brain, kidney, heart and liver of streptozotocin induced diabetes Sprague-Dawley rats. As per Oroojan et al (2020), eugenol has an antioxidant impact on oxidative stress that caused by H2O2 in male mice islets of Langerhans via boosting catalytic activity of CAT. Furthermore, eugenol showed antioxidant activity *in vitro* by scavenging hydrogen peroxide produced by the fentons reaction and preventing the development of lipid peroxidation (Nagababu et al 2010). In another *in vitro* free radical scavenging activity assay, eugenol potentially scavenged the hydrogen peroxide on dose dependent manner. Hence it is clear that eugenol has potential hydrogen peroxide scavenging activity in *in vitro* and CAT enhancing capacity in *in vivo*. More importantly, eugenol rich leaf extract of *oscimum* sanctum (250 mg/kg) nullified the oxidative stress caused by sodium fluoride in swiss albino mice by increasing CAT enzyme activity (Prakash et al 2018). At the same time, eugenol exhibited the cardio protective role in rats under doxorubicin toxicity (Fouad and Yacoubi, 2011). Gathering all, due to free radical scavenging property and CAT enhancing capacity, eugenol protected the heart tissue under sodium fluoride toxicity induced oxidative stress, in this study.

Further, GPx levels were significantly lower in the Ft group than NC, while GPx levels were significantly higher in Ft+Egt rats when compare to Ft (Fig.3). Treatment of Eugenol to fluoride rats confirmed a greater enhancement in GPx activity relative to fluoride intoxicated group and a slight decrement when compared to standard Vitamin E treatment. When compared to NC, there were no significant changes have been observed in the Egt group.

GPx activity was significantly decreased in the fluoride intoxicated rats, in the present study. The similar results have been observed in Chauhan and colleagues (2013) conducted an experiment, in which female Sprague Dawley rats at the age of 6 and 18 month old were subjected to sodium fluoride. The results revealed that increased oxidative stress reduced glutathione peroxidase activity. In another study, fluoride intoxication for 25 days to adult female rats also found that decreased levels of glutathione reductase activity due to oxidative stress in the liver tissue (Błaszczyk et al 2011). It was also observed that fluoride poisoning reduces glutathione peroxidase enzyme activity in the brain, kidney, liver, plasma, and testis of 8 week old male Wistar rats, according to Inkielewicz-Stepniak and Krechniak (2004). Furthermore, prolonged exposure to sodium fluoride through drinking water for 60 days causes oxidative damage in wistar strain rats' kidney and liver tissues through lowering glutathione peroxidase enzyme activity. Sodium fluoride was also induced the hypertension and oxidative stress causing cardiac damage in heart tissue male albino rats on dose dependent manner (Oyagbemi et al 2016). Hence it is thought that sodium fluoride increased the oxidative stress in different tissues including heart, while in the same manner antioxidant enzyme GPx was decreased in the present study.

In the current research, GPx activity levels were significantly increased in the eugenol treated fluoride intoxicated rats. Similarly, eugenol was decreased the oxidative stress by increasing the glutathione peroxidase activity in liver tissue of rat under arthritis induced by carrageenan (Adefegha et al 2018). A research on the effects of eugenol on glutathione peroxidase in bovine ovarian cortical secondary follicles grown *in vitro* found that eugenol enhanced glutathione peroxidase enzyme activity m-RNA expression levels. Additionally, eugenol prevents cisplatin-induced testicular damage via boosting antioxidant capacity by raising glutathione peroxidase enzyme activity, which was dramatically reduced in the cisplatin-induced rat group (Ekinci Akdemir et al 2019). Moreover, eugenol protected male rats against carbon tetra chloride-induced oxidative stress by boosting glutathione peroxidase enzyme activity, whereas this enzyme activity was dramatically reduced in the carbon tetra chloride toxicity rat group (Kumaravelu et al 1996). In BRL-3A normal rat hepatocytes *in vitro*, another eugenol analogue, aspirin eugenol ester, prevented the paraquat producing oxidative stress caused liver damage by boosting antioxidant enzyme glutathione peroxidase enzyme activity (Zhang et al 2016). The antioxidant enzyme glutathione peroxidase was increased in the Arsenic Trioxide group supplemented with eugenol where it prevented the oxidative stress assisted renal injury in wistar rats, while this enzyme was lowered in the Arsenic Trioxide alone group (Binu et al 2017). Hence, gathering all, it is very clear that eugenol has antioxidant potentiality that correlated with increased antioxidant enzyme glutathione peroxidase enzyme in both previous studies and in the present study.

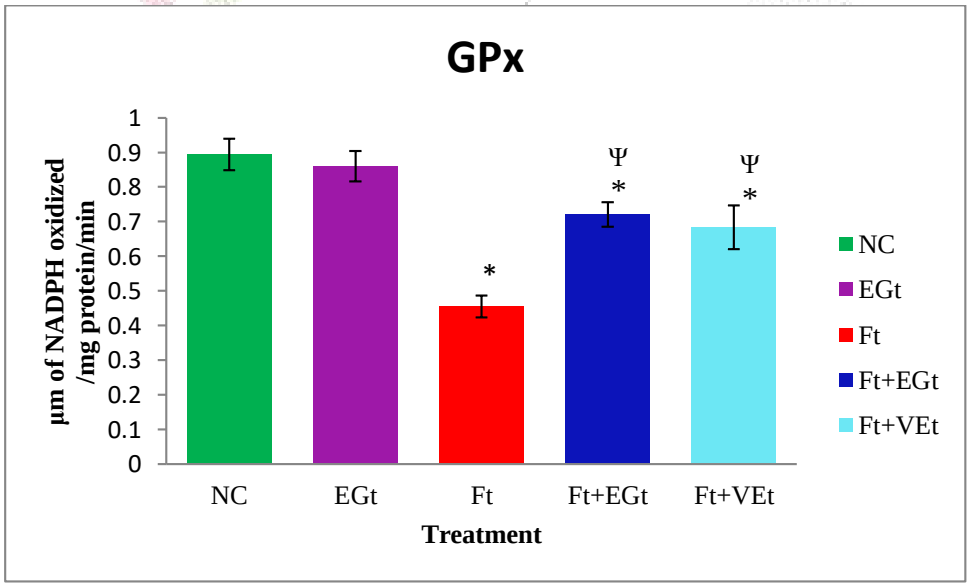

Fig.3. Effect of eugenol on the GPX under fluoride intoxicated condition. The values are significant compared with normal control (*p<0.05).

Finally, when compared to NC, there was slight GR changes have been observed in the Egt group. While, GR levels were significantly lower in the Ft group than NC, further GR levels were significantly higher in Ft+Egt rats when compare to Ft (Fig.4). Treatment of Eugenol to fluoride rats confirmed a greater enhancement in GR activity relative to fluoride intoxicated group and a slight increment when compared to standard Vitamin E treatment.

The obtained results in the present study were revealed that decreased levels of GR observed in the fluoride intoxicated rat heart tissue. Similar results were observed by Bharti and Srivastava (2009) in the rat brain. They have been administered fluoride orally at a dose of 150 mg/L for 28 days to rats which causing oxidative stress in the brain. Under fluoride-induced oxidative stress, glutathione reductase enzyme levels were shown to be lower. On other hand, Chauhan and colleagues (2013) conducted an experiment, in which female Sprague Dawley rats at the age of 6 and 18 month old were subjected to sodium fluoride. The results revealed that increased oxidative stress reduced glutathione reductase activity. Fluoride consumption of adult female rats for 25 days resulted in reduced glutathione reductase activity owing to oxidative stress in the liver tissue, according to another study (Błaszczyk et al 2011). It was found that sodium fluoride was induced the hypertension and oxidative stress, causing cardiac damage in heart tissue of male albino rats on dose dependent manner (Oyagbemi et al 2016). In addition, female wistar strain rats were given 150 ppm sodium fluoride in their drinking water. Sodium fluoride caused oxidative stress in numerous tissues such the heart, liver, and kidneys by inhibiting antioxidant enzyme like glutathione reductase (Bharti et al 2014). Fluoride has a detrimental influence on the antioxidant system through changing antioxidant enzymes such as glutathione reductase, as evidenced by all prior findings. It also validates the findings of the current study, which show that fluoride inhibits the glutathione reductase enzyme in heart tissue.

Increased glutathione reductase activity was observed in the fluoride intoxicated rats supplemented with eugenol natural compound. It was found that eugenol has the antioxidant activity that reduces the oxidative stress under illness. In a study, eugenol protected male rats against carbon tetra chloride-induced oxidative stress by boosting glutathione reductase enzyme activity, whereas this enzyme activity was dramatically reduced in the carbon tetra chloride toxicity rat group (Kumaravelu et al 1996). In a study, sub-acute administration of antioxidant compound isoeugenol in 30-day streptozotocin-induced diabetic Sprague-Dawley strain rats was studied by Rauscher and his colleagues in the year 2001. Eugenol enhanced glutathione reductase activity in the hepatic, renal, brain, and cardiac tissues, but this enzyme activity was lowered in the organs examined. Eugenol enhanced antioxidant capacity by raising glutathione reductase activity levels in concanavalin-A assisted T-cell-mediated acute hepatitis, but its levels were lowered in the hepatitis state. It was also found that eugenol rich extract of clove significantly decreased the oxidative stress in liver cirrhosis by increasing glutathione reductase activity, while glutathione reductase activity was significantly decreased in liver cirrhosis (Ali et al 2014).

Glutathione reductase activity involves conversion of oxidized glutathione into reduced form. While, reduced glutathione is very essential for the glutathione peroxidase enzyme. By utilizing reduced glutathione, glutathione peroxidase enzyme converts hydrogen peroxide into water, where hydrogen peroxide is very toxic to the cell. At the same time increased levels of glutathione peroxidase enzyme in the eugenol treated fluoride intoxicated rats, in the present study also support the increased levels of glutathione reductase activity. It is very clear the both glutathione peroxidase and glutathione reductase activities are interdependent. Hence, it is very clear that eugenol has antioxidant property due to its role in increasing levels of antioxidant enzymes such as glutathione reductase and glutathione peroxidase.

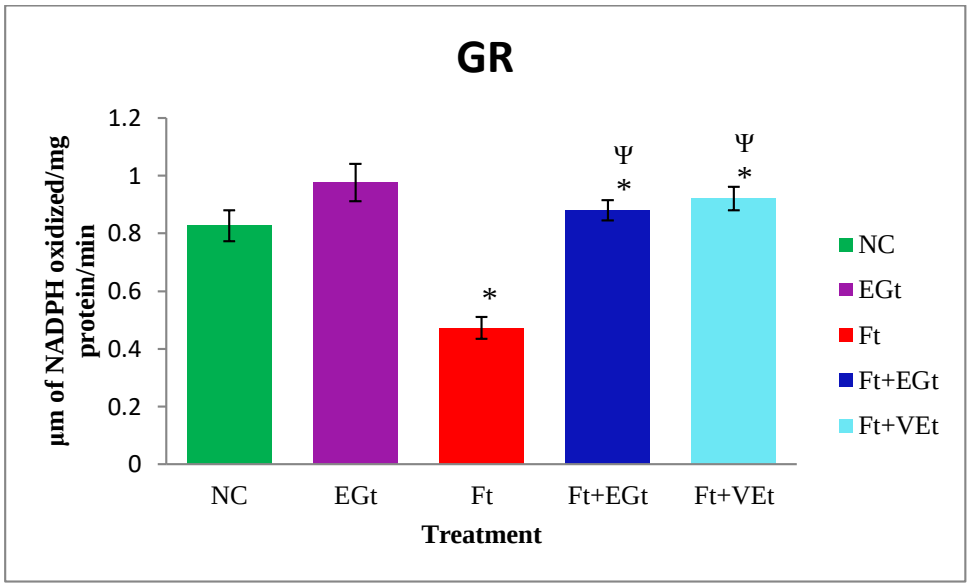

Fig.4. Effect of eugenol on the GR under fluoride intoxicated condition. The values are significant compared with normal control (*p<0.05).

## CONCLUSION

The findings of this study reveal that the eugenol can protect cardiac tissue under oxidative stress caused by fluoride by enhancing antioxidant enzyme. In future, clinical studies on the action of eugenol must be determined in fluoride intoxicated people.

**ABSTRACT**

A disruption in the equilibrium between the generation of reactive oxygen species and antioxidant defense enzymes is referred to as oxidative stress. In the present study, we planned to identify the hepatoprotective effect of *Phyllanthus amarus* alkaloid rich fraction in wistar strain albino male rats. The hepatic damage was induced by the D-galactosamine and ameliorative effect was tested with alkaloid rich fraction of *P. amarus* by measuring oxidative stress markers such as G6PDH, LDH, SDH, MDH and GDH in the liver tissue. Activity levels of G6PDH, SDH, MDH and GDH were significantly decreased in D-galactosamine induced hepatitis rats when compare to normal control rat group, while their activities were significantly increased in hepatitis rat group that supplemented with alkaloid rich fraction of *P. amarus*. In contrast, LDH enzyme activity of liver was significantly increased in the hepatitis rat group when compare to normal control rats, while its activity was significantly decreased in hepatitis rats treated with alkaloid fraction. In conclusion, it is very clear that alkaloid fraction of *P. amarus* has hepatoprotective property with respect of decreasing oxidative stress by regulating oxidative stress marker enzymes. The isolation and identification of specific alkaloid compounds with hepatoprotective properties and anti-oxidative stress will require much further research.

## INTRODUCTION

*Phyllanthus amarus* is medicinally important medicinal plant, belongs to the family *Euphorbiaceae.* It has been proved to treat many deadly diseases traditionally and pharmaceutically. In traditional herbal system, *P. amarus* has been used hugely in various regions around world to treat many adverse effects. In India, especially, this plant being used traditionally to treat anemia, appetizer, asthma, astringent, bronchitis, conjunctivitis, cough, diabetes, diarrhoea, diuretic, dropsy, dysentery, dyspepsia, eye disorders, fevers,, genitourinary disorders, gonorrhea, hepatitis, itchness, jaundice, leucorrhea, menorrhagia, oligogalactia, ringworm, scabies, skin ulcers, sores, stomachic, swelling, thirst, tuberculosis, tumor (abdomen), urogenital tract infections, and warts.[1] In addition, pharmaceutically this plant has been proved as antiamnesic, antibacterial, anticancer, antifungal, anti-diarrhoeal, gastroprotective, antiulcer, analgesic, anti-inflammatory, anti-allodynic, anti-oedematogenic, antinociceptic, antioxidant, antiplasmodial and antiviral.[1]

Alkaloids are indeed organic molecules which mostly contain basic nitrogen atoms, those abundantly available in nature in the tissues of plants and others. This group also contains certain associated neutral molecules and weakly acidic constituents also present. Allo-securine, dihydrosecurinine, epibubbialine, isobubbialine, nor-securinine, phyllanthine,

Securinine, securinol and tetrahydrosecurinine alkaloids were isolated from the *P. amarus* through chromatographic methods.[2,3] In addition to that alkaloids Foo and Wong, were isolated 4-hydrosecurinine, 4-methoxy-nor-securinine, 4-methoxy dihydrosecurinine and 4-methoxytetrahydrosecurinine.[4] Hence, the present research paper design to separate alkaloids fraction from *P.amarus* and the same was tested for hepatoprotective activity with reference to oxidative stress enzymes.

G6PDH is a cytoplasmic enzyme present all organisms, a part in pentose phosphate pathway which produces NADPH (nicotinamide adenine dinucleotide phosphate) that is necessary for elimination of free radicals such as reactive oxygen species produced in cell.[5] This NADPH helps to protect the cells from oxidative stress caused by substances like $H_2O_2$ by maintaining the level of glutathione in these cells and also maintains glucose through pentose phosphate pathway.[6] LDH is abbreviated as lactate dehydrogenase enzyme present in virtually most living tissue/cells. Generally, a dehydrogenase is a molecule-to-molecule hydride exchange enzyme. It is a biomarker of severe ailments and diseases since it is

©Copyright protected. Unauthorised republication, reproduction, distribution, dissemination and copying of this document in whole or in part is strictly prohibited.

produced after tissue injury.[7] LDH mediates the rearrangement of pyruvate and lactate, as well as NAD+ and NADH, at the same time. Whenever $O_2$ is missing or in scarcity, it transforms pyruvate, the end result of glycolysis, to lactate, and it reverses the process during the Cori cycle in the hepatic tissue.[8] Succinate dehydrogenase, also known as respiratory complex II, is an enzyme complex present in the inner mitochondrial membrane of eukaryotic and several bacterial cells. In the TCA cycle, this enzyme transforms succinate to fumarate catalytically, and in the electron transport chain, it converts ubiquinone to ubiquinol.[9] SDH receives electrons and transfers them through its four subunits, SDH-A, SDH-B, SDH-C, and SDH-D, before continuing the electron transfer to electron transport chain's complex II. Further, the electrons of FADH2 following SDH catalysis and ubiquinone are subsequently transported to complex III of electron transport chain, where they are used to continue the synthesis of the cell's energy moiety, adenosine triphosphate.[10] The MDH2 gene encodes malate dehydrogenase (MDH), which is found in mitochondria and is also known as malate dehydrogenase 2 in humans. Malate dehydrogenase uses the NAD/NADH cofactor complex in the TCA cycle of carbohydrate metabolism to catalyze the bidirectional oxidation of malate to oxaloacetate. MDH is indeed active in gluconeogenesis, or the conversion of simpler compounds into glucose.[11] Glutamate dehydrogenase (GDH) enzyme present in the mitochondrial matrix made up of six identical monomers that form hexameric forms. This enzyme catalyzes the reversible oxidative deamination of glutamate to alpha-ketoglutarate with the release of free ammonia as a by-product. This enzyme uses either NAD or NADP as a co-factor to complete this reaction.[12]

## MATERIAL AND METHODS

### Collection of plant material

*P. amarus* plant was collected in Tirupati, Andhra Pradesh, India in the month of August and September 2017. Botany taxonomist Dr. Madhava Chetty, Department of Botany, S. V. University has identified and authenticated it. The Department of Botany, S. V. University, Tirupati has held a voucher specimen No.2151 in the herbarium lab. Further, the plant material was washed with water and rinsed with sterile distilled water. It was subjected to shade dry after washing and powdered with a mechanical grinder. This material was further used for extraction of alkaloid rich fraction.

### Preparation of alkaloids rich fraction from *P.amarus*

Alkaloids rich fraction was prepared by the method of general acid–base extraction as described by Houghton and Raman, 1998[13]. Briefly, the dried plant powder of *P.amarus* soaked in methanol for 24 h with occasional stirring. After soaking, the mixture was filtered using Whatman No. 1 filter paper. The filtrate collected had been concentrated under reduced pressure using rotary evaporator. The concentrated crude extract has been combined with 1 M Hcl and purified for any precipitate removal. 2N NaOH was gradually applied to this filtrate to produce an off-white precipitate. Now the precipitate was divided into equal quantities of water and dichloromethane (DCM) layers. Separated, evaporated and measured the DCM layer contained alkaloids. Dragendorff 's reagent (5 % bismuth nitrate, 4 % acetic acid, and 2 % potassium iodide) tested the separated alkaloids from crude. The rich alkaloid fraction yield was approximately 5 % (w/w).

### Animals and maintenance:

Indian Institute of Science (IISc), Bangalore provided male Wistar rats weighing 180± 200 g. The animals were kept under standard laboratory conditions by maintaining temperature 27 ± 2ºC, natural light dark cycle such as photoperiod of 12 h light and 12 h, and humidity about 55–60%. The rats were maintained by providing regular pellet diet that was supplied by M / s Hindustan Lever Ltd., Mumbai and water ad libitum. Animal ethical committee approved the design of this study (Resolution No.10/08/a/CPCSCA/IAEC/SVU/09-10/ZOOL/KRS/ Dt.25.09.2009). Animals were divided into five groups of six rats each, after 7 days of acclimatization.

### Grouping of animals:

**Group I- Normal Control (NC)**: Rats received saline for 21 days and served as normal control.

**Group II- Alkaloid rich Fraction control (AF)**: Rats were given alkaloid rich fraction of *P. amarus* (100mg/kg b/w**)** for 21 days.

**Group III- Hepatitis Control (H)**: A single injection of D-galactosamine hydrochloride (800mg/kg b/w) was given intraperitoneally for the induction of hepatitis 48 hours before sacrifice.

**Group IV- Hepatitis + Alkaloid rich Fraction treatment (H+AF)**: Pre-treatment of alkaloid rich fraction of *P. amarus* (100mg/kg b/w**)** orally for 21 days and a single injection D-galactosamine hydrochloride (800mg/kg b/w) 48 hours before sacrifice.

**Group V- Hepatitis + Silymarin treatment (H+S):** Pre-treatment of standard drug silymarin (100 mg/kg b/w) orally for 21 days and a single injection D-galactosamine hydrochloride (800mg/kg b/w) 48 hours before sacrifice.

### Glucose-6-Phosphate dehydrogenase (G-6-PDH)

The behavior of glucose-6-posphate dehydrogenase was assessed using the Mastanaiah et. al. (1978) method.[17] 10% (W / V) of homogeneous tissue was prepared in ice cold sucrose solution (0.25 M), centrifuged at 1000 g at $4^0$C for 15 minutes, and supernatant used as an enzyme source. The 2 ml reaction mix comprises 2 µ moles of INT, 100 µ moles of sodium phosphate buffer (pH 7.4), 0.3 µ mole of NADP and 20 µ moles of glucose-6-phosphate. The reaction was started by adding 0.5 ml of homogenous tissue containing 50 mg as an enzyme extract. The incubation was done at $37^0$C for 30 minutes, and the

©Copyright protected. Unauthorised republication, reproduction, distribution, dissemination and copying of this document in whole or in part is strictly prohibited.

reaction was then halted by adding 5 ml of glacial acetic acid. The developed formazan was extracted into toluene in 5 ml at $5^0$C. The color intensity was read at 495 nm versus the blank toluene. The G-6-PDH activity was represented as µ moles of formazan formed/mg protein/hour.

**Lactate dehydrogenase (LDH)**

The activity of Lactate Dehydrogenase was determined by the Nachlas et. al., (1960),[14] and with minor modifications as suggested by Prameelamma and Swami (1975).[15] 10% (W / V) homogeneous liver tissue was prepared in an ice cold solution of 0.25 M sucrose, centrifuged for 15 minutes at 40C at 1000 g and supernatant used as enzyme source. The final 2 ml reaction mixture contained 40 µ moles of sodium lactate, 100 µ moles of phosphate buffer (pH 7.4), 0.1 µ mole of NAD and 4 µ moles of INT. The reaction was started by adding 0.2 ml of homogeneous 20 mg tissue as an enzyme resource and incubated at 37°C for 30 minutes, and the reaction was halted by adding 5 ml of glacial acetic acid. Zero time controls were retained by adding 5 ml of glacial acetic acid to the incubation solution led to the advent of the source enzyme. At 50C, the formazan developed was extracted into 5 ml of toluene overnight. The color formed was analyzed against the blank toluene at 495 nm in a Spectrophotometer. The activity of the enzyme was represented in µ moles of formazan formed / mg protein / hour.

**Succinate dehydrogenase (SDH)**

The activity of SDH was determined by the Nachlas et. al., (1960),[14] and with minor modifications as suggested by Prameelamma and Swami (1975).[15] 10% (W / V) homogeneous liver tissue was prepared in an ice cold solution of 0.25 M sucrose, centrifuged at 1000 g at 40C for 15 minutes and obtained supernatant used as enzyme resource. The 2 ml reaction mix comprises 4 µ moles of INT, 100 µ moles of phosphate buffer (pH 7.0) and 40 µ moles of sodium succinate. The incubation was done at 370C for 15 minutes, and the reaction was then halted by adding 5 ml of glacial acetic acid. The following stages were followed same as designated for LDH. The SDH activity was represented in µ moles of formazan formed / mg protein / hour.

**Malate dehydrogenase (MDH)**

The activity of MDH was determined by the Nachlas et. al., (1960),[14] and with minor modifications as suggested by Prameelamma and Swami (1975).[15] 10% (W / V) homogeneous liver tissue was prepared in an ice cold solution of 0.25 M sucrose, centrifuged at 1000 g at 40C for 15 minutes and obtained supernatant used as enzyme resource. The 2 ml reaction mix comprises 4 µ moles of INT, 100 µ moles of phosphate buffer (pH 7.0), 0.1 µ mole of NAD and 40 µ moles of sodium malate. The reaction was started by adding 0.2 ml of homogenous tissue containing 20 mg as an enzyme extract. The incubation was done at 370C for 15 minutes, and the reaction was then halted by adding 5 ml of glacial acetic acid. The following stages were followed same as designated for LDH. The MDH activity was represented in µ moles of formazan formed / mg protein / hour.

**Glutamate dehydrogenase (GDH)**

Activity of glutamate dehydrogenase (GDH) was assessed using the Lee and Lardy (1965) procedure.[16] 5% (W / V) of homogeneous tissue was prepared in ice cold sucrose solution (0.25 M), centrifuged at 1000 g at 40C for 15 minutes, and supernatant used as an enzyme source. The 2 ml reaction mix comprises 2 µ moles of INT, 100 µ moles of phosphate buffer (pH 7.0), 0.1 µ mole of NAD and 40 µ moles of sodium glutamate. The reaction was started by adding 0.2 ml of homogenous tissue containing 10 mg as an enzyme extract. The incubation was done at 370C for 15 minutes, and the reaction was then halted by adding 5 ml of glacial acetic acid. The developed formazan was extracted into toluene in 5 ml. The color intensity was read at 495 nm versus the blank toluene. The GDH activity was represented as µ moles of formazan formed/mg protein/hour.

## RESULTS AND DISCUSSION

In the present study, the activity levels of G6PDH in alkaloid fraction treated hepatitis animals were recovered as compared to normal control rats. The G6PDH of the hepatitis control rat group was considerably lower than that of the other groups studied. Normal control rats given the alkaloid fraction, on the other hand, showed very minor increasing changes in G6PDH when compared to the normal control group. In hepatitis rats, silymerin, a widely available plant-derived medicine, was shown to be somewhat greater efficient than the alkaloid fraction in increasing G6PDH activity (Figure 1)

D-galactosamine is a hepatotoxin which induces the hepatic tissue damage by producing oxidative stress such as reactive oxygen species and reactive nitrogen species. In the oxidative stress, reactive oxygen species like superoxide radicals are generated through mitochondria which in turn converted into the hydrogen peroxide by the enzyme superoxide dismutase.[18] Further, these superoxide radicals converted into most dangerous hydroxyl radials. D-galactosamine, on the other hand, causes liver damage in rats, which is linked to induction of lower levels of G6PDH by the hepatotoxin in rats. Due to lower activity of G6PDH, increased levels of oxidative stress were observed in hepatic tissue.[19] Alternatively, the functionality of G6PDH was reduced in the hepatic tissue of the current study's hepatitis rats. This implies that reduced conversion of glucose-6-phosophate to 6-phosphogluconate causes NADPH production in the HMP shunt to be diminished. Intern, the glycolytic and krebs cycle paths are harmed by this process as an alternative source of energy. When oxidoreductases in the mitochondria are inhibited, the energy supply for regular metabolic processes is reduced. The decreased amount of NADP might potentially be a factor in Dgalactosamine's inhibition of G6PDH.[20] Many research studies found that a toxin that induces the liver

©Copyright protected. Unauthorised republication, reproduction, distribution, dissemination and copying of this document in whole or in part is strictly prohibited.

toxicity causes the decline of G6PDH.[21] Similarity, in the present study, D-galactosamine also induced the hepatic damage and reduction levels of G6PDH.

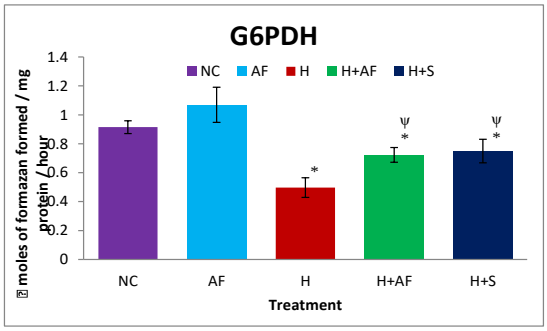

**Figure 1:** Effect of Alkaloid rich fraction on Glucose-6-Phosphate Dehydrogenase (G-6-PDH) activity in the hepatic tissue of male albino rats.

A research found that an alkaloid-rich extract of *Litsea glutinosa* bark enhanced the activity of G6PDH in diabetic mice's liver.[22] The restoration of decreased GSH is the primary function of NADPH generated by G6PDH within liver. This protects liver tissue by detoxifying hydroxyl radicals, and hydrogen peroxide which are oxygen radicals generated in the liver.[23] Likewise, in the current study, an alkaloid-rich fraction and silymerin enhanced the activity of G6PDH in the hepatitis liver. At the same time, alkaloids from plant species also showed free radical scavenging activity.[24] On whole G6PDH reduction resulting free radicals were might also scavenged by the alkaloids of *P.amarus,* in the present study. Hence it is hypothesized that alkaloid rich fraction increased the G6PDH activity in the liver tissue by scavenging free radicals such as hydrogen peroxide and hydroxyl radicals.

LDH levels in the hepatitis group were considerably higher than NC, but LDH levels in alkaloid-rich fraction treated hepatitis rats were substantially lower than Hepatitis (Figure 2). Treatment of hepatitis rats with alkaloid-rich fraction resulted in a larger decrease in LDH activity compared to hepatitis groups, as well as a substantial decrease compared to standard medication Silymarin treatment. There were no significant differences in the AF group as compared to the NC group.

The livers plays a significant role in regulating the metabolism of carbohydrates by keeping glucose levels within a normal range and express a series of enzymes that are turned on alternatively or off probably depends on if the blood sugar levels take up or down. Especially, glycolysis of glucose in liver cells takes place in the cytosol under aerobic and anaerobic conditions.[25] In muscle and liver, during aerobic respiration, glucose in the cytosol is transformed to pyruvate, which then enters mitochondria for high energy generation, but during anaerobic respiration, pyruvate in the cytosol is transformed to lactic acid by the enzyme LDH, which then transforms NADH to NAD.[26] Again, to improve aerobic respiration, lactic acid is formed and enters the liver, where it is converted to glucose through a process known as the cori cycle by LDH. Hence liver is a main organ for the regeneration of glucose under hypoxia.[27] Furthermore, liver failure has been linked to an increase in macrophage content, which causes endothelial cell destruction in sinusoids either direct or indirect through the production of cytokines. Hypoxia liver injury, commonly known as hepatitis, is a condition in which the liver's normal function is disrupted and the level of hypoxia-sensitive enzymes such as LDH rises.[28] Another reason is that hypoxia inducible fctor-1 is a gene found in the liver that causes increased hypoxia in liver disorders such as cirrhosis, tumors, and fibrosis, and others.[29]

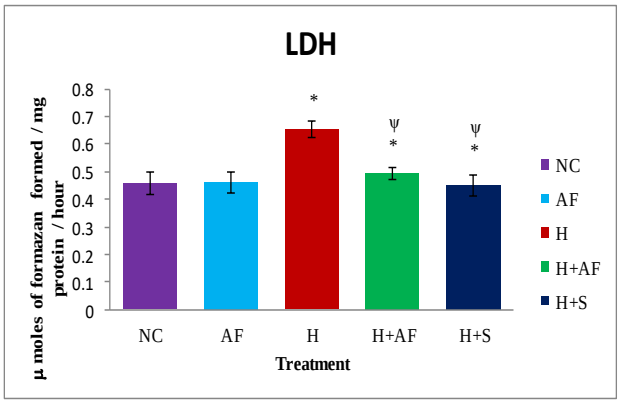

**Figure 2:** Effect of Alkaloid rich fraction of *P. amarus* on Lactate Dehydrogenase (LDH) activity in the hepatic tissue of male albino rats.

When compared to the normal control rats, the D-Galactosamine induced hepatitis rat group had higher levels of LDH in this research. Our findings are consistent with a recent study that after two injections of D-Galactosamine, LDH levels in liver fibrosis rats increased dramatically as compared to normal rats.[30] In a similar manner, CCL4-induced hepatic damage in Kunming mice produced the same effects, such as an increase in LDH levels.[31] In this research work, D-galactosamine-induced hepatitis rats treated with an alkaloid fraction obtained from the *p.amarus*, on the other hand, had lower LDH activity levels in rats when compare to hepatitis group. Similar results were reported in previous study that, *Acanthus ilicifolius* plant contained *alkaloid Acanthus ilicifolius* alkaloid A synthesized and tested for hepatoprotective activity in CCl4 induced hepatic damage in rats. Where they found that a decreased level of LDH was observed in alkaloid treated rats, an indication that alkaloid protected the liver cell from the hepatotoxin.[31] Our results correspond those of another study, which found that an alkaloid fraction extracted from *Hygrophila auriculata* leaves protected liver tissue against CCL4 toxicity by lowering LDH levels at various doses.[32] Based on the findings and their agreement with prior research, it is clear that the alkaloid-rich fraction of *P. amarus* is an excellent source of hepatoprotective alkaloids. Furthermore, it is believed that *P. amarus* alkaloids protected liver tissue by lowering hypoxia levels and reducing the expression of the hypoxia inducible fctor-1 gene and LDH in the liver.

SDH levels in the hepatitis group were considerably lower than NC, but SDH levels in alkaloid-rich fraction treated hepatitis rats were substantially higher than Hepatitis (Figure 3). Treatment of hepatitis rats with alkaloid-rich fraction resulted in a larger increase in SDH activity compared to hepatitis groups, as well as a little bit decrease compared to standard medication Silymarin treatment. There were no significant differences in the AF group as compared to the NC group.

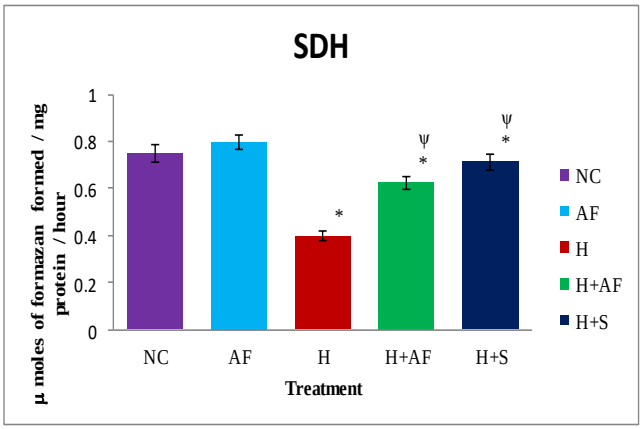

**Figure 3:** Effect of Alkaloid rich fraction of *P. amarus* on Succinate dehydrogenase (SDH) activity in the hepatic tissue of male albino rats

Studies on the worm *Caenorhabditis elegans* supported the theory that perhaps the SDH performs a particular role in mitochondrial oxygen management. An oxygen-hypersensitivite worm was found to have a particular SDH mutation instead of a complete class of mitochondrial respiratory mutants.[33] Mutations in any of the SDH genes cause the complex II to breakdown completely in humans. Complex II can thus be ignored as a cause of further superoxide generation because it is not present. As a result, scientists believe that superoxide excessive production, which has been linked to carcinogenesis in humans and hypersensitivity to oxygen in mutant worms, is due to the SDH's inability to appropriately diminish the UQ pool, which is required to withstand oxidative stress.[34] The deficiency of SDH activity would not only lead to lower ATP production–a situation that may also be caused by a severe Complex I or Complex IV defect–but it will also deprive the Reaction Center of the only dehydrogenase activity capable of keeping the Ubiquitin pool at a high reduction status. This might lead to a decrease of the respiratory chain's anti-oxidant ability, as well as oxidative stress.[34] On other hand, Succinate, a tricarboxylic acid cycle intermediary involved in mitochondrial ATP production, has been identified as a key signaling molecule in a number of diseases. When succinate concentrations are high, the major ROS generating site in Complex II, FAD in SDHA, is unable to produce ROS. The mechanism of succinate-mediated suppression of ROS generation at FAD is that succinate may prevent FAD from receiving oxygen.[35] The stimulation of human GPR91, which really is accountable for liver damage, is induced by succinate. Furthermore, succinate is a substrate for the SDH enzyme, which is diminished in many liver disorders, resulting in an increase in ROS, which leads to liver damage.[36] Similarly, decreased SDH levels were observed in the liver cancer.[37] In the present study, D-galactosamine induced hepatitis rats exhibited decreased levels.

In contrast, plant compounds such as phenols, flavonoids and alkaloids are pharmaceutically active in reducing liver diseases by inducing increase levels of SDH. SDH levels were found to be higher in the alkaloid-rich fraction obtained from *Phyllanthus amarus* treated hepatitis rats in the current investigation. Our results were correlated with a study that the hydroalcoholic extract of *Chrysanthemum balsamita, Calendula officinalis* herbs were increased the SDH activity in the CCl4 induced heptotoxicity in the albino rats. These herbs were contained rich amount of alkaloids.[38] Along with, the similar results were observed in another study that a single dosage of 120 mg/kg of monocrotaline, a pyrrolizidine alkaloid, induced the increased levels of SDH in rats after 12 days.[39] Hence, it is hypothesize that alkaloid fraction of this study protected the liver tissue from the D-galactosamine induce hepatotoxicity by inducing SDH, decreasing oxidative stress.

MDH levels in the hepatitis group were considerably lower than NC, but MDH levels in alkaloid-rich fraction treated hepatitis rats were substantially higher than Hepatitis (Figure 4). Treatment of hepatitis rats with alkaloid-rich fraction resulted in a larger increase in MDH activity compared to hepatitis groups, as well as a somewhat lower when compared to standard medication Silymarin treatment. There were slight differences in the AF group was observed as compared to the NC group.

It has been reported that mitochondrial destruction is an initial and distinctive hallmark of alcohol liver diseases, and that it plays a role in liver damage etiology. Distended mitochondria with disoriented cristae have been seen in electron microscopy investigations, and experimental animal research have indicated that giving high amounts of ethanol to rats reduces the functional capacities of hepatic mitochondria by a modest but substantial amount.[40] Decrease levels of hepatic enzymes, notably the mitochondrial enzyme MDH, are commonly observed in alcoholics, even when steatosis is the sole histopathological abnormalities and this has supported the idea of mitochondrial damage.[41] It was well understood that higher amounts of free radicals cause mitochondrial damage. Reduced levels of mitochondrial enzymes have been linked to mitochondrial damage in liver disorders. In the same manner, decreased activity levels of MDH have been found in D-galactosamine induced hepatitis rats because of D-galactosamine induces the liver damage by increasing free radicals.[42] In the current investigation, reduced levels of MDH were detected in the D-galactosamine induced hepatitis rat group, which was consistent with previous findings.

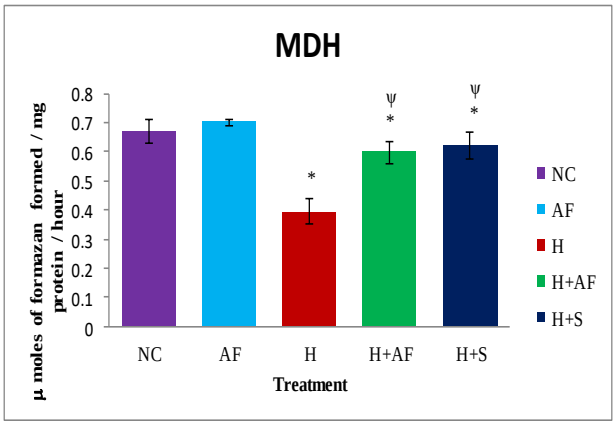

**Figure 4:** Effect of Alkaloid rich fraction of *P. amarus* on Malate dehydrogenase (MDH) activity in the hepatic tissue of male albino rats

Phytochemical secondary metabolites are abundant in medicinal plants. Phenols, flavonoids, and alkaloids are among the most commonly used medicinal formulations. Several investigations have discovered that plant alkaloids and alkaloid fractions protect liver tissue against chemically induced liver damage. The alkaloid fractions isolated from *Murraya koenigii* leaves ethanol extract protected liver tissue infected with chemicals like paracetamol and CCl4.[43] In another study, *Sarcococca saligna* plant alkaloids such as alkaloid-C, holaphylline and sarcovagine-D were reported to exhibit hepatoprotective properties in CCl4-induced hepatotoxicity.[44] The alkaloid fraction isolated from *p. amarus* also protected the hepatic tissue of male albino rats infected with D-galactosamine hepatitis in the current study. Furthermore, plant alkaloids have a number of significant pharmacological characteristics, one of which is free radical scavenging or antioxidant activity. In a study, fangchinoline and Cepharanthine from the *Stephania rotunda* plant scavenge free radicals such as DPPH, ABTS, and superoxide radicals *in vitro* antioxidant assays.[45] Hence, it is very clear that alkaloid fraction of this study also might be scavenges the free radicals in hepatitis rats. At the same time alkaloid fraction protected liver tissue under the hepatitis by increasing the MDH levels in this study. Furthermore, silymarin also exhibited highest hepatoprotective property by increasing MDH leaves. Hence, alkaloid fraction from *Phyllanthus amarus* is protected liver tissue by preventing free radicals, mitochondria damage and increasing MDH.

GDH levels in the hepatitis group were significantly lower than NC, but GDH levels in alkaloid-rich fraction treated hepatitis rats were substantially higher than Hepatitis (Figure 5). Treatment of hepatitis rats with alkaloid-rich fraction resulted in a larger increase in GDH activity compared to hepatitis groups, as well as a somewhat lower when compared to standard medication Silymarin treatment. There were slight differences in the AF group was observed as compared to the NC group.

The current study indicates that in hepatitis rats, GDH activity was significantly reduced. The reduction in GDH function is due to the enzyme's inactivation by higher ammonia levels (product-inhibitor), which reduces the enzyme's kinetic effectiveness.[46] Drug injuries, ischemia injuries, metabolic illness, toxins and viral infections, are some of the causes of hepatic necrosis. Liver necrosis induced the damage of mitochondria which induce the release of mitochondrial enzymes. In the present study, increased mitochondrial membrane fluidity and subsequent mitochondrial enlargement may affect the activity of the mitochondrial enzyme GDH, which in turn may affect the state of mitochondrial NAD depletion in hepatitis. The reduction in GDH activity implies that during the hepatitis condition, the mechanisms of deamination and amination that regulate ammonia toxicity in the kidney are also disrupted.[47] In GDH knockout mice, however, a lack of GDH in liver leads to greater in circulatory ammonia and a reduction in the detoxification mechanism into urea, altering ammonia metabolism. The same study discovered that a lack of GDH in the liver causes metabolic changes such as changes in gluconeogenesis, the use of lipids instead of carbohydrates for energy generation, and an influence on food intake circadian rhytms.[48] Hence it is very supportive to the present investigation that decreased levels of GDH in hepatitis rats may induces the all the above said alterations in rats body.

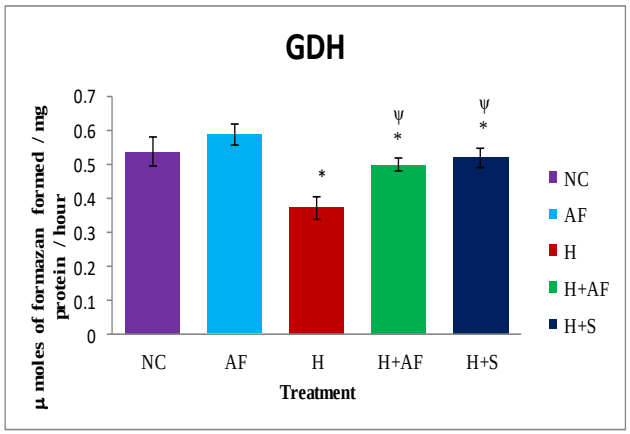

**Figure 5:** Effect of Alkaloid rich fraction of *P. amarus* on Glutamate dehydrogenase (GDH) activity in the hepatic tissue of male albino rats.

Alterations in GDH activity is caused by ethanol exposure to progressive mitochondrial modification and degradation. The reduction in GDH activity is due to the enzyme's inactivation by higher ammonia levels, which reduces the enzyme's functional effectiveness. Besides, high ammonia and lactate levels, according to another study, inhibit GDH function.[46] The elevated LDH seen in this study is consistent with the fact that lactate limits GDH action. Means hepatitis rats exhibited elevated LDH which intern increase lactate, such lactate inhibits the GDH.

Many medicinal plants have been studied in vitro and *in vivo* for their hepatoprotective efficacy against CCl4, d-galactosamine, paracetamol-induced liver damage, and viral-infected hepatitis. These plants have been prevented

hepatic damage by inhibiting oxidative stress caused by chemicals and virus. plants with antioxidant property is major agent in reducing oxidative stress whereas this property is associated with phenols, flavonoids, terpenoids, alkaloids and may other plant secondary metabolites.[49] Plant extracts, separated fractions and isolated compounds protects the liver damage from chemicals and others. In this connection, plants having liver protection by increasing MDH also studied. For example, *phyllanthus niruri, Croton hypoleucus, Vicia calcarata Desf* have been protected liver damage by reducing oxidative stress and increasing MDH in animal models.[50] Similarly, alkaloid rich fraction isolated from *P. amarus* and silymerin, in this study, were also protected the liver tissue from oxidative stress by increasing MDH levels. Hence, these fraction and compounds are suggestive agents to treat hepatitis associated with oxidative stress.

## CONCLUSION

The findings of this study reveal that the alkaloid fraction of *P. amarus* is a rich source of oxidative stress relievers which enhance oxidative stress marker enzymes in hepatic tissue under hepatitis conditions. In future, the mechanism of action of the alkaloid fraction must be determined, as well as the isolation of individual alkaloid compounds is necessary to be done.

Dr.V. Sailaja, Head I/C, Dept. of Botany, Assistant Professor of Zoology, Vikrama Simhapuri University P.G Centre, Kavali, Nellore Dist., PIN-524201

**BRIEF PROFILE**

Dr.V.Sailaja has been working and contributing to the field of organic farming, & environmental science related to bio-diversity and aquaculture. She has 31 years of teaching and Research experience. She was awarded Gold medal in M.Sc Zoology by Sri Venkateswara University, Tirupathi. She has 58 research publications in reputed highly scopus national and international journals and presented more than 50 papers in various National and International seminars and conferences. She attended 25 national and International workshops. She attended more than 50 online seminars and workshops. She has received many honourary awards. Some of the important awards are Best women award-2011, State Best Citizen of Andhra Pradesh Award -2011, International Women of Distinction Award in Sciences -2016, Bharath Vikas National Award -2016, Outstanding Educator and Scholar Award-2017, National Distinguished scholar and Icon -2017, Exemplary Teacher Award -2018, Outstanding National Science service Award -2019, National Distinct Women Educator and Scholar award-2021. She has organized three National Seminars, one National Symposium, one National Workshop, one National webinar, one International Webinar and one training programme on skill development. Two PhD's were awarded under her able guidance. Presently she is guiding three Ph.D students. She Worked as Co-Ordinator, Eco-AIR Project, A.P State science centre, Amaravathi. This project was sanctioned by DST, New Delhi.She has done minor research project on "Ecological Study of Mangroves at Chippaleru Estuary Lakshmipuram Village Thummalapenta, Kavali, SPSR Nellore". She has published 15 books and her biodata was published in books The Magnificience of Humbles and Imminent Researcher and Scholar Icon 2017. She held different positions like In-charge for Central Instrumentation Facilities scheme under UGC Programme in J.B Degree and p.g college, Kavali, worked as HOD, Dept of Biotechnology, J.B. Degree and P.G. College, Kavali, worked as Head In-charge, Department of Zoology, and presently working as Head In-charge, Department of Botany, Vikrama Simhapuri University Post Graduate Centre, Kavali. She acted as paper setter for different Colleges and various Universities. She worked as In-charge for Biotechnology Park at Jawahar Bharathi College, Kavali performing various activities like 'Spirulina Cultivation', 'Mushroom Cultivation', 'Green House and Shady House maintenance', 'Vermicompost and Biopesticide preparation'. She is an Associate fellow of A.P Academy of Sciences. She worked as Co-ordinator, Eco-AIR Project, AP State Science Centre, Vijayawada. She is an Editorial Board Member and reviewer for various reputed journals. She is a life member in Association of Biotechnology and pharmacy, ISCAP, Indian Science Congress and All India Association for Educational Research.

Running title : Natural products and drug discovery

## Abstract

Natural products have a long history of clinical use and are rich source of bioactive compounds. The development of tools and techniques for identifying and analyzing NP bioactive compounds to ensure their quality and discover new drugs is thus very important and still in demand. The developmental prospects in bio-medical, health, nutrition, and other interrelated sciences along with some of the emerging trends in the subject area are also discussed as part of the current review of the basic and core developments, innovation in techniques, advances in methodology, and possible applications with their effects on the sciences in general and natural products chemistry in particular. The present study showed that the in-depth analysis of the drug relationships extracted from the literature-based network sheds new light on drug discovery research. The results also suggested that certain drugs could be purposed for treatment of various ailments.

**Keywords:** Natural products, Drug discovery

## Introduction

Natural products are the source of active ingredients in most of the drugs. The current era has witnessed an ever changing role in modern drug discovery. Natural product based medicines also flourished in the Orient. Charaka Samhita, the first treatise devoted to the concepts and practice of Indian Ayurveda, was written around 900 BC and contains 341 plant derived medicines. The Sushruta Samhita (Circa 600 BC) was mainly devoted to surgical practices, but also described 395 medicinal plants and 57 animal derived products (Dev, 1999).

Historically, natural products served as important drug leads against a wide array of human diseases. From 1981 to 2014, among all of the 1211 approved small-molecule therapeutic agents, natural product related drugs could account for almost 65% of the marketed drugs, which were either used unaltered or developed based on the naturally occurring structures. (Newman & Cragg 2016).

Natural extracts can be sourced in huge number of plants materials and includes primary and secondary metabolites as proteins, fats and oils, dietary fibers, sugars, antioxidants, essential oils and aromas, and colors. They are largely used as ingredients in the food processing industry for their texturing, reservative or coloproperties, and as active compounds in cosmetics or pharmaceuticals. Conventionally, such extracts are obtained using solid-liquid ring extraction considered as a unit operation. Extraction process is composed of several unit operations such as pre-treatment of plant material (drying, grinding…) and post-treatment of liquid extract (filtration, concentration, purification). The most crucial unit operation in the process is solid-liquid extraction, particularly when it is not optimized, is often time and energy consuming, induces the use of huge amount of water or petroleum solvents harmful for environment and users and generates large quantity of waste. Moreover, resulting extract is not always safe as it may contain residual solvents, contaminants from raw material, or denatured compounds due to drastic extraction conditions.

Natural medicines have been extensively used for thousands of years in many regions of the world, including China, India, USA, Russia etc. These medicines have gained increasing popularity in many western countries in recent years due to their reliable therapeutic effects. (Hu et al 2012; vikram et al., 2014). In the past 30 years, the percentage of use of natural products for the treatment of different diseases has risen to 50%. With increasingly extensive application of natural medicines and their bioactive ingredients for disease treatment, therapeutic responses need to be clearly identified to ensure their therapeutic efficacy and safety.(De Gorter et al., 2012;Patridge et al., 2016).

Recent scientific findings, concerning the medicinal applications of bioactive substances from plant extracts, have sparked more interest for further development of novel plant-based pharmaceuticals (Verpoorte 2009). This initiative might be very important for more than 80% of the world's population, who are still largely reliant on plant-based medicines and natural products as a primary source of treatment (Beyene et al., 2016). About 500 various herbal species have been used in modern medicine to treat various illnesses based on anti-inflammatory antioxidant properties of plant derived drug-like substances. The last decade

has witnessed an unprecedented growth of herbal medicine all over the world (Barnes et al., 2007; Pathak & Das 2013).

The chemical methods adopted for the discovery of the molecules have also undergone changes leading to the development of technologies such as combinatorial chemistry (combichem), microwave assisted organic synthesis (MAOS) and high-throughput (HTS) biological screening. These new technologies have enabled medicinal scientists to accelerate the discovery process. Drugs are designed, synthesised and purified as the first stage of the development process. The medicinal chemist leverages knowledge of synthetic chemistry, medicinal chemistry and biology to achieve the lead molecule for further clinical development.

The contribution of chemistry is not confined just to the discovery stage. It carries its purpose along the entire spectrum of clinical development. Each and every stage of clinical development involves surplus amounts of formulated drugs for studying potential benefits in human trials. All drugs are manufactured under strict Good Manufacturing Practices (GMP) standards to ensure they meet the compliance requirements drafted by regulatory bodies. Drug developers leverage on the analytical chemical testing and process development for meeting the regulatory compliances. It is estimated that about 50% of the analytical chemistry services are outsourced. The majority of these support services are now being rendered by Contract Research Organisations such as Charles River Laboratory, Covance, Quintiles, PPD, Eurofins, SGS Life Sciences, Wuxi AppTech, etc. Analytical methods and instrumentation are regularly used in the preclinical testing, toxicity testing, ADME analysis, product release testing, formulation and quality control.

In short, chemistry remains the most invaluable science and plays the most critical role in the drug development process. It serves as the backbone to framework the drug discovery and bolstering the growth of the pharmaceutical industry.

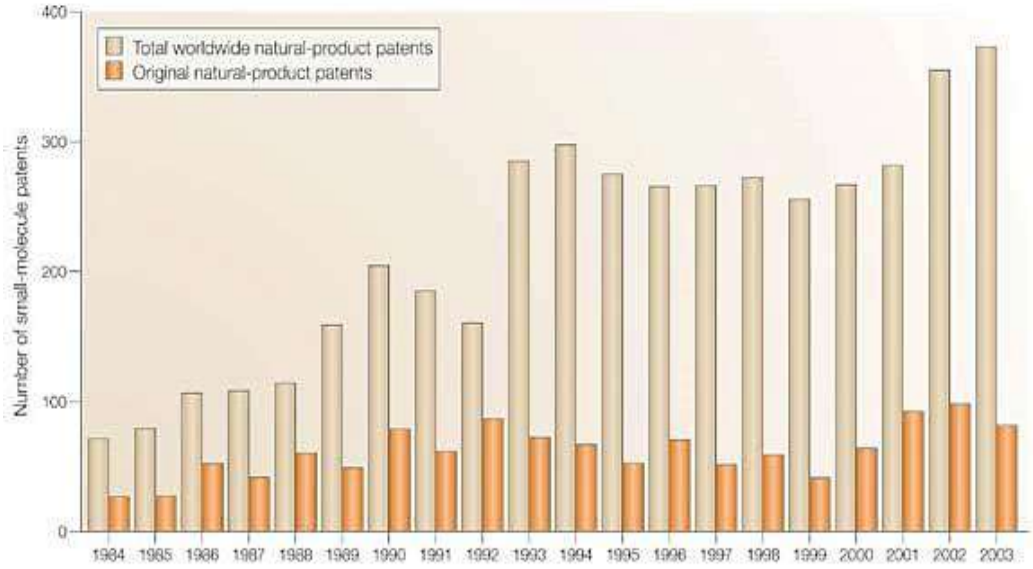
Many chemists and biologists have attempted to explain the puzzle of why so many compounds in nature have biological effects in humans and other species. One explanation that has been widely accepted is that it is the result of long term coevolution within biological communities: interacting organisms that evolved in close proximity to one another developed compounds that could influence the biological processes of neighboring species. As these compounds proved to be advantageous, they became a trait on which natural selection could act, and were retained and improved throughout the course of evolution. Given the similarities between aspects of human physiology and that of other animals, it is not

surprising that such molecules can also exert biological effects in humans. For example, many chemicals that plants evolved to defend themselves against herbivores are now used as laxatives, emetics, cardiotonics or muscle relaxants in humans. In addition, humans have taken advantage of some of the discovered properties of natural compounds: those that are able to interact with or suppress the growth of bacteria, for example, are now used as antimicrobial drugs in medicine.

Drug discovery and development is one of the most complex and expensive activities within the framework of the pharmaceutical industry. It encompasses a wide array of end-to-end activities with a plethora of supply chain and support services. It is estimated that the average cost to research and develop each successful drug is between $800 million to $1billion (Paul et al., 2010). Drug discovery and development can be classified into discovery phase, preclinical phase and early stage development, mid stage development and late stage development. Drug discovery has undergone many changes over the years but the goal has remained same: to uncover safer medicines for all diseases. Drug discovery and development is driven by the knowledge of chemistry of the molecules and their association with life process.

Historically, drugs were discovered through identifying the active ingredient from traditional remedies or by serendipitous discovery. Later chemical libraries of synthetic small molecules, natural products or extracts were screened in intact cells or whole organisms to identify substances that have a desirable therapeutic effect in a process known as classical pharmacology. (Takenaka 2001; Lee et al., 2012). Since sequencing of the human genome which allowed rapid cloning and synthesis of large quantities of purified proteins, it has become common practice to use high throughput screening of large compounds libraries against isolated biological targets which are hypothesized to be disease modifying in a process known as reverse pharmacology. Hits from these screens are then tested in cells and then in animals for efficacy.

Drug discovery has changed over the years but the goal remains the same: to find safer medicines for the deadliest diseases. Traditionally, the discovery of new drugs has arisen from observations that various plant extracts possess interesting biological effects. However, early users of such plant extracts did not understand or realize which components in the material were responsible for achieving these therapeutic benefits. The main difference between modern and age-old medicine is identifying the composition of matter, or the active form, within the medicine itself. This modern drug discovery and development is mostly a



complex, expensive, time consuming and market-driven process with very few novel drug candidates actually making it through the Food and Drug Administration (FDA) for approval. Discovery and development of new drugs does not rely so much on miracles or serendipity anymore, but instead utilizes highly planned processes involving cutting edge technologies. The previous era of modern drug discovery was dominated by chemistry, whereas now a more rational approach is employed where knowledge about enzymes and receptors has required a unique dialogue between chemists and biologists.

Modern drug discovery involves the identification of screening hits, medicinal chemistry and optimization of those hits to increase the affinity, selectivity (to reduce the potential of side effects), efficacy/potency, metabolic stability (to increase the half-life), and oral bioavailability. Once a compound that fulfills all of these requirements has been identified, it will begin the process of drug development prior to clinical trials. One or more of these steps may, but not necessarily, involve computer-aided drug design. Modern drug discovery is thus usually a capital-intensive process that involves large investments by pharmaceutical industry corporations as well as national governments (who provide grants and loan guarantees). Despite advances in technology and understanding of biological systems, drug discovery is still a lengthy, "expensive, difficult, and inefficient process" with low rate of new therapeutic discovery. In 2010, the research and development cost of each new molecular entity was about US$1.8 billion. Drug discovery is done by pharmaceutical companies, with research assistance from universities. The "final product" of drug discovery is a patent on the potential drug. The drug requires very expensive Phase I, II and III clinical trials, and most of them fail. Small companies have a critical role, often then selling the rights to larger companies that have the resources to run the clinical trials.

Finding viable drug targets (the so-called biological approach) (Overington et al., 2006) has become increasingly used in recent decades with the advancements in the field of genomics and proteomics. A medicinal chemist uses this information to seek out relevant targets capable of being affected by the addition of compounds. These specifically synthesized drug molecules are proposed, synthesized and tested for direct action on these protein targets in order to effectively treat a wide variety of illnesses. In previous times, “classical medicinal chemists” would modify the existing bio-active molecules from natural products. These natural products were the source of most of the active ingredients in most medicine (Newman & Cragg 2007). With the help of molecular biology in combination with computer-assisted drug design, medicinal chemists can now rationally design new drug

molecules with known targets in mind. These compounds would have computational data encouraging the intended results even before they screen. This saves time and allows for a more comprehensive understanding of the drug-target interplay. To succeed in the discovery process medicinal chemists have to perform these initial important tasks: i) identification of lead molecules which have the desired biological activity using new technologies such as HTS and combinatorial chemistry ii) the lead modification or optimization which could be done by employing structure-activity analysis (SAR) in order to improve the desired pharmacological properties by considering absorption, distribution, metabolism, and excretion (ADME) profile, and iii) scale-up of the optimized lead for further drug development process and efficacy testing.

Figure 1 shows worldwide pharmaceutical small-molecule natural-product patents granted in the years 1984–2003.

The chart shows a period of increasing patent activity through the 1980s, a flattening or even slight decline from 1990 to 1999, and a pickup of activity between 2000–2003. In the context of worldwide pharmaceutical R&D spending, which essentially tripled from roughly US $10 billion to US $30 billion over the same period, the overall trend in the 1990s can be viewed as a relative decline.

Fig. 2.Natural products have already made extensive contributions to society. The finding that the chemical space they occupy is largely bounded paradoxically reveals substantial opportunity for future impact.

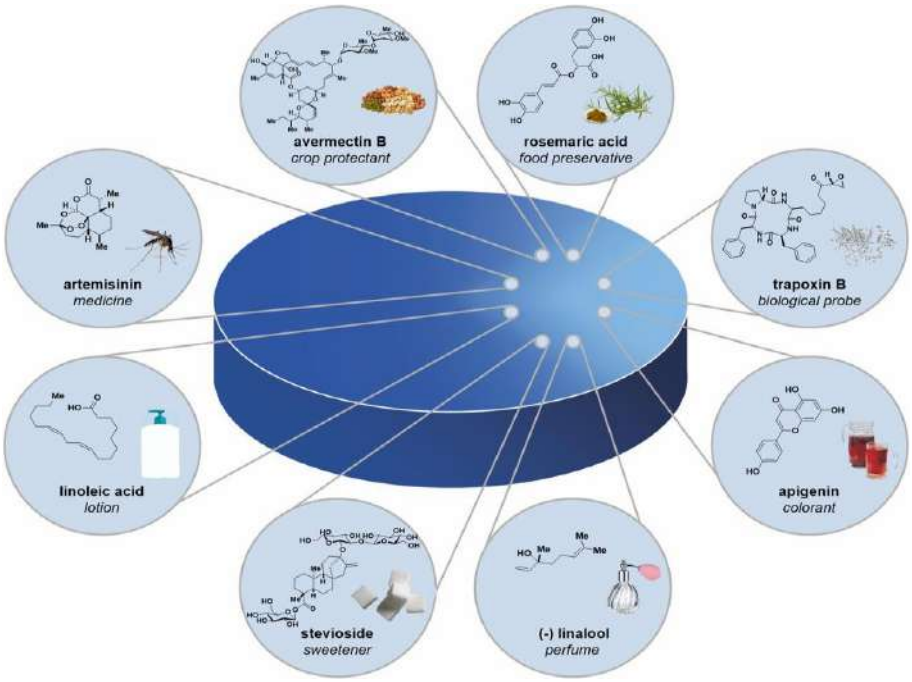


Figure 3: Drug discovery cycle

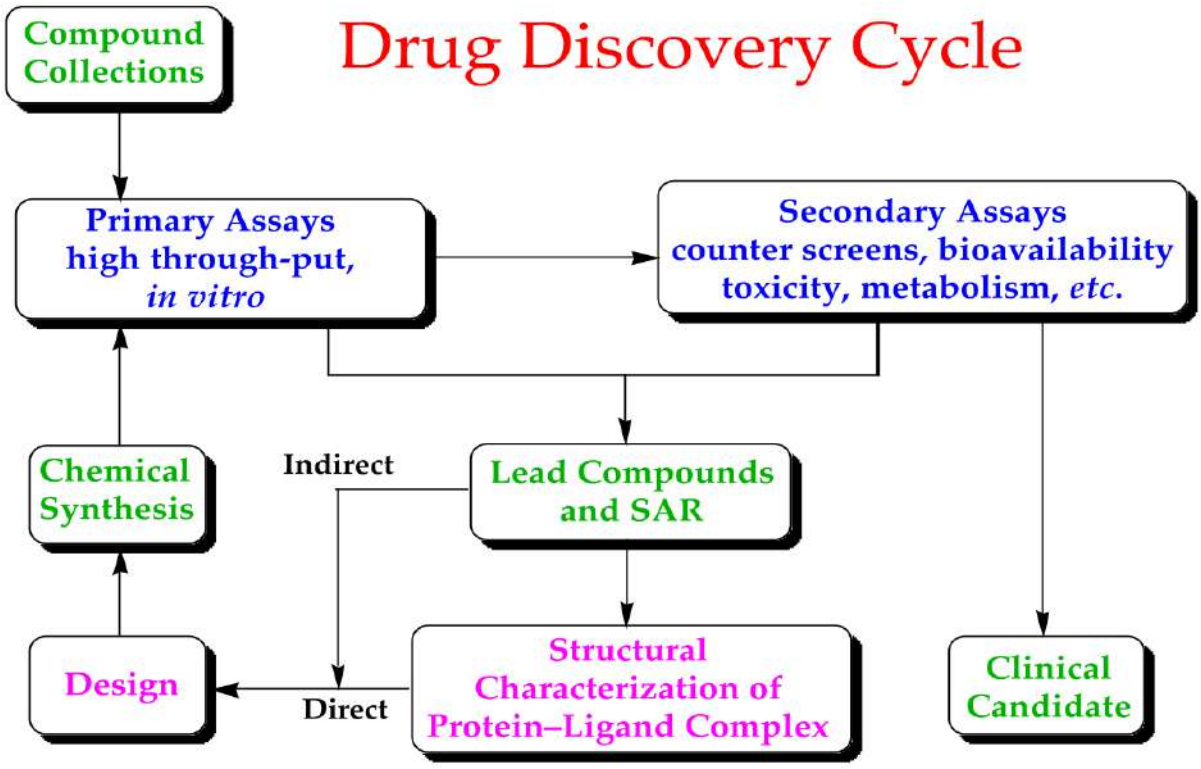

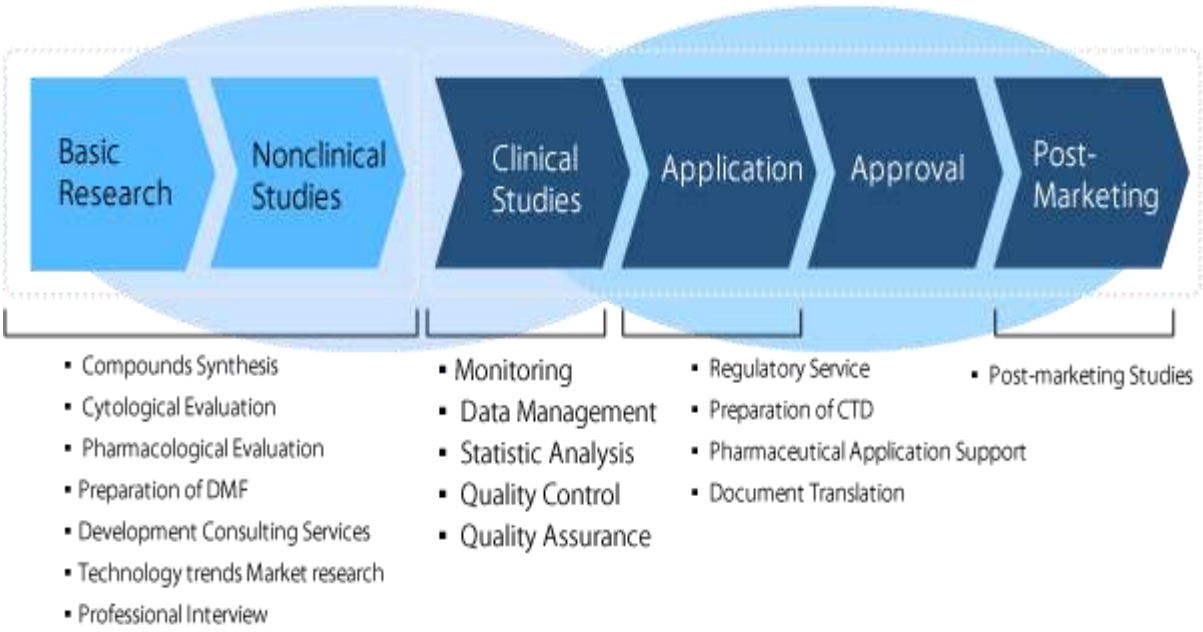

Figure 4 : Stages in the dug discovery

**Conclusion:**

In summary, new biological targets, methodologies and advanced computing have improved modern drug discovery and have given medicinal chemists and biologist a more profound skill set and toolkit to grasp the nuances of disease pathophysiology.

## ABSTRACT

This study is aimed at presenting the existing nanoscience in the cell. Nature itself is an excellent nanotechnologist. Nature provides us with a range of fine particles. Cell is the structural and functional unit of life. Any living body in general and the cell in particular is considered as an museum for nanoscience. It is amazing to note that all living organisms consist of a variety of nano structures. It is the basal metabolism, environmental influence that transforms certain structures into nano structures by evolution. In this paper a review is presented in a novel way integrating the nanoscience with cell and cell organelle

**Keywords**: Nano Science, Human Body, Organ system

## INTRODUCTION

Each biological activity whether catabolic or anabolic is tailored from the nanoscience. In all the living being the activities are performed at a nano level, the cumulative effect of these nano actions result in any of the life processes. Nature itself is an excellent nano technologist, there are a number of natural processes were the application of nanoscience is seen. In day to day activities all the living beings are completely associated with the manifestations of nanoscience. If we consider the theory of evolution the manifestation of nanoscience is flavored. Nanoparticles are peculiar and unique in their properties and nature. Nanoscale materials have far larger surface areas than similar masses of large scale materials. As surface area per mass of a material increases, a greater amount of the material can come into contact with surrounding materials, thus affecting reactivity. One benefit of greater surface area and improved reactivity in nanostructured materials is that they have helped create better catalysis. As a result, catalysis by engineered nanostructured materials already impacts 1/3 of catalyst market. Large surface area also makes nanostructured membranes and materials ideal candidates for water treatment and desalination, among other uses.

## REVIEW OF LITERATURE

Literature review was done to explore the nanoscience, nanotechnology in biological activities. Most of the literature is on nanotechnology and its applications in industry

and agriculture and human health care. These concepts were considered and implied to the metabolic activities of the cell. One medical example of nanotechnology is the bio barcode assay, a relatively low-cost method of detecting disease-specific biomarkers in the blood. The bio –barcode assay has proven to be considerably more sensitive that conventional assays for the same target biomarkers, and it can be adapted to detect almost any molecular target.

## DISCUSSION

Globally nanotechnology and its diverse products are omnipresent and form an integral part of our life style. Nature itself is a skilled nanotechnologist, with numerous examples of common nano materials in the living organisms, indeed life revolves around cells which themselves are microscopic in size and metabolize molecules which are pico to nano in size, precipitation, oxidation, reduction are the natural processes involving the nanoparticales . It is estimated that there are more that 100 million living species on the earth today. Each living organism consumes free energy to create and maintain its organization; this free energy drives complex system of chemical processes at nano level.

Cell is an unique entity where there are no of cell organelle with a specific boundary the cell membrane . If we look into the basic structure of the cell the main components are cell membrane, cytoplasm and cell organelle. These components are interlinked and integrated at nanolevel. Cell membrane or Plasma membrane is a biological membrane which formed by the assembly of biomolecules i.e., proteins and lipds at nano scale. This nanonature of the cell wall is responsible for its unique properties of selective permeability a rare phenomenon in the biological systems. If we go deep into this phenomenon of selective permeability, transport across the membrane the manifestation of nanotechnology can be visualized. There is nothing in the living organisms, but with certain chemicals for its own, obeys the physical laws. However the chemistry of cell is very unique. There is 70 % of water in the cell, which recalls water is the medium for the life supporting chemical reactions. Matter is made of combination of elements, likewise the cells too. However the characteristic feature of the cell is the way in which the atoms are linked together in groups to form molecules. Atoms are so small that it is hard to imagine their size, for example the carbon atom is roughly 0.2 nanometer in diameter. There are 89 naturally occurring elements, each differing form the other. Living organisms, however are made of only a small selction of these elements .i.e,., carbon 0.2 nm radius (C) , Hydrogen 0.12 nm radius (H), Nitrogen 0.15 nm radius (N), and oxygen 0.14 nm radius (O) , make up 95 % of organic weight. Water accounts for 70% of a cell's weight, and most intracellular reactions occur in an aqueous environment. Life on the Earth began in the ocean, and conditions in that primeval environment put a permanent stamp on the chemistry of living things. Life therefore depends mostly on the properties of water. Most of the biological activities are based on the reactions of the elements H and O. Similarly C also plays an important role as an element in the living organisms (Table: 1 )

| Sl No | Building blocks of life at Nanolevel | Large Units of life |
|---|---|---|
| 01 | Monosaccharide- sugars (1 nm) | Polysaccharides |
| 02 | Fatty Acids (4-200 nm) | Fats, Lipids and Membranes |
| 03 | Amino acids (0.1 -1 nm) | Proteins |
| 04 | Nucleotides (0.33 nm) | Nucleic Acids |

Table: 1, Size of bimolecules at Nano level

## CONCLUSION

Life is an autocatalytic process, where the nano particles of nucleotides, amnioacids, provide the information. With the above discussion it may be concluded that the nano particles are the basis of life process. Nanotechnology is entering many industry sectors including plastic, energy, electronics, and aerospaceResearch is going on the nanotechnology imply with the life processes. These studies pave way for the improvement of human health. Nanomaterials are playing very important role in generating environmental friendly and treating pollutants effectively. The environment is protected by using nanomaterials in Fuel cells and solar cells which gives long lasting power which can be used in all electrical, mechanical, agricultural and electronic devices instead of burning fuels eliminating pollutants. Nanotechnology has the potential to generate radically new food products, and this technology is increasingly employed in the areas of food production and packaging.

# SUSTAINING QUALITY IN HIGHER EDUCATION

**Dr. I.S.Chakrapani[1], A. Indira Priyadarsini[2], Dr.K.N.Sundareswara Rao[3]**
[1]IQAC Coordinator, PRR & VS Govt. College, Vidavlur, Nellore Dist
[2] Lecturer in Botany, SVA Govt. College, Srikalahasti
[3] Lecturer in Telugu, Govt. College for Men (A), Kadapa

**ABTRACT:**

Quality assurance in higher education is the need of the hour in Indian scenario. Quality of any higher education institution is measured by carefully devised bench marking. Indian Higher education has developed by leaps and bounds since independence, but quality is questionable. Many challenges need to be addressed. This paper critically examines the challenges faced by Indian Higher education in brief and the steps to be taken to sustain and assure quality.

**Key words** : Quality, Quality Assurance, Higher Education

***"Excellence in thinking and action is the foundation for any mission. Excellence is not by accident. It is a process, where an individual or organization or nation continuously strives to better oneself"***

***-Dr. APJ Abdul Kalam***

Higher education of any country is an enabler to attain economic growth, a vehicle for wealth generation and technological progress. Ancient India was a centre of excellence, as detailed in the chronicles. British invasion transformed Indian education to their colonial needs. At the time of independence, only 20 universities and 500 colleges were existing. There were about 2.1 lakh students pursuing different courses in higher education. After independence, there has been an asymptomatic growth of Indian Higher Education. There is a growth of 47.9 times in the case of the Degree awarding Universities, 82.02 times in the case of Colleges. The students enrolment has increased to over 174.49 times in the system of higher education in comparison to the times of Independence. With more than 990 universities, 40000 colleges and 5000 technical institutions, India has the second biggest higher education system in the world. This is quite enchanting. But the other side of the coin portrays a gloomy outlook. Poor student –teacher ratio, exclusivity, lack of research culture integrating institute and industry are the main short comings.

The challenges faced by higher education in India include -

- Gross enrollment ratio is still less than 30%
- Mere degree holders are being produced, not intellectuals
- Degrading environment consciousness, values & ethics among youth
- Insufficient global competitiveness and employability in Indian youth
- Higher education is not still inclusive, not extended to the masses

- Competent faculty are not being attracted to work in this arena
- Lacking world class institutions and research facilities at higher education level
- Quality of academic research is poor
- Applied research is not upto the global bench mark
- Lack of innovation culture
- Higher education institutions are not able to get a place in global rankings
- Industry-institution interaction is very poor

Amidst these challenges, 'quality' is a big question mark. Though the National Assessment and Accreditation Council (NAAC) has been instrumental in generating a quality consciousness and quality culture among the Higher Education Institutions in India, still many are out of NAAC framework. According to the British Standards Institution, "the totality of features and characteristics of a product or service that bearon its ability to satisfy stated or implied needs". The concept and culture of quality is essential for accountability, credibility, visibility, image and brand value of any institution. It is also required for getting through the competition and maintain standards. In the light of the challenges mentioned above, there is a dire need to expand the accreditation frame work to include more and more Higher education institutions. Since its institution in 1994, NAAC has instilled quality culture in Indian Higher education, while travelling through the path of resistance to acceptance, acceptance to appreciation and appreciation to enlightenment.

In the context of higher education, Quality assurance is a "systematic management and assessment procedures adopted by a higher education institution or system to monitor performance and to ensure achievement of quality outputs or improved quality". Quality assurance aims at giving stakeholders confidence about the management of quality and the outcomes achieved. Quality Assurance indicators framework and benchmarking is effectively devised by NAAC on par with global standards. As afore said, NAAC is successful in motivating Higher Education Institutions to volunteer for assessment, quality sustenance is questionable due to the challenges faced by our higher education system. The following may help sustain quality.

**Steps to sustain Quality:**

1. Steps shall be taken to improve the graduate outcomes. At the minimum, 50% of students should secure employment or pursue higher education
2. Curriculum shall be framed in such a way that at least 60% of the Under graduate students engage themselves in socially productive nd economically viable activites during the period of their study.
3. Students pursuing UG courses shall be trained in soft/life skills that lead them to be better citizens in the changing global scenario
4. Vacancies of teaching positions shall be filled from time to time and all the teachers must be trained in their respective domains and methodologies to carry out teaching-learning transaction effectively
5. All institutions shall get NAAC accreditation within a prescribed time limit.

6. Outcome based curriculum shall be implemented immediately.
7. There should be continuous evaluation of learning outcomes, with a combination of formative, interim and summative evaluation.
8. Faculty should be given professional enrichment continuously by way of awareness programmes about emerging trends and empowered technologically in assisting teaching technologies.
9. All educational administrators must be given leadership training to realize national educational goals.
10. Higher educational institutions shall be connected to local communities and industries.
11. While research is promoted, the same should be integrated with community well being in particular and national well being at large. Quality research should be encouraged.

ABSTRACT:

Emergence of novel corona virus (SARS-CoV-2) in 2019 has marked the third major event after Severe Acute Respiratory Syndrome Corona virus (SARS-CoV) in 2002 and the Middle East Respiratory Syndrome Coronavirus (MERS-CoV) that introduced pathogenic coronavirus into human populations on a global scale. The disease caused by SARS-CoV2 is named Corona Virus Disease (COVID-19). This pandemic spread over 205 countries including India and has become a public health emergency. As on 06th April 2020, 3577 cases are reported in India, out of which 83 died. While the Govt. of India is taking all the measures including lock down, to control the pandemic, efforts have been intensified to device low-cost indigenous testing kits and discover potential therapeutic agents to combat the pandemic successfully. The present paper reviews the impact of COVID-19 on cancer patients suggests measures needed to help in this emergency.

**Key Words:** COVID-19; Corona virus; Lock down; Health emergency; Public health

## INTRODUCTION:

The outbreak of novel corona virus - 2019 was first reported on December 31, 2019 from Wuhan city of Hubei province in China[1]. The outbreak started as a cluster of pneumonia cases, caused by a new Corona virus[2]. Number of new cases are reported all over the world, including India. On 30th January 2020, the World Health Organization (WHO) declared global Public Health Emergency[3]. There have been many remedial measures taken by government of various countries across the world, which include travel restriction, awareness campaigns, timely release of guidelines & health bulletins by authorities and even lock down.

## CORONA VIRUSES:

Corona viruses are positive sense RNA viruses, having spike like projections on the surface which render them a crown like appearance[4]. In the past, two major outbreaks of coronavirus infection caused much damage. In 2002, Severe Acute Respiratory Syndrome (SARS) coronavirus[5] and in 2012 Middle East Respiratory Syndrome coronavirus (MERS-CoV)[6] emerged causing potentially life-threatening respiratory tract infections[7].

## NOVEL CORONA VIRUS-2019 AND ITS TRANSMISSION:

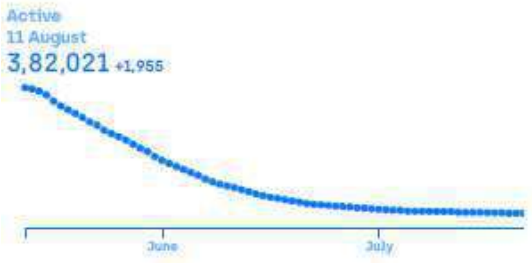
The novel corona virus responsible for COVID-19 also belong to β-genera of corona viruses. This belongs to the subgenus *sarbecovirus*, subfamily

orthocoronavirinae[8] and is named as SARS-CoV-2, by the Corona Virus Group (CSG) of the International Committee on Taxonomy of Viruses[9]. The genome of the SARS-CoV-2 was sequenced[10], and it is found to have 79 % similarity with the genome of SARS-CoV and 96.2% similarity to a bat CoV RaTG13[11]. As per the availability of data as on the date of writing this paper, it is assumed that the SARS-CoV-2 might have transmitted from bats, which are the most likely reservoirs, to human beings, employing an unknown intermediate host[12,13]. Studies reveal that the new virus emerged as solitary species jump from possibly a mammalian intermediary host[14]. It is established by now that the SARS-CoV-2 infects humans utilizing the angiotensin converting enzyme 2 (ACE 2) as the receptor[11]. Probably the bat coronavirus and novel corona virus might have emerged from same ancestor [15].

The basic reproduction number (Ro) of the novel corona virus is estimated to be about 2.2[16] or even more. Evidences of pneumonia cases indicate the human-to-human transmission of this virus[17], possibly through a mammalian intermediary host[14]. SARS-CoV-2 has 10-20 times higher affinity towards humans than SARS-CoV[1]. The transmission is taking place at alarming rates. Nosocomial infection among healthcare workers and patients, contact-transmission among family members and droplet infection in crowded areas are of critical concern at this juncture.

## COVID-19 CLINICAL SYMPTOMS:

The common clinical symptoms of COVID-19 infection include cough, tiredness, production of phlegm, sore throat, headache, fever and shortness of breath [18]. Fever and cough are dominant, while diarrhoea and vomiting seem less common [19]. Manifestation of the disease suggests that viral tropism differs among SARS-CoV-2[20], SARS CoV[21], MERS-CoV[22] and influenza[23]. While a few of the patients were quite asymptomatic, few others developed acute respiratory distress syndrome, septic shock, multi organ dysfunction and metabolic acidosis that was difficult to correct[24]. Disease progression is associated with high levels of inflammatory cytokines[25]. While majority of the patients exhibit lymphocytopenia[26,27], severely affected patients showed renal involvement [28]. Elderly male patients, who have comorbidities showed higher death rate and risk as well[29]. The overall fatality rate is apparently less, between 2-3%[30], but the absolute numbers are very high. Neonates and elderly people must be taken care of to reduce the death rates due to COVID-19. Therapies aiming to disturb virus entry into host may prove good to combat the disease [31].



## COVID -19 IN INDIA:

The first COVID-19 case in India was recorded in Kerala state on30th January 2020[32]. By 2nd February 2020 two more cases were recorded. Then there was a brief pause, and by 07th March 2020 the number of cases raised to 34. There has been a steady increase in the number of cases. On 06th April 2020, at 16.58pm, the number of cases all over India raised to 4067 (Image 1) as per the announcement of Ministry of Health and Family Welfare, Govt of India (GOI)[32]. There has been a steady raise in the number of cases, and the situation is alarming, as it is globally.

The Govt. of India has taken good measures to contain COVID - 19 transmission including the lockdown imposed on 23rd March 2020, after a one-day Janata curfew call given by the Prime Minister of India. GOI has taken a number of good initiatives including regular announcements, awareness programmes on use of sanitisers, social distancing & home quarantines, and issue of advisories and release of various guidelines for management of the disease outbreak and related issues from time to time. As of 05th April 2020, India is classified as being in local transmission stage by World Health organization (WHO)[33]. The second wave badly hit India in the month of March 2021, with the COVID-19 spreading to the nook and corners of the country. Many causalities happened, and people in the age group of 21-45 were even affected worst.

Gradually the curve was flattened among hue and cry of a possible third wave. As on 12th August 2021, at 8.00 am IST, there were 3,87,987 active cases reported with a net positivity rate of 1.2%[34].

Image 1: Spread of COVID-19 in India as on 12th Aug 2021

(Source:, https://www.covid19india.org/ accessed on 12.08.2021; 11:35 am)

IMPACT OF COVID ON CANCER PATIENTS:

With the spread of COVID-19, governments have taken various measures from limited restrictions to lockdowns across Indian states. Mobility of people was curtailed. Transborder movement of people was affected. Many decisions had to be taken to safeguard public health at large, sacrificing economic interests. People suffered a lot due to lack of timely access to amenities, resources, health care services. Mass migrations of people were witnessed.

Healthcare providers strived hard to meet the demands. Many people restrained themselves from routine clinical investigations, screening, diagnosis and treatment for non-COVID 19 diseases. So also, people suffering from various cancers could not access health care facilities. The impact of COVID-19 on cancer patients is of concern.

Cancer is characterized by uncontrolled cell growth and their spread to other parts of the body[35]. It is a set of is a set of diseases and the prognosis is influenced by the timing of diagnosis and intervention[36]. There has been an unprecedented competition for health-care facilities during the COVID-19 outbreak, and oncology professionals have had to protect the most vulnerable from a potentially fatal pandemic. The general principle of risk-to-benefit ruled the prioritization of utilization of health-care facilities[37]. Since the onset of pandemic, there is a steep drop in cancer diagnosis across the world[36]. Studies show there has been a decline in the number of tests to screen for cervical, breast and colon cancer by 85 per cent or more after the first Covid-19 cases were diagnosed in India[38].

A drop-in diagnosis and reported number of cases does not necessarily reflect a drop-in incidence of the disease. Many surgeries were cancelled during the pandemic period. Delays in cancer screening and treatment is expected to cause 10000 more deaths over the next decade[39]. Not only cancer care, but also research was impacted much during the time. The vulnerable population of cancer patients suffered a lot due to reduction in the number of outpatient clinics, elective procedures, and from discharging patients from inpatient services[40,41].

In spite of the above, there have been certain positive effects. People accessed diagnostic and therapeutics nearby, avoiding journey. This led to a diversified approach in treating cancer patients. Three tired approach of giving health care to low, medium and high priority regimens is developed[40]. Telehealth and virtual medicine are more utilized.

## CONCLUSION:

Fighting against COVID-19 is no mean to a world war. Fight against the spread of this disease is almost a war without weapons. In these times, a coherent effort from all the stakeholders – policy makers, health care professionals, scientists, educationists and the general public is the need of the hour to contain the pandemic.

Since cancer patients are vulnerable and prone to many an illness, it is time to revisit the priorities of providing health care during the pandemic times. A congenial way of balancing the provision of cancer care while minimizing exposure risk to COVID-19 must be developed.

**Abstract**
Plants have been used since ancient times to cure diseases and to improve health and wellbeing of the populations. Plant diversity is a great source of medicines, while it provides direct economic benefits in the form of timber, food, fibre, industrial enzymes, flavours, cosmetics, emulsifiers, dyes, plant growth regulators, bio-pesticides and biofertilizers etc. The secondary metabolites, alkaloids, saponins, quinones, indoles, anthraquinones, terpenoids, flavonoids, phenolic compounds and amino acids are localised in cells. These have therapeutic properties and responsible for phytochemical markers to identify the genuine drug. *Strychnos colubrina* L. was screened for the presence of secondary metabolites using standard protocols as given by Harborne (1973),Gibbs(1974), Kokate (2001)and Khandelwal (2006), followed by pharmacological evaluation. Methanolic leaf extracts are tested for antioxidant and antimicrobial activities. The results were expressed as standard ± mean deviation (SD) of five replicates. Where ever applicable, the data were subjected to one-way and 2-way ANOVA and differences between samples were determined by with Scheffe's post hoc test, Dunnet's test using the program Statistical Analysis System (SASS V25). P Values < 0.05 were regarded as significant. In the preliminary phytochemical studies, the tannins, phenolic compounds, Alkaloids, flavonoids, Saponins, fats, oils, terpenoids have *shown positive test in Strychnos colubrina.* Glycosides, Lignins, Quinones, Anthraquinones, Anthocyanides, Coumarins, Carbohydrates, reducing sugars and Aminoacids are found to be absent. Sterols are absent in *Strychnos colubrina.* Administration of methanolic leaf extracts of *Strychnos colubrine* (200mg/kg) to have significant detrimental effect on one of 3 bacterial strains used i.e, *Staphylococcus aureus* and it has no effect on other 3 microbes namely, *Bacillus subtilis, Pseudomonas aeruginosa* and a fungal strain namely *Candida albicans.* Methanolic extract of plant leaves of *Strychnos colubrina* has not earlier been reported to have anti-microbial activity. The statistical analysis of the DPPH and $NO_3$ free radical tests with the *Strychnos colubrina* methanol extract has shown significant difference in results with the control groups in both the comparisons. The extracts solution exhibited significant anti-oxidant properties in the both tests Present study is significant and fills the gap in the ethno-medico-botanical repository of Andhra Pradesh.

**Keywords:** methanolic extract, snake wood tree, phytochemicals, antioxidant, antimicrobial, scheffe's post hoc test, dunnet's test

## Introduction

Plants have been used since ancient times to heal and cure diseases and to improve the health and the wellbeing of the populations. Products made out plants for therapeutic or other human health benefits contain either raw or processed ingredients from one or more plants, is the focus of this research. The plant diversity is a great source of medicines, provides direct economic benefits in the form of timber, food, fibre, industrial enzymes, flavours, fragrance, cosmetics, emulsifiers, dyes, plant growth regulators, bio-pesticides and biofertilizers. The biochemicals present in vast majority of the plant species are the great reservoirs of new and potential drugs. They can be used for monitoring the environmental changes. They are the key resources for new genes and biotechnological valuable compounds (Marotrao Dalvi, 2010). Parts of any plant that are used for therapeutic purpose or used a precursor for making a useful drug. This makes it possible to differentiate between medicinal plants whose therapeutic properties and constituents have been established scientifically, and plants that are considered as medicinal but which have not yet been subjected to a thorough scientific study (Sofowora *et al.,* 2013). Medicinal plants are important constitute of flora and are widely distributed in India. The importance of medicinal plants and traditional health systems to solve healthcare problems of the world is gaining increasing attention. Because of this resurgent interest, the research on plants of medicinal importance is growing phenomenally across the world, often to the detriment of natural habitats and mother populations in the countries of origin. In most of the developing countries traditional medical practices have adopted as an integral part of their culture. Medicinal plants form an important pool for the identification of novel drug leads which have proven their value as a source of molecules with therapeutic potential since ancient time (Atanasov *et al.,* 2015). According to Harshberger (1896) the study on ethnobotany has now become a critical need of time.

### India-An 'Emporium of Ethnomedicinal Plants'.

India has been one of the oldest countries having well-orchestrated medical practices based on plant resources. So

far on the globe about 4, 80, 000 plant species are discovered. India is known as an 'Emporium of Medicinal Plants' due to occurrence of more than 48,000 plant taxa, of which 18,000 are flowering plants, among these 10,000 plant species are estimated to be used by 4635 ethenic communities for human and veterinary health care.

The plant materials and recipes from herbs used traditionally by various human societies is a challenging field of research in ethnobotanical studies. The indigenous systems of medicine have their roots in folk medicine still practiced in remote tribal and rural areas and aboriginal societies where modern civilization has not yet made in roads. There are some miraculous medicines known to the tribals and rural folk and much acquired knowledge through experience of ages is usually passed on from one generation to other generation as a guarded secret of certain families. Recent studies have shown that groups having common or similar climate and environments but different ethnic and /or religion backgrounds have a very different knowledge and use of medicinal plant. It is not yet clear what factors influence this diversity in utilization.

**Fig 1:** Strychnos colubrina Plant

## Materials and Methods

Leaves of *Strychnos colubrina* were collected from Penchalakona forest of Nellore district Andhrapradesh, India. The plants were identified by comparing with herbarium specimens. The plant material was purified with distilled water and was shade dried for one month. Leaf sample of the material was ground into fine powder and stored in air tight containers at room temperature. The powdered material was then extracted using solvent, methanol in the ratio 1:10 using Soxhlet apparatus. (Khan *et al*., 1988). The solvent was evaporated under reduced pressure in rotatory evaporator to get methanol and ethanol extracts. After extracting all colouring material, the solvent was removed by evaporating in a water bath, which gave rise to a solid isolate of extract used for antimicrobial and antioxidant activities along with phytochemical analysis.

**I. Phytochemical analysis:** The phytochemical analysis of the leaves was done to find out the presence of bioactive compounds with the help of standard qualitative protocols. (Harborne, 1973 and Gibbs, 1974, Kokate, 2002.)

**Tests performed for the presence of phytochemicals**

**A. Tests for Flavonoids**

- **Shinoda test (Magnesium hydrochloride reduction test):** To the test solution few fragments of magnesium ribbon and concentrated hydrochloric acid were added drop wise and reddish to pink colour was resulted.
- **Zinc Hydrochloride reduction test:** To test the sample solution for the flavonoids added a mixture of zinc dust and concentrated hydrochloric acid results in red colour.
- **Lead acetate test:** When aqueous basic lead acetate was added to test sample produces reddish brown precipitate.

**Ferric chloride test:** To few ml of test samples taken separately, few drops of ferric chloride were added which resulted in the formation of blackish red precipitate.

- **Alkaline reagent test**: To detect the presence of flavonoids, sodium hydroxide solution is added to turn the test sample solution green. When few drops of diluted acid is added the solution turns colourless to indicate the presence of flavonoids.

**B. Tests for Saponins**

- Foam test: 5ml of extract was vigorously shaken to obtain a stable froth, which was added with olive oil (3 drops). Presence of emulsion indicates the existence of saponins.

**C. Tests for Glycosides**

- **Kellar Kiliani test:** 1ml of concentrated sulphuric acid was taken in a test tube then 5ml of extract and 2ml of glacial acetic acid and ferric chloride (one drop) and observed for blue color formation.
- **Raymond's test:** Test solution when treated with dinitrobenzene in hot methanolic alkali giving a violet colour.
- **Molisch test:** Alpha naphthol with conc.H2SO4 when added to test sample gives reddish violet ring at the junction of 2 layers.
- **Conc.H2SO4 test:** Conc.H2SO4 was added to test sample which resulted in appearance of reddish colour.
- Legal's test: The test samples when treated with pyridine and sodium nitroprusside solution blood red colour will be developed.
- **Bromine water test:** When bromine solution is added the test solution gives yellow precipitate.

**Tests for Alkaloids**

- **Dragendorff's test:** 1 ml of the sample solution is taken in a test tube, and few drops of potassium bismuth iodide solution (Dragendorff's reagent) was added. The presence of alkaloids was determined by the appearance of reddish-brown precipitate.
- **Meyer's test:** 1ml of the sample solution is added with few drops of potassium mercuric chloride solution (Meyer's reagent). A creamy white precipitate was formed indicating the presence of alkaloids.
- **Hager's test:** To 1 ml of each of the sample few drops of Hager's reagent (Picric acid) was added. Yellow precipitate was formed reacting positively for alkaloids.
- **Tannic acid test:** When few ml of 10% Tannic acid was added to 1ml of each sample, a buff colour precipitate was formed giving positive result for alkaloids.

- **FeCl 3 test:** One drop of FeCl 3solution was added to each of the test sample, formation of yellow precipitate was resulted reacting positively for alkaloids.

**D. Tests for Sterols**

- **Libermann-Buchard test:** When few drops of acetic anhydride and few drops of concentrated sulphuric acid were added to the test samples if a brown ring shows up at the junction of two layers, it indicates presences of steroids. 2. Salkowski test: The presence of sterols can be detected by adding few drops of concentrated sulphuric acid to the test samples in chloroform, the lower layers of solution turns green on sterols presence.

**E. Tests for Tannins and Phenolic Compounds**

- **Gelatin test:** When gelatine and water were added to test samples formation of white precipitate was resulted.
- **Lead acetate:** Few ml of test samples were taken in different test tubes followed by the addition of aqueous basic lead acetate. It results in the formation of reddish brown bulky preceipitate.
- **Alkaline reagent:** The test solution will give a yellowish red precipitate when sodium hydroxide solution was added.
- **Ellagic acid test:** Presence of phenols in the test solution can be detected by adding 5% each of glacial acetic acid and Sodium Nitrite. If the solution turn Niger brown colour, it indicates phenols in solution.

**F. Tests for Fats and Oils**

- **Stain test:** when we a small quantity of extract between two filter papers, the stain on filter papers gives the presence of the oils.
- **Saponification test:** Added a few drops of 0.5N alcoholic potassium hydroxide to various extracts with a drop of phenolphthalein separately and heat on water bath for 1-2hours. If the solution produces soap or partial neutralization of alkali, it's a sign of presence of oils and fats.

**G. Tests for Lignins**

- **Labat test:** The test sample turns olive green colour on addition of gallic acid when lignins are present.
- **Furfuraldehyde test:** The test sample turns red colour on addition of fur furaldehyde when lignins are present.

**H. Tests for Quinones**

- **Alcoholic KOH test:** When alcoholic KOH was added to the test samples red to blue colour appears reacting positively for quinones.

**I. Terpenoids and steroids test**

- 50% $H_2SO_4$ is added along the sides of the test tube containing a mixture of methanolic HCl and acetic anhydride. If there is any change in color, from green to blue-green (sometimes via red or blue) indicates the presence of terpenoids and steroids Anthraquinones test
- 5 g plant powder was shaken with 20 ml of benzene and filtered. To the filtrate 5 ml of 10% ammonium hydroxide solution was added and shaken well. Presence of pink red or violet color, in the ammonical phase indicates the presence of free anthroquinones (Fransworth, 1966).

**J. Anthocyanidin test**

- To the plant extract was added equal volume of methanolic HCl. Appearance of red or purple color indicates the presence of anthocyanidins.

**K. Coumarin test**

- When few drops of sodium hydroxide are added to the methanolic extracted test solution, if the solutions turning yellow indicates presence of coumarins.

**L. Proteins test (Millions test)**

- 2 ml of methanolic extract was boiled with a few drops of Million's reagent (Millions reagent is a solution of mercuric nitrate in nitric acid) results in the formation of red color indicates the presence of proteins.

**M. Carbohydrate test (Molish test)**

- To the methanolic extract, c-naphthol solution (1gm dissolved in 100 ml of ethanol w/v) was added. Then conc. $H_2SO_4$ is added gently along the walls of the inclined test tube. Appearance of a red to violet color at the interface is taken as a positive reaction.

**N. Indole test**

- If a violet color was developed on adding Ehrlich reagent to the alcoholic extract, it is considered as a positive reaction for indoles.

**O. Test for reducing sugars**

- To the 5 ml of methanolic extract, 5 ml of Benedict's reagent was added in a boiling test tube. The test tubes were incubated in boiling on water bath for 15-30 minutes. The formation of an orange red precipitate indicated the presence of reducing sugars.

**P. Test for amino acids**

- To the methanolic extract, was added few drops of Ninhydrin solution and boiled. The formation of violet colour indicates the presence of amino acids.

**Determination of In vitro Antioxidant Activity of *Strychnos colubrina* methanolic leaf extracts Using DPPH Scavenging Method, Nitric oxide radical scavenging method.**

**A. DPPH (1, 1-Diphenyl-2picrylhydrazyl) free radical scavenging activity**:(**Blois, 1958)**

1. The ability of the sample to scavenge DPPH radicals were determined
2. 0.5 ml of aliquot of test at different concentrations (100 µg/ml and 200 µg/ml) in methanol was taken and to this, 100mM methanolic solution (0.5 ml) of 1, 1-Diphenyl-2picryl hydrazyl (DPPH) was added.
3. The mixture was incubated for 30 min in darkness and at ambient temperature.
4. Absorbance was recorded at 517 nm.

**B. Nitric oxide radical scavenging activity: (Ganesh *et al*., 2004).**

- The standard used here was Ascorbic acid. 100 µg/ml and 200 µg/ml solution of standard in methanol and ethanol were used for assay.
- Sample solution was prepared by dissolving the sample in methanol and ethanol

- 10 mg of each extract were dissolved in methanol and ethanol and solutions of 100 µg/ml and 200 µg/ml concentrations were prepared.
- In this assay 0.5 ml of Sodium nitro prusside (Ganesh *et al*., 2004). (5 mmol) in phosphate buffered saline pH 7.4, was mixed with different concentration of the sample and incubated at 25°C for 3 hrs.
- A control without the test compound, but an equivalent amount of methanol and ethanol were taken. Buffer solution containing tube is acted as control.
- Then 1.5 ml of Griess reagent (1% sulphonyl amide, 2% phosphoric acid and 0.1% N-1-naphthyl ethylene diamine dihydrochloride) was added and incubated for 30 minutes.
- The absorbance of the chromophore formed during diazotization of nitrite ions with suphanilic acid and its subsequent coupling with Napthyl ethyl enediamine was read at 546 nm. The experiment was repeated in triplicate.
- Absorbance was measured at 546 nm and the percentage scavenging activity was measured.

$$\text{Percentage inhibition} = \frac{\text{Absorbance of Control} - \text{Absorbance of Test X } 100}{\text{Absorbance of Control}}$$

- The percentage of inhibition for each reaction was then calculated, and EC50 values (µg/mL) were calculated from the linear equation from the curve between the percentage of inhibition and the solution's concentration. Each experiment was conducted in triplicate. The EC50 value of each extract was expressed as the mean˘SD. The assays were performed as previously described.

**Determination of Antibacterial Activity activity of *Strychnos colubrina* methanolic leaf extracts using Disc Diffusion Assay**

Kirby-Bauer method (Bauer *et al* 1966) was followed to perform sensitivity test using disc diffusion with standard antibiotics. The assessment of antimicrobial activity was done based on the measure of diameter of inhibition zones, Sensitivity tests were performed by disc diffusion (*NCCLS, 1998*). The assays were performed against three clinically pathogenic bacteria *Bacillus subtilis MTCC 441, Staphylococcus aureus MTCC 737, Pseudomonas aeruginosa MTCC 1035* and a fungal pathogen *Candida albicans MTCC 3018.* Each extract was dissolved in 95% Methanol or sterile water at different concentrations (250, 500 and 1000 mg/mL). Then each solution was impregnated on to a small disc of filter paper and placed on the top of agar containing 100 µL of bacterial solution at a concentration of 1.5ˆ108 CFU/mL per plate (adjusted by comparing to 0.5 McFarland). In the same manner each plate has carried a blank disk by keeping solvent control only in the centre, and antibiotic discs (6mm diam) of 20 µg/ml, Streptomycin sulphate (for bacteria) and Nystatin 20 µg/ml, (for fungal) were used as positive control. All of the plates were incubated at 37°C for 18 hours for bacteria and at 28°C for 48 hours for fungi. The zones of growth inhibition around the discs were measured after 18 hours of in incubation at 37°C for bacteria and 48 hours for fungi at 28°C, respectively. The size of inhibitory zone is taken as a measure of sensitivity of micro-organism to the plant extract.

**Statistical Analysis**

Each test is conducted in three sets. The average value is calculated duly following statistical methods. Experimental results were expressed as standard ± mean deviation (SD) of five replicates.

Where ever applicable, the data were subjected to one-way analysis of variance (ANOVA), 2-way analysis of variance (ANOVA) methods and differences between samples were determined by with Scheffe's post hoc test, Dunnett's post hoc test using the Statistical Analysis System (SAS, 1999) programme. P Values < 0.05 were regarded as significant.

## Results

**Phytochemical studies**

## Conclusion

**The phytochemical studies:** These studies have been carried out during the present study for preliminary screening of secondary metabolites and qualitative analysis of whether these compounds are present or not in various taxa. These studies act as an identification marker of genuine plant-based drugs. In the preliminary phytochemical studies, the tannins, phenolic compounds, alkaloids, flavonoids, saponins, fats, oils, terpenoids are known to present in *Strychnos colubrina.* Whereas glycosides, lignins, quinones, anthraquinones, anthocyanides, coumarins, carbohydrates, reducing sugars and aminoacids and Sterols are found to be absent in this plant

**The anti-oxidant activity of *Strychnos Colubrina:*** Phytochemical analysis of the extracts has shown the presence of some flavonoids and phenolics. These compounds give antioxidant effect, and this can be used for drug extractions from *Strychnos colubrina* in the future. Quantitative analysis of these bio-active constituents in *Strychnos colubrina* leaves have to be further investigated in the future. They can become potent antioxidants.

**Anti-microbial activity of *Strychnos Colubrina:*** The present study reveals that *Strychnos Colubrina* leaf extracts have significant detrimental effect on one of three bacterial strains used i.e, *Staphylococcus aureus* and it shows no effect on other two bacteria namely, *Bacillus subtilis*, *Pseudomonas aeruginosa* and a fungal strain namely *Candida albicans*. Methanolic plant extract generally contain various potent phytochemicals in mixed form. This may be the reason for the lesser inhibitory effect shown by leaf extract when compared to that exerted by proven antibiotics. For the study of plant extracts, the number of microbial strains was reduced in accordance with their known function as food destroying agents and human pathogens. The methanolic extract of plant leaves of *Strychnos colubrina* has not earlier been reported to have anti-microbial activity.

As discussed above, medicinal plants are at the mainstay in the treatment of diseases for the vast majority of tribal and rural people. As the present study reveals the potential of these medicinal plants, further research can be directed to probe into the structure and mechanism of action of the bioactive therapeutic principles for development of drugs to treat various diseases that affect the mankind. Phytochemical screening of ethno-medico-botanical species indicated the presence of numerous potential chemical constituents which have high therapeutic value. Thus, the phytochemical studies of this species may lead for further investigations to find out drugs of importance. The present study concludes that the plant species with numerous highly effective phytochemical compounds like saponins, alkaloids, terpenoids, steroids, lignins, tannins, indoles, anthroquinones and several types of anthocyanidins, phenolic compounds, flavonoids and lipid compounds having many medicinal applications, used in wide range of formulations, commercial, higher therapeutic and economic values. Biological activity conducted in screening the medicinal properties of selected plant material of methanolic extracts of leaves of *Strychnos colubrina* has proven as antibacterial and anti-oxidant, agent. It is, therefore, implied that the isolation and proper characterization of the active

constituents from the extracts of the select plant species as possible antioxidant, antimicrobial agent is possible. Quantitative analysis of the active compounds in *Strychnos colubrina L.* leaf extracts should be further studied. Hence this report provides insights into the therapeutic potential of the phytomedicine and scope for further research on these drugs. Further investigations must be carried out from this research for the benefit of human welfare. The present screening may also be useful for continuing, future research mainly in the field of pharmaco toxicology.

# పాలేరు నాటకం - బోయిభీమన్న సామాజిక స్వప్నం

- డా॥. గోపవరం పద్మప్రియ, తెలుగు అధ్యాపకులు పి.ఆర్. ఆర్ & వి.యస్ ప్రభుత్వ డిగ్రీ కళాశాల, విడవలూరు.

హితేన సహితం సాహిత్యం. ఈ సాహిత్యం ఎవరి హితాన్ని కోరుతుంది? అని ప్రశ్నించుకుంటే ''సామాజిక హితం'' అనే జవాబు దొరుకుతుంది. సమాజంలో ఎవరిమేలును? అని తర్కిస్తే, ఎవరు అన్ని విధాల బాధలను అనుభవిస్తూ అణచివేతకు గురవుతున్నారో వారికి మేలు జరగాలి. మన భారతీయ సమాజంలో వేలాది సంవత్సరాలుగా సాంఘికంగా ఆర్థికంగా అణచి వేతకు గురవుతూ పేదరిక, సామాజిక రేఖకు దిగువన వున్న వారు దళితులే. వీరికే మేలు జరగాలి.

ఆర్థికంగా, రాజకీయంగా అన్ని స్థాయిల వారితో సమానమైన జీవనస్థాయిని వారికి కల్పించాలి. సామాజిక రంగంలో ప్రతిదానిలోను సమానమైన ప్రజాస్వామిక ప్రాతిపదికను వారికందించాలి. సమాజిక వ్యవస్థను సమూలంగా మార్చివేయాలి. దళితుల అభివృద్ధికి ప్రభుత్వాలు, రాజ్యాంగం అనేక పథకాలను రచిస్తున్నా అభివృద్ధి అంతంత మాత్రమే వుంది. దానికి కారణం వాటిని అందుకునే వర్గాలవారికి వాటికి సంబంధించిన సరైన జ్ఞానం లేకపోవడమే. అలాంటి దళితులలో చైతన్యాన్ని పురికొల్పడానికి అనేకమంది సాహితీమూర్తులు సామాజిక చైతన్య ఉద్యమంలో తమవంతు పాత్రను పోషించారు. వారిలో చైతన్యాన్ని నింపడానికి సుంబోధక మైన సాంఘిక నాటక ప్రక్రియను సృజించిన తొలితరం సాంఘిక నాటక రచయితల్లో బోయిభీమన్న ఒకరు. వీరు పేద దళిత వర్గంలో పుట్టి కష్టాలు బాధలు అనుభవించినా నిరంతరం సంతోషంగా జీవించాడు.

నా సుఖాలు, సంతోషాలు
సమస్తమూ సరస్వతీ ప్రీత్యర్థం
నా కష్టాలు, నష్టాలు, దురదృష్టాలు
అన్నీ శివార్పణం - అంటూ జీవించాడు

అవమానాలను ఎదిరిస్తూ కులతత్వాన్ని వివరించి దళితుల సామాజిక చైతన్యానికి మార్గాలను అన్వేషించిన చైతన్యశీలి. ఈయన రచించిన పాలేరు, కూలిరాజు, పడిపోతున్న అడ్డుగోడలు, ప్రగతి, మానవుని మరోమజిలి, అనసూయ ఈ నాటకాలన్నీ ఆనాటి సమకాలిన సామాజిక ప్రతిబింబాలే. సమాజిక శ్రేయస్సే ఆధునిక నాటక ధ్యేయం.

సామాజిక బాధ్యతతో రచనలు చేసే ఏ రచయితకైనా నాలుగు ప్రశ్నలు ఎదురవుతాయని 'జాషువా స్వప్న సందేశం' సిద్ధాంత వ్యాసంలో రాచపాళెం చంద్రశేఖర్ రెడ్డిగారన్నారు అవి ఏమిటంటే?

1. తాను నివశిస్తున్న సమకాలీన సమాజం ఎలావుంది?
2. ఆ సమాజం అలా ఉండడానికి గల కారణాలేవి?
3. ఆ సమాజం ఎలా ఉండాలని రచయిత ఆశిస్తున్నాడు?
4. తాను కలలుగన్న సమాజం ఏర్పడ్డానికి గల పరిష్కారం మార్గాలేమిటి?

ఈ నాలుగు ప్రశ్నలకు రచయితకు దొరికే సమాధానమే రచయిత స్వప్నమవుతుంది. బోయిభీమన్న కూడా ఆనాటి సమాజం ఎలావుందో కళ్ళారా చూచి, అనుభవించారు గనుక దాన్ని ఇతివృత్తంగా స్వీకరించాడు. దానికి గల కారణాలను అన్వేషించి వాటి పరిష్కార మార్గాలను కనుగొన్న ద్రష్ట , స్రష్ట, నవ సమాజ నిర్మాత భీమన్న.

ఏ సమాజమైన వివక్షకు గురవడానికి కారణం అవిద్య, అజ్ఞానం, వీటికి కారణం భారతదేశంలో వేళ్ళూనుకొన్న కులతత్వం. ఈ రెండింటిని భారతీయ సమాజం నుంచి పారద్రోలడానికి బోయిభీమన్న సూచించిన రెండు మార్గాలు.

1. విద్య
2. కులాంతర వివాహాలు

ఈ రెండింటిని తన పాలేరు నాటకంలో ప్రతిపాదించాడు. భీమన్నగారి "కూలిపోతున్న అడ్డుగోడలు" కేవలం కులాంతర వివాహాలకి ప్రాధాన్యమిస్తుంది / ప్రధాన భూమిక వహిస్తుంది. పాలేరు నాటకంలో విద్య, కులాంతర వివాహం అనే ద్విముఖవ్యూహం ద్వారా సాంఘీక విప్లవానికి బోయిభీమన్న అంకురార్పణ గావించారు. భూస్వాములు కామంతో కబళించే దళిత స్త్రీల సమస్యలు సైతం చిత్రిస్తూనే తాను చెప్పదలచుకున్న ప్రధాన సమస్యలపై తన దృష్టిని కేంద్రీకరించి మిగిలిన సమస్యలన్నింటిని పాలేరుతనం చుట్టూ అల్లుకున్న దళిత జీవన విధానాన్ని ఈ నాటకంలో సమర్ధవంతంగా చెప్పగలిగారు.

**ఇతివృత్తం :** "ఇతివృత్తం నాట్యస్య శరీరం పరికల్పితం"

పాలేరు నాటక ఇతివృత్తాన్ని సంక్షిప్తంగా పరిశీలిస్తే గోదావరి తీరంలో కుబేరయ్యే అనే భూస్వామి ఉంటాడు. అతని దగ్గర పుల్లయ్య అనే పాలేరు పనిచేస్తుంటాడు. అతని కొడుకు వెంకన్నను పాలేరుగా నియమిస్తాడు. వెంకన్న తల్లిచనిపోగా పుల్లయ్య భార్య చెల్లెలు సీత వెంకన్న ఆలనా పాలనా చూస్తూవుంటుంది. కుబేరయ్య దగ్గర వీరేశు అనే పాలేరు కూడా వుంటాడు. వాడు భూస్వామి చెప్పిన పనిని తు.చ. తప్పక చేస్తుండేవాడు. వెంకన్న అన్న, అతని చదువు అన్న వీరేశుకు చులకన అదే ఊరిలో సమాజహితం కోరే ఉపకారి మాస్టారు ఉంటాడు. చదువు సమాజాన్ని మారుస్తుందని నమ్మే అభ్యుదయశీలి. అందరిని పాఠశాలకు రమ్మని ప్రభోదిస్తూ వుంటాడు. అదే ఊరిలో సంస్కారవంతమైన సంపన్న కుటుంబానికి చెందిన యువతి వనబాల వెంకన్నను ప్రేమిస్తుంది. వనబాల, ఉపకారి మాస్టారి సహాయంతో వెంకన్న కాకినాడలో అనాధాశ్రమం చేరి అక్కడ సుందరం (వనబాల అన్న) రామంల సహాయంతో చదువును సాగిస్తాడు. వీరేశు, సీత ప్రేమించుకుంటారు. సీతపై భూస్వామి కన్నేశాడని తెలుసుకొని సీతను తీసుకొని వీరేశు పారిపోతాడు. వెంకన్న అనాధ శరణాలయం వారి సహాయంతో బాగాచదువుకొని డిప్యూటి కలెక్టరయి వెంకటేశ్వరరావుగా మారతాడు. వెంకన్న ముందు దోషిగా నిలబడ్డ కుబేర్రావును క్షమిస్తాడు. రామం చేసుకోవాల్సిన వనబాలను, వెంకన్న, వనబాలల ప్రేమ వ్యవహారం తెలుసుకొని రామం, సుందరం వారి వివాహం జరిపిస్తారు. ఇదీ నాటక ఇతివృత్తం.

పాలేరు నాటక ప్రారంభంలోనే.

బానిసతనమును - బావుముురా
భారతభూమికి - భాగ్యము తేరా!
సకల దేశముల - సర్వ మానవుల
సామ్యము - సాధింపుముురా ?
ఒకడు తినుచు - మరియొకడు పస్తుపడి
యుండుట - ధర్మము కాదురా !
కూడూ , గుడ్డ, కొంపయు సమానముగ
కూర్పుముురా లోకమున.
ప్రభువు - సేవకుడు లేని సంఘమును
పదిలముగా నిర్మింపురా !
సౌఖ్యము, సంతోషము మానవులకు
సమకూర్చుముురా ! వీరా ?

ఈ పాట ఆనాటి సమాజాన్ని చిత్రీకరిస్తూ, కవికలగన్న సమాజాన్ని ఆవిష్కరిస్తుంది. పాలితులు పాలకుల మధ్య వ్యత్యాసాలు లేని సమాజం నిర్మాణం చేయమని, అలా చేసేటప్పుడు జాగ్రత్త అవసరమని హెచ్చరిస్తాడు. ఈ ఒక్క గేయం నాటక సారాంశాన్ని, కవి స్వప్నాన్ని ఆవిష్కరిస్తుంది.

ఒకప్పటి హిందూ సమాజ ఆచార వ్యవహారాలు ఈనాడు లేకపోయినప్పటికి, వాటి ప్రభావం ఈ నాటికీ కనిపిస్తూనే వుంది. అస్పృశ్యులుగా గుర్తించబడిన అనేకమంది ఈనాటికి చదువుకు నోచుకోలేదు. ఎన్ని నంక్షేమ కార్యక్రమాలు చేపట్టినా దళితుల్లోని అక్షరాస్యతను ఇతర కులాల అక్షరాస్యతలో పోలిస్తే చాలా తక్కువగానే కనిపిస్తుంది. అనేకమంది దళితపిల్లలు

ఈనాటికి పాలేర్లుగా కార్మికులుగా, కూలీలుగా పని చేయకపోతే గడవని కుటుంబాలు ఈరోజుకు వున్నాయి. ఇలాంటి సామాజిక, ఆర్థిక నేపథ్యంలో చదువు ప్రాధాన్యతను పాలేరు నాటకం వివరిస్తూ.

కన్నబిడ్డ లజ్ఞానాంధకార మందు
ఒకరి నొక్కరు పట్టి కొట్టుకొనుచుండ
విద్య అనియెడు కాగడా వెలుగుజూపి
ఏల రక్షించుకొనరు మీ బాలకులను ?
విద్యలేని మనష్యులు వింత పశువు
లన వినరె? పశుత్వమ్మె మీక మృతమగునె ?
బడికి పంపుడు, విద్యనేర్పుడు, రవంత
ముందునకు బోవనిండు మీ ముద్దుసుతుల

అంటూ పాలేర్లుగా బ్రతుకుతున్న చిన్నారుల జీవితాలను తీర్చిదిద్దాల్సిన తల్లిదండ్రులను చైతన్య వంతం చేస్తూ ఆలపించిన గీతమిది. ఈనాటి బాలకార్మిక వ్యవస్థ 60 సంవత్సరాల స్వాతంత్ర్యం తర్వాత స్వాతంత్ర్యానంతర ఫలశృతిగానే మిగిలిపోయింది. పసి పిల్లల జీవితాన్ని పణంగా పెట్టవద్దని ఉపకారి "పసిబిడ్డ తెచ్చు సంపాదనకాశించి మనుగడ మాపు జనకులారా"! అని తల్లిదండ్రులను మానవత్వం మరచిన మనుషులుగా సంభోదిస్తాడు.

దళిత స్త్రీలలోను విద్యపట్ల ఆసక్తిని కలిగిస్తాడు. స్త్రీల యొక్క విద్యావశ్యకతను ప్రభోదిస్తాడు.

వంటయిల్లోకటె ప్రపంచమ్ముగా చేసి
తనయుల నేర్పించు తల్లులారా
జాతశక్కి విహీనమై చచ్చుచుండ
కన్నులను మూసికొంటిరే గాఢనిద్ర

చిన్నతనంలోనే పసిపిల్లల పెంపకం, ఇంటి చాకిరీ మోసే అమ్మాయి చదువుకోలేక నిరంతర శ్రమలోకి, అంతులేని చాకిరీలోకి తమకు తెలియకుండానే నెట్టివేసే ఆడపిల్లల తల్లుల అమాయకత్వాన్ని చిత్రిస్తూ ఉపకారి పాత్ర ద్వారా జాగృతం చేశాడు.

డిప్యూటీ కలెక్టరు వెంకటేశ్వరరావు తనగ్రామానికి తిరిగివచ్చి ఉపాధ్యాయుడైన ఉపకారితో మీ చలువ వల్లనే నేను ఇంత వాడినయ్యాను. మీరు నాదగ్గర ఉండాలి అని అడిగినప్పుడు.

"అది స్వార్థం అవుతుంది నీ వంటి కలెక్టర్లను ఎంతమందిని తయారు చెయ్యాలో నేను ఈ దళిత సంఘం నుండి ఒక కలెక్టర్ అన్న మాటేమిటి? ఒక్కసారి బడిలో చేరిన వాడు కోరికను బట్టి పట్టుదలను బట్టి ఇంజనీరు, డాక్టరు, ప్రొఫెసర్, లాయరు, జడ్జీ ఏదైనా కావచ్చు. నియమాతిక్రమణ చేయనక్కర్లేదు. న్యాయం కల్గిస్తుంటే చాలు"

ఇక్కడ ఉపకారి ఉపన్యాసం విన్నతర్వాత నేనూ మీ ఉద్యమంలో భాగమవుతానని వెంకటేశ్వరరావు అనడు. ఒక బాధ్యత గల నిజాయితీ ఆఫీసరుగానే చిత్రీకరించ బడ్డాడు. ఇక్కడ బోయిభీమన్న ఎదిగిన దళితుల పట్ల తన అపనమ్మకాన్ని చెప్పి చెప్పక చెప్పాడు. పైకెదిగిన దళితులు క్రిందిస్థాయి దళితుల పట్ల నిర్లక్ష్యాన్ని వ్యక్తం చేస్తున్నారనే వైనాన్ని మౌనంగానే చిత్రీకరించాడు. నేను ఇక్కడ స్పష్టంగా చెప్పదలచిన మాటేమిటంటే దళిత అవకాశాలు పొంది ఉన్నతస్థాయికి వెళ్ళిన దళితులు, దళితాధికారులు వారితోటి పేదరికపు స్థితిలో వున్న దళితుల అభ్యున్నతి కోసం కృషి చేయలేదనడం సత్య దూరం కాదు.

పాలేరు వెంకన్న గ్రాడ్యుయేట్ అయి కలెక్టరయ్యాడు. దళితుల పిల్లలకు పేర్లుండవు. పేర్లున్నా పూర్తి పేరుతో ఏ పాలేరునూ పిలవరూ. అందుకే చదువుకోవడం వల్లనే పాలేరు వెంకన్న వెంకటేశ్వర రావయ్యాడు. ప్రభుత్వం దళితుల కోసం కేటాయించిన పోస్టును అందుకొని డిప్యూటీ కలెక్టరూ అయ్యాడు. ప్రభుత్వం నిర్దేశించిన పథకాలు సఫలం కావాలంటే విద్య తప్పనిసరి అనే అంశాన్ని బోధిస్తుంది. విద్య ద్వారా హోదా, గుర్తింపు పొందిన వెంకన్న లాంటి వాస్తవమూర్తులు ఎవరైనా వున్నారా? ఈ నాటకం ఆశించిన ఫలితాన్ని సాధించిందా అని వితర్కించుకంటే -

ఆ రోజుల్లో ఆంధ్ర రాష్ట్రమంతటా పాలేరు కూలిరాజు, నాటకాలు గ్రామాల్లో ఉర్రూతలూపాయి పాలేరు నాటకాన్ని చూసి, పాలేరుపని మానేసి విద్యనభ్యసించి ఉన్నతోద్యోగాలు సంపాదించిన దళిత ప్రజానీకం అనాడు కోకొల్లలు. నాటక దిక్సూచిలో ముద్రించిన మాజీ ప్రభుత్వ ప్రధాన కార్యదర్శి ఐ.ఏ.ఎస్. ఆఫీసర్ గారి మాటల్ని ఒకసారి పరిశీలిద్దాం. ''నేను పాలేరుని. పాలేరు నాటకం చూసి చదువుకోవాలని అక్షరాలు నేర్చుకొని చదివి కలెక్టరయ్యాను. పాలేరు నాటక ప్రభావం నామీద, నా ప్రజలమీద ఎంతగానో వుంది. ఈ నాటకం రాకపోతే నేను పాలేరుగానే మిగిలిపోయేవాడిని. బోయిభీమన్న ఋణం జన్మజన్మలకు తీర్చుకోలేనిది'' అని ఎన్నో సందర్భాల్లో అన్నారు. ఈ నాటకం సామాజికంగా విప్లవం తీసుకొచ్చిం దనడానికి ఇంతకంటె మరొక నిదర్శనం లేదు.

కవి తనస్వప్నం కోసం నూతన భావాలోచన గలిగిన ఒక పాత్రను ఎన్నుకొన్నాడు. వనబాల మోతుబరి రైతు కులానికి చెందిన అభ్యుదయవాది. అభ్యుదయ నవ సమాజ ఆలోచనపరంపర గలిగిన సోదరుడు సుందరం పాత్రను కవిసృష్టించుకున్నాడు. వారి వాదనకు, వేదనకు, నవసమాజ బోధనకు బ్రహ్మసమాజం వేదికయింది. కులరహిత, మతరహిత, వర్గరహిత సమాజం కోసం బ్రహ్మసమాజం ఏర్పడింది. బ్రహ్మ సమాజ నియమావళిని ఆచరిస్తూ నవ సమాజానికి వెలుగురేఖగా బోయిభీమన్న స్వాప్నిక దర్శనానికి నిదర్శనంగా వనబాల కలెక్టర్ వెంకటేశ్వరరావు వివాహం తరతరాల సంప్రదాయబద్ధమైన ఊరులో బ్రహ్మ సమాజ పద్ధతుల ప్రకారం జరగడం నవసమాజ అభ్యుదయ వేడుక.

అయితే ఇక్కడ కవి ఒక సందేహాన్ని సీతపాత్ర ద్వారా వ్యక్తం చేస్తాడు.

''పైకొచ్చిన వాణ్ణి పై వాళ్ళు పై నుంచే ఎగరేసుకుపోతే,
ఇక మాకు మిగిలిందేమిటండమ్మా''

అప్పుడు వనబాల నేను మీ వాడకీ వచ్చి ఉంటానని నమ్మబలుకుతుంది. ఇక్కడ కవి నేటి వాస్తవిక పరిస్థితిని వివరించినట్లైనది. నేటి సమాజంలో అందరూ వనబాల లాంటి వారు వుండరు కాబట్టి ఈ సందేహాన్ని కవి ఇక్కడ వ్యక్తం చేశాడు. గురజాడ అప్పారావుగారు చెప్పినట్లు దళితులు, అగ్రవర్ణాల వారు వివాహం చేసుకోమన్న భావాన్ని మొదట ఉన్నత దళిత వర్గం పాటిస్తే దళిత సమాజం సమ తౌల్యాన్ని పొందుతుంది. వృద్ధిచెందిన దళితుడు వృద్ధి చెందకుండా ఉన్న అదే దళితవాడకు చెందిన వారితో వివాహాలు కలుపుకుంటే కవి స్వప్నించిన నవసమాజం నిజంగా ఆవిష్కృతమవుతుంది.

రాముడు ఆదర్శమూర్తి. రామతత్వం ప్రజలకు జీవన శుబోధన వ్యక్తం వెంకన్న నవసమాజ రాముడు విద్యా జ్ఞాన ప్రబోధాన్ని తన సమాజానికి అందించి ఉన్నత శిఖరాలకు ఎదగమని ముందు దళిత వర్గాలకు వెన్ను తట్టిన వాడు అభినవ వెంకన్న. పాలేరుతనం నశించినా పాలేరు నాటకం అణచివేత, బానిసత్వం, అస్వతంత్ర్యత ఉన్నంతకాలం నిలచివుంటుంది. కాబట్టి ఇది ఎప్పటికీ క్లాసిక్కే.

# బోయి భీమన్న సాహిత్యం - సమాలోచన

అంతర్జాల అంతర్జాతీయ సదస్సు – 21 & 22, ఫిబ్రవరి 2022

## భావవీణ ప్రత్యేక సంచిక

Journal of Literary, Culture & Language Studies

భీమన్న గారి సాహిత్యమంతా చదివాను. పాటలను, అందులో వినసొంపులను ఎంచి సిద్ధాంతాలు మొన్న అల్లుకొన్నది. మీసాలని వాళ్ళందాన్ని పంచుకొన్న వాళ్ళనూ వెలుపలికి తరిమేశారా భీమన్న చెప్పిన్న మద్రాసు విశ్వవిద్యాలయం తెలుగు అధ్యాపకులు, రవి, సహచరి, సాహితీమిత్రులు అందరి పక్షాన నిండుదనాన్ని గారవ మహితా అభినందనలు తెలియజేస్తున్నాను.

– డా॥ ఎన్. గోపి

అత్యధిక్యానంతో మొండుకుపోయి అన్యతక్కువ సాహిత్య సృష్టికే సమాజ ప్రయోజనాన్ని అంటి కాకిని బాధ్యతల మీదని మహాకవి దాశ భీమన్న గారి వ్యక్తిత్వం, సాహిత్యం విశ్వం. సామాజిక ప్రయోజనాన్ని అంటి చాటి నిబద్ధతకే ప్రాధాన్యం ఇచ్చిన భీమన్న అభిమాన సాహిత్యాన్ని స్వాగతించిన్న మహోన్నతమైన వ్యక్తి భీమన్న.

– ఆచార్య గుత్తి వీరభద్రుడు

భీమన్న గారు చెప్పినట్లు మనిషి, సాహిత్యం ద్వారా సామాజిక ప్రయోజనం పొందినప్పుడే ఎన్ని గడులు దాటి, ఎన్ని తరాలను ఎంతటి ప్రభావితుల్ని చేసి మంచిని పంచాలనే మాట్లాడిన పరిణామంలో ఉన్నత వ్యక్తులుగా తీర్చుకోవచ్చు. అనుసరణీయ వ్యక్తిత్వంతో మద్రాసు విశ్వవిద్యాలయం తెలుగు శాఖ అందించిన భీమన్న పురస్కారం. భీమన్న పరిశోధన వ్యక్తిత్వం ప్రతిబింబ ద్వారా మెలుగులోకి తీసుకురావడంలో అధ్యాపకులు తెలియజేసే మద్రాసు విశ్వవిద్యాలయం తెలుగు శాఖాధిపతి ఆచార్య పెద్దలి శంకరయ్య గారికి శిష్యురాలిగా, భీమన్న పెంపుదలంలం వారాంతి మనిషిగా రాయించినట్లు...

– డా॥ ఎన్. గోపి వెలిబుచ్చారు

# కార్యనిర్వహణాధికారిగా మార్గదర్శకత్వం వహించగల స్త్రీ మూర్తి తార

– డా॥. గోపవరం పద్మలియ, తెలుగు అధ్యాపకురాలు, పి.ఆర్.ఆర్. & వి.ఎస్. ప్రభుత్వ డిగ్రీ కళాశాల, విడవలూరు, శ్రీ పొట్టి శ్రీరాములు నెల్లూరు జిల్లా.

కూజంతం రామ రామేతి మధురం మదురాక్షరమ్
ఆరుహ్య కవితాశాఖం వందే వాల్మీకి కోకిలం.

వాల్మీకి రామాయణం విశ్వజనీనమైన కావ్యం. ఈ గ్రంథం భారతీయ సంస్కృతినీ, సమగ్ర మానవ జీవన విధానాన్నీ శ్రీరామ చరితం ద్వారా అత్యంత సుందరంగా ఆవిష్కరించింది. దేశ విదేశాల్లో దీనికి కల జనాదరణ అనన్య సామాన్యం. యుగాలు గడిచినా, తరాలు, అభిరుచులు మారినా పాఠకుల్లో రామాయణం పట్ల మక్కువ ఏమాత్రం చెక్కుచెదరలేదు. వివిధ భాషల్లోనూ, విశేషించి తెలుగులోను నేటికి రామాయణం ఆధారంగా అనేక ప్రక్రియలు వెలువడుతున్నాయి. దీనికి కారణం ఆ రచనలో లోకోత్తరమైన శైలి ఉంది. శబ్దాల పోహళింపులో పాఠకుణ్ణి మైమరపించే సొగసు ఉంది. పాత్ర చిత్రణలో అంతులేని సొగసు, నిబద్ధత, ఏకాగ్రత కన్పిస్తుంది.

రామాయణంలోని స్త్రీ పాత్రలన్ని పరిశీలిస్తే అందరిలోను వివేకం, విజ్ఞత, సహనం, భావోద్వేగం, సమయస్ఫూర్తిలో నేటి నారీలోకానికి, సమాజానికి మార్గదర్శకంగా లభిస్తాయి. ఈ లక్షణాలతో పాటు రామాయణంలోని వాలి భార్య కార్యనిర్వహణాధ్యక్షురాలిగా కూడా కన్పిస్తుంది. తార పాత్ర చిత్రణలో మరో ప్రత్యేకత ఉంది. ఈమె మాటల ద్వారా చేతల ద్వారా ఆమె మనస్తత్వం, వ్యక్తిత్వం ప్రస్ఫుటం కావడం సహజమే. అంతకు మించి ఇతరులు ఆమె గురించి మాట్లాడే విధానం ఆమె వ్యక్తిత్వ విశిష్ఠతను బోధపరుస్తుంది.

వాలి సుగ్రీవుల కథ అందరకు విదితమే. వీరి కథలో 'తార' కీలక పాత్ర పోషిస్తుంది. వాలిని సుగ్రీవుడు యుద్ధానికి ఆహ్వానించినప్పుడు ఆమె ఎంతో ముందు చూపును బంధుజనం పట్ల అభిమానాన్ని ప్రదర్శిస్తుంది. వాలిని ''నీ బలం లోకానికతంకూ తెలుసు. నీకు శత్రువులు ఎవరూ లేరు. నిన్ను యుద్ధానికి రమ్మని రెచ్చగొడుతున్నవాడు సుగ్రీవుడే..... నిన్ను గెలవడం సాధ్యం కాదని తెలిసే యుద్ధానికి పిలిచాడు. నీ చేతిలో చావు దెబ్బలు తిని పారిపోయాడు. అటువంటి వాడు మళ్ళీ యుద్ధానికి వచ్చాడంటే అనుమానించాలి. అతని కంఠ ధ్వనిలో ధైర్యం, గెలుస్తాననే నమ్మకం ఉన్నాయి. అతడు తన బలాన్ని నమ్ముకుని ఎదుర్కొనేందుకు రాలేదు. వేరొకరి సహాయాన్ని నమ్ముకుని ఇలా వచ్చాడు కుమారుడు అంగదుడు గూఢాచారుల వల్ల విన్న మాటలు నాకు చెప్పాడు. ఇక్ష్వాకు వంశీయులు ఈ అడవిలో నీ తమ్ముడిని వెదుక్కుంటూ వచ్చారని, వారిని జయించడం ఎవరివల్ల గాదని చెప్పాడు''.అని హితవు చెప్పింది. తన మాటను త్రోసిపుచ్చుతాడని తనవి ఊహకాదని గూఢాచారుల వల్ల తెలుసుకున్న విషయాన్ని వివరిస్తున్నానని తెలిపింది. రాజ్యపాలనలో ఎప్పటికప్పుడు రాజ్యం చుట్టు ప్రక్కలు ఏమి జరుగుతుందో తెలుసుకోవడం ఒక వీరుని భార్యకు ఉండాల్సిన ముఖ్య లక్షణం ఇక్కడ కన్పిస్తుంది.

అదే సమయంలో కుంటబ క్షేమాన్ని, దాని పట్ల గల ప్రేమను, బంధుజనుల మధ్య ఉండాల్సిన బాంధవ్యాల్ని వ్యక్తం చేస్తుంది.

సుగ్రీవో విపులగ్రీవో మహాబన్ధుర్మతస్తవ
భ్రాతృ సాహృదయాలమ్బనాన్యా గతిరిహస్తి తే.

(నీకు సుగ్రీవుడి కంటే గొప్ప బంధువుల వేరొకడు లేడు. అతడి పట్ల సోదరి ప్రేమ చూపించు అతణ్ణి సుఖపడనీ, నువ్వు క్షేమంగా ఉండు. ప్రస్తుతం అంతకు మించి నీకు వేరొక మార్గం లేదు)

యది తే మత్రియం కార్యం యది చావైషి మాం హితామ్
యాచ్యమాన: ప్రియత్వేన సాధు వాక్యం కురుష్యమే.

నువ్వునాకు ప్రాణాధికుడైన ప్రియుడివి నాకు నీక్షేమం కావాలి. అందుకే ప్రార్థిస్తున్నాను. నేను చెప్తున్న హిత వాక్యం విను. నా మాటలు విని కోపగించుకోకు. రామిడితో విరోధం రాకుడా జాగ్రత్తపడు.ఇలా తన దగ్గర గల అన్ని మార్గాల్లో భర్తకు హితువు చెప్పింది. గూఢాచారుల వల్ల తెలిసింది చెప్పింది. బంధువుల పట్ల ఉండాల్సిన అభి మానాన్ని వివరించింది. చివరకు ప్రియమైన భార్య మాటైనా వింటాడేమోనని ప్రేమతో తన మాటను వెలిబుచ్చింది.

కాని వాలి ఆమె మాటల్లోని లోతును పరిశీలించ కుండా స్త్రీ భావనతో ఒక చులకనను మనసు నందుంచు కుని "నీ హృదయం దర్శితా తావన్మయి భక్తి స్వయాకృతా" (నా పట్ల నీకున్న ప్రేమ వలన భక్తి వల మాట్లాడావు) ఇక చాలు మిగిలిన స్త్రీలతో వెనక్కు అంతఃపురంలోకి వెళ్ళమని శాసిస్తాడు.

సమర్థుల మాటను పాటించకపోతే కలిగే నష్టమే ఇక్కడ కల్గింది. వాలి మరణ వార్తవిని విలపిస్తుంది.

సుగ్రీవస్య త్వయాభార్యా హృతా సచ వివాసితః
యత్తత్తస్య త్వయా పుష్టిః ప్రాప్తేయం ప్లవగాధిప.

(వానర రాజ! సుగ్రీవుడిని రాజ్యం నుంచి వెళ్ళగొట్టావు. అతడి భార్యను అపహరించావు. దానికి ఫలితంగానే ఇంత ఆపద వచ్చింది. నీ క్షేమంకోరి చెప్పిన మాటలు తృణీకరించి వచ్చి యీ స్థితిలో పడ్డావు.

ధర్మాన్ని పాటించకపోతే, అహంకారం వదలకపోతే ఒక్కోసారి మరణాన్ని కూడా ఎదుర్కోవలసి వస్తుందని ఆమె ధర్మ విలాపమే గుర్తు చేస్తుంది.

విలపిస్తున్న తారతో హనుమంతుడు "సుగ్రీవుడు, అంగదుడూ దుఃఖంతో దిక్కుతోచకుండా వున్నారు. ఇప్పుడు అంగదుడికి యౌవనంగా జ్యాభిషేకం చేయాలి. సింహాసనం మీద కూర్చున్నా అంగదుడిని చూస్తే నీ దుఃఖం కొంత ఉపశమిస్తుంది. అనడంతో వానర రాజ్య క్షేమం కూడా ఆమె మీద ఆధారపడ్డట్టు చెప్తున్నాడు. ఆమె లేకపోతే, ఆమె కుటుంబ సారధ్యం వహించకపోతే సుగ్రీవుడు, అంగదుడు దిక్కుతోచని వారవుతారని చెప్పడంలో ఆమె ఉనికి ఆ కుటుంబానికి, రాజ్యానికి ఎంత క్షేమమే అర్థమవుతుంది. ఒక ఒక సమర్థవంతు రాలైన స్త్రీకి ప్రతీకగా ఇక్కడ హనుమంతుడు ఆమెను చిత్రీకరించాడు.

ఆమె సామర్థ్యాన్ని కూడా వాలి చనిపోతూ సుగ్రీవుడికి వివరిస్తాడు. ఆమె సలహా రాజ్యపాలనకు ఎంతో విలువై నదని వివరిస్తాడు. ఎప్పుడూ ఆమె మాటను తృణీకరించ వద్దని ఇలా సలహా ఇస్తాడు. "తార సుషేణుడి కూతురు. ఈమె అతి సుక్ష్మమైన విషయాలను గురించి చాలా చక్కగా ఆలోచించే శక్తి గలది. హఠాత్తుగా వచ్చిపడే పరిస్థితులను ఎలా ఎదుర్కోవాలో నిర్ణయించగల సమర్థురాలు. ఈ పని మంచిది అని యీమె నిర్ణయిస్తే మరో ఆలోచన లేకుండా ఆ పని చెయ్యవచ్చు. ఆమె అభిప్రాయం ఎప్పుడూ సరైనది. అది మారదు" అని తన అనుభవం ద్వారా ఆమె దక్షతను వివరించాడు.

"నాథా! నేను చెప్పిన మాట విని అంతఃపురంలో సుఖంగా ఉండవలిసిన వాడిని నా మాట వినకక ఇలా ఎగుడు దిగుడు నేలపై రాళ్లమీద పడి ఉన్నావా! ...." ఇలా స్త్రీకి సహజమైన శోకాన్ని ప్రదర్శిస్తూ రాముడితో తనను హత్య చేయమంటుంది. స్త్రీకి గల సహజ భావోద్వేగాలలోను తన మాట వినలేదని బాధ కన్పిస్తుంది. భర్త మొండితనానికి, అహంకారాటకి బలైన స్త్రీగా మిగులుతుంది.

రాముడికిచ్చిన మాటను మరచి కిష్కందలో సుగ్రీవుడు చాలాకాలానికి మళ్ళీ దొరికిన రాజభోగాలను తృప్తిగా అనుభవిస్తున్నాడు. తన భార్య రుమ, సౌందర్యవతి తార లభించడంతో రాజ్య భారమంతా మంత్రులకు వదిలేసి స్త్రీలతో ఏకాంతంగా గడుపుతువ్నడు. మంత్రులకు ధర్శనాన్ని కూడా నిరాకరిస్తున్నాడు. ఒకరోజు హను

మంతుడు రాముని గడువును గుర్తుచేసాడు. అన్ని దిక్కులలోని వానరసైన్యాలను వెంటనే కిష్కింధకు చేరమని ఆజ్ఞాపించు అని చెప్పి అంతఃపురంలోకి పోయాడు. ఇక ఆ విషయాన్ని వదిలేసిన సుగ్రీవుడి చర్యకు రాముడు వేదన చెంది కోపాన్ని ప్రదర్శించగా లక్ష్మణుడు కోపోద్రేకంతో కిష్కింధకు బయలు దేరాడు. రాజ్యంలో లక్ష్మణుడు ప్రవేశించిన విషయం తెలుసుకున్న సుగ్రీవుడు భయపడి అతనిని ఎదర్కోవడానికి తారనే పంపుతాడు.

ఇక్కడే అర్థమతుతుంది. మనకు రాజ్యంలో మంత్రులు, ఇతర సేనాధిపతులు, పరిపాలనాధిపతులు ఇంతమంది ఉండగా ఒక స్త్రీని లక్ష్మణుడిముందుకు పంపడంతో ఆమె వాక్చాతుర్య సామర్థ్యం, కార్యనిర్వహణ సమర్థత ఎంతటివో చెప్పకనే చెప్తాయి. అతని నమ్మకాన్ని ఒమ్ము చేయకుండా అంతే సమర్థతతో లక్ష్మణుడిని ఆహ్వానించి ఎదుర్కొని నిలబడి శాంతపరుస్తుంది. ఆమె మాటల్లోనే ఆమె ఎంత సూక్ష్మ పరిశీలనా శక్తి, లోకజ్ఞానం కలదో మనకు అర్థమవుతుంది.

సుగ్రీవుడి పొరబాటును అంగీకరిస్తూనే లక్ష్మణుడికి కోపం తగదనే హితువును, స్వాంతన వచనాన్ని పలుకు తుంది. రాకుమారా! నువ్వు గొప్పవీరుడివి. మీరు సాధించాలనుకుంటున్న మహాకార్యంలో స్వజనుల మీదనే కోపం తెచ్చుకుంటే ఎలా? సుగ్రీవుడు చేసింది పొరబాటే అయితే దానిని అర్థం చేసుకొని ఔదార్యంతో క్షమించాలి. మీ వంటి వారు కూడా కోపానికి వశమైతే ఎలా? అని సంభాషిస్తుంది. ఎంత భోగలాలసతలో ఉన్న మీ కార్య సాధనకు అవసమరైన ప్రయత్నాలను ఇంతకముందే ఆరంభించాడనీ వివరిస్తుంది. సుగ్రీవుని కామంపట్ల లక్ష్మణుడికి ఏహ్యం కల్గుతుందేమోననే భావంతో విశ్వామిత్రుడిని గుర్తు చేస్తుంది. మేనకతో పదేళ్ళు సంసార సుఖాన్ని అనుభవించి ఒక్క రోజుగానే భావిం చాడు. అంతటి మహాత్ముడికే ఆ స్థితి కల్గితే వానరుడైన సుగ్రీవుడి విషయం గురించి ఇక ఆలోచించక్కర లేదనే విషయాన్ని వివరించింది.

రామకార్యం పట్ల సుగ్రీవుడికున్న ఆసక్తిని తన వాక్చాతుర్యంతో ఇలా వివరించింది.

రుమాం మాం చాఙ్గదం రాజ్యం ధనధాన్యవసూనిచ
రామ ప్రియార్థం సుగ్రీవస్ప్రౌదిత మతిర్మయ

(రాముడికి మేలు చేయడానికి రుమనూ, నన్ను, అంగదుడిని, ధన ధాన్యాలను, రత్నాలనూ, రాజ్యాన్ని తృణ ప్రాయంగా త్యజించగలడు) ఏ సుఖాలతో ఐతే సుగ్రీవుడు మునిగి తేలుతున్నాడో వాటన్నింటిని రాముడికోసం విడవగలడనే సందేశాన్ని లక్ష్మణుడికి విన్న వించింది. దాని ద్వారా లక్ష్మణుడికి సుగ్రీవుడి పట్ల లక్ష్మణుడికి విశ్వాసాన్ని కల్గిస్తుంది.

"లంకలో అనేక కోట్ల మంది భయంకరమైన రాక్షసులు ఉన్నారట వారినందరినీ చంపనిదే రావణుడిని చంపలేరు. సీతను పొందలేరు. ఇదంతా రాముడు ఒక్కడూ చేయగలగినది కాదు. సుగ్రీవుడు చేయగలిగినది కాదు. అందుకే కోట్లమంది వానరవీరులను పిలుస్తన్నారు.

సుగ్రీవుడి తప్పును ఎత్తి చూపుతూనే వానర రాజుల అభిజాత్యం, ఆత్మ గౌరవాన్ని కాపాడుతుంది. సుగ్రీవుడి సాయం లేనిదే రాముడు సీతను చేరుకోలేడని రక్షేచలేడని హెచ్చరిస్తుంది. వానరసైన్య సహాయం అనివార్యమనే విషయాన్ని స్పష్టం చేస్తుంది. ఇంతలోనే స్త్రీత్వాన్ని ప్రదర్శిస్తూ 'అసలు అంత కోపంతో రక్తంలా ఎర్రగా ఉ న్న నీకళ్ళను చూచి మా వానర స్త్రీలంతా భయ పడు తున్నారు. వాలికి పట్టిన గతే సుగ్రీవుడికి పడుతుందని బెంబేలు పడుతున్నారని" అంతలోనే తాను భయాన్ని ప్రదర్శిస్తూ లక్ష్మణుడి పట్ల వినయాన్ని ప్రదర్శించడం తారకే చెల్లుతుంది. తారను దాటి సుగ్రీవుడిని చేరేటప్పటికి లక్ష్మణుడిని ఒక సౌమ్య మూర్తిగా తన మాటలతో మార్చేసిన విజ్ఞురాలు.

విజ్ఞత, సమయస్ఫూర్తి, ధర్మం, ఆత్మ గౌరవం కలది.

మాటను స్పష్టంగా ధైర్యంగా చెప్పగలిగే వివేకం కలగలది. నేటి పాలనా రంగ, సంస్థల అధికారులకు ఒక మంచి ప్రధాన కార్యనిర్వహణాధికారిగా తార మార్గదర్శకం వహించగలదు.

**Abstract**:

For centuries long many cliques of people of English Literature had appreciated Milton have still been thinking that Milton and his exceptional talent has to be confined only to his way and style of writing and very few knew his depth knowledge about music despite being the son of a musician since we could find a swell and sway to the verse, a delicacy of sound, the famous organ tone in his Paradise Lost. So, the present paper is to establish Milton's acquaintance with music and its very indelible impact upon his poetry.

**Keywords:** Milton, Poetry, Madrigal, Metrical, Music, Musician, Paradise Lost

## Introduction

The two extraordinary talented elements in arts music and poetry go hand in hand in respect to rhythm and sound. These, accordingly, are the musical qualities that can be detected in any poem. Hence, it can be exposed that Milton consciously borrowed from contemporary music for some of the rhythms of his Paradise Lost. And here it can be argued that the music by which he was consciously influenced by is the musical knowledge already hidden in him as bedrock which quality he hereditarily got from his father. Going beyond this somehow further, it can be stated that this theme and variation technique, his use of assonance, syncopation and all the rest is in some way Influenced by his musical background. And here in this aspect it may be noteworthy to mention that his poetry must have been influenced by his own music which quality has been kept aside unnoticed by many literature enthusiasts and here it may be assumed its only because many literature paramours do not have musical knowledge equally too. Despite all kinds of struggles and tribulations that clouded Milton's life with darkness, his tenacity, concentration and intrapersonal relationship that he maintained with poetry and music could not disturb and deviate him anymore of which Hilaire Belloc stated as "these two things in Milton, his love of music, his poetic art, must, then, be kept separate, the one does not explain the other, and Milton's love of music, his inheritance in music, his comprehension of music, belong to Milton the man not Milton the poet".

People used to think that the three arts of dancing, poetry and song in any way were inseparable. Even during the time of King David, who, on one occasion at least, danced as well as sang his psalms before the ark. Seventeenth century witnessed the tremendous and huge impact of music upon almost the total human kind of the planet irrespective of their place and position in the society. Indeed, no one was in a position to claim to be highly- educated one possessed substantial musical skill. Under such circumstances that existed then, it is not too astonishing to notice that Milton's father was a musician who is in fact was a composer of real merit of whom Aubrey opined that he was an

ingenious man: delighted in musique; composed many songs now in print, especially that of Oriana "who got a gold medal from a Polish prince for composing forty parts of an “In Nominee,”

As it is a well-known fact that Milton’s father was a musician and as rightly pointed out by Anthony Wood that “Milton himself had a delicate, tuneable voice, an excellent ear, could play on the organ, and bear a part in vocal and instrumental music," where it can be said with noteworthy probability that he was influenced by his musical background in the writing of his poetry especially Paradise Lost. Having been influenced by such a father and by paying his regular visits to the services in St. Paul’s hearing to the best sacred music the early Milton not only learned to sing a part in a madrigal or psalm at first sight but mastered keyboard instrument also where the organ music left an indelible impact on him as the following well-known lines of “Il Penseroso” testify:

“Then let the peeling organ blow
To the full- voiced choir below
In cervice high and anthem clear
As may with sweetness through mine ear
Dissolve me into ecstacies
And bring all Heaven before my eyes”
Il Penseroso

There can be found another edifying passage in “L’Allegro” in which Milton makes a mention of music married to immortal verse:

” In notes, with many a winding bout
Of linked sweetness long drawn out,
With wanton heed, and giddy cunning;
The melting voice through mazes running;
Untwisting all the chains that by
The hidden soul of harmony.”
L’Allegro

So, the intent of the present paper is to establish Milton's acquaintance with music and its very indelible impact upon his poetry.

John Milton is very brief and enigmatic on the theme of verse technique. His most striking sound on poetic rhythm is the few laconic words of the note proceeding Paradise Lost. “true musical delight…. consists only in apt Numbers, fit quantity of Syllables, and the sense variously drawn out from one Verse into another.”Related to Milton’s own practice this statement has a treasure of meaning. We can make ourselves concern here with the last phrase only, "the sense variously drawn out from one verse into another." Milton believed that the "sense" (meaning the line of thought) should not come to an extensive close, but should be "drawn out." He believed too, that this movement should be achieved "variously," Two important ideologies of poetic rhythm, then, can be inferred from this last phrase of the note to Paradise Lost. The first is incessant movement, and the second is variety. Here a significant resemblance can be found to the continuous flow and free-moving rhythms of the madrigal. The connection is predominantly striking when we consider some of Milton's own descriptions of rhythm and contemporary music. His poetic words on rhythm, for instance, of course, a redolent of the English madrigal:

“…. muses intricate
Eccentric, intervolved. Yet regular
Then most, when most irregular they seem:”
Paradise Lost, Book V, Lines 622-624

There were two important musical forms that were very famous and significant during Milton’s days. They are English Madrigal and English Metrical Psalter. Madrigal is a short lyrical poem in a strict poetic form that emerged during medieval period which was a complex music composition with polyphonic unaccompanied vocal piece. And the latter isa translation of one of the psalms into rhyming strict-metre verse usually sung as a hymn in worshipping the Lord in Churches. These two important musical forms can be found in the poetry of Milton especially in his great epic poem Paradise Lost being highly attributed by him few of which have been discussed hereunder.

To make a mention about of the madrigal as "drawn out" Milton seems to be referring to the method in which the correlation of voices is used to construct an effect of quiet, continuous, forward movement, with one voice taking up the

rhythmic weight before it has been dropped by another. It is this effect, so general in the madrigal and well understood by him, that Milton strove to reproduce in the rhythms of his heroic verse. In this regard what Mr. Symonds comments on Milton's verse mentioned below, seems very interesting which is pertinent to English Madrigal. “It not unfrequently happens that a portion at least of the sound belonging to a word at the commencement of a verse is owed to the cadence of preceding lines, so that the strain of the music which begins is wedded to that which dies by indescribable and almost imperceptible interpenetrations. The rhythmic dance may therefore be prolonged through sequences and systems of melody, each perfect in itself, each owing and lending something to that which follows and which went before through concords and affinities of modulatedsound.” Then coming to the point of incessant movement in the lines given hereunder from Paradise Lost may be the best exemplification for it where there is a continuous flow of rhythm with varied speed and strength of impulse, rising and falling and freely placed the break after any syllable in the line of course at times with two such breaks of which T. H Banks made a mention that “forty percent of full stops in Paradise Lost occur within the line.”

At once as far as Angels kenn he views
The dismal Situation waste and wilde,
A Dungeon horrible, on all sides round
As one great Furnace flam'd, yet from those flames
No light, but rather darkness visible
Serv'donely to discover sights of woe,
Regions of sorrow, doleful shades, where peace
And rest can never dwell, hope never comes
That comes to all; but torture without end
Still urges, and a fiery Deluge, fed
With ever-burning Sulphur unconsum'd:
Such place Eternal Justice had prepar'd
For those rebellious, here thir Prison ordain'd
In utter darkness, and thir portion set
As far remov'd from God and light of Heav'n
As from the Center thrice to th' utmost Pole.

Paradise Lost I, 59-74

Then, to make a mention of the music, of English metrical psalters, we can find certain common characteristics. Some tunes are printed not indicating any reference of bars and few notes are also with some unequal lengths. Both semibreves which are whole notes and minims which are also called as half notes are used which seems somehow in a disorganized system as they don’t represent the accents of the verse, and some could be divided into equal sections and some other not at all correspond any time-signature which may be out of the choice of tuning that the composer does may be in order to destruct the monotonous swing of the alternate eight and six with accents incessantly recurring in similar positions which to see may be confused but when played can be found that the long and short notes have been adjusted with great care. Sometimes an occasional whole note will intrude into such a sequence of halves and some regularly open and end with a whole note and few of the intervening notes are almost always halves.

So, it can be understood that lack of uniformity of correspondence between length of note and metrical accent established two important principles of which the first is that the speech accent does not influence the length of musical notes in the psalter where a syllable accented by the iambic prosody of the verse may be held by a whole note and the second is that the length of musical note does not repeatedly influence the verse. From this brief observation of the English metrical psalter then, three important factors can be discovered for the purpose of tracing the influence of music on poetry as on of Milton’s early biographer also says “David psalms were in esteem with him above all poetry”. Milton out of the jubilant and tenacious heart that he had sung many of the psalms of David which Milton’s father psalm harmonies like Psalm 114 and 136 and in 1648 Psalm 80 to 88 which his family also sang them at Bread Street, which psalm harmonies were composed by Young John Milton showing the influence of the note-for-syllable principle of the metrical Psalters. And then again with a gap of 25 years, Milton made his debut into psalms and put the first eight of them into verse. So, these

characteristics of English metrical had had an influence on Milton's poetry. In all this, we have an immediate parallel with the English metrical Psalter. For the long opening, note of each musical phrase encouraged reversal of the first foot in the verse and this is exactly what we find most common in Paradise Lost.

If we bring up now of Paradise Lost, we will be surprised to find the same characteristics in Paradise Lost. The effect of pitch on Paradise Lost is also an evident upon the reading of any long passage including the following the brief quotation and its important contribution should never go unnoticed.

……. Arms on Armour clashing bray'd
Horrible discord, and the madding Wheeles
Of brazen Chariots rag'd;
Paradise Lost VI, 209-211

In other passages various caesuras irregularly succeed one another. In these cases, they are not only conducive to metrical variety but serve to express the vehement feelings of the several speakers. A good example is Adam's indignant address to Eve after the Fall.

Out of my sight, /thou serpent, // that name best
Befits thee/with him leagu'd//thy self as false
And hateful://nothing wants, /but that thy shape
Paradise Lost X, 867-869

Apart from this, Milton, in his Paradise Lost, makes use of some other rhythmical tricks found in music. Few of the modern music examples like syncopation can be found throughout Paradise Lost as mentioned below Book XI

And over them triumphant Death hus Dart
Shook, delaid to strike.....
Paradise Lost XI, 491-492

And in Book XI too,

The multitude of Angels with a shout
Loud as from numbers without number
Paradise Lost III, 345-346

Putting the considerations of rhythm aside for a while and observe the poem, we can notice that Milton meticulously made use of onomatopoeia in almost all in his depictions, for instance to say of his mentioning of the Bacchants the following is the one.

….
the Race
Of that wilde Rout that tore the Thracian Bard.
Paradise Lost VII, 33-34

in which the violent deed is echoed in those very words.
Brusht with the hiss of russling wings
Paradise Lost I, 768

A kind of the technique in audibility with reverberation principle which is fairly common in music is concentrated by Milton in the lines mentioned below.

…….I fled and cry'd out Death;
Hell trembled at the hideous Name, and Sigh'd
From all her Caves, and back resounded Death.
Paradise Lost II, 787-789

Milton's exceptionally talented art is seen at its best in his use of alliteration which makes his lines high sounding and harmonious to understand for which the following opening lines of Paradise Lost are the best example.

Of Man's First Disobedience, and the Fruit
Of that Forbidden Tree
Paradise Lost I, 1-2

They hand ln hand with wandering steps and slow,
Through Eden took thir solitaire way.
Paradise Lost XII, 648-649

Milton is very clear and clever enough in distributing his alliterative words where the words used with one part of speech i.e., nouns the

same word when used again but with another part of speech i.e., adjectives as can be found in the following lines.

Dire was the tossing, deep the groans, despair
Tended the sick……
Paradise Lost XI, 489-490

…….. dire was the noise
Of conflict; over head the dismal hiss
Of fiery Darts in flaming volies flow
And flying volted either Host with fire
Paradise Lost VI, 211-214

Milton makes a combination of letters of his alliteration through the timings of "linked sweetness long drawn out" in such a way that the ear is able to trace the windings of the stream of harmony from the beginning of the sentence to its ends which may found and felt in almost all descriptions in Paradise Lost which mentioned hereunder in which we can notice that the alliteration lies not only in the initial letter, but in the use of liquids, labials at regular intervals.

….and what resounds
In Fable or Romance of Uthers Son
Begirt with British Armoroc Knights:
And all who since, Baptiz'd or Infidel
Jousted in Aspromont of Montalban,
Damasco, or MorocooTribisond
Or whom Biserta sent from Afric shore
When Charlemain with all his Peerage fell
By Fontarabbia.
Paradise Lost I, 579-587

It can be observed that Milton frequently made a combination of alliteration with resonance. As there is chance for a vowel sound to be pronounced for a longer time than a consonant, they seem to be more effective in producing similarity of sound than while parallelly they interfere themselves not as much of upon the observation either of the ear or eye. We may always not be able to recognize assonance unless we search for them as found in the lines from Paradise Lost mentioned below.

Dwelt from Eternitie, Dwelt then in thee,
Bright effluence of bright essence increate.
Paradise Lost III, 5-6

Of thir great potentate; for great indeed
His name, and great high was his degree in heaven;
Paradise Lost III, 706-707

We can come across another harmonious effect is secured by presenting like sounds near the beginning and also somewhere in the middle and finally at the end of a sentence. This is undistinguishable with an arrangement recognized to be satisfactory in music where the key-note of the melody is sounded at these places which can more clearly be understood by looking at the following example words.

The letters em followed by our, powers, how, en, most, offend, our and enemy:

And reassembling our afflicted Powers
Consult how we may henceforth most offend
Our Enemy…….
Paradise Lost I, 186-188.

The modulation in music can be found in the following passage when before one series of tone is ended another series is begun. It can now be observed here how the sounds like f, b, s, w and p as alliedto b, are introduced in overlapping series. The sounds of the whole passage as a result are intermingled together so as to produce ageneral effect of unity and progress.

….. the Aire
Floats, as the pass, fann'd with unnumbered plumes:
From Branch to Branch of the Smaller Birds with song
Solac'd the Woods and Spread their painted wings
Paradise Lost VII, 431-434.

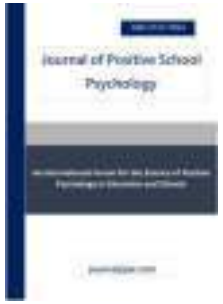
The same method of transition is used in the following quotation.It has a subtle and artistic music all its own:

Followed with acclamation and the sound

Symphonious of ten thousand Harpes that tun'd
Angelic harmonies: the Earth, the Aire
Resounded, …
Paradise Lost VII, 558-561

Lastly, the outcome of pitch inParadise Lost is apparentupon the reading of any lengthy passage. Though the following is a brief quotation that is taken for example of that kind, its important contribution should never go unnoticed.

…. Arms on Armour clashing bray'd
Horrible discord, and the madding wheeles
Of brazen chariots rag'd; . . .
Paradise Lost VI, 209-211



## Conclusion

After making a careful observation of Milton's poetry, it is conspicuously understood that a decent deal and a deep impact of music has been stirred up by Milton's to be used in his poetry. Despite being old, Milton's interest and tenacity was not found coming down as John Aubrey rightly said that "He had an organ in his house; He played on that most…. He would be cheerful even in his gowte-fitts, and sing." Dr. Samuel Johnson also says that after an hour's exercise from twelve to one O' clock Milton dined, "then played on the organ, and sang, or heard another sing; then studied till six."

So, this paper has made it clear that there are certain qualities in Paradise Lost that may be called musical. They are called musical because they are of the spirit of music, though they may be found secondarily in other arts. The present paper, however, has a deeper significance than this. It shows, as clearly as possible, that the influence of madrigal and metrical psalter are among the sources of Miltonic rhythm which means that music in some or the other way influenced Milton the poet. Purely based on this parameter, then, the other musical qualities noted in this paper are also, in an unsettled degree, credited to his knowledge and interest in music, the reason being that a man cannot control what he unconsciously derives. If Milton unconsciously derived certain elements from the madrigal and metrical psalter, it is judicious to say that he was undoubtedly influenced in some degree by other musical qualities.

# PORTRAYAL OF WOMEN IN R. K. NARAYAN'S *THE DARK ROOM*

**[1]G. Madhavaiah**

*[1]Research Scholar, V.S. University, Nellore & Dr. V. Sri Rama Murthy, Research Supervisor, Govt. Degree College Vidavalur.*

## Abstract

The most prevalent Indian writer Rasipuram Krishna Swamy Narayan Iyer, popularly known as R.K. Narayan was born in a South Indian conservative Brahmin family in the Madras Presidency on 10th October1906. Narayan has covered the lean of human seasons from boyhood to the old age. He has depicted many varieties of characters with different ages and outlook. His characterization covers different levels of age from childhood, adolescent and age. Narayan tried to portray the real south Indian middle class society, their joys, sufferings, particularly of women. Narayan has shown his deep concern for women representing the middle class community. He has written novels in English, which is not the mother tongue of the characters. The approach is very realistic and genuine. Narayan has very light approach towards life which is resembled in many characters of his novels. With his native and fresh style of writing, Narayan has attracted the attentions of many writers like E.M. Foster, Graham Green and William Walsh. He presents his characters very natural with simple thought process which is easily understood by common readers. His characters speak in lucid English language which is easily understood by common readers. This made him easy to connect with south Indian middle class readers. They find themselves in the characters and own them. It's one of the reasons of Narayan's success.

**Keywords**: Domestic violence, tradition and culture, middle class and domination.

## Introduction

Many novels of Narayan are around middle class community, educated and semi-urban issues. Country side women are rarely depicted in his novels. Since all the novels of Narayan take place in the imaginary town "Malgudi" and it is a semi-urban locality, the people of Malgudi are also educated, cultured but innocent. As the time changes Malgudi was also updated with railway station, power facility and educational institutions. Though Narayan is very realistic writer, he did not touch the ugly side of reality. The situations are not very problematic unlike the other contemporary novelist, Mulk Raj Anand, Narayan seldom touched the social problems like domestic violence, caste system, untouchability, feudal domination, dowry system and other social inequalities. He quoted in an article that the mood of comedy, the sensitivity to atmosphere, the probing of psychological factors, are the necessary ingredients in fiction. Narayan strongly believed that life is illogical and man always tries to bring his fantasies into reality. Women of the society got adjusted to the patriarchal Hindu society and they are unaware that they are losing their rights and freedom. The family and society have tuned women that they have to accept and tolerate all their burdens, just because they are women. The male dominated society imposed them all for many years and they were not strange to them. Woman was always kept in a secondary place loosing individuality, stature and strength as shown in Hindu religious books. As the characters are

from middle class community, Narayan tries to craft middle class women out of the old fashioned, who are home makers but uneducated. Narayan also came from educated middle class family but he has broad thinking towards women. Many female characters find maximum space in many novels of Narayan.

**The Dark Room**:

The Dark Room is the third novel of Narayan. This is a special novel because it tries to up bring the domestic violence and women worries in Indian marital system. This novel was written in 1930. It deals with the contemporary social issues and challenges. The Dark Room was an inspiration by Isben's "A Dolls' House" in which the heroine comes out of the house for self-education. The concept of equality and education for women was a revolutionary concept. Savitri, the protagonist of the novel tries hard for identity and freedom. In 1930, the idea of questioning the family conditions and cultural practices was a big thing. The domination of male in the society and family was high in society. Savitri explains the situation,

"Men are impetuous. One moment they will be all in temper and the next all kindness. Men have to bear many worries and burdens, and you must overlook it if they are sometimes unreasonable."

The above lines tell us the mood and attitude of men of that age. The instability in the mind set of men how they respond due to their worries and burdens. Though men face outside problems, they enjoy certain domestic privileges. The society has given them many duties and rights also. These rights are mainly used to dominate women at home and in society. Ramani, husband of Savitri gets attracted to another woman at the office. Ramani works for the Englandia Insurance Company. Those were the days when men and woman started working out at offices. Obviously the attraction between the opposite genders takes place. According to Indian customs extra marital relationship is considered as sin. If a man and a woman want to have physical relation it must happen only after marriage. That relation was restricted only to wife and husband. The strong ethical and marital system of India taught the same to the society. When Savitri knows about the extra marital relationship of her husband with she cries,

"Do not touch me, you are dirty, you are impure.

Even if I burn my skin, I cannot cleanse myself of the impurity of your touch".

The physical relation between unmarried couple is considered to be very impure and sin. Savitri, who always bears all the pain in the silence breaks out with her husband and shouts. Savitri tries to control herself and tells him why she becomes like that. A family woman has to give birth to children and nurture them. She has to work for the house and family. She cannot follow trend and fashion. Just like a typical Indian woman, who believes that her whole life is her husband, Savitri jumps into a river. The timely arrival of Mari, a blacksmith and burglar who was crossing the river found Savitri floating on the water. Mari's wife Ponni tries to comfort her. The other choice to Savitri was to go to her parent's house and to live independently. But she doubts corning her bread and butter,

"If I take the train and go to my parents, I shall be living on my husband's earnings. What can I do myself? Unfit to earn a handful of rice except begging. If I had gone to college and studied, I might have become a teacher or something".

The above lines tell us the woman position of financial status. Due to the dependence over the husband, they are forced to survive on their husband's income. In the pre-independence India, women had no financial freedom, no right for education and marriage. RK Narayan shows the contemporary woman problems and tries to find out the traditional and modern thinking of woman. He ties to promote the status of women very consciously. It is a great achievement of RK Narayan's creative thinking that he tried to portray Indian women and then way of life without hurting or damaging the soul of Indian tradition and culture. The typical Indian woman is seen in the character Savitri, when her husband got attracted towards another woman, she tries to check herself and compares with Sanatabai in physical appearance

"What is she like?"

"I am not bad, am I"?

> "These strum pets with their power and paint!"
>
> "Has she as clear skin as mine without her paint"?

When a husband is diverted to another lady, an Indian woman feels envious because she could not manage to attract her husband as the other woman does.

Looking at the mirror Savitri says,

"Perhaps I'm not good enough for him".

"Let me admit my completion has become rather sooty, and these dark rings under the eyes".

"I am getting careless about my hair, and braid it any how".

Instead of finding fault from the husband side Savitri finds fault with herself. That's how the society has impact on the woman mind set and made her think that the problem and the root cause are taken and blamed herself. At the end of the novel, Savitri decides to give up her life to stop all these social and marital problems. But she gets a very brave idea, why can't I live and survive on my own. Instead loosing life I can live away from him and lead life. She also thinks off her children who would become orphans, if she dies. The women of 1930s, 1940s, their thinking and the women of 1980s and their thinking can be clearly observed in his novels. The first generation women were very loyal to the old social customs; they strictly followed them without any hesitation and questioning. The second generation women are educated and matured, unlike their parents and grandparents, they are assertive and modern. It was the time the western women started raising their voice for their rights too, but Narayan did not try to bring the transformation in the Indian women abruptly, it was slow and gradual within the limits. The beauty in Indian marriage system is family. When a male and female get married, they make a family. In any society, family is very important and backbone to society. For a strong society, we need strong family system which develops human and social values needed to survive in society. Family system develops relationships, affection and concern among family members. The complete responsibility shall be led by women in the family. The treatment to women characters is very assertive in his novels. We find almost all women characters as housewives and very few working with own self-image and desire for emancipation. The married women are found giving high respect to age-old traditions and practices. The typical Indian women are orthodox, submissive, docile, meek minded and follow age-old traditional, cultural and religious practices in the male dominated society.

## Conclusion:

The women characters are very realistic and very close to reality. The mindset and ideology is apt to the contemporary religious, cultural and social conditions. The impact of rich Indian culture, influence of epics, Indian philosophy and the Hindu Dharma play a vital role in the thinking behaviors and decision making. The Hindu philosophy has made lot of impact on the ideology of Indian woman and in their lifestyle. In every stage of their life the reference of Hindu religious characters are set as an example. The women are traditionally good, carried the reputation of the family and more responsible for good and bad in the society. Responsibility is the main characterization of Indian woman social outlook, following strong believes and having patience is generally made ornaments to woman. The characters of Narayan also have all the above mentioned qualities. The women of the era are found with very good tendencies . The supreme and divine qualities of love, sacrifice and courage are found in the woman characters. Women are not supposed to rise above man and lead them. The contemporary constrains of social and cultural practices are strictly followed by the women. Sufferings and struggles commonly appear in every woman's personal life and they are meant to bear with them.

Women are made responsible for all social and family circumstances. They never had the feeling that they were equivalent to men. Supremacy of man over woman is very natural and general thing. The trend got same change in the late 70s and 80s. Women have to accept life and society as it comes. R.K. Narayan's writing style and supports and represents the

same in his novels. Narayan has originally depicted the original tendencies and realistic nature of society, because the characters of Narayan are very original and natural, so they accept and respond to the situations so normally. Imagination is not permitted in his characters. Illusion and revolutionary ideology are not seen in the behaviors of the characters. In his long writing career, Narayan has presented the changes in the society and conditions of women accordingly. They behaved and responded to the contemporary conditions. Narayan never portrayed them responding contrast to the contemporary mindset. He never tried to be a reformer or improver but just presented the conditions of the women as natural as they are without addition or obliteration. Narayan's natural and genuine characterization stuns the readers and takes them to Malgudi. It would have been better if Narayan had brought some awareness or criticism on the contemporary evil practices like domestic violence, dowry system and equality through his characters. But, Narayan showcased the conditions to the readers and constrained himself as a presenter.

White light generation

ABSTRACT

The photoluminescence properties of different concentrations of $Sm^{3+}$ activated $Sr_3Gd(PO_4)_3$ phosphors synthesized by modified citrate gel-combustion method were investigated for white light emitting diode (w-LED) applications. The studied phosphors were characterized through powder x-ray diffraction (PXRD), Fourier transform infrared (FTIR) spectroscopy, scanning electron microscopy (SEM), photoluminescence excitation, emission and lifetime studies. The PXRD profiles confirmed the body centred cubic structure of undoped and $Sm^{3+}$ -doped phosphors. The SEM studies showed the distribution and agglomeration of particles. The characteristic emission transitions such as $^4G_{5/2} \rightarrow {}^6H_{5/2}$ (~561 nm), $^4G_{5/2} \rightarrow {}^6H_{7/2}$ (~598 nm), $^4G_{5/2} \rightarrow {}^6H_{9/2}$ (~645 nm) and $^4G_{5/2} \rightarrow {}^6H_{11/2}$ (~705 nm) were noticed at their respective positions when excited at 403 nm wavelength. The highest luminescence intensity was found for 1.0 mol% of $Sm^{3+}$ doped phosphors at 403 nm excitation showing luminescence quenching and it was ascribed to dipole-dipole interaction type of energy transfer among the excited $Sm^{3+}$ ions at higher concentrations. The reddish-orange color of emitted luminescence was examined by evaluating the chromaticity coordinates. The experimental results confirm the potentiality of studied phosphors for w-LED applications.

## 1. Introduction

In the past few years, rare earth (RE) ions activated phosphor materials play a key role in the design of light emitting diodes (LEDs) for various photonic applications due to their superior advantages compared to traditional light sources such as incandescent bulbs and fluorescent lamps. The incandescent bulbs consume more energy and the fluorescent lamps having coated with toxic materials cause harm to the mankind as well as environment [1,2]. The phosphor converted white LEDs have been the most suitable light sources in various fields owing to their reliability, long-life, low energy consumption, high fluorescence efficiency and environmental protection [3,4]. It is well known that there are two different approaches to design commercial white LEDs. In one approach, it has been fabricated combining blue emitting indium gallium nitride (InGaN) LED-chip with yellow emitting cerium activated yttrium aluminium garnet (YAG: $Ce^{3+}$). But it is not favorable for photonic applications due its low color-rendering index (CRI < 85) and high correlated color temperature (CCT ≥ 7615 K) [5,6]. Therefore, a w-LED source must have low CCT with good CRI and high color uniformity. In second approach, a near ultra violet light emitting diode (NUV-LED) chip has been combined with a tri-color (blue, green, red) phosphor [7]. Since the commercial red-emitting $Y_2O_2S$: $Eu^{3+}$ phosphor is not suggestable for photonic applications due to its fever efficiency at NUV excitation (370-410 nm) and harmful decomposition products [8], there is a need to search for new and novel red-emitting phosphors which can be effectively excited by NUV-LED chips producing intense and high efficient red-luminescence.

Among the available phosphates, the orthophosphate phosphors in the form $M_3N(PO_4)_3$, where M is di-valent cation, N is trivalent cation are more significant owing to its simple fabrication technique even at low temperatures with single phase, eco-friendly and non-toxic behavior, excellent thermal stability at high temperatures and good chemical durability [9–12]. It is well known

that tri-valent samarium ($Sm^{3+}$) has been an essential activator to generate orange and/or reddish-orange luminescence through $^4G_{5/2} \rightarrow {}^6H_J$ ($J$ = 5/2, 7/2, 9/2, 11/2) transitions at NUV excitation [13–15]. Based on these advantageous characteristics, the $Sr_3Gd(PO_4)_3$ phosphor has been selected to investigate NUV excited luminescence properties of $Sm^{3+}$ ions for deep reddish-orange luminescence. In literature [14,15], $Sm^{3+}$ and $Sm^{3+}/Ce^{3+}$ doped $Sr_3Gd(PO_4)_3$ phosphor prepared by conventional solid state reaction method have been reported for reddish-orange emitting devices. This paper reports the modified citrate-gel combustion fabrication of $Sr_3Gd(PO_4)_3$: $Sm^{3+}$ phosphors, their structure, morphology and concentration dependent luminescence properties. The quenching in luminescence and lifetime $^4G_{5/2}$ emission state was investigated. The experimental results showed that the studied phosphors are the suitable candidates for deep reddish-orange emitting sources at NUV excitation.

## 2. Experimental techniques

### 2.1. Materials and method of synthesis

The $Sr_3Gd_{(1-x)}(PO_4)_3$:$xSm^{3+}$ phosphors, where $x$ = 0, 0.1, 0.5, 1.0 and 2.0 mol% were fabricated via modified citrate-gel combustion method using high-grade $Sr(NO_3)_2$ (99.0%), $Gd(NO_3)_3 \bullet 6H_2O$ (99.9%), $NH_4H_2PO_4$ (98%), $Sm(NO_3)_3.6H_2O$,(99.9%) and $C_6H_8O_7.H_2O$ (99.0%) as starting materials. 1.0 M solution of each were prepared by dissolving stoichiometric quantities in double-distilled water. All these solutions were mixed in drop-wise and stirred well for 30 min using a magnetic stirrer operating at 500 rpm. The metal nitrates and $C_6H_8O_7.H_2O$ (citric acid) in the ratio of 1:2wt% was taken to prepare the studied phosphors. The citric acid was used as a chelating agent to form transparent complex gel upon drying. The citric acid solution was prepared in 10 ml of double-distilled water and added in drop-wise to the compound solution with continuous stirring and then stirred further for 30 min. A light-brown colored powder was obtained after drying at 80 °C for 24 h and it was heat treated at 200 and 400 °C for 3 h in each step with intermediate grinding. Finally, the powders were sintered at 1250 °C for 5 h to produce milky-white $Sr_3Gd(PO_4)_3$:$xSm^{3+}$ ($0 \le x \le 2.0$ mol%) phosphors and they were referred as SGPSm$x$ phosphors where $x$ represents the concentration of $Sm^{3+}$ ions in mol%. A schematic diagram showing the various steps involved in modified citrate-gel combustion method is illustrated in Fig. 1.

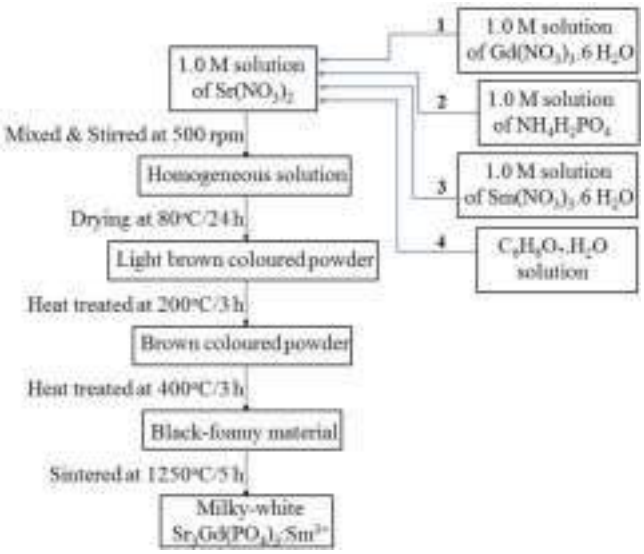

**Fig. 1.** Various steps involved in modified citrate gel-combustion method of fabrication of SGPSmx phosphors.

### 2.2. Characterization

The powder x-ray diffraction (PXRD) analysis of SGPSm$x$ ($0 \le x \le 2.0$ mol%) phosphors was carried out with a BRUCKER USA D8 advance diffractometer using 1.541 Å radiation from CuK$\alpha$ source. The KBr technique Fourier-transform infrared (FT-IR) spectral analysis was carried out with a PerkinElmer FT-IR spectrometer using a pellet made of KBr to sample ratio 300:1. The morphology was studied with FEI-Quanta FEG 200F high resolution-scanning electron microscope (HR-SEM). The photoluminescence excitation and emission studies were carried out with a FP-8300 JASCO fluorescence spectrometer provided with xenon flash lamp as a light source. The luminescence decay analysis was carried out with a FLS 1000 photoluminescence spectrometer using Xe-flash lamp in pulsed mode. All the measurements were carried out at room temperature only.

## 3. Results and discussion

### 3.1. Phase analysis

The powder X-ray diffraction (PXRD) patterns of SGPSm$x$ ($0 \le x \le 2.0$ mol%) phosphors shown in Fig. 2(a) are crystallized into body-centred cubic (BCC) crystal structure with a lattice constant of 10.11 Å ($a = b = c$; $\alpha = \beta = \gamma = 90°$) and they are good agreement with JCPDS No. 29–1301. A two-dimensional view of arrangement of $Sr_3Gd(PO_4)_3$ unit cells is shown in Fig. 3. The intensity of these PXRD patterns decreases with increase of $Sm^{3+}$ concentration with their positions remains undeviating. Taking into account the ionic radii of $Gd^{3+}$ (~0.0938 nm) and $Sm^{3+}$ (~0.0964 nm), one can suggest more probability for $Sm^{3+}$ ions to occupy the $Gd^{3+}$ sites without any modification in lattice phase. However, the variation in ionic radii introduces a negligible lattice distortion creating micro-strains that could affect the optical properties of $Sm^{3+}$ ions. The variation in intensity of a PXRD peak positioned at $2\theta$ = 27.88 ° corresponding to (310) crystal plane with increase of $Sm^{3+}$ ions concentration is illustrated in Fig. 2(b).

The average size of crystallites has been determined using Debye-Scherrer's equation, $D = 0.89\lambda/\beta.cos\theta$, where $\lambda$ denotes the wavelength of X-rays used (0.015,406 nm), $\beta$ denotes the full-width at half-maximum (in radians) and $\theta$ denotes the diffraction angle [16]. According to this equation, the value of D is found to be ~55 nm. The value of D is also calculated using Hall-Williamson's (H-W) equation, $(\frac{\beta.Cos\theta}{\lambda}) = (\frac{1}{D}) + (\frac{\varepsilon.Sin\theta}{\lambda})$, where $\varepsilon$ denotes the magnitude of micro-strains. The reciprocal of intercept of $(\beta Cos\theta/\lambda)$ vs. $(Sin\theta/\lambda)$, called H-W plot shown in Fig. 2(c) represents the average size of crystallites [17]. According to H-W, the magnitude of D is found to be ~58 nm which is in good agreement with that obtained from Debye-Scherrer method. The magnitude of microstrains ($\varepsilon$) due to lattice distortions is estimated to be ~0.00059 and it is relatively smaller than those reported for $SrEuMgAl_{10}O_{17}$ phosphor (~0.00,751 nm) [18].

### 3.2. FT-IR and SEM analysis

The FT-IR spectral profiles of undoped and 0.5 mol% $Sm^{3+}$ doped SGPSm phosphors are shown in Fig. 4. A group of IR absorption bands observed at about 1076, 1016, 999 and 949 $cm^{-1}$ have been ascribed to the asymmetric stretching vibrations of $(PO_4)^{3-}$ units [19,20]. The IR band noticed at ~685 $cm^{-1}$ corresponds to Sr–O symmetric stretching vibrations [21]. The bands positioned at about 592 and 520 $cm^{-1}$ have been related to O–P–O asymmetric bending vibrations and P–O asymmetric stretching vibrations,

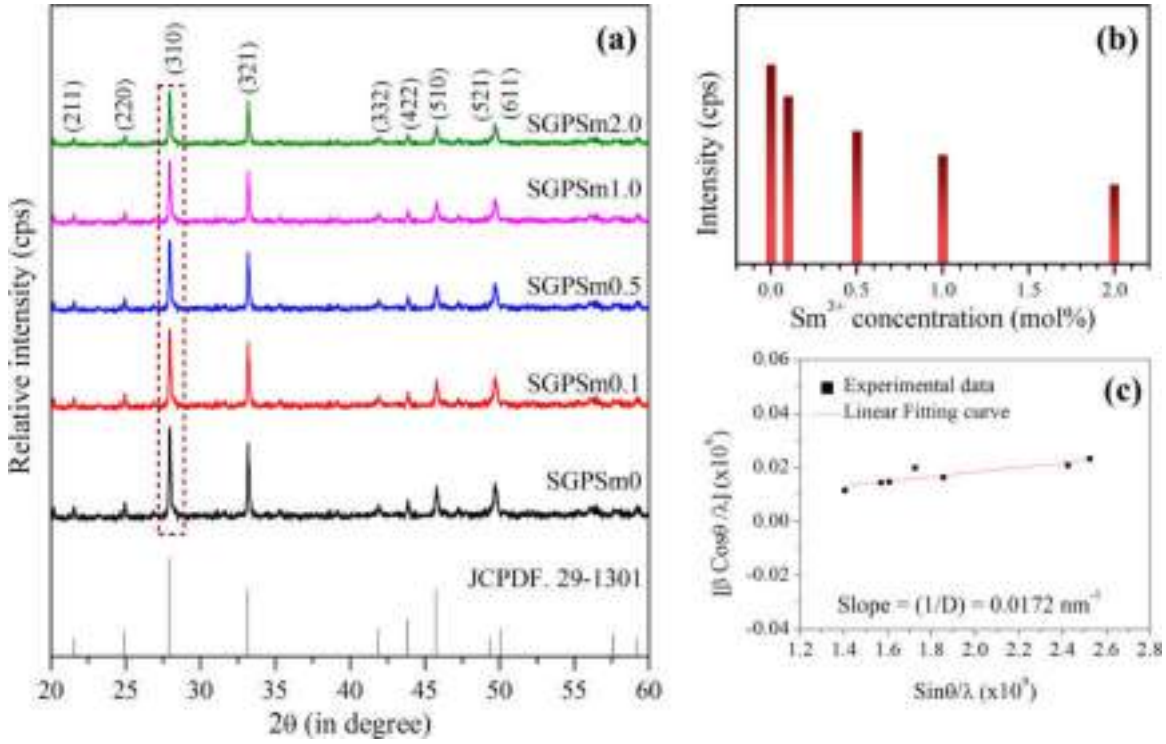

**Fig. 2.** PXRD patterns of SGPSmx phosphors (a), variation of intensity of PXRD peak ($2\theta = 27.88°$) as a function of $Sm^{3+}$ ions concentration (b) and the H-W plot of SGPSm1.0 phosphor (c).

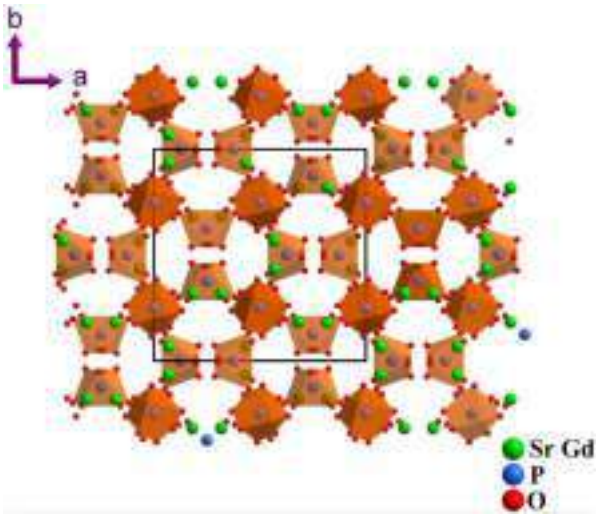

**Fig. 3.** Two-dimensional arrangement of BCC crystalline $Sr_3Gd(PO_4)_3$.

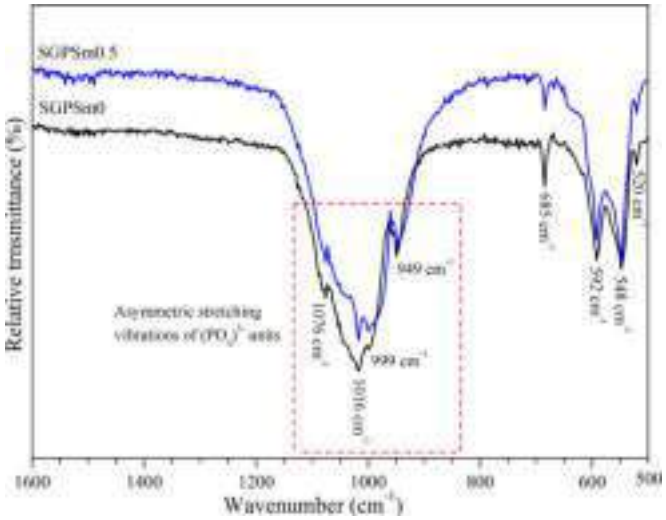

**Fig. 4.** FT-IR spectra of SGPSmx ($x = 0$ and 0.5 mol%) phosphors.

respectively [22,23]. The IR band located at ~548 $cm^{-1}$ has been assigned to Gd–O symmetric stretching vibrations [24].

The SEM analysis reveal about the surface morphology that includes the information about size, shape, orientation and distribution of particles. The HR-SEM micrograph of SGPSm1.0 phosphor is described in Fig. 5(a). This micrograph explores that the crystallized particles are agglomerated with different size and shape and oriented randomly with uneven distribution. The size of the particles has been estimated applying the ImageJ software and the corresponding histogram showing the particle size is shown in Fig. 5(b). The size of the agglomerated particles varies from 100 to 300 nm with average size of the order of 216 nm.

### 3.3. Photoluminescence analysis

The photoluminescence excitation (PLE) spectra of SGPSm*x* ($0 \leq x \leq 2.0$ mol%) phosphors in the spectral region 300-500 nm monitoring the emission at 598 nm corresponding to $^4G_{5/2} \rightarrow {}^6H_{7/2}$ transition are shown in Fig. 6. The observed transitions have been ascribed to $^6H_{5/2} \rightarrow {}^2F_{5/2}$ (302 nm), $^6H_{5/2} \rightarrow {}^4P_{5/2}$ (307 nm), $^6H_{5/2} \rightarrow {}^4P_{3/2}$ (312 nm), $^6H_{5/2} \rightarrow {}^2L_{15/2}$ (318 nm), $^6H_{5/2} \rightarrow {}^4G_{9/2}$ (333 nm), $^6H_{5/2} \rightarrow {}^4H_{9/2}$ (345 nm), $^6H_{5/2} \rightarrow {}^4D_{3/2}$ (361 nm), $^6H_{5/2} \rightarrow {}^6P_{7/2}$ (375 nm), $^6H_{5/2} \rightarrow {}^4L_{15/2}$ (391 nm), $^6H_{5/2} \rightarrow {}^4F_{7/2}$ (403 nm), $^6H_{5/2} \rightarrow {}^4L_{13/2}$ (416 nm), $^6H_{5/2} \rightarrow {}^4M_{19/2}$ (422 nm), $^6H_{5/2} \rightarrow {}^4G_{9/2}$ (438 nm), $^6H_{5/2} \rightarrow {}^4M_{17/2}$

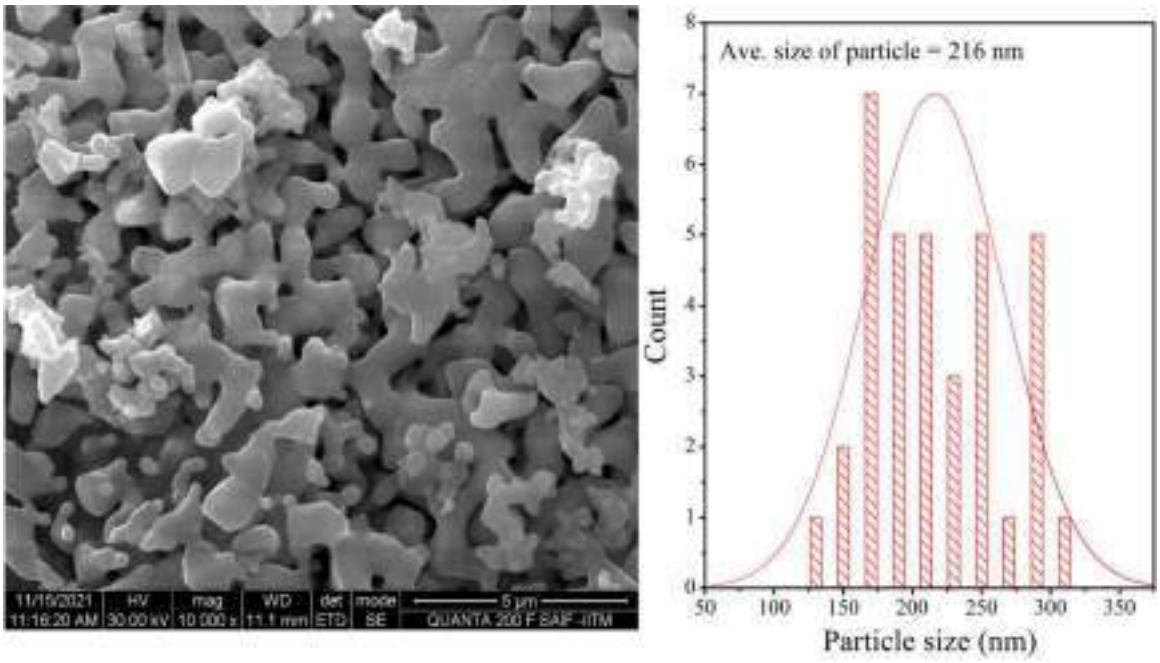

**Fig. 5.** HR-SEM micrograph of SGPSm1.0 phosphor (a) and the corresponding histogram showing the particle size distribution (b).

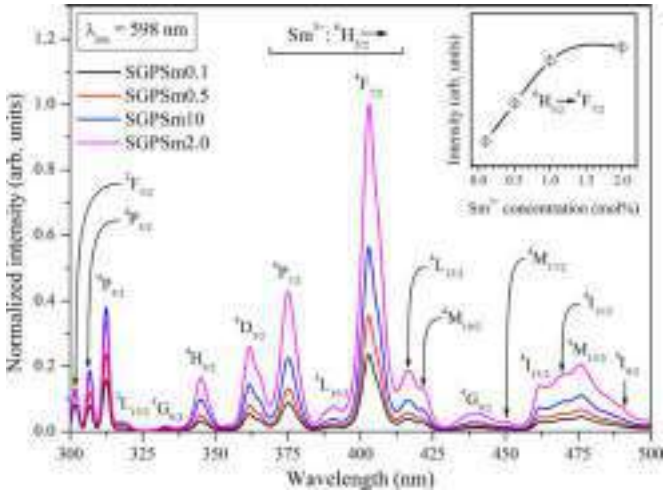

**Fig. 6.** PLE spectra of SGPSmx phosphors. Inset shows the variation of intensity of $^6H_{5/2} \rightarrow {}^4F_{7/2}$ transitions as a function of $Sm^{3+}$ concentration.

(450 nm), $^6H_{5/2} \rightarrow {}^4I_{13/2}$ (462 nm), $^6H_{5/2} \rightarrow {}^4M_{15/2}$ (476 nm) and $^6H_{5/2} \rightarrow {}^4I_{9/2}$ (490 nm) transitions [25].

Since the $Sm^{3+}$ ions exhibit intense and sharp PLE transitions in near UV region (370-410 nm), there is probability to replace the commercial red-emitting $Y_2O_2S$: $Eu^{3+}$ phosphor in designing white LEDs. As seen the PLE spectra, it is clear that the $^6H_{5/2} \rightarrow {}^4F_{7/2}$ (403 nm) transitions possess highest intensity compared to other transitions. Therefore, the SGPSm*x* phosphors can effectively excite at 403 nm wavelength to produce intense luminescence. Further, the intensity of these transitions increases with increase of concentration of $Sm^{3+}$ as illustrated in inset of Fig. 6 which indicates the intensity variation of $^6H_{5/2} \rightarrow {}^4F_{7/2}$ (403 nm) transition as a function of $Sm^{3+}$ ions concentration.

The emission spectra of SGPSm*x* ($0 \leq x \leq 2.0$ mol%) phosphors in the spectral region 500-725 nm at 403 nm excitation is shown in Fig. 7 and they are similar to those reported for $SrAl_2O_4$: $Sm^{3+}$ [13], $Sr_3Gd(PO_4)_3$: $Sm^{3+}/Ce^{3+}$ [14] and $Sr_3Gd(PO_4)_3$: $Sm^{3+}$

**Table 1**
Comparison of (ED/MD) intensity ratios in SGPSmx phosphors.

| Sample code | Intensity ratio, $I_R = (I_{ED}/I_{MD})$ | | | |
|---|---|---|---|---|
| | $(\frac{^4G_{5/2}\rightarrow{}^6H_{9/2}}{^4G_{5/2}\rightarrow{}^6H_{5/2}})$ | $(\frac{^4G_{5/2}\rightarrow{}^6H_{9/2}}{^4G_{5/2}\rightarrow{}^6H_{7/2}})$ | $(\frac{^4G_{5/2}\rightarrow{}^6H_{11/2}}{^4G_{5/2}\rightarrow{}^6H_{5/2}})$ | $(\frac{^4G_{5/2}\rightarrow{}^6H_{11/2}}{^4G_{5/2}\rightarrow{}^6H_{7/2}})$ |
| SGPSm0.1 | 0.316 | 0.82 | 0.075 | 0.029 |
| SGPSm0.5 | 0.313 | 0.998 | 0.098 | 0.031 |
| SGPSm1.0 | 0.329 | 0.972 | 0.098 | 0.03 |
| SGPSm2.0 | 0.321 | 0.974 | 0.095 | 0.092 |

[15]. These spectra reveal four characteristic emission transitions of $Sm^{3+}$ ions. The emission mechanism of $Sm^{3+}$ ions at 403 nm excitation is illustrated in a partial energy level diagram shown in Fig. 8. When excited at 403 nm wavelength, some of the $Sm^{3+}$ ions get excited to $^4L_{13/2}$ higher energy state which is more unstable according to uncertainty principle ($\Delta E.\Delta\tau \geq h/4\pi$). Immediately, these excited ions decays to $^4G_{5/2}$ metastable-energy state producing emission through $^4G_{5/2} \rightarrow {}^6H_{5/2}$ (561 nm), $^4G_{5/2} \rightarrow {}^6H_{7/2}$ (598 nm), $^4G_{5/2} \rightarrow {}^6H_{9/2}$ (645 nm) and $^4G_{5/2} \rightarrow {}^6H_{11/2}$ (705 nm) transitions.

It is well known that higher site symmetry around the RE active ions tend to enhance their emission intensity. The site symmetry of host environment around the active ions has been obtained by evaluating the intensity ratio of electric diploe (ED) to magnetic dipole (MD) transitions [$I_R = (I_{ED} + I_{MD})$]. For $I_R < 1$, the environment around the RE active ions becomes more symmetric and for $I_R > 1$, the environment becomes asymmetric [26]. According to the spectroscopic rules, the $Sm^{3+}$: $^4G_{5/2} \rightarrow {}^6H_{5/2}$, $^6H_{7/2}$ transitions belong to MD ($\Delta J = 0$ or $\Delta J = \pm 1$), while the $Sm^{3+}$: $^4G_{5/2} \rightarrow {}^6H_{9/2}$, $^6H_{11/2}$ transitions belong to ED ($\Delta J = \pm 2$ or $\Delta J \leq 6$) transitions [27]. The values of $I_R$ evaluated for various transitions found to be lesser than unity (see Table 1) showing more symmetric environment around the $Sm^{3+}$ ions in SGPSm*x* phosphors.

The Commission International de l'Eclairage (CIE-1931) coordinates evaluated from the emission spectra helps us to know the color perception of SGPSm*x* phosphors. They are found to be (0.527, 0.458), (0.576, 0.420), (0.585, 0.413) and (0.581, 0.416) for SGPSm*x* phosphors, respectively at 403 nm excitation and they are

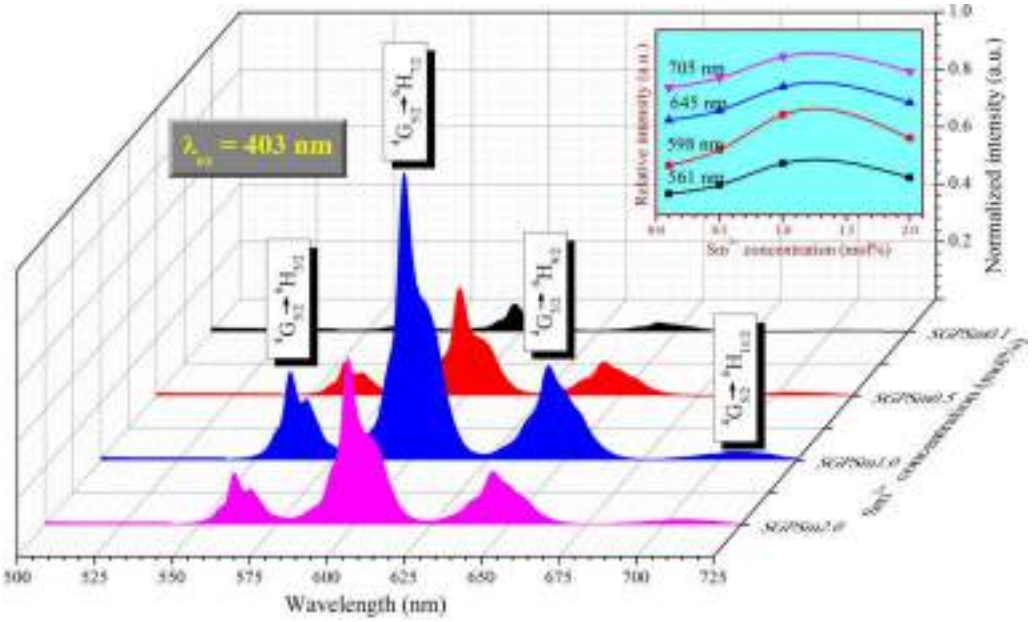

**Fig. 7.** Emission spectra of SGPSmx phosphors. Inset shows the variation of intensity of observed emission transitions as a function of $Sm^{3+}$ concentration.

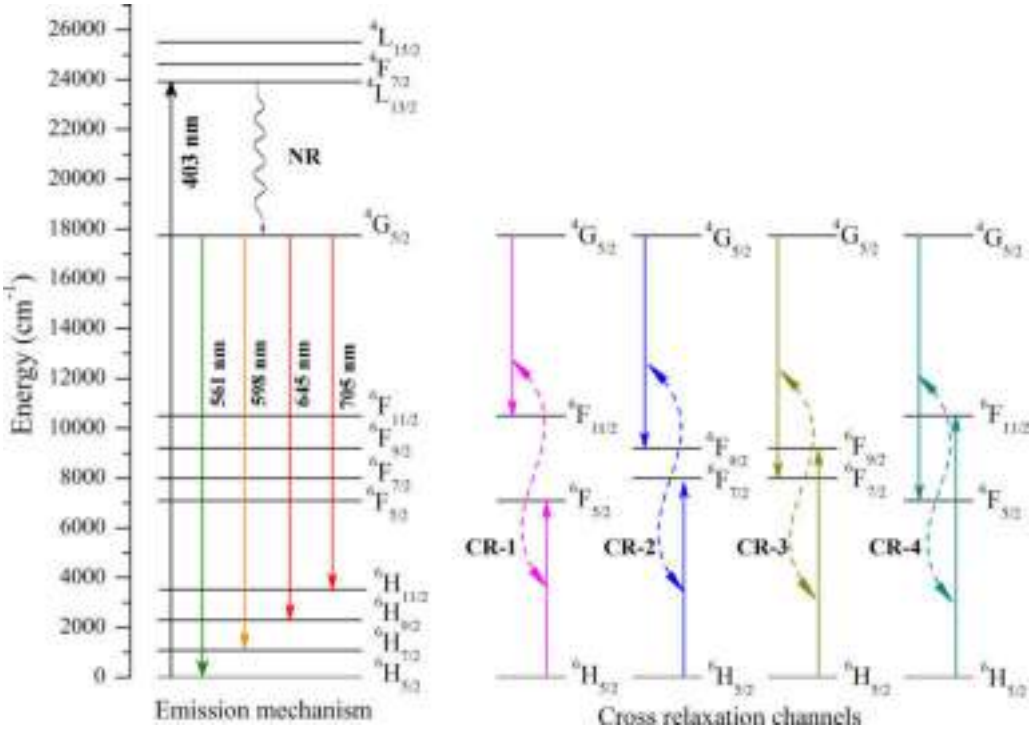

**Fig. 8.** Partial energy level diagram showing emission of SGPSmx phosphors at 403 nm and the corresponding cross-relaxation channels.

presented in a chromaticity diagram shown in Fig. 9. These results show that the color of emitted luminescence has been tuned from yellowish-orange for SGPSm0.1 to deep reddish-orange for SGPSm1.0. The CIE coordinates of SGPSm*x* ($x$ = 0.5, 1.0 and 2.0 mol%) phosphors are found very close to those reported for Amber LED NSPAR70BS commercial reddish-orange phosphor. The CIE coordinates of SGPSm*x* phosphors are also close to other phosphor materials available in literature [15,28–38]. A comparison of CIE coordinates of different phosphors activated with certain RE ions exhibiting orange and/or reddish-orange luminescence is shown in Table 2.

### 3.4. Luminescence decay

The luminescence decay curves of $Sm^{3+}$: $^4G_{5/2}$ emission state has been studied by exciting at 403 nm by monitoring the emission at 598 nm and they are presented in Fig. 10(a). For all $Sm^{3+}$ ions concentration, the behavior of these decay curves is fitted to single exponential function, $I = I_0.e^{-t/\tau}$, where $I_0$ indicates the initial intensity and $\tau$ indicates the lifetime which can be determined by taking the first e-folding times the initial intensity at $t$ = 0 s. For SGPSm*x* phosphors the lifetime is estimated to be 1.42, 1.39, 1.31 and 1.28 ms for $x$ = 0.1, 0.5, 1.0 and 2.0 mol%, respectively.

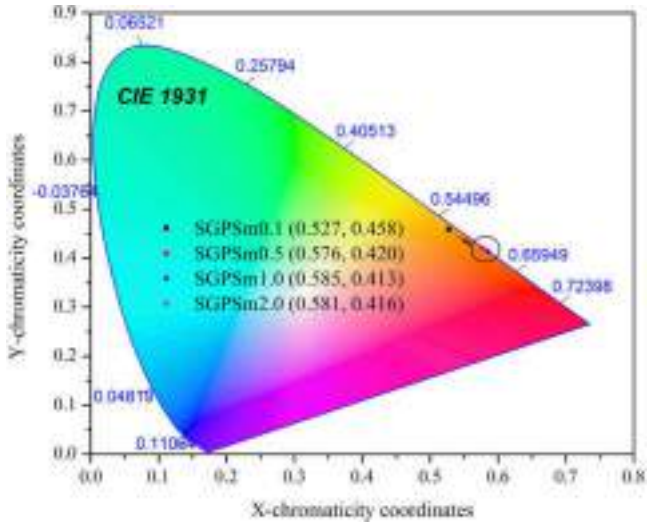

**Fig. 9.** CIE chromaticity diagram of SGPSmx phosphors excited at 403 nm radiation.

### 3.5. Quenching mechanism

As seen the emission spectra shown in Fig. 7, it is clear that the intensity of emitted luminescence increase with increase of $Sm^{3+}$ concentration reach to maximum at $x$ = 1.0 mol% and then decrease showing concentration luminescence. The inset of Fig. 7 shows the variation of intensity of different transitions with peak maximum at ~561 nm ($^4G_{5/2} \rightarrow {}^6H_{5/2}$), 598 nm ($^4G_{5/2} \rightarrow {}^6H_{7/2}$), 645 nm ($^4G_{5/2} \rightarrow {}^6H_{9/2}$) and 705 nm ($^4G_{5/2} \rightarrow {}^6H_{11/2}$) as a function of $Sm^{3+}$ concentration. Therefore, $x$ = 1.0 mol% is known as optimum or critical concentration of $Sm^{3+}$ ions showing efficient emission in SGPSm$x$ phosphors. Similarly, from the observed values of lifetime it is clear that they decrease with increase of $Sm^{3+}$ ions concentration leading to energy transfer (ET) among the excited $Sm^{3+}$ ions at higher concentrations. Fig. 10(b) represents the variation of lifetime of $Sm^{3+}$: $^4G_{5/2}$ emission state as a function of $Sm^{3+}$ ions concentration in SGPSm$x$ phosphors. The process of ET at higher concentrations has been ascribed to non-radiative transitions that occur through exchange type of interaction or multi-pole interaction or radiation reabsorption process. The exchange interaction is active for critical transfer distance between the dopant ions of the order 3-4 Å only. Beyond this, the multi-pole interaction such as dipole-dipole (d-d), dipole-quadrupole (d-q) and quadrupole-quadrupole (q-q) become active [39]. The type of interaction responsible for non-radiative energy transfer has been identified by evaluating the critical transfer distance ($R_c$) [40].

$$R_c \approx 2\left(\frac{3V}{4\pi x_c N}\right)^{1/3} \quad (1)$$

where $V$ is the volume of unit cell, $N$ is the number of available sites for the occupation of dopant ions in the unit cell and $x_c$ is the critical concentration of dopant ions. In case of SGPSm$x$ phosphors, $V$= 1034.59 Å, $x_c$= 1.0 mol% and $N$= 4 [41]. The value of $R_c$ is found to be 7.91 Å indicating multi-pole interaction is the major reason for non-radiative transfer of energy among the excited dopant ions leading to concentration quenching. According to the theory of sensitized luminescence in solids by Dexter [39], the emission intensity (I) per activator concentration ($x$) is given as

$$\left(\frac{I}{x}\right) = \frac{K}{\beta . x^{Q/3}} \; (For \beta \gg 1) \quad (2)$$

where K and $\beta$ are constants for a particular interaction mechanism under the same excitation condition in a given host matrix and Q corresponds to exchange, d-d, d-q and q-q interactions for 3, 6, 8 and 10, respectively. According to the above equation, the plot of log(I/$x$) versus log($x$) is a straight line with a slope equal to (-Q/3). For SGPSm$x$ phosphors, the slope of log(I/$x$) versus log($x$) plot shown in Fig. 10(c) is equal to 1.844 and the corresponding

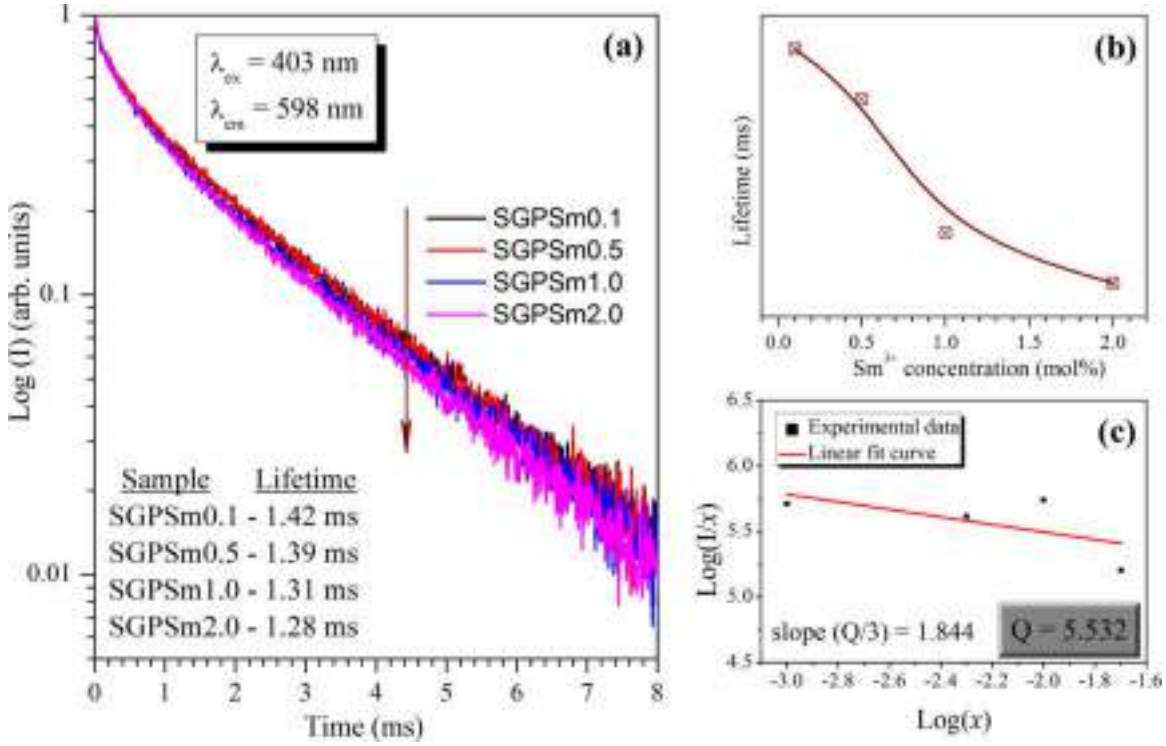

**Fig. 10.** Luminescence decay curves of $Sm^{3+}$: $^4G_{5/2}$ emission state in SGPSmx phosphors (a), variation of lifetime as a function of $Sm^{3+}$ concentration (b) and logarithmic plot of (I/$x$) vs. $x$ in SGPSmx phosphors (c).

**Table 2**
Comparison of CIE chromaticity coordinates and quantum yields ($\eta_{QE}$) in different phosphors.

| Host | $\lambda_{ex}$ (nm) | CIE coordinates | Emitted color | Reference |

value of $Q \approx 6$ which leads to d-d interaction ET among the excited $Sm^{3+}$ ions and it is possible through the cross-relaxation channels illustrated below [42] and they are illustrated in Fig. 8.

$$CR-1: \left[{}^4G_{5/2}, {}^6H_{5/2}\right] \rightarrow \left[{}^6F_{11/2}, {}^6F_{5/2}\right]$$
$$CR-2: \left[{}^4G_{5/2}, {}^6H_{5/2}\right] \rightarrow \left[{}^6F_{9/2}, {}^6F_{7/2}\right]$$
$$CR-3: \left[{}^4G_{5/2}, {}^6H_{5/2}\right] \rightarrow \left[{}^6F_{7/2}, {}^6F_{9/2}\right]$$
$$CR-4: \left[{}^4G_{5/2}, {}^6H_{5/2}\right] \rightarrow \left[{}^6F_{5/2}, {}^6F_{11/2}\right]$$

## 4. Conclusions

The SGPSm$x$ ($0 \leq x \leq 2.0$ mol%) phosphors of composition $Sr_3Gd_{(1-x)}(PO_4)_3$:$xSm^{3+}$ with BCC structure have been successfully synthesized via modified citrate-gel combustion method and it is confirmed by the PXRD studied. The studied phosphors are crystallized into 55-58 nm in size with a lattice distortion of the order ~0.00059. The FT-IR spectral analysis confirms the presence of $(PO_4)^{3-}$ units, Sr–O, Gd–O, O–P–O and P–O bonds with different vibrational modes. The HR-SEM micrograph shows the agglomerated and randomly distributed particles of different size and shape. The 403 nm wavelength corresponding to ${}^6H_{5/2} \rightarrow {}^4F_{7/2}$ transition has highest potentiality to excite the studied phosphors generating deep reddish-orange luminescence. The luminescence quenching noticed beyond $x = 1.0$ mol% has been ascribed to exchange interaction type of energy transfer among the excited $Sm^{3+}$ ions at higher concentrations. The decay profiles of ${}^4G_{5/2}$ emission state are well fitted to single exponential function supporting the d-d interaction mechanism. The reddish-orange color perception has been studied by evaluating the chromaticity coordinates. The experimental results confirm the SGPSm1.0 phosphor has highest potentiality to replace commercial red emitting phosphors in the design of phosphor-converted white LED devices.

ABSTRACT

The SGPEu*x* phosphors of composition $Sr_3Gd_{(1-x)}(PO_4)_3$:$xEu^{3+}$ were synthesized by modified citrate-gel combustion method for white LED sources. The optimum conditions of synthesis were obtained from thermogravimetric and differential scanning calorimetry. The synthesized phosphors were crystallized into BCC structure with JCPDS No. 29–1301. The presence of various bonds due to stretching and bending vibrations of different functional groups were studied through Fourier transform infrared spectroscopy. The morphology was examined using high-resolution scanning electron microscopy. The luminescence analysis was carried out through photoluminescence excitation and emission studies. The charge transfer band and f-f transitions of $Gd^{3+}$ and $Eu^{3+}$ ions cause a transfer of energy from $Gd^{3+}$ to $Eu^{3+}$. A suitable excitation wavelength for efficient luminescence was selected as 273 nm by studying the emission properties at different excitations. The quenching in luminescence noticed beyond 2.0 mol% was assigned to non-radiative transitions at higher $Eu^{3+}$ concentrations. The analysis of colour perception and colour temperature of emitted luminescence was studied using chromaticity coordinates evaluated from the emission spectra. The observed results suggest that the 2.0 mol% of $Eu^{3+}$ doped SGPEu phosphor has more proficiency to design new class of w-LED sources.

## 1. Introduction

Since few decades, research on light emitting diodes has become more significant owing to their fabulous properties such as high brightness, high luminescence efficiency, non-toxic nature, low-energy consumption, relatively long lifetime, stable luminous output, energy-saving and eco-friendly behaviour [1–3]. Compared to conventional incandescent and fluorescent lighting devices, the white light emitting diodes (w-LEDs) are more favourable. Commercial w-LEDs have been designed combining InGaN-LED blue-chip with YAG: $Ce^{3+}$ yellow-phosphor and it was unfavourable due to its low colour-rendering index (CRI) of the order 85 and relatively high correlated colour temperature (CCT) of the order 7615 K [4,5]. In order to fabricate a w-LED with more superior properties such as low

CCT and high colour uniformity with good CRI, ultra violet light emitting diode (UV-LED) chip can be combined with a tri-colour (blue, green, red) phosphor [6]. Therefore, the LED-based lighting technology requires variety of novel phosphor materials with good thermal and chemical stability, strong absorption in UV or near-UV region with high conversion efficiency. Many researchers across the globe focused a light to fabricate new, novel and low energy consumption phosphor materials to meet the requirement of present technology [7–9].

Among all the available host matrices investigated, orthophosphate host with general formula $A_3M(PO_4)_3$, where A represents di-valent cation, M represents tri-valent cation, has been considered as a prominent one due to its ease of fabrication, low synthesis temperature, non-toxicity, good thermal and chemical stability and good rare earth (RE) ion solubility for solid-state lighting (SSL) applications. Depending on different A and M, many compounds such as $Ca_3Y(PO_4)_3$: $Eu^{2+}$, $Mn^{2+}$ [10], $Ba_3Lu(PO_4)_3$:$Sm^{3+}$ [11], $Sr_3La(PO_4)_3$: $Eu^{2+}$, $Mn^{2+}$ [12], $Sr_3Y(PO_4)_3$:$Eu^{3+}$ [13] and so on have been fabricated through different techniques such as conventional sloid-state method, combustion technique, sol-gel method, coprecipitation, etc. Among these orthophosphate, $Sr_3Gd(PO_4)_3$ is more promising host as it crystallizes into single-phase at relatively low temperatures and favourable to enhances the luminescence efficiency of RE ions.

Among trivalent RE ions, $Eu^{3+}$ is more significant due to its characteristics such as non-degenerate ground ($^7F_0$) and excited ($^5D_0$) energy states and simple energy-level system. It has been used as a spectroscopic probe to investigate site symmetry around it and fluorescence probe to study the surface morphology and homogeneity of any kind of host matrix [14–16]. The $Eu^{3+}$ ions are capable of producing intense luminescence through $^5D_0 \rightarrow {}^7F_{0,1,2,.6}$ transitions in many hosts however, the emission due to $^5D_{1,2} \rightarrow {}^7F_1$ transitions become insignificant [17,18]. A tunable warm-white-light emitting single component $Sr_3Gd(PO_4)_3$:$Eu^{2+}$,$Mn^{2+}$ phosphor was synthesized via conventional solid state reaction method for w-LEDs [19]. The $Ba_3La(PO_4)_3$:$Eu^{3+}$/$Tb^{3+}$ phosphors were prepared and characterized for plasma display panels and Hg-free lamps [20]. $Eu^{3+}$ -doped $BaNb_2O_6$ [21], $Na_3Gd(PO_4)_2$ [22] and $SrAl_2O_4$ [23] phosphors were reported as potential candidates to use in w-LEDs.

The present work focused a light on modified citrate-gel combustion method of synthesis of $Sr_3Gd(PO_4)_3$:$Eu^{3+}$ (SGPEu) phosphors for w-LED sources. The thermal, structural, morphological and luminescence properties were discussed. Optical analysis was carried out by exciting at various near UV wavelengths. The colour perception and CCT analysis was carried out using chromaticity co-ordinates evaluated from the emission spectra. The applicability of studied phosphors for w-LED sources was also discussed.

## 2. Experimental techniques

### 2.1. Materials and method of synthesis

The SGPEu*x* phosphors of composition $Sr_3Gd_{(1-x)}(PO_4)_3$:$xEu^{3+}$, where $x = 0$, 0.1, 0.5, 1.0, 2.0 and 5.0 mol% were synthesized following modified citrate-gel combustion method. High purity $Sr(NO_3)_2$ (99.0%, Honeywell), $Gd(NO_3)_3.6\ H_2O$ (99.9%, Sigma Aldrich), $NH_4H_2PO_4$ (98%, Alfa Aesar), $Eu(NO_3)_3{\cdot}H_2O$,( 99.9%, Sigma Aldrich) and $C_6H_8O_7{\cdot}H_2O$ (99.0%, Sigma Aldrich) were used without further purification. The stoichiometric amounts of starting materials were dissolved in double-distilled water and stirred for 30 min using a magnetic stirrer at 500 rpm to get 1.0 M homogeneous solution of each. The starting materials and citric acid ($C_6H_8O_7{\cdot}H_2O$) were taken in the ratio 1:2 wt%. The citric acid solution was prepared by dissolving stoichiometric amounts in 10 ml double-distilled water and it can act as a chelating agent to form transparent complex gel upon drying. The citric acid solution was added in drop-wise to the mixed solution and stirred for 30 min. The resultant homogeneous solution was dried at 80 °C for 24 h producing light-brown coloured powder. This powder was heat treated at 200 and 400 °C for 3 h in each step with intermediate grinding using pestle and agate motor producing black-foamy material and it was sintered at different temperatures to obtain final

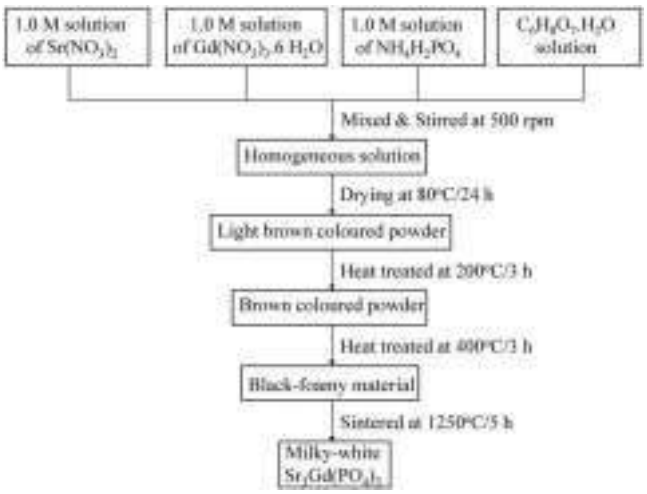

**Fig. 1.** Various steps involved in modified citrate gel-combustion method of synthesis of SGPEu*x* phosphors.

product.

The powder X-ray diffraction (PXRD) patterns of precursor sample sintered at 1250 °C for 3 h are close to the joint committee on powder diffraction standards (JCPDS) number 29–1301 with slight deviation in their positions. To optimize the duration of sintering process, the precursor powders were further sintered at 1250 °C for 5 and 7 h. The PXRD profiles obtained for a precursor powder sintered at 1250 °C for 5 h were well matched with the JCPDS No. 29–1301. The fabrication conditions for SGPEu*x* ($0 \leq x \leq 5.0$ mol%) phosphors through modified citrate-gel combustion method were optimized to be 1250 °C for 5 h. Fig. 1 represents the various steps involved in the modified citrate-gel combustion method of synthesis of SGPEu*x* phosphors. For convenience, the synthesized phosphor materials were referred as SGPEu0, SGPEu0.1, SGPEu0.5, SGPEu1.0, SGPEu2.0 and SGPEu5.0 according to $x = 0$, 0.1, 0.5, 1.0, 2.0 and 5.0 mol%, respectively.

### 2.2. Characterization

Thermal analysis of the SGPEu phosphors were carried out through thermo-gravimetry and differential scanning calorimetry (TG-DSC) using NETZSCH STA 449 F3 Thermal Analyzer in the presence of air-atmosphere at 5.0 K/min. in the temperature range 50–1400 °C using as-prepared precursor powders. The crystalline phase analysis was carried out with BRUCKER USA D8 advance diffractometer with $\lambda_{CuK\alpha} = 1.541$ Å. The Fourier-transform infrared (FT-IR) study was done with a PerkinElmer FT-IR spectrometer following KBr technique using a pellet made of KBr to sample ratio 300:1. The surface morphology was studied using FEI-Quanta FEG 200 F high resolution-scanning electron microscope (HR-SEM). The room temperature photoluminescence excitation and emission studies were carried out with FP-8300 JASCO fluorescence spectrometer and the decay studies were carried out with a Jobin YVON Fluorolog-3 spectrofluorimeter. All the measurements were carried out at room temperature only.

## 3. Results and discussions

### 3.1. Thermal analysis

To know the various reaction processes such as endothermic and exothermic reactions and respective weight loss mechanism in the process of formation of SGPEu phosphors have been investigated through TG-DSC study of precursor powder. The TG-DSC curve in the temperature ranges from 25 to 1400 °C are presented in Fig. 2. The endothermic peak noticed at ~180 °C belongs to evaporation of $NH_3$ and $H_2O$ and the corresponding weight loss is of the order of ~5.38%. An endothermic peak at ~324 °C corresponds to a weight loss of ~3.68% and it could be due to the removal of acetone and moisture. A major weight loss takes place from 324 to 900 °C with a peak maximum at ~750 °C corresponds to a weight loss of ~19.08% and it is mainly due to the release of $CO_2$ gas. The weak exothermic peak identified at ~1250 °C shows the formation of SGP phase [21,24] leading to a total weight loss of ~28.14% during the process of formation of SGP phase indicating a good amount of yield through modified citrate-gel combustion method.

### 3.2. Powder X-ray diffraction analysis

In order to confirm the phase of SGPEu phosphors, the precursor powders are heat treated for 3 h at different temperatures such as 625 °C, 750 °C, 915 °C, 1015 °C, 1115 °C, 1225 °C, 1250 °C and 1275 °C and the corresponding powder x-ray diffraction (PXRD) profiles are shown in Fig. 3**(a)**. The PXRD profiles heat treated at 1225 °C, 1250 °C and 1275 °C are found identical but deviate in intensity. From Fig. 3**(a)** one can notice that the PXRD profiles of the precursor powders heat treated at 1250 °C are found more intense than that of 1225 °C and 1275 °C. To optimize the sintering time required to get SGP phase without impurities, the precursor is heat

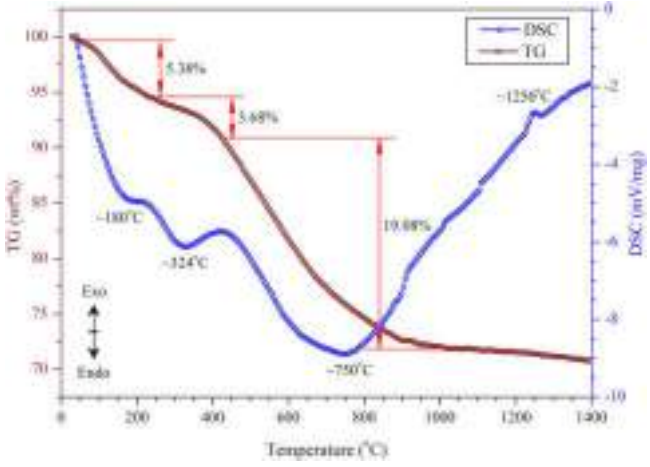

**Fig. 2.** TG-DSC curves for SGPEu0 precursor powder.

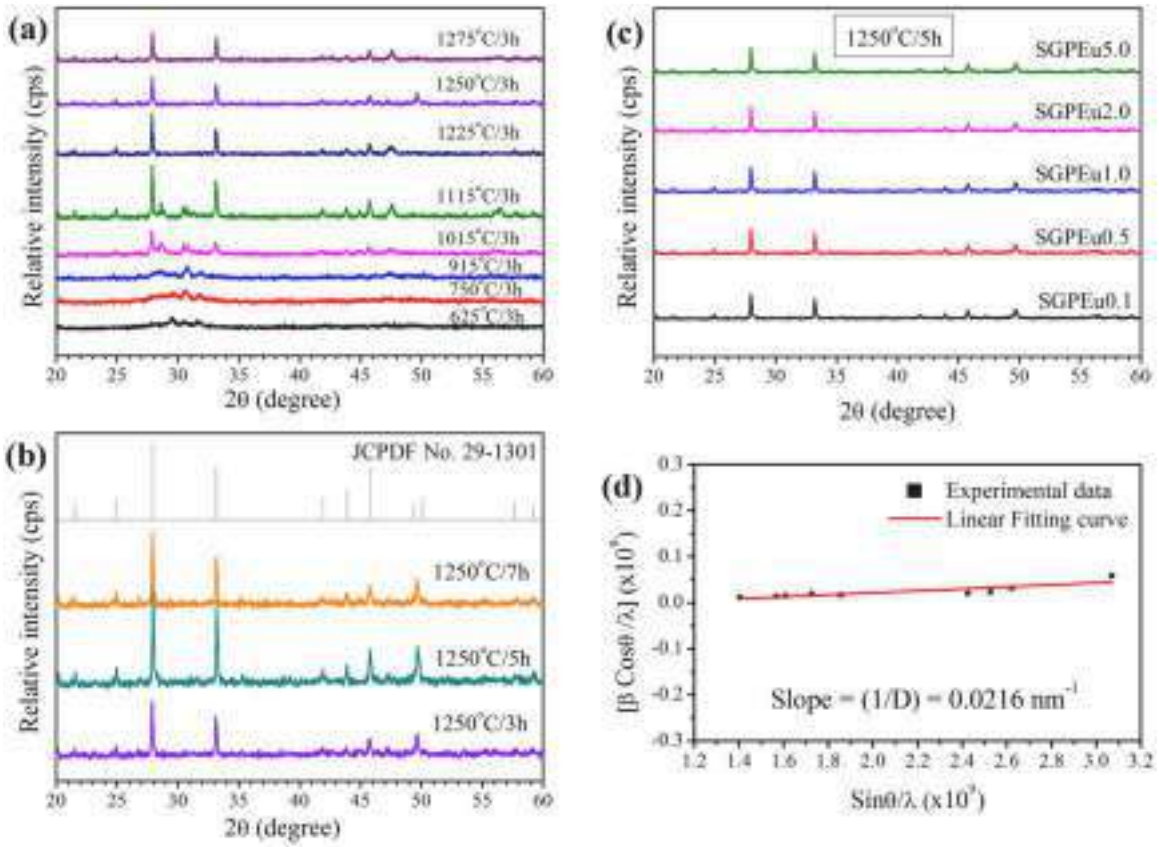

**Fig. 3.** PXRD profiles of SGPEu0 precursor heat treated at different temperatures for 3 h (a), sintered at 1250 °C for different time (b), SGPEu*x* phosphors sintered at 1250 °C/5 h (c) and the Hall-Williamson plot for SGPEu0 precursor sintered at 1250 °C/5 h (d).

treated at 1250 °C for 3, 5 and 7 h and the corresponding PXRD profiles are shown in Fig. 3**(b)**. From these results it is clear that the PXRD profiles obtained at 1250 °C for 5 h are found more intense than those obtained for 3 and 7 h. The synthesized phosphors are crystallized into a body centered cubic (BCC) structure with lattice parameters a = b = c = 10.11 Å, α = β = γ = 90° and they are well matched with JCPDS No. 29–1301. The PXRD profiles of SGPEu*x* ($0 \leq x \leq 5.0$ mol%) phosphors sintered at 1250 °C for 5 h are described in Fig. 3**(c)**.

The PXRD profiles reveal a monotonic decrease in intensity with increase of concentration of $Eu^{3+}$ indicating uniform distribution of $Eu^{3+}$ ions among the SGP crystal lattice. Taken into account the ionic radii of $Eu^{3+}$ (~0.095 nm) and $Gd^{3+}$ (~0.0938 nm) and the absence of deviation in PXRD peak position, it can be concluded that the $Eu^{3+}$ ions suitably replace the $Gd^{3+}$ sites in SGPEu phosphors. The average size of crystallites (D) has been obtained following a well-known Debye-Scherrer's equation.

$$D = \frac{0.89 \times \lambda}{\beta \times Cos\theta} \tag{1}$$

where λ indicates the wavelength of incident X-rays from CuKα source (1.5406 Å), β indicates the full-width at half-maximum (in radians) and θ indicates the angle of diffraction. The average size of crystallites is determined to be ~47 nm and it can be confirmed from the Hall-Williamson's (H-W) equation [25] shown below.

$$\left(\frac{\beta \,.\, Cos\theta}{\lambda}\right) = \left(\frac{1}{D}\right) + \left(\frac{\varepsilon \,.\, Sin\theta}{\lambda}\right) \tag{2}$$

here ε is a constant representing the magnitude of micro-strains present in the given phosphor materials. A graph drawn taking ($\beta\, Cos\theta/\lambda$) on Y-axis and ($Sin\,\theta/\lambda$) on X-axis is known as H-W curve. The reciprocal of intercept of H-W curve gives the average size of crystallites. For SGPEu phosphors, the average size of crystallites is found to be ~46 nm from the H-W curve shown in Fig. 3**(d)**. These results show that the average size of SGPEu crystallites obtained from the Debye-Scherrer method is in good agreement with that of H-W method.

The presence of defects or stress or crystal plane distortion results micro-strain ($\varepsilon$) which can affect the optical properties of doped RE active ions. According to Cullity and Stock [26], the angle of diffraction and the micro-strain are related as, $\varepsilon = (\beta . Cos\theta)/4$. Further, smaller the size of nanoparticles more will be the micro-strain. According to this equation, the micro-strain present in SGPEu

phosphors is estimated to be 0.00059 for crystallites of average size 46–47 nm. Verma et al. [27] reported the micro-strain presented in $Sr_{1-x}Eu_xMgAl_{10}O_{17}$ phosphor as ~0.00751 nm for crystallites of average size 14–20 nm. The value of micro-strain increases from 0.00059 to 0.00072 when the concentration of $Eu^{3+}$ changes from 0 to 5.0 mol%.

### 3.3. FT-IR and SEM analysis

To know the presence of various functional groups in SGPEu phosphors, the FT-IR spectrum of SGPEu0 phosphor is recorded and shown in Fig. 4. A strong IR absorption band with sub-peaks at about 1076, 1016, 999 and 949 $cm^{-1}$ has been associated with asymmetric stretching vibrations of $(PO_4)^{3-}$ units [28,29]. A narrow band centered at about 592 $cm^{-1}$ is related to the O–P–O asymmetric bending vibrations [30]. Another narrow band located at about 520 $cm^{-1}$ is assigned to the P–O asymmetric stretching vibrations [31]. The IR absorption bands noticed at about 685 and 548 $cm^{-1}$ have been related to the Sr–O and the Gd–O vibrations, respectively [32,33].

The morphology which plays a key role in optimizing the luminescence properties of a phosphor material has been studied using HR-SEM and its micrograph for SGPEu0 phosphor is shown in Fig. 5**(a)**. This micrograph explores that the crystallized particles are appear to be agglomerated with irregular morphology with an average particle size of the order of 250 nm obtained using ImageJ software. The histogram showing the particle distribution is illustrated in Fig. 5**(b)**. The PXRD investigations show that the average size of crystallites is of the order of 46–47 nm only, while the average particle size is calculated to be 250 nm from the HR-SEM micrograph confirming the agglomeration of crystallites. The agglomeration of particles leads non-radiative losses due to the multiple-scattering effect.

### 3.4. Photoluminescence excitation spectra

The optical analysis of SGPEu$x$ ($0 \leq x \leq 5.0$ mol%) phosphors has been carried out by studying the photoluminescence excitation (PLE), emission and the luminescence decay dynamics. The PLE spectra in the spectral region from 220 nm to 500 nm monitoring the emission at 612 nm corresponding to $Eu^{3+}$: $^5D_0 \rightarrow {}^7F_2$ transition is shown in Fig. 6. As seen these spectra, one can notice a broad charge transfer band (CTB) in the spectral range 220–270 nm with sub-peaks along with sharp and intense excitation bands due to $Gd^{3+}$ and $Eu^{3+}$ ions indicating the efficient energy transfer (ET) from the host to $Eu^{3+}$ ions. The CTB has been ascribed to $O^{2-} \rightarrow Eu^{3+}$ [34] and a similar kind of broad band was observed for $SrAl_2O_4$: $Eu^{3+}$ phosphors [23].

The $Gd^{3+}$ ions display $^8S_{7/2} \rightarrow {}^6D_{7/2}$ (246 nm), $^8S_{7/2} \rightarrow {}^6D_{9/2}$ (253 nm), $^8S_{7/2} \rightarrow {}^6I_{13/2}$ (273 nm), $^8S_{7/2} \rightarrow {}^6I_{17/2}$ (276 nm) and $^8S_{7/2} \rightarrow {}^6I_{7/2}$ (279 nm) transitions [35] while the $Eu^{3+}$ ions demonstrate excitation transitions originated from $^7F_0$ ground and $^7F_1$ first excited energy states. They have been assigned to $^7F_1 \rightarrow {}^5G_5$ (246 nm), $^7F_1 \rightarrow {}^5K_9$ (253 nm), $^7F_1 \rightarrow {}^5K_6$ (273 nm), $^7F_0 \rightarrow {}^5K_5$ (276 nm), $^7F_1 \rightarrow {}^5K_5$ (279 nm), $^7F_0 \rightarrow {}^5F_5$ (294 nm), $^7F_0 \rightarrow {}^5F_1$ (299 nm), $^7F_1 \rightarrow {}^5F_2$ (305 nm), $^7F_1 \rightarrow {}^3P_0$ (312 nm), $^7F_0 \rightarrow {}^5H_5$ (319 nm), $^7F_1 \rightarrow {}^5H_3$ (328 nm), $^7F_0 \rightarrow {}^5D_4$ (362 nm), $^7F_1 \rightarrow {}^5D_4$ (366 nm), $^7F_0 \rightarrow {}^5G_3$ (376 nm), $^7F_1 \rightarrow {}^5G_3$ (382 nm), $^7F_0 \rightarrow {}^5L_5$ (394 nm), $^7F_1 \rightarrow {}^5L_5$ (400 nm), $^7F_1 \rightarrow {}^5D_3$ (415 nm), $^7F_0 \rightarrow {}^5D_2$ (465 nm) and $^7F_1 \rightarrow {}^5D_2$ (470 nm) transitions [36]. Increase of $Eu^{3+}$ concentration has no impact on the intensity of $Gd^{3+}$ transitions while it considerably enhances the intensity of $Eu^{3+}$ excitation bands. The variation of intensity of $Eu^{3+}$: $^7F_0 \rightarrow {}^5L_5$ (394 nm) transitions as a function of $Eu^{3+}$ ions concentration is shown as inset of Fig. 6. Among the observed excitation bands, the $Gd^{3+}$: $^8S_{7/2} \rightarrow {}^6I_{13/2}$ (273 nm), $Eu^{3+}$: $^7F_1 \rightarrow {}^5F_2$ (305 nm), $Eu^{3+}$: $^7F_1 \rightarrow {}^3P_0$ (312 nm) and $Eu^{3+}$: $^7F_0 \rightarrow {}^5L_5$ (394 nm) transitions found significant intense and sharper.

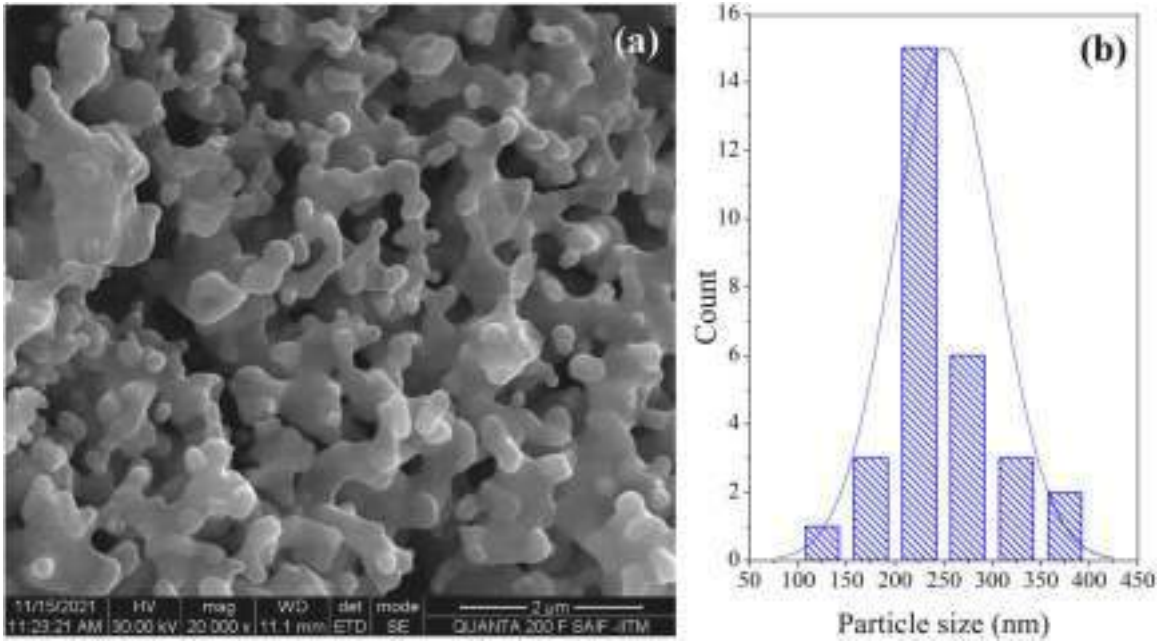

**Fig. 5.** HR-SEM micrograph of SGPEu0 phosphor (a) and particle size distribution histogram (b).

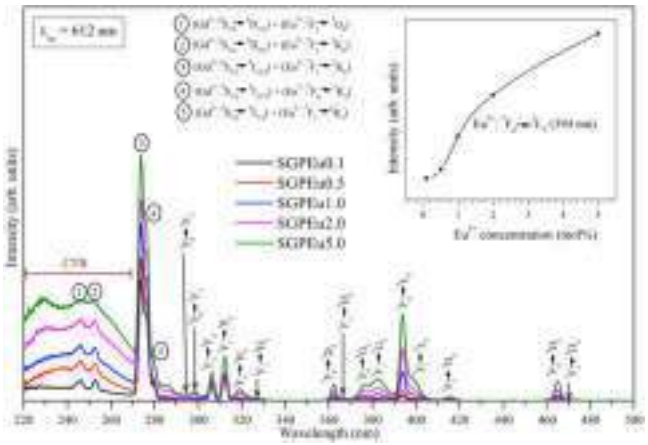

**Fig. 6.** PLE spectra of SGPEu phosphors ($\lambda_{em}$ = 612 nm).

### 3.5. Emission spectra

In order to optimize the excitation wavelength, the emission spectra of SGPEu1.0 phosphor in the spectral region from 525 to 725 nm are recorded at different excitations such as 273, 305, 312 and 394 nm. The emission spectra along with the assignment of observed emission transitions are shown in Fig. 7. These spectra reveal two groups of emission bands due to $^5D_1 \rightarrow {}^7F_J$ and $^5D_0 \rightarrow {}^7F_J$ transitions. As can see these spectra, it is clear that the intensity of emission transition obtained at 273 nm are found more potential compared to other excitations. The inset figure shows the variation of intensity of $^5D_0 \rightarrow {}^7F_2$ transition as a function of $Eu^{3+}$ ions concentration. Therefore, the excitation wavelength has been optimized to be 273 nm for efficient luminescence from SGPEu*x* phosphors.

The emission spectra of SGPEu*x* ($0 \leq x \leq 5.0$ mol%) phosphors in the spectral region from 400 to 725 nm at 273 nm excitation are described in Fig. 8. These spectra are normalized w.r.t the intensity of $^5D_0 \rightarrow {}^7F_1$ transition of SGPEu2.0 phosphor. These spectra exhibit three groups of emission bands in blue, green and yellow-to-red regions corresponding to $^5D_2 \rightarrow {}^7F_J$, $^5D_1 \rightarrow {}^7F_J$ and $^5D_0 \rightarrow {}^7F_J$ transitions. The observed emission bands have been ascribed to $^5D_2 \rightarrow {}^7F_0$ (450 nm), $^5D_2 \rightarrow {}^7F_1$ (468 nm), $^5D_2 \rightarrow {}^7F_2$ (483 nm), $^5D_1 \rightarrow {}^7F_0$ (536 nm), $^5D_1 \rightarrow {}^7F_1$ (545 nm), $^5D_0 \rightarrow {}^7F_0$ (580 nm), $^5D_0 \rightarrow {}^7F_1$ (594 nm), $^5D_0 \rightarrow {}^7F_2$ (612 nm), $^5D_0 \rightarrow {}^7F_3$ (653 nm) and $^5D_0 \rightarrow {}^7F_4$ (685 nm) transitions [35]. It is well known that the emission due to $^5D_0 \rightarrow {}^7F_{5,6}$ transitions cannot be observed as they belong to IR

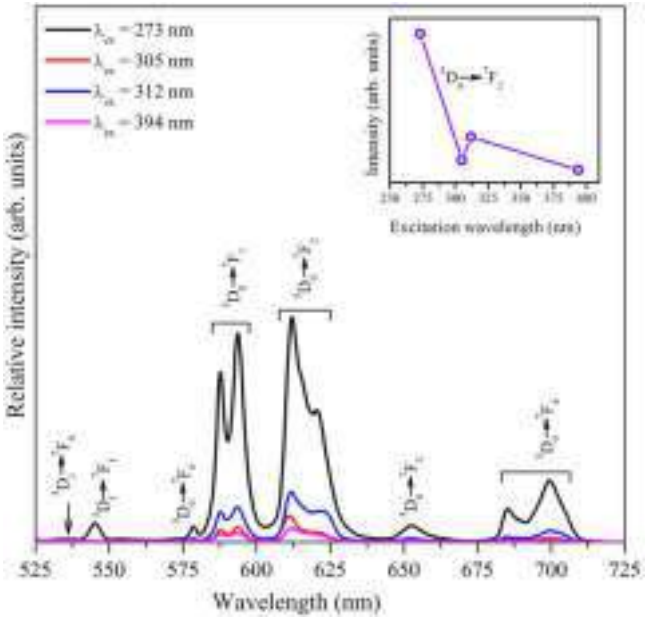

**Fig. 7.** Emission spectra of SGPEu1.0 phosphor at different excitations.

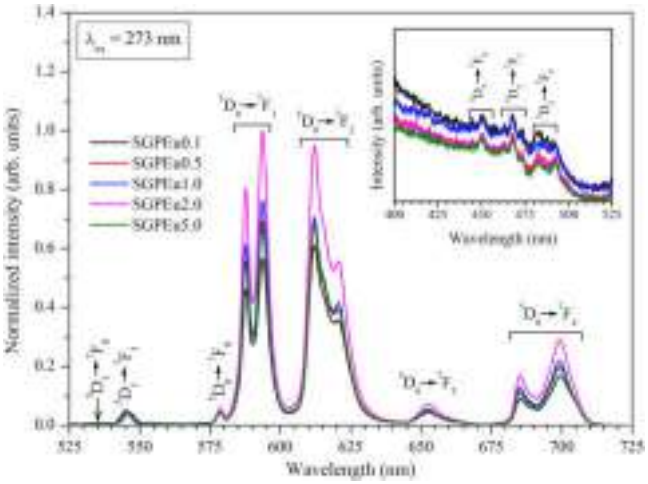

**Fig. 8.** Emission spectra of SGPEu*x* phosphors at 273 nm excitation.

region.

The emission mechanism of $Eu^{3+}$ ions in SGPEu*x* phosphors is illustrated in a partial energy level diagram shown in Fig. 9. Upon 273 nm excitation, the ground state $Gd^{3+}$ ions get excited to $^6I_J$ energy states. Since, the $Eu^{3+}$: $^5K_5$, $^5K_6$, $^5K_9$, $^5G_5$ energy states are equally positioned to that of $Gd^{3+}$: $^6I_J$, $^6D_J$ energy states, the excited $Gd^{3+}$ ions interact with ground state $Eu^{3+}$ ions and excite them to higher energy states through energy transfer (ET) process. The light photons of incident radiation corresponding to 273 nm wavelength also interact directly with some of the ground state $Eu^{3+}$ ions and get excite them to $Eu^{3+}$: $^5K_6$ higher energy state. As the $Eu^{3+}$: $^5K_6$ state is more uncertain according to the uncertainty principle ($\Delta E \,.\, \Delta\tau \geq h/4\pi$), a fast non-radiative (NR) decay happens resulting to enhance the population of $Eu^{3+}$: $^5D_{2,1,0}$ energy states leading to produce emission in blue, green and yellow-red regions.

As can see the emission spectra obtained at 273 nm excitation (see Fig. 8), it is clear that the intensity of observed emission transitions increases with increase of concentration of $Eu^{3+}$ ions reaches to maximum at $x = 2.0$ mol% and then decrease for further higher concentrations showing the concentration quenching phenomenon. The variation of intensity of $Eu^{3+}$: $^5D_0 \rightarrow {}^7F_J$ ($J = 0,1,2,3,4$) transitions as a function of $Eu^{3+}$ ions concentration is illustrated in Fig. 10**(a)**. The observed luminescence quenching has been ascribed to self-absorption and/or non-radiative (NR) energy transfer among the excited $Eu^{3+}$ ions at higher concentrations. The non-radiative energy transfer includes cross-relaxation (CR) channels and the resonant energy transfer (RET) mechanism. Some of the possible CR and RET channels are shown below and they are illustrated in Fig. 9.

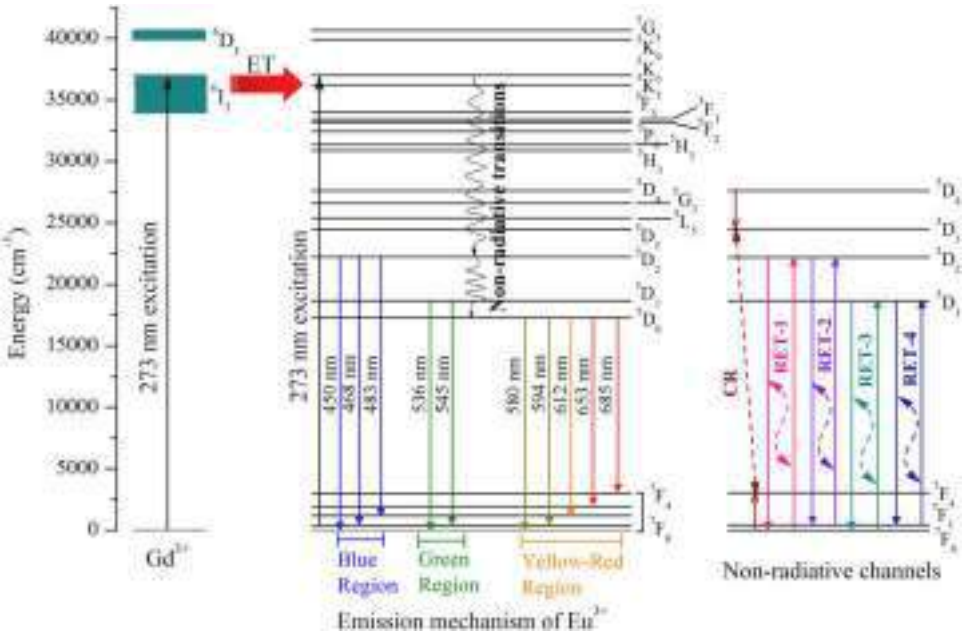

**Fig. 9.** Partial energy level diagram showing the emission mechanism of SGPEux phosphors at 273 nm excitation along with possible non-radiative channels.

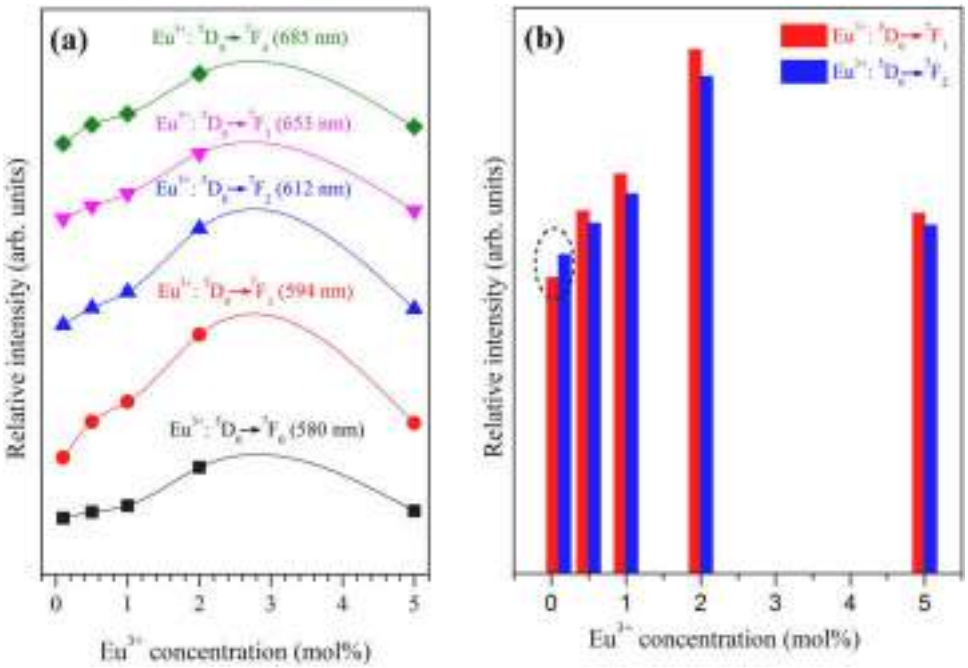

**Fig. 10.** Variation of intensity of $Eu^{3+}$: $^5D_0 \rightarrow {}^7F_{0-6}$ transitions (a) and comparison of intensity of $Eu^{3+}$: $^5D_0 \rightarrow {}^7F_1$ and $Eu^{3+}$: $^5D_0 \rightarrow {}^7F_2$ transitions (b) as a function of $Eu^{3+}$ ions concentration.

CR:[$^5D_4$, $^7F_0$] → [$^5D_3$, $^7F_4$].
RET-1:[$^5D_2$, $^7F_0$] → [$^7F_0$, $^5D_2$].
RET-2:[$^5D_2$, $^7F_1$] → [$^7F_1$, $^5D_2$].
RET-3:[$^5D_1$, $^7F_0$] → [$^7F_0$, $^5D_1$].
RET-4:[$^5D_1$, $^7F_1$] → [$^7F_1$, $^5D_1$].
The $Eu^{3+}$: $^5D_0 \rightarrow {}^7F_1$ and $Eu^{3+}$: $^5D_0 \rightarrow {}^7F_2$ transitions exhibit magnetic and electric dipole behaviour according to the spectroscopic

selection rules $\Delta J = 1$ and $\Delta J = 2$, respectively [37]. These transitions have been used as a spectroscopic probe to study the local site-symmetry of any host matrix around the $Eu^{3+}$ ions. The intensity ratio of observed electric and magnetic dipole transitions ($I_R$) provides the information regarding the local site-symmetry and it can be obtained using the integrated intensities of $Eu^{3+}$: $^5D_0 \rightarrow {}^7F_2$ and $Eu^{3+}$: $^5D_0 \rightarrow {}^7F_1$ transitions. When the site symmetry around $Eu^{3+}$ ions is asymmetric, then the intensity of $Eu^{3+}$: $^5D_0 \rightarrow {}^7F_2$ transition predominates the intensity of $Eu^{3+}$: $^5D_0 \rightarrow {}^7F_1$ transition and the corresponding intensity ratio become higher than unity and vice-versa. The values of $I_R$ for SGPEu1.0 phosphor under different excitations and for different doping levels at 273 nm excitation are summarized in Table 1.

When the SGPEu1.0 phosphor is excited at different wavelengths, the intensity ratio is found to be less than unity showing higher symmetric environment around the $Eu^{3+}$ ions in SGPEu1.0 phosphor. In order to confirm the site-symmetry of SGPEu*x* host environment at different doping levels, they are excited at 273 nm. The value of $I_R$ is found to be 1.08 for SGPEu0.1 phosphor showing asymmetric environment and the intensity of $Eu^{3+}$: $^5D_0 \rightarrow {}^7F_2$ transition is found higher than the intensity of $Eu^{3+}$: $^5D_0 \rightarrow {}^7F_1$ transition. Fig. 10**(b)** illustrates the comparison of intensity of $Eu^{3+}$: $^5D_0 \rightarrow {}^7F_1$ and $Eu^{3+}$: $^5D_0 \rightarrow {}^7F_2$ transitions as a function of $Eu^{3+}$ ions concentration. For other doping concentrations ($x = 0.5$, 1.0, 2.0 and 5.0 mol%), the value of $I_R$ is found to be less than unity and the intensity of $Eu^{3+}$: $^5D_0 \rightarrow {}^7F_1$ transition predominates the intensity of $Eu^{3+}$: $^5D_0 \rightarrow {}^7F_2$ transition. These results confirm that at higher concentrations ($x \geq 0.5$ mol%) there is symmetric environment around the $Eu^{3+}$ ions owing to increased micro-strain which tend to distribute $Eu^{3+}$ ions uniformly in SGPEu lattice.

### 3.6. Colour perception and colour temperature

The colour perception of emitted luminescence has been investigated by evaluating the Commission International de I'Eclairage (CIE-1931) chromaticity coordinates (x, y). The human-eye can recognize the visible light through three different cone cells like short, middle and long spectral regions corresponding to blue (420–440 nm), green (530–540 nm) and red (560–580 nm) regions, respectively. The tri-stimulus parameters X, Y and Z related to these cone cells illustrate the colour perception. Wright [38] and Guild [39] proposed a simple way to evaluate X, Y and Z tri-stimulus parameters using the following equations.

$$X = \int_0^\infty I_{(\lambda)} \,.\, T_{(\lambda)} \,.\, \bar{x}_{(\lambda)} \,.\, d\lambda \tag{3}$$

$$Y = \int_0^\infty I_{(\lambda)} \,.\, T_{(\lambda)} \,.\, \bar{y}_{(\lambda)} \,.\, d\lambda \tag{4}$$

$$Z = \int_0^\infty I_{(\lambda)} \,.\, T_{(\lambda)} \,.\, \bar{z}_{(\lambda)} \,.\, d\lambda \tag{5}$$

where $I_{(\lambda)}$ and $T_{(\lambda)}$ indicates the intensity of illuminant spectrum and the transmission spectrum of the filter ($0 \leq T \leq 1$), respectively. The functions $\bar{x}(\lambda)$, $\bar{y}(\lambda)$ and $\bar{z}(\lambda)$are known as the CIE colour matching functions. The colour of emitted luminescence can be specified in a chromaticity diagram using two colour coordinates (x, y) which can be obtained from the following equations.

$$x = \frac{X}{X + Y + Z} \tag{6}$$

$$y = \frac{Y}{X + Y + Z} \tag{7}$$

The CIE colour coordinates of SGPEu*x* phosphors excited at 273 nm have been evaluated following the above said procedure and they are summarized in Table 2. All these coordinates are close to the standard CIE white illuminant coordinates (0.333, 0.333) and they are well located in the white region of CIE diagram shown in Fig. 11. These coordinates are found close to the standard daylight illuminant-D50, cool white fluorescent illuminant-F2, broad fluorescent illuminant-F8 and daylight simulator-B [40,41]. They are also close to those reported for $SrAl_2O_4$:1.0 $Eu^{3+}$ [23], $BaMg_2V_2O_8$:0.01 $Eu^{3+}$ [42], $Ca_2Gd_8(SiO_4)_6O_2$: $Dy^{3+}$ [43] and $YAl_3(BO_3)_4$: 2.0% $Eu^{3+}$/ 0.5%$Tb^{3+}$ [44] phosphors.

The correlated colour temperature (CCT) expressed in the Kelvin units is a measure of appearance of colour of light emitted from a

source of light. Commonly, the CCT of a light source found between 2700 K and 6500 K and it is independent of its temperature. Light source with CCT rating 2700–3000 K appear as warm-white, 3000–4000 K appear as neutral-white and 4000–6500 K appear as cool-white. So higher the Kelvin rating, the cooler the light source will appear. Generally, warm-white light is more significant for the relaxation of eyes and softening the skin-tone by reducing imperfections. Therefore, warm-white light sources have been used in bedrooms, dining rooms and gardens. The cool-white light has been used for better brightness and it has been used in lounges and living rooms. The neutral-white light sources reproduce all colours equally and they have been used to illuminate the objects in art gallery and photography [45].

McCamy [46] evaluated the CCT values of light sources using the equation, $CCT = -449\,z^3 + 3525\,z^2 - 6823.3\,z + 5520.33$. The constant $z = (x - x_e)/(y - y_e)$, where ($x_e = 0.3320$, $y_e = 0.1858$) represents the coordinates of epicenter point and ($x$, $y$) represents the CIE coordinates of light source. Upon 273 nm excitation, the CCT values of SGPEu*x* phosphors are found close to the standard daylight illuminant-D50, cool white fluorescent illuminant-F2, broad fluorescent illuminant-F8 and daylight simulator-B [40, 41]. The evaluated CCT values confirm that the studied phosphors could be the best choice to replace the cool-white light sources. A comparison of CCT values of various light sources is also given in Table 2. It is well known that the phosphor coatings on lighting devices enhances their working efficiency by reducing their surface temperature [47–50]. Based on the experimental results it can be suggested that the SGPEu2.0 phosphor can have more proficiency to be used to design a novel and new class of w-LED sources with relatively good working efficiency.

### 3.7. $Eu^{3+}$: $^5D_0$ decay dynamics

To confirm the presence of NR transitions at higher $Eu^{3+}$ ions concentration, the luminescence decay dynamics of the $Eu^{3+}$: $^5D_0$ emission state has been studied monitoring the emission and excitation wavelengths at 612 and 273 nm, respectively and they are presented in Fig. 12**(a)**. The decay curves of SGPEu*x* ($x = 0.1$, 0.5, 1.0 and 2.0 mol%) phosphors have been well fitted to a single

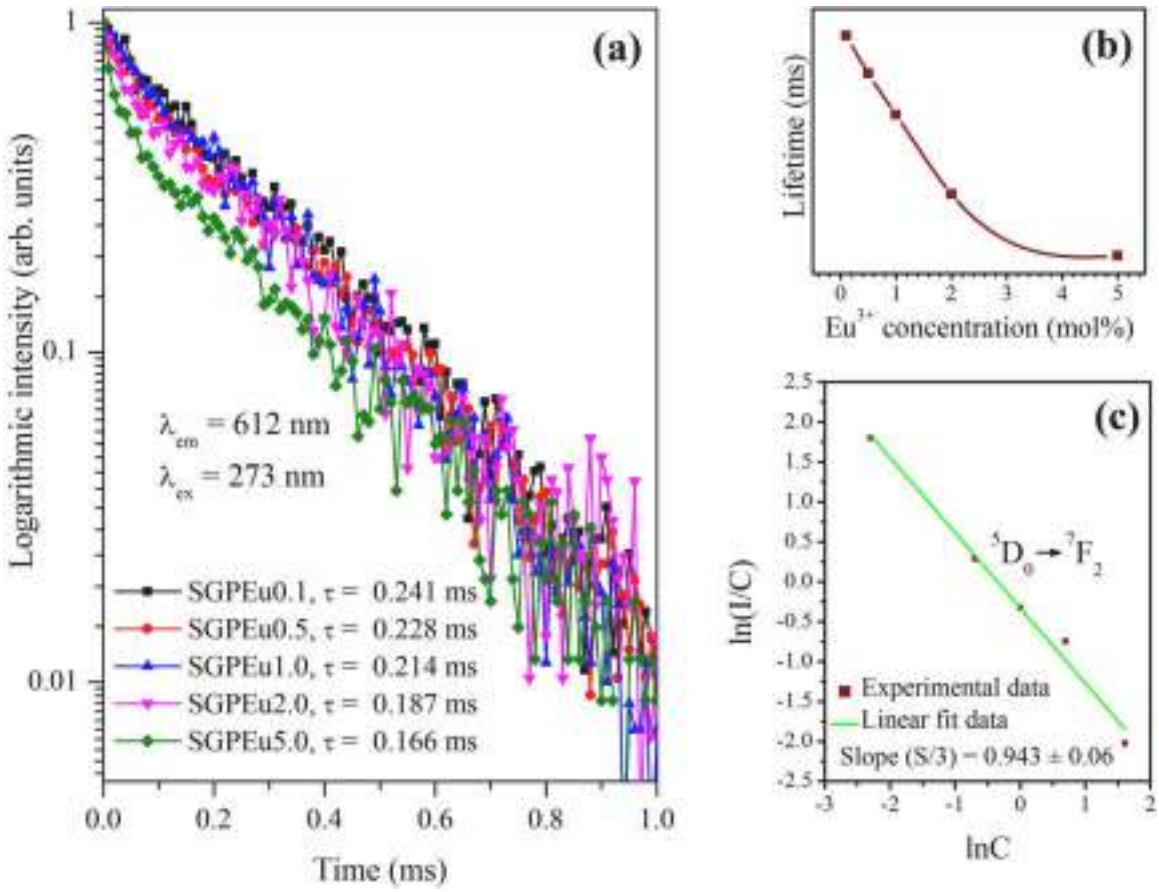

**Fig. 12.** Logarithmic plot of decay profile of $Eu^{3+}$: $^5D_0$ emission state (a) and the variation of lifetime as a function of $Eu^{3+}$ concentration (b). The ln (I/C) vs. ln C plots for $^5D_0 \rightarrow {}^7F_2$ (612 nm) transition in SGPEu*x* phosphors.

exponential function, $I = I_0.e^{-t/\tau}$, where $I_0$ is the initial luminescence intensity at t = 0 s and τ is the lifetime of the emission state. The lifetime values have been obtained taking the first e-folding time the initial intensity at t = o seconds and they are found to be 0.241, 0.228, 0.214 and 0.187 ms for *x* = 0.1, 0.5, 1.0 and 2.0 mol% doped SGPEu*x* phosphors, respectively. The decay curve of SGPEu5.0 phosphor is fitted to $I = [A_1.\exp(-t/\tau_1) + A_1.\exp(-t/\tau_1)]$, where $\tau_1$ and $\tau_2$ represents the lifetimes of slow and fast decay, respectively. The average lifetime has been calculated as 0.166 ms using the relation, $\langle\tau\rangle = \frac{A_1\tau_1^2 + A_2\tau_2^2}{A_1\tau_1 + A_2\tau_2}$. The observed values of lifetime decrease with increase of $Eu^{3+}$ ions concentration indicating the energy transfer among the excited $Eu^{3+}$ ions at higher concentrations. The variation of lifetime of $Eu^{3+}$: $^5D_0$ emission state as a function of $Eu^{3+}$ concentration is shown in Fig. 12**(b)**.

To know the reasons behind the quenching of luminescence and the gradual decrease of lifetime with the addition of $Eu^{3+}$ ions has been assigned to ET process among the excited ions. According to Blasse [51], the exchange and/or multi-polar interaction mechanisms like dipole-dipole (d-d), dipole-quadrupole (d-q) and quadrupole-quadrupole (q-q) are responsible for ET process among the excited active ions. According to Dexter [52], the exchange interaction mechanism plays a key role in the critical transfer distance ($R_c$) range 3–4 Å only. Beyond this limit, the multi-polar interaction mechanisms predominate. The value of $R_c$ has been evaluated using the following equation.

$$R_c = 2\left(\frac{3\,V}{4\,\pi\,x_c\,N}\right)^{1/3} \tag{8}$$

where *V*, $x_c$ and *N* indicates the unit cell volume, critical concentration and number of crystallographic-sites available to replace the active ions. In case of SGPEu*x* phosphors, the *V*, $x_c$ and *N* values are 1034.59 Å, 2.0 mol% and 4, respectively [53]. The evaluated value of $R_c$ is estimated to be ~29 Å for SGPEu*x* phosphors indicates that the multi-polar interaction mechanisms play a key role in ET process. The type (i.e., d-d, d-q, q-q) of interaction mechanism has been identified following Van Uitert [54] equation.

$$\ln\left(\frac{I}{C}\right) = K - \left(\frac{S}{3}\right).\ln(C) \tag{9}$$

where I stand for intensity of emission transition and C stands for concentration of active ions. Here K is a constant related to a particular excitation and (S/3) indicates the slope of $\ln\left(\frac{I}{C}\right)$ versus $\ln(C)$ plot and it is shown in Fig. 12**(c)**. The parameter S can have values 3, 6, 8 and 10 corresponding to exchange, d-d, d-q and q-q interactions, respectively. From the evaluated value of slope 0.943 $\pm$ 0.06, the parameter S is nearly equal to 3 indicating exchange interaction type of ET among the excited $Eu^{3+}$ ions at higher concentrations.

## 4. Conclusions

A series of different concentrations of $Eu^{3+}$ ions doped SGPEu*x* ($0 \leq x \leq 5.0$ mol%) phosphors have been synthesized by modified citrate-gel combustion method for w-LED sources. The PXRD studies show that the SGPEu phosphors are crystallized into BCC structure with JCPDS No. 29–1301 and the average size of crystallites has been estimated to be 46–47 nm. The HR-SEM micrograph illustrates the agglomeration of crystallites with irregular morphology with an average particle size of ~250 nm. A suitable excitation wavelength for efficient luminescence has been selected as 273 nm corresponding to $Gd^{3+}$: $^8S_{7/2} \rightarrow {}^6I_{13/2}$ + $Eu^{3+}$: $^7F_1 \rightarrow {}^5K_6$ transitions by studying the emission at different excitations. The quenching in luminescence is observed beyond 2.0 mol% and it can be assigned to non-radiative losses among the excited $Eu^{3+}$ ions. Upon 273 nm excitation, the SGPEu*x* phosphors emit cool-white light with CCT rating 4785–4758 K. Based on the experimental results, it is suggested that the SGPEu2.0 phosphor is the best choice to be used to design new w-LED sources.

## Declaration of Competing Interest

The authors declare that they have no known competing financial interests or personal relationships that could have appeared to influence the work reported in this paper.

## Acknowledgements

The authors are thankful to the DST and SAIF, IITM, Chennai 600036 for providing HR-SEM.

## ABSTRACT

A series of LAGBPr phosphors of composition $Li_6AlGd_{(1-x)}(BO_3)_4$: $x$ $Pr^{3+}$ ($0 \leq x \leq 2.0$ mol%) were prepared by solid-state reaction method and characterized through thermal, structural, morphological and photoluminescence studies. Thermal investigation shows that the LAGBPr phosphors crystallize at 640 °C. The powder X-ray diffraction studies show that the size of crystallites is of the order of 77 nm. The excitation spectra reveal a charge transfer band due to $O^{2-} \rightarrow Pr^{3+}$ (230–250 nm), host-related ($Gd^{3+}$) bands from 205 to 315 nm and some f-f transitions of $Pr^{3+}$ ions from 420 to 500 nm. The fluorescence properties were investigated by exciting within the host and within dopant ($Pr^{3+}$) ions. A tunable fluorescence from orange-red to white to bluish-white was observed when excited at 274 nm and a bluish-white fluorescence at 449 nm excitation. Upon 449 nm excitation, a blue-shift is observed with increase of concentration of $Pr^{3+}$ ions. The optimal concentration of $Pr^{3+}$ ions for efficient fluorescence is confirmed to be 1.0 mol%, and a quenching in fluorescence was noticed and it was ascribed to the non-radiative transfer of energy through $[^3P_0, {}^3H_4] \rightarrow [^1D_2, {}^3H_6]$, $[^3P_0, {}^3H_4] \rightarrow [^3H_6, {}^1D_2]$ and $[^1D_2, {}^3H_4] \rightarrow [^3H_4, {}^1D_2]$ channels. The LAGBPr1.0 phosphor has more proficiency to be used in LED applications.

## 1 Introduction

Currently, the fast-growing phosphor technology focussed a light on new and novel phosphor materials with enhanced physical, thermal, chemical and optical properties to fulfil the needs in solid-state lighting technology (SSLT) which can reduce the utilization of energy to generate light compared to conventional incandescent lamps [1–3]. Using light emitting diodes (LEDs), the white light generation is possible in two different approaches, combining blue LED with commercial red and green phosphors or with yellow phosphor. The operating temperature imposes limitations for fluorescence efficiency and colour rendering index of these commercial phosphors. The white light generation is possible by rectifying these limitations combining tri-colour phosphor with UV-LED-chip [4–6]. Thus, LEDs play a crucial role in SSLT due to their long life, thermal stability, low energy-consumption and echo-friendly nature [7–11]. The phosphor-converted light emitting diodes (PCLEDs) with relatively high quantum yield are necessary in designing advanced SSL devices. However, the working efficiency of PCLEDs has been affected by the emitted fluorescence properties of phosphor materials used to fabricate them and there must be a special interest for the design and development of new and highly efficient phosphor materials.

From the literature [12–15], it is known that the compounds with aluminate group and borate group have potential applications as non-linear optical materials owing to their excellent absorption in vacuum ultra violet (VUV) region, chemical durability, bright emission in visible region and tunability in fluorescence properties of rare earth (RE) ions. Further, borate-based phosphors have good thermal stability and require low temperatures for their fabrication. The incorporation of gadolinium and lithium to aluminate-based phosphors favours in enhancing the fluorescence properties of REs by reducing non-radiative centres [16–18]. The merits of borate group, aluminate, gadolinium and lithium in improving the strength of optical transitions of RE active ions and to design a new and novel host matrix for phosphor-converted white LEDs, the $Li_6AlGd(BO_3)_4$ phosphor host has been selected. The thermal, structural and morphological studies impose for better luminescence properties of RE active ions. M.M. Yawalkar et al. [19] investigated the photoluminescence and thermoluminescence properties of $Eu^{3+}$ -doped $Li_6Gd(BO_3)_3$ phosphor prepared by solid-state reaction method and assigned its phase to JCPDS No. # 80–0843. The addition of $Al^{3+}$ ions promotes the fluorescence intensity due to the local site distortion under near ultra violet (nUV) excitation [20, 21]. Based on these merits, it is assumed to be noteworthy to investigate the $Li_6AlGd(BO_3)_4$ phosphor as an outstanding host matrix for SSL applications.

Among the available RE ions, $Pr^{3+}$ has been the most promising ion due to its simultaneous emission in blue, green and red regions. The intense fluorescence in 600–700 nm spectral region makes them appropriate for red emission centres for PC-WLEDs. The presence of multiple metastable emission states such as $^3P_0$, $^3P_1$ and $^1D_2$ makes $Pr^{3+}$ ions to exhibit a tunable emission from greenish-blue to intense red. The presence of numerous energy states of $Pr^{3+}$ ions facilitates us to understand the different relaxation processes like multi-phonon relaxation (MPR) process, cross-relaxation (CR) process and the resonant energy transfer (RET) processes in different host matrices. The $Pr^{3+}$ -doped different phosphor materials have been synthesized and investigated for various scientific, industrial and household applications. For example, $SrMoO_4$: $Pr^{3+}$ phosphors for optical thermometric application [22], $LiPbB_5O_9$: $Pr^{3+}$ phosphors to convert blue light into red light for WLEDs [23], $YVO_4$: $Pr^{3+}$ [24] and $BaNb_2O_6$: $Pr^{3+}$ [25] phosphors for thermal sensing applications and $BaMoO_4$: $Pr^{3+}$ [26] phosphors for cathode luminescence and solid-state lighting applications. These virtues imposed a keen interest in investigating the fluorescence properties of $Pr^{3+}$ ions in $Li_6AlGd(BO_3)_4$ phosphor.

In the present research work, $Li_6AlGd(BO_3)_4$ phosphors activated with different concentrations of $Pr^{3+}$ ions were prepared through solid-state reaction method and characterized. The concentration-dependent fluorescence properties were studied at near UV excitation. Reasons for the tunable emission for different concentrations and the quenching in fluorescence intensity were discussed in detail. The suitability of these phosphors for SSL devices is also discussed.

## 2 Experimental techniques

### 2.1 Materials and method of synthesis

High purity grade $Li_2CO_3$ (98.0%, TCS, JAPAN), $Al_2O_3$ (90.0%, Molychem, INDIA), $Gd_2O_3$ (99.9%, Molychem, INDIA), $H_3BO_3$ (99.5%, Merk, INDIA) and $Pr_2O_3$ (99.9%, Alfa Aesar, US) in stoichiometric quantity were used to prepare LAGBPr$x$ phosphors of composition $Li_6AlGd_{(1-x)}(BO_3)_4$: $x$ $Pr^{3+}$ ($x$ = 0, 0.05, 0.1, 0.5, 1.0 and 2.0 mol%) through conventional solid-state reaction method. The following solid-state reaction shows the formation of $Li_6AlGd(BO_3)_4$: $Pr^{3+}$ phase.

$$3\,Li_2CO_3 + \frac{1}{2}Al_2O_3 + \left(\frac{1-x}{2}\right)Gd_2O_3 + 4\,H_3BO_3 + \left(\frac{x}{2}\right)Pr_2O_3 \rightarrow Li_6AlGd_{(1-x)}(BO_3)_4{:}\,xPr + 3\,CO_2\uparrow + 6\,H_2O\uparrow + 1.5\,O_2\uparrow \quad (1)$$

A batch composition of 3.0 g homogeneous powders in stoichiometric ratio with an additional amount of 2.0 wt% of $H_3BO_3$ (to compensate the evaporation of $H_3BO_3$ at higher temperatures) was prepared in the presence of acetone using agate mortar and pestle. The as-prepared samples were heat treated at 200 °C for 2 h and then sintered at different temperatures for different timings. These samples were referred as LAGBPr0, LAGBPr0.05, LAGBPr0.1, LAGBPr0.5, LAGBPr1.0 and LAGBPr2.0 according to $x$ = 0, 0.05, 0.1, 0.5, 1.0 and 2.0%, respectively.

### 2.2 Characterizations

The thermogravimetry and differential scanning calorimetry (TG-DSC) study was carried out with a NETZSCH STA 449 F3 Thermal Analyzer in the presence of air-atmosphere at 5.0 K/min. using the as-prepared un-doped homogeneous powder. The crystalline phases of prepared samples were examined with BRUCKER USA D8 advance diffractometer with $\lambda_{CuK\alpha}$ = 1.541 Å. The Fourier-transform infrared (FTIR) spectrum was recorded with PerkinElmer FT-IR spectrometer following KBr technique using KBr to sample ratio 300:1. The morphology of LAGBPr0 phosphor was studied on FEI-Quanta FEG 200F high-resolution-scanning electron microscope (HR-SEM). The room temperature photoluminescence excitation and emission studies were carried out with FP-8300 JASCO Fluorescence Spectrometer. The decay studies were carried out on FLS 1000 photoluminescence spectrometer provided with Xe-flash lamp in pulsed mode.

## 3 Results and discussions

### 3.1 Thermal analysis

In order to know the various reaction processes, the thermal analysis of the as-prepared homogeneous LAGBPr0 powder has been done using TG-DSC. The TG data coupled with DSC in the temperature range 50 °C–1000 °C shown in Fig. 1 reveal a major weight loss step accompanied by a broad and intense endothermic peak positioned at around 515.0 °C with two considerably weak overlapping endothermic peaks positioned at around 389.5 and 727.2 °C and an exothermic peak at around 640.0 °C. The positions of these two overlapping peaks have been identified applying the Gaussian deconvolution procedure (see inset of Fig. 1). The endothermic peak noticed at 389.5 °C is attributed to the vapourization of acetone and $H_2O$ and the endothermic peak at 727.2 °C is assigned to the release of $CO_2$ [27]. The strong and broad endothermic peak at 515.0 °C corresponds to the phase transition of LAGBPr0. The exothermic peak observed at 640.0 °C is ascribed to the formation of final phase of LAGBPr0 phosphor.

### 3.2 Crystalline phase analysis

The powder X-ray diffraction (PXRD) patterns of LAGBPr0 sample heat treated at 200, 400, 600, 620, 640, 670 and 700 °C for 1 h are shown in Fig. 2a.

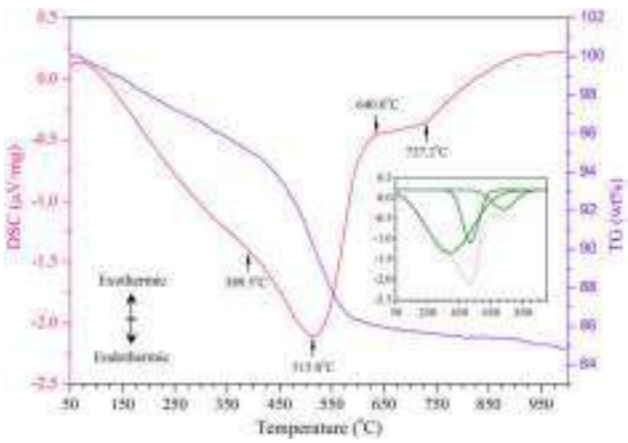

**Fig. 1** TG-DSC profiles of LAGBPr0 sample

These PXRD patterns show that no considerable change in phase is noticed beyond 640 °C, and thus, the sintering temperature is optimized to be 640 °C. In order to optimize the time of sintering, the samples are heat treated at 640 °C for 1 h, 2 h and 3 h and their PXRD profiles are illustrated in Fig. 2b. As seen in these profiles, the PXRD patterns obtained at 640 °C/2 h appear to be sharp and intense. So, the LAGBPr$x$ phosphors show a steady phase when sintered at 640 °C/2 h.

From the literature, no reports are found on the crystalline phase of $Li_6AlGd(BO_3)_4$ phosphor; however, it is close to $Li_6Al_2(BO_3)_4$ phase (JCPDF No. 70–2044), which has been crystallized into primitive anorthic structure with lattice parameters, a = 6.13 Å, b = 4.82 Å, c = 8.23 Å, α = 90.0°, β = 118.0°, γ = 90.0° and space group $P\bar{1}$ (2) [28]. The PXRD profiles of LAGBPr0 along with standard XRD data of $Li_6Al_2(BO_3)_4$ are presented in Fig. 3. This figure reveals that the positions of PXRD peaks of LAGBPr0 phosphor are almost the same as that of $Li_6Al_2(BO_3)_4$ structure except a slightly variation in their intensity. This figure also reveals the presence of impure phase that belongs to $Gd_2O_3$ phase (JCPDF No. 86–2477). The assignment of some of the intense PXRD peaks of $Gd_2O_3$ phase is displayed in Fig. 3. The large ionic radius of $Gd^{3+}$ (1.08 Å) compared to $Al^{3+}$ (0.68 Å) could be one of the reasons for intensity variation of observed PXRD peaks of LAGBPr0 sample. The difference in ionic radii of $Gd^{3+}$ and $Al^{3+}$ ions might be responsible for the $Gd_2O_3$ phase.

The PXRD profiles of different concentrations of $Pr^{3+}$ -doped LAGBPr$x$ ($0 \le x \le 2.0$ mol%) phosphors sintered at 640 °C/2 h show an identical pattern with a little variation in intensity which decrease with the increase of concentration of $Pr^{3+}$ ions (see Fig. 2c). The decrease in intensity of PXRD peaks indicates that the $Pr^{3+}$ ions suitably replace the $Gd^{3+}$ sites without any modification in phase of $Li_6AlGd(BO_3)_4$ phosphor. The average size of crystallites (D) has been calculated using the Debye–Scherrer's equation.

$$D = \frac{0.89 \times \lambda}{\beta \times \mathrm{Cos}\theta} \tag{2}$$

where λ is the wavelength of incident X-rays ($\lambda_{CuK\alpha}$ = 1.5406 Å), β is the full-width at half-maximum (in radians), and θ is the diffraction angle. According to Debye–Scherrer's equation, the average

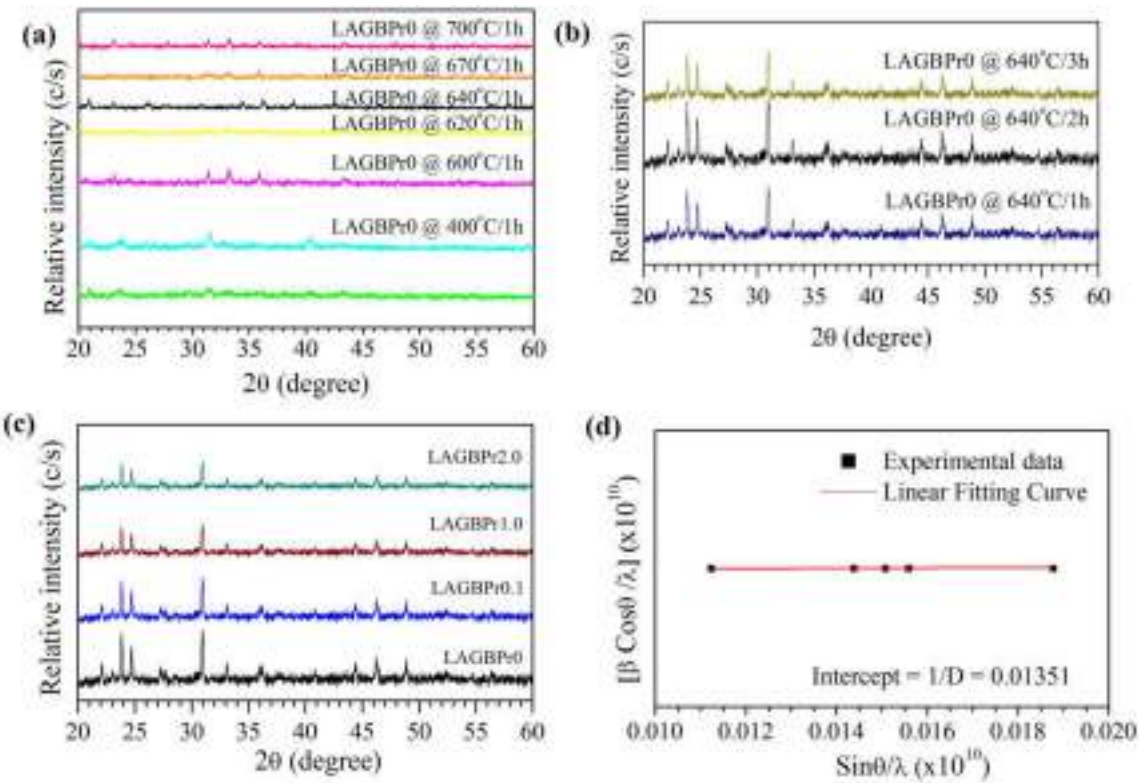

**Fig. 2** PXRD profiles of LAGBPr0 sample at different temperatures (**a**), sintered at 640 °C for different times (**b**), LAGBPr$x$ samples sintered at 640 °C/2 h (**c**) and the Hall–Williamson plot for LAGBPr0 sample (**d**)

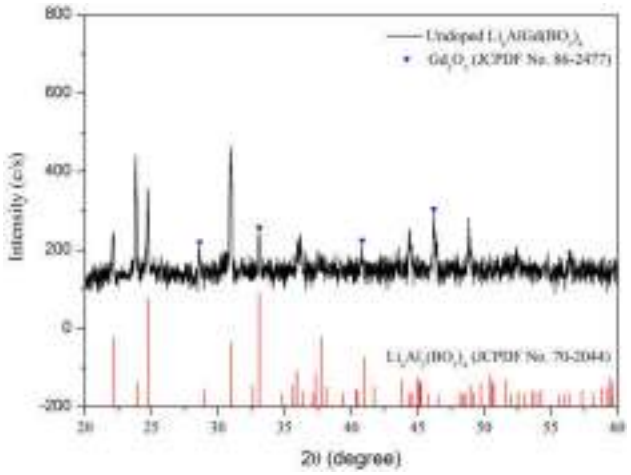

**Fig. 3** PXRD profile of LAGBPr0 along with standard XRD data of JCPDS No. 70–2044

size of crystallites is obtained as ~ 77 nm. The crystallite size can also be obtained from the Hall-Williamson's (H-W) method [29].

$$\left(\frac{\beta \times \mathrm{Cos}\theta}{\lambda}\right) = \left(\frac{1}{D}\right) + \left(\frac{\varepsilon \times \mathrm{Sin}\theta}{\lambda}\right) \quad (3)$$

Here ε is a constant and it is the measure of micro-strains present in the prepared phosphors. The reciprocal of the intercept of H-W curve shown in Fig. 2d represents the average size of crystallites. According to H-W method, the average size of crystallites is found to be ~ 74 nm which is very close to that obtained from the Debye–Scherrer's method. The micro-strain has been calculated using the following equation [30]:

$$\varepsilon = \frac{\beta \times \mathrm{Cos}\theta}{4} \quad (4)$$

In case of LAGBPr*x* phosphors, the value of ε is estimated to be $0.44 \times 10^{-3}$ which is smaller than the strain reported for CdS nanoparticle (ε ~ 0.0494) synthesized by chemical precipitation method [31].

### 3.3 FTIR and SEM analysis

To investigate the presence of various structural bonds, the LAGBPr*x* phosphors are examined through FTIR investigation. Usually, borate vibrational modes have been identified in three different regions: (i) B-O asymmetric stretching vibrations in $BO_3$ units from 1200 to 1500 $cm^{-1}$, (ii) B-O symmetric stretching vibrations in $BO_4$ units from 800 to 1500 $cm^{-1}$ and (iii) B-O-B bending vibrations between $BO_3$ and $BO_4$ units from 600 to 800 $cm^{-1}$ [32, 33]. The FTIR spectrum of LAGBPr0 sample in the region from 1600 to 400 $cm^{-1}$ presented in Fig. 4 reveals nearly nineteen IR absorption bands. The IR bonds noticed at around 1496, 1440, 1334, 1258 and 1214 $cm^{-1}$ correspond to B-O asymmetric stretching vibrations in $BO_3$ units [34]. The IR bond located at around 1102 $cm^{-1}$ refers to the Al-O stretching vibration mode [35]. The IR bonds noticed at around 985, 948, 933 and 905 $cm^{-1}$ belong to the B-O symmetric stretching vibrations in $BO_4$ units [32, 36]. The IR bond located at around 867 $cm^{-1}$ refers to the Li–O vibrational mode [37]. The IR bond located at around 762 $cm^{-1}$ refers to the $AlO_4$ tetrahedral aluminate units [38]. The IR bonds identified at around 721, 709 and 600 $cm^{-1}$ have been assigned to B-O-B bending vibrations between $BO_3$ and $BO_4$ units [39, 40]. The IR bond peaked at around 553 and 494 $cm^{-1}$ has been ascribed to the Gd-O vibrations [41]. The IR bond located at around 443 $cm^{-1}$ refers to $AlO_4$-$LiO_4$ lattice vibrations [42], while the bond positioned at around 419 $cm^{-1}$ attributed to Al-O vibrations [43].

The morphological investigation of phosphor materials gives the information regarding the size, shape, orientation and distribution of particles. As a reference, the HR-SEM image of LAGBPr0 sample is shown in Fig. 5. As seen in this image, one can notice a leaf-like morphology for the LAGBPr particles which are distributed uniformly with random orientation. The average size of the particles over the surface of leaf has been measured to be 1100 nm using image-J software.

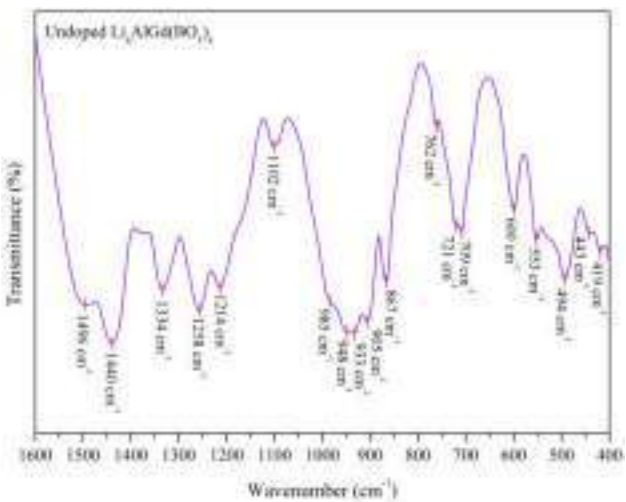

**Fig. 4** FTIR profile of LAGBPr0 sample

### 3.4 Fluorescence properties

The visible fluorescence properties of LAGBPr$x$ ($0 \leq x \leq 2.0$ mol%) phosphors have been investigated through photoluminescence excitation, emission and decay studies. The excitation spectra have been recorded in the spectral region from 220 to 500 nm monitoring the emission at 613 nm corresponding to $Pr^{3+}$: $^3P_0 \rightarrow {}^3H_6$ transition. The spectra normalized with respect to the intensity of $Gd^{3+}$: $^8S_{7/2} \rightarrow {}^6I_{11/2}$ (274 nm) transition are shown in Fig. 6. They reveal broad band ranges from 230 to 250 nm and it can be attributed to the charge transfer band (CTB) of $O^{2-} \rightarrow Pr^{3+}$ ions [44]. The presence of CTB indicates the possibility of energy transfer (ET) from the host (donor) to the $Pr^{3+}$ luminescent centres (acceptor). The sharp excitation bands located from 250 to 315 nm (see Fig. 6a) can be ascribed to $Gd^{3+}$ ions and the considerably weak bands are due to f-f transitions of $Pr^{3+}$ ions that ranges from 420 to 500 nm (see Fig. 6b).

The transitions due to $Gd^{3+}$ ions have been ascribed to $^8S_{7/2} \rightarrow {}^6D_{9/2}$ (253 nm), $^8S_{7/2} \rightarrow {}^6I_{11/2}$ (274 nm), $^8S_{7/2} \rightarrow {}^6I_{9/2}$ (277 nm), $^8S_{7/2} \rightarrow {}^6I_{7/2}$ (284 nm), $^8S_{7/2} \rightarrow {}^6P_{8/2}$ (302 nm), $^8S_{7/2} \rightarrow {}^6P_{5/2}$ (307 nm) and $^8S_{7/2} \rightarrow {}^6P_{1/2}$ (313 nm) transitions, while the transitions due to $Pr^{3+}$ ions have been assigned to $^3H_4 \rightarrow {}^3P_2$ (449 nm), $^3H_4 \rightarrow {}^3P_1$ (473 nm) and $^3H_4 \rightarrow {}^3P_0$ (485 nm) transitions [25, 45–49]. The presence of $Gd^{3+}$ and $Pr^{3+}$ transitions is an indication for the uniform distribution of $Pr^{3+}$ ions in LAGBPr$x$ phosphors. As seen in the excitation spectra, it is clear that the intensity of excitation bands due to $Gd^{3+}$ ions decreases, while the intensity of $Pr^{3+}$ ions increases with the increase of concentration of $Pr^{3+}$ ions. The variation of intensity of $Gd^{3+}$: $^8S_{7/2} \rightarrow {}^6I_{11/2}$ (274 nm) and $Pr^{3+}$: $^3H_4 \rightarrow {}^3P_2$ (449 nm) transitions is illustrated in Fig. 6c. The CTB with peak maximum at around 243 nm and the sharp and intense excitation band located at around 274 nm ($Gd^{3+}$: $^8S_{7/2} \rightarrow {}^6I_{11/2}$) indicate efficient transfer of energy from the host to $Pr^{3+}$ ions. Therefore, the fluorescence properties of LAGBPr$x$ ($0 \leq x \leq 2.0$ mol%) phosphors have been investigated by exciting at near UV and visible radiations corresponding to 274 nm (within the host, $Gd^{3+}$: $^8S_{7/2} \rightarrow {}^6I_{11/2}$) and 449 nm (within dopant ions, $Pr^{3+}$: $^3H_4 \rightarrow {}^3P_2$) wavelengths, respectively.

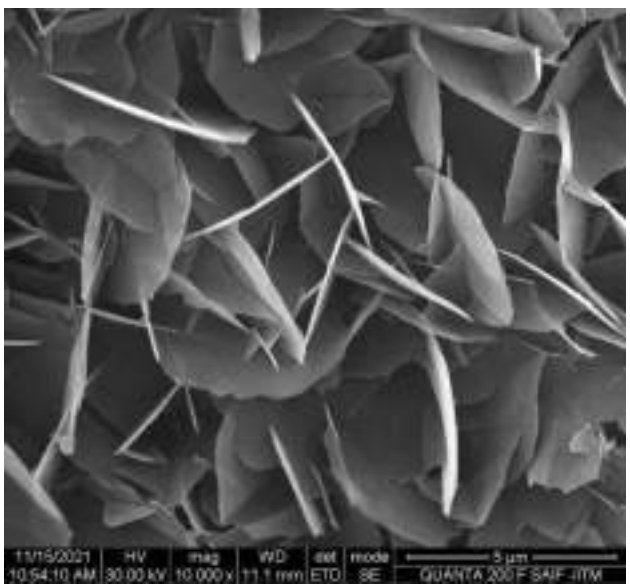

**Fig. 5** HR-SEM image of LAGBPr0 sample

#### 3.4.1 *Within the host excitation*

When the LAGBPr$x$ ($0 \leq x \leq 2.0$ mol%) phosphors are excited at 274 nm (i.e. within host excitation) corresponding to $Gd^{3+}$: $^8S_{7/2} \rightarrow {}^6I_{11/2}$ transition, the emission spectra reveal nine emission transitions due to $^3P_1 \rightarrow {}^3H_5$ (547 nm), $^3P_1 \rightarrow {}^3H_6$ (580 nm), $^1D_2 \rightarrow {}^3H_4$ (594 nm), $^3P_0 \rightarrow {}^3H_6$ (613 nm), $^3P_1 \rightarrow {}^3F_2$ (625 nm), $^3P_0 \rightarrow {}^3F_2$ (647 nm), $^3P_1 \rightarrow {}^3F_3$ (662 nm), $^3P_0 \rightarrow {}^3F_3$ (694 nm) and $^1D_2 \rightarrow {}^3H_5$ (706 nm) transitions. The spectral profiles along with their assignment are presented in Fig. 7. Among the observed emission transitions, the $^3P_0 \rightarrow {}^3H_6$ (613 nm) transition possess highest intensity compared to other transitions. Additionally, the intensity of these transitions decreases monotonically with the increase of $Pr^{3+}$ ions concentration. The variation of intensity of $^3P_0 \rightarrow {}^3H_6$ (613 nm) transition as function of $Pr^{3+}$ ions concentration is illustrated as inset of Fig. 7. The emission mechanism of LAGBPr$x$ phosphors is illustrated in partial energy level diagram shown in Fig. 8.

When excited at 274 nm wavelength, the ground state $Gd^{3+}$ ions interact with the incident light photons and get excited into $Gd^{3+}$:$^6I_J$ energy states. Immediately they transit non-radiatively to $Gd^{3+}$:$^6P_J$ energy states. In the present phosphors it can be predicted that the $Pr^{3+}$:$4f^15d^1$ configuration is located below the $Pr^{3+}$:$^1S_0$ energy state resulting to produce $4f^15d^1 \rightarrow 4f^2$ inter-configurational transitions [50]. The $Gd^{3+}$ ions sensitize $Pr^{3+}$ ions efficiently by

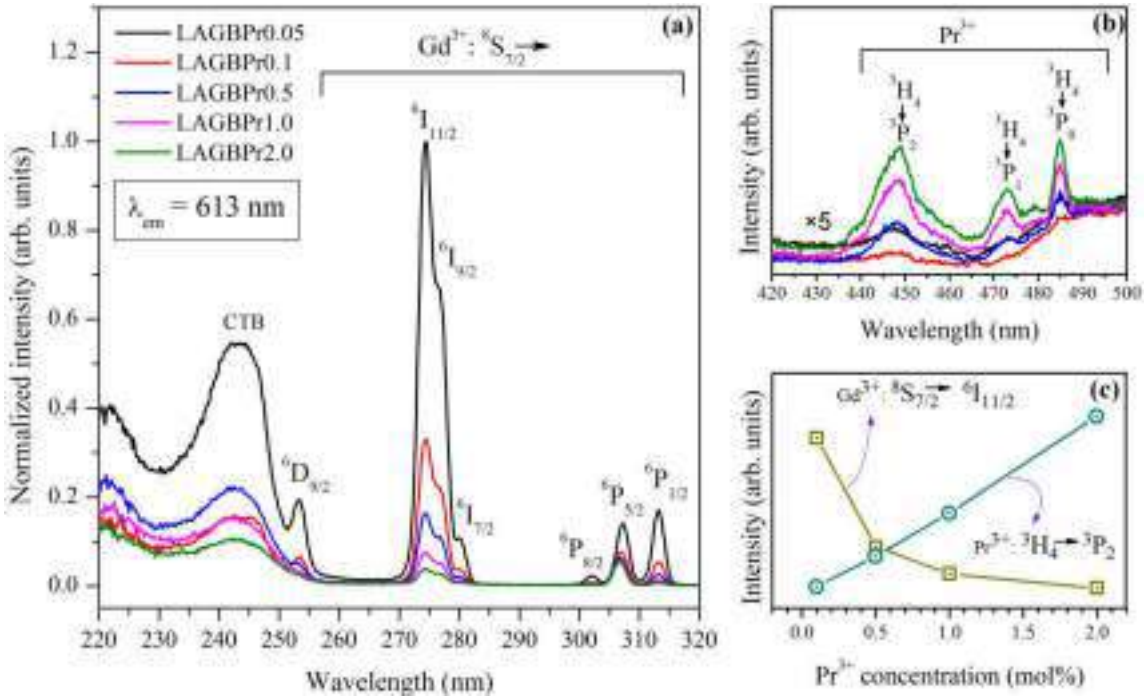

**Fig. 6** Excitation spectra of LAGBPr*x* phosphors from 220–320 nm (**a**), 420–500 nm (**b**) and the variation of intensity of excitation bands as a function of $Pr^{3+}$ ions concentration (**c**)

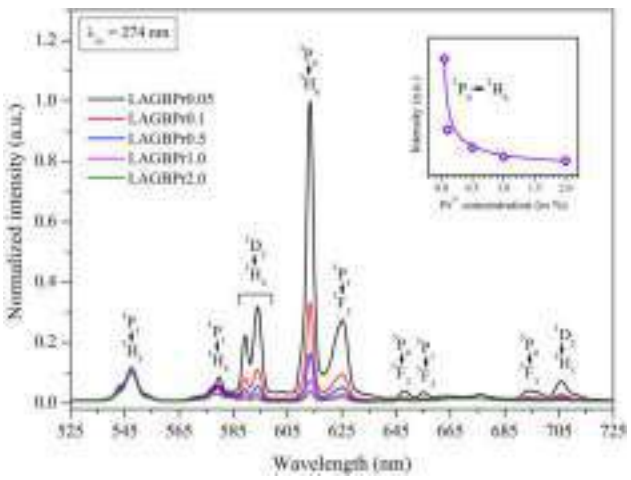

**Fig. 7** Emission spectra of LAGBPr*x* phosphors ($\lambda_{ex}$ = 274 nm). Inset shows the variation of intensity of $Pr^{3+}$: $^3P_0 \rightarrow {}^3H_6$ transition as a function of $Pr^{3+}$ ions concentration

transferring energy from $Gd^{3+}$:$^6P_J$ energy states to $Pr^{3+}$:$4f^15d^1$ configuration. From there a fast non-radiative (NR) decay materializes to $Pr^{3+}$:$^3P_J$ energy states producing different radiative transitions illustrated in Fig. 8.

The colour perception of emitted fluorescence has been studied by finding the Commission International de I'Eclairage (CIE-1931) colour coordinates (x, y) using the emission spectral profiles. It is well known that human eye can identify the light through three different cone cells in the spectral regions 420–440 nm (short), 530–540 nm (middle) and 560–580 nm (long). The parameters related to tri-stimulus values X, Y and Z of three types of cone cells describe the colour sensation and they are given below [48, 51]:

$$X = \int_0^\infty I_{(\lambda)} \,.\, T_{(\lambda)} \,.\, \overline{x}_{(\lambda)} \,.\, d\lambda \tag{5}$$

$$Y = \int_0^\infty I_{(\lambda)} \,.\, T_{(\lambda)} \,.\, \overline{y}_{(\lambda)} \,.\, d\lambda \tag{6}$$

$$Z = \int_0^\infty I_{(\lambda)} \,.\, T_{(\lambda)} \,.\, \overline{z}_{(\lambda)} \,.\, d\lambda, \tag{7}$$

where $I_{(\lambda)}$ represents intensity of illuminant spectrum and $T_{(\lambda)}$ represents the transmission spectrum of the filter ($0 \le T \le 1$). $\overline{x}(\lambda)$, $\overline{y}(\lambda)$ and $\overline{z}(\lambda)$ represent the CIE colour matching functions. The colour of emitted light obtained from the tri-stimulus values (X, Y and Z) has been represented graphically, called the chromaticity diagram using colour coordinates (x, y).

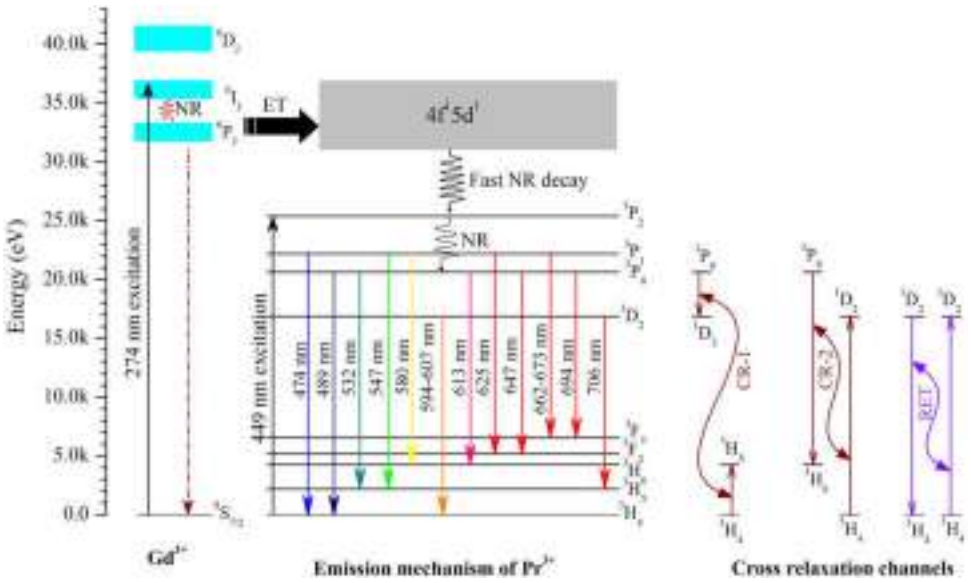

**Fig. 8** Partial energy level diagram showing the emission mechanism of $Pr^{3+}$ ions at 274 nm and 449 nm excitations and the cross-relaxation channels responsible for energy transfer

$$x = \frac{X}{X+Y+Z} \tag{8}$$

$$y = \frac{Y}{X+Y+Z} \tag{9}$$

The evaluated colour coordinates of LAGBPr*x* phosphors at 274 nm excitation are summarized in Table 1 and they are located in CIE chromaticity diagram shown in Fig. 9. The colour purity (CP) of emitted luminescence has been determined using a well-known equation shown below:

$$Colour\,purity = \frac{\sqrt{(x-x_e)^2+(y-y_e)^2}}{\sqrt{(x_d-x_e)^2+(y_d-y_e)^2}} \times 100, \tag{10}$$

where $(x, y)$, $(x_e, y_e)$ and $(x_d, y_d)$ are the coordinates corresponding to CIE, equal energy point and dominant wavelength point, respectively. The value of CP varies from 5 to 41% for different concentrations of $Pr^{3+}$ in LAGBPr*x* phosphors when excited at 274 nm and they are summarized in Table 1. The value of CP of the order ~ 5% obtained for $x$ = 1.0 mol% clears that the LAGBPr1.0 phosphor exhibits intense white light at 274 nm excitation. The correlated colour temperature (CCT) has been used to know the colour appearance of emitted luminescence. A light source with CCT ranges from 2700–3000 K emits warm-white light, from 3000–4000 K emits neutral-white light and from 4000–6500 K emits cool-white light. The value of CCT has been found following McCamy [52].

$$CCT = -449\,z^3 + 3525\,z^2 - 6823.3\,z + 5520.33, \tag{11}$$

where $z = (x - x_e)/(y - y_e)$ is a constant and the coordinates of epicentre point are ($x_e$ = 0.3320, $y_e$ = 0.1858). The CIE coordinates of LAGBPr1.0 phosphor (0.316, 0.312) with CCT ~ 6446 K are almost close to standard daylight illuminant-D65 (0.3127, 0.3290) of CCT ~ 6500 K and daylight fluorescent source F5 (0.3137, 0.3453) of CCT ~ 6350 K.

**Table 1** Comparison of CIE coordinates and colour purities of LAGBPr*x* phosphors

| Sample code | CIE coordinates | | Colour purity (%) | CIE coordinates | | Colour purity (%) |
|---|---|---|---|---|---|---|
| | $\lambda_{ex}$ = 274 nm | | | $\lambda_{ex}$ = 449 nm | | |
| | x- | y- | | x- | y- | |
| LAGBPr0.05 | 0.492 | 0.330 | ~ 41 | 0.222 | 0.250 | ~ 55 |
| LAGBPr0.1 | 0.403 | 0.320 | ~ 15 | 0.223 | 0.236 | ~ 55 |
| LAGBPr0.5 | 0.362 | 0.329 | ~ 7 | 0.232 | 0.269 | ~ 55 |
| LAGBPr1.0 | 0.316 | 0.312 | ~ 5 | 0.221 | 0.248 | ~ 55 |
| LAGBPr2.0 | 0.261 | 0.259 | ~ 32 | 0.218 | 0.249 | ~ 55 |

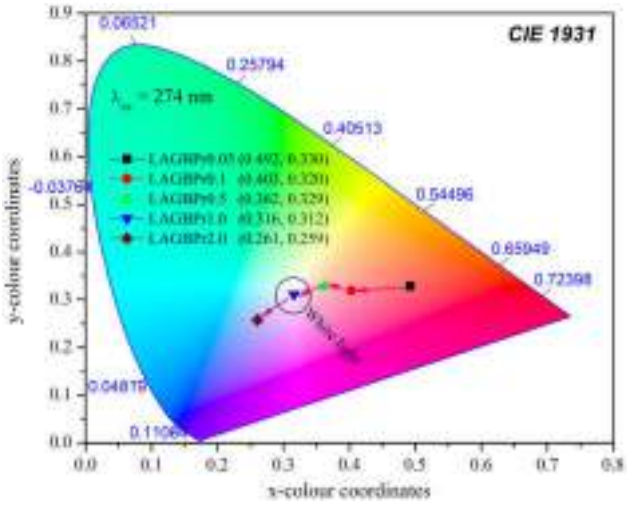

**Fig. 9** CIE chromaticity diagram showing the colour coordinates of LAGBPr*x* phosphors at 274 nm excitation

As seen in the chromaticity diagram shown in Fig. 9, one can observe that the colour of emitted fluorescence has been tuned from orange-red to white and then to bluish-white with the increase of concentration of $Pr^{3+}$ ions from $x = 0.05$ mol% to $x = 2.0$ mol%. The colour coordinates obtained for LAGBPr*x*1.0 phosphor ($x = 0.316$, $y = 0.312$) are very close to the standard white colour ($x = 0.333$, $y = 0.333$). Therefore, LAGBPr*x* phosphors can be used as excitation source to generate white light from the PCLEDs and/or as a white light source at 274 nm excitation. The CIE coordinates of LAGBPr1.0 phosphor are close to those reported for $Lu_{0.94}Pr_{0.06}MoO_6$ (0.315, 0.312), $Lu_{1.92}Pr_{0.08}MoO_6$ (0.352, 0.316) [53] and $Pr^{3+}$: $Ba_2CaWO_6$ (0.29, 0.35) [54] phosphors.

### 3.4.2 *Within the active ($Pr^{3+}$) ion excitation*

When the LAGBPr*x* ($0 \le x \le 2.0$ mol%) phosphors are excited at 449 nm (i.e. within the $Pr^{3+}$ ions) corresponding to $Pr^{3+}$: $^3H_4 \rightarrow {}^3P_2$ transition, a broad emission band is noticed in the spectral region from 450 to 590 nm with sub-peaks and some emission bands originated from the f-f transitions of $Pr^{3+}$ ions. The presence of broad emission band can be ascribed to the host emission. In literature, a host emission band has also been reported for $Pr^{3+}$-activated $SiO_2$ matrix [46]. In this case, the emission spectra reveal six emission transitions due to $^3P_1 \rightarrow {}^3H_4$ (474 nm), $^3P_0 \rightarrow {}^3H_4$ (489 nm), $^3P_0 \rightarrow {}^3H_5$ (532 nm), $^1D_2 \rightarrow {}^3H_4$ (607 nm), $^3P_0 \rightarrow {}^3F_2$ (646 nm) and $^3P_1 \rightarrow {}^3F_3$ (673 nm) transitions. The partial energy level diagram shown in Fig. 8 also describes the emission mechanism of LAGBPr*x* phosphors at 449 nm excitation. As a reference, the emission spectrum of LAGBPr1.0 phosphor along with the assignment of observed transitions are described in Fig. 10a. Interestingly, a fluorescence quenching has been noticed beyond $x = 1.0$ mol% and it can be attributed to the ET among the excited $Pr^{3+}$ ions. The variation in intensity of $Pr^{3+}$: $^3P_1 \rightarrow {}^3H_4$ transition as a function of $Pr^{3+}$ ions concentration is shown as inset of Fig. 10a.

The spectra normalized w.r.t the intensity of $Pr^{3+}$: $^3P_1 \rightarrow {}^3H_4$ transition are shown in Fig. 10b. As seen in these emission profiles, one can perceive a blue-shift with increase of concentration of $Pr^{3+}$ ions. This shift has been ascribed to the slight variation in ionic radii of $Pr^{3+}$ ions (1.13 Å) and $Gd^{3+}$ ions (1.08 Å) leading to site distribution of $Pr^{3+}$ ions in the vicinity of $Gd^{3+}$ ions in LAGBPr*x* phosphors [55]. The inset of Fig. 10b presents the blue-shift noticed for $Pr^{3+}$: $^3P_1 \rightarrow {}^3H_4$ transition. The CIE colour coordinates of LAGBPr*x* phosphors at 449 nm excitation are also listed in Table 1 and they are located in CIE chromaticity diagram shown in Fig. 11. Further, the value of CP is found to be ~ 55% for LAGBPr*x* phosphors when excited at 449 nm. As seen in this CIE diagram, it is clear that all the colour coordinates are well fitted in the bluish-white region causing the absence of tunability for emitted fluorescence. The $YNbO_4$: $Pr^{3+}$-$Yb^{3+}$ [56], $YInGe_2O_7$: $Pr^{3+}$ [57] and $Sr_5Ta_4O_{15}$: $Pr^{3+}$ [58] phosphors exhibit bluish or bluish-white fluorescence under suitable excitations.

## 3.5 Decay time analysis

The fluorescence decay time of $Pr^{3+}$: $^3P_0$ emission state has been determined by exciting the phosphor samples at 274 nm wavelength and monitoring the emission at 613 nm corresponding to $^3P_0 \rightarrow {}^3H_6$ transition and they are shown in Fig. 12. The decay time has been measured taking 1/e times the initial intensity and they are found to be 88.2, 74.3, 57.8, 53.2 and 46.0 µs for $x = 0.05$, 0.1, 0.5, 1.0 and 2.0 mol%, respectively. The measured decay time values decrease with the increase of $Pr^{3+}$ concentration as shown in inset of Fig. 12. The decrease in fluorescence decay time could be due to ET among the excited $Pr^{3+}$ ions at higher concentrations.

The observed quenching in fluorescence of various emission transitions of $Pr^{3+}$ ions at 449 nm excitation could be due to self-absorption and/or non-radiative

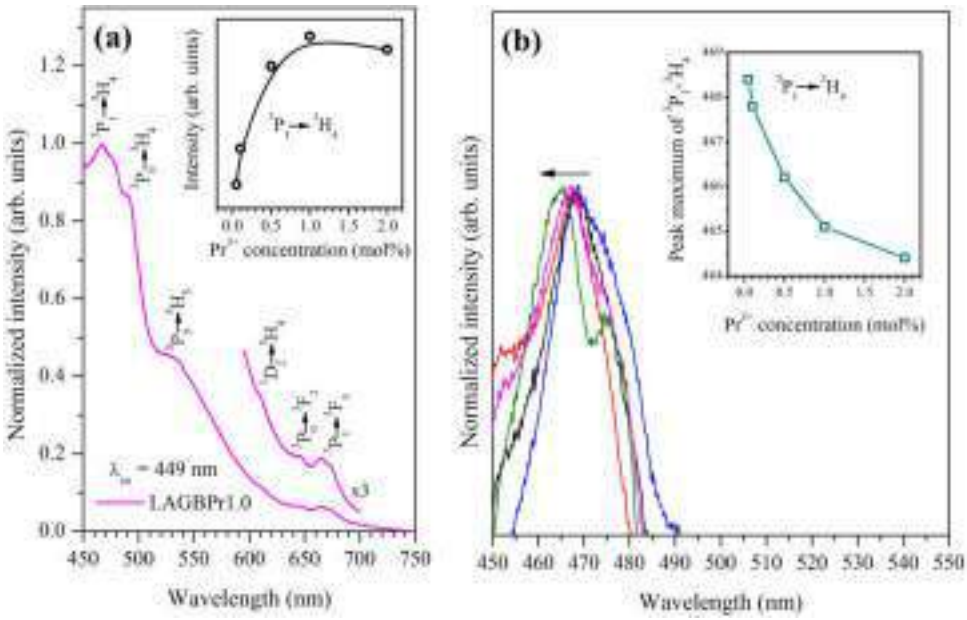

**Fig. 10** **a** Emission spectrum of LAGBPr1.0 phosphors ($\lambda_{ex}$ = 449 nm) and the variation of intensity of $Pr^{3+}$: $^3P_1 \rightarrow {}^3H_4$ transition as a function of $Pr^{3+}$ ions concentration. **b** Normalized emission spectra of LAGBPr*x* phosphors and the variation of peak maximum of $Pr^{3+}$: $^3P_1 \rightarrow {}^3H_4$ transition as a function of $Pr^{3+}$ ions concentration

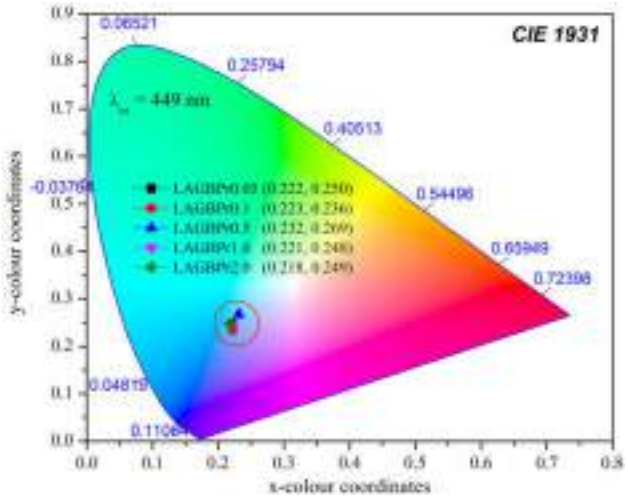

**Fig. 11** CIE chromaticity diagram showing the colour coordinates of LAGBPr*x* phosphors at 449 nm excitation

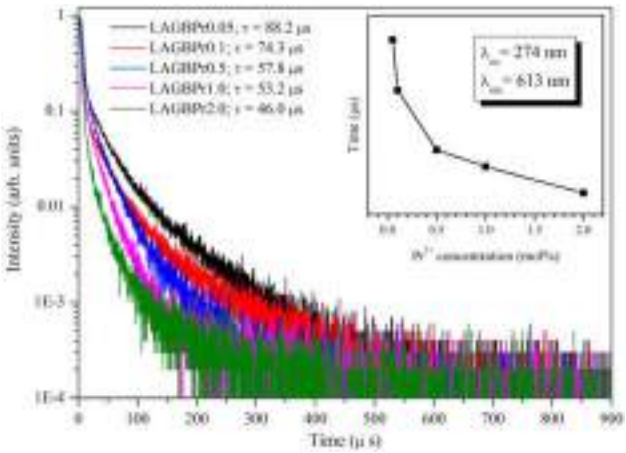

**Fig. 12** Fluorescence decay profiles of $Pr^{3+}$: $^3P_0$ emission state in LAGBPr*x* phosphors. Inset shows the variation of lifetime as a function of $Pr^{3+}$ concentration

transfer of energy among the excited $Pr^{3+}$ ions. The non-radiative (NR) transfer of energy has been assigned to the cross-relaxation (CR) channels and the resonant energy transfer (RET) mechanism is described below and is illustrated clearly in Fig. 8.

$$CR-1: \left[{}^3P_0, {}^3H_4\right] \rightarrow \left[{}^1D_2, {}^3H_6\right]$$

$$CR-2: \left[{}^3P_0, {}^3H_4\right] \rightarrow \left[{}^3H_6, {}^1D_2\right]$$

$$RET: \left[{}^1D_2, {}^3H_4\right] \rightarrow \left[{}^3H_4, {}^1D_2\right]$$

In general, white light can be generated by two different ways, by combining GaN blue LED-chip with YAG: $Ce^{3+}$ yellow phosphor or using a tri-colour phosphor excited at near UV radiation. The efficiency of white light source designed by the first method is not favourable due to low colour rendering index and poor illumination compared to near UV excited tri-colour phosphors. Furthermore, a phosphor coating on LED improves its efficiency and helps in quenching its surface temperature [59–62]. The observed experimental results suggest that the LAGBPr1.0 phosphor is suitable for lighting applications.

## 4 Conclusions

The LAGBPr$x$ ($0 \leq x \leq 2.0$ mol%) phosphors were synthesized by solid-state method and characterized for white LED applications. Thermal analysis through TG-DSC study explores an endothermic peak at 515.0 °C corresponding to the phase transition and an exothermic peak at 640.0 °C confirming the final phase of LAGBPr$x$ phosphors. A monatomic decrease in intensity of XRD peaks with the increase of concentration of $Pr^{3+}$ ions indicates the suitable replacement of $Pr^{3+}$ ions in $Gd^{3+}$ ion sites and uniform distribution of $Pr^{3+}$ ions in LAGBPr$x$ phosphors. The average size of crystallites is found to be ~ 77 nm and ~ 74 nm from the Debye–Scherrer and the Hall-Williamson methods, respectively. The magnitude of micro-strain presents is of the order of $0.44 \times 10^{-3}$. The FTIR investigations reveal the presence of B-O asymmetric and symmetric stretching vibrations, B-O-B bending vibrations, Al-O stretching vibrational modes, $AlO_4$ tetrahedral aluminate units, $AlO_4$-$LiO_4$ lattice vibrations and Gd-O vibrations. The HR-SEM image of LAGBPr0 phosphor shows a leaf-like morphology with random orientation of particles. The excitation spectra reveal a charge transfer band due to $O^{2-} \rightarrow Pr^{3+}$ ions (230–250 nm), host-related ($Gd^{3+}$) bands along with some f-f transitions of $Pr^{3+}$ ions. Upon 274 nm excitation, a tunable fluorescence from orange-red to white to bluish-white is observed, while at 449 nm excitation bluish-white fluorescence only observed. Upon 449 nm excitation, a blue-shift is noticed with the increase of concentration of $Pr^{3+}$ ions. The optimal concentration of $Pr^{3+}$ ions for efficient optical properties is confirmed to be 1.0 mol%. At 449 nm excitation, a quenching in luminescence is identified beyond 1.0 mol% and it has been assigned to the non-radiative transfer of energy through [$^3P_0$, $^3H_4$] → [$^1D_2$, $^3H_6$] and [$^3P_0$, $^3H_4$] → [$^3H_6$, $^1D_2$] cross-relaxation channels and [$^1D_2$, $^3H_4$] → [$^3H_4$, $^1D_2$] resonant energy transfer mechanism. From the experimental results, it can be concluded that the LAGBPr1.0 phosphor has more proficiency for lighting applications.

Blue light sources

ABSTRACT

Different concentrations of $Ce^{3+}$-doped $TeO_2$-$WO_3$-$GeO_2$-$Ce_2O_3$ (TWGCe) glasses were prepared by melt-quenching method and characterized. Different spectroscopic and luminescence properties were evaluated using room temperature absorption and emission spectra. The absence of sharp X-ray diffraction peaks and the presence of broad band from 18° to 35° shows the amorphous phase of studied glasses. The Fourier transform infrared absorption spectra show the presence of various vibrational bonds. The optical properties of TWGCe glasses were studied by exciting the glass samples at 323 nm ultraviolet wavelength. The quenching in luminescence is noticed at × = 0.5 mol% along with a red-shift at higher $Ce^{3+}$ concentrations. The decay time was found decrease with increase of concentration of $Ce^{3+}$ ions. These glasses emit intense blue luminescence with CIE coordinates (0.161, 0.018) when excited at 323 nm radiation. These glasses are favourable as blue light sources in the design of phosphor-based white LEDs.

## 1. Introduction

The multi-component glasses are of most significant compared to single crystals. They are of interest due to their low fabrication cost, flexibility in manufacturing different sizes and shapes. The glassy materials have been used to produce various optical components with excellent transparency. They exhibit intense emission in near ultraviolet and visible regions, possesses relatively high density and more rare earth (RE) ion solubility [1–4]. They have tremendous applications as host materials for variety of RE ions doped laser sources, fiber amplifiers in communication, dispersion-control devices, sensors in industry, scintillators in radio-physics, etc…[5,6]. The trivalent cerium ($Ce^{3+}$) ions are the most commonly used REs for intense luminescence in the spectral range of 300–600 nm. These are most significant in designing oxide-based scintillators owing to their high fluorescence yield strength and short lifetime of the order of $10^{-8}$ – $10^{-9}$ s. The $Ce^{3+}$ -doped scintillators find wide range of applications in the fields of bio-imaging, defense, communication and high-energy physics [7,8]. The emission of strong blue light from $Ce^{3+}$ activated multi-component glass or glass-ceramics have been used to generate white light in phosphor based white light emitting diodes (w-LEDs) [9,10].

The tellurite-based glasses are of noteworthy due to their excellent non-linear optical properties with low phonon energy, relatively good thermal stability with chemical durability, low manufacturing temperature. These glasses are more advantages in enhancing the fluorescence efficiency by reducing multi-phonon relaxations rates [11,12]. The presence of $TeO_4$, $TeO_{3+1}/TeO_3$, $WO_6$, $WO_4$ and $GeO_6$ structural units which help in strengthening glass network, glass forming ability and hence thermal stability. The structural, physical and thermal properties [13] and the shielding properties [14] of $TeO_2$-$WO_3$-$GeO_2$ glasses have been studied. Certain $RE^{3+}$ ions activated $TeO_2$-$WO_3$-$GeO_2$ glasses were fabricated and characterized for various visible and fiber laser sources [15–17]. This work reports on the structural and photoluminescence properties of $TeO_2$-$WO_3$-$GeO_2$-$CeO_2$ (TWGCe) glasses. The optimization of $Ce^{3+}$ concentration and photometric properties were also discussed.

## 2. Materials, method of preparation and instrumentation

The TWGCe*x* glasses of composition (85-*x*) $TeO_2$-5 $WO_3$-10 $GeO_2$-*x* $Ce_2O_3$ (*x* = 0, 0.1, 0.5 and 1.0 mol%) were prepared by melt-quenching method using $TeO_2$ (≥99.5 %), $WO_3$(≥99 %), $GeO_2$(99.999 %) and $Ce_2O_3$(99.9 %) as precursor materials. The stoichiometric amounts of precursor materials of 20 g batch each were thoroughly mixed in the presence of acetone and melted at 875 °C for 40 min using alumina crucible. The melt was air-quenched by pouring onto a preheated brass mould and annealed at 300 °C for 10 h and then cooled to room temperature producing bubble-free and transparent glasses (see Fig. 1**a**). All these glass samples were polished for optical quality with 0.18 cm thick and then used for other characterizations. The prepared glass samples were referred as TWGCe*x* glasses, where × stands for the concentration of $Ce^{3+}$ ions in mol%.

The Archimedes principle was applied to obtain density measurements using double-distilled water as an immersion-fluid. The Abbes' refractometer illuminated with sodium vapour lamp (λ = 5893 Å) was used to find the refractive indices. The room temperature optical absorption spectra were recorded on Agilent Cary 60 UV–Visible spectrometer. The transmittance mode infrared absorption spectra were recorded with PerkinElmer FT-IR spectrometer following KBr technique. The scanning electron microscopy-energy dispersive X-ray spectrum (SEM-EDS) was recorded on VEGA3 TESCAN provided with BrukerEasy EDS equipment. The excitation and emission spectra were carried out with Jobin Yvon Fluorolog-3 spectrofluorimeter and the lifetime measurements were done using FLS 1000 photoluminescence spectrometer with light source in pulsed mode. All the optical measurements were performed at room temperature.

## 3. Results and discussion

### 3.1. Basic characteristic parameters

The phase of TWGCe*x* glasses has been examined by powder X-ray diffraction (XRD) studies. The XRD profiles shown in Fig. 1**b** reveal a broad-bump range from 18° to 35° and it has been assigned to the combined effect of multiple-scatterings at non-uniformly distributed atoms leading to exhibit amorphous phase of studied glasses. Some of the significant basic parameters of TWGCe*x* glasses are summarized in Table 1. The values of refractive index (n) and density (d) increase with increase of $Ce^{3+}$ concentration and their variation are illustrated in Fig. 2. The decrease in molar volume ($V_m$) with $Ce^{3+}$ concentration leads compactness of elements. The reflection loss is found to be ~ 18 % for all the samples indicating negligible loss of incident light intensity or the studied glasses allow most of the incident light to absorb or transmit through them. The ratio of molar refraction ($R_m$) to molar volume ($V_m$) has been used to predict metallic or non-metallic behaviour of glass samples. ($R_m/V_m$) > 1 for metallic nature of solids while ($R_m/V_m$) < 1 for non-metallic nature of solids [18]. In the present investigation, the value of ($R_m/V_m$) is found to be ~ 0.63 for all TWGCe*x* glasses indicating their non-metallic nature. The increased concentration of $Ce^{3+}$ ions (C) cause a decrease in inter-ionic distance ($r_i$) resulting to energy transfer among the excited $Ce^{3+}$ ions at higher concentrations.

In order to evaluate the optical band gap energy of prepared TWGCe*x* glass samples, the room temperature optical absorption spectra were measured and presented in Fig. 1**c**. The optical band gap energy is one of

**Table 1**
Comparison of basic parameters of TWGCe*x* glasses.

| Parameter | TWGCe0 | TWGCe0.1 | TWGCe0.5 | TWGCe1.0 |
|---|---|---|---|---|
| Optical path length, *l* ± 0.01 cm | 0.18 | 0.18 | 0.18 | 0.18 |
| Density, d ± 0.001 g/cm$^3$ | 4.454 | 5.067 | 5.086 | 5.102 |
| Refractive index, n ± 0.001 | 2.448 | 2.453 | 2.458 | 2.462 |
| Reflection losses, $R_L$ ± 0.02 % | ~18 | ~18 | ~18 | ~18 |
| Molar refraction, $R_m$ ± 0.01 cm$^3$ | 22.12 | 19.48 | 19.45 | 19.42 |
| Molar volume, $V_m$ ± 0.01 cm$^3$ | 35.41 | 31.13 | 31.02 | 30.94 |
| ($R_m$ / $V_m$) ± 0.02 | ~0.63 | ~0.63 | ~0.63 | ~0.63 |
| Concentration, C ± 0.02 × $10^{20}$ ions/cm$^3$ | – | 1.10 | 5.53 | 11.03 |
| Inter-ionic distance, $r_i$ ± 0.01 Å | – | 20.84 | 12.18 | 9.68 |
| Indirect band gap energy, $E_g$ ± 0.02 eV | 2.56 | 2.40 | 2.24 | 2.16 |
| Direct band gap energy, $E_g$ ± 0.02 eV | 2.84 | 2.74 | 2.54 | 2.42 |

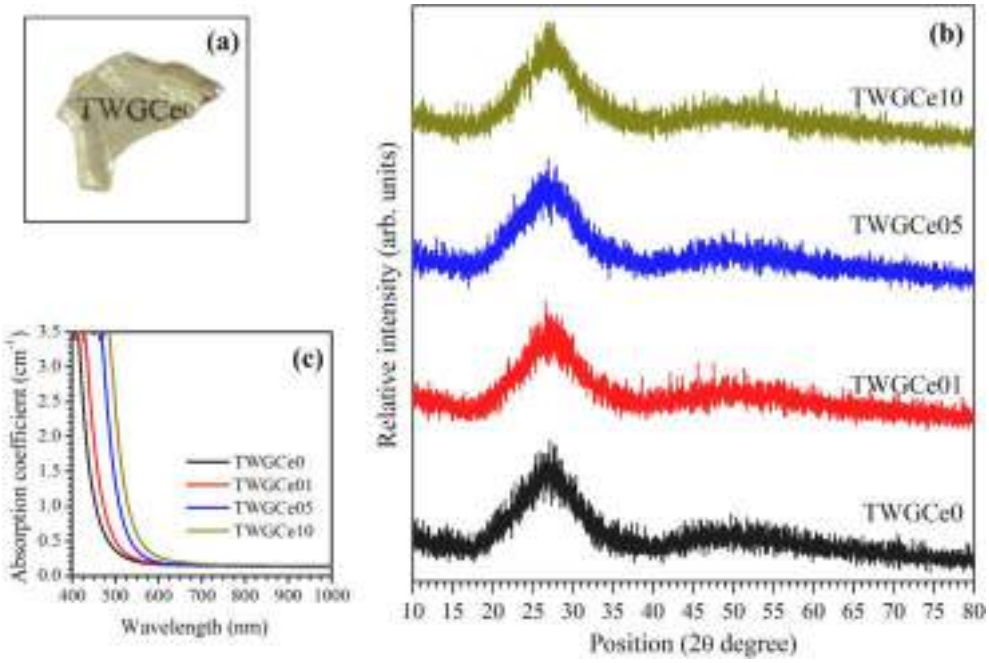

**Fig. 1.** Image of TWGCe05 glass (a), XRD profiles(b) and absorption spectra (c) of TWGCe*x* glasses.

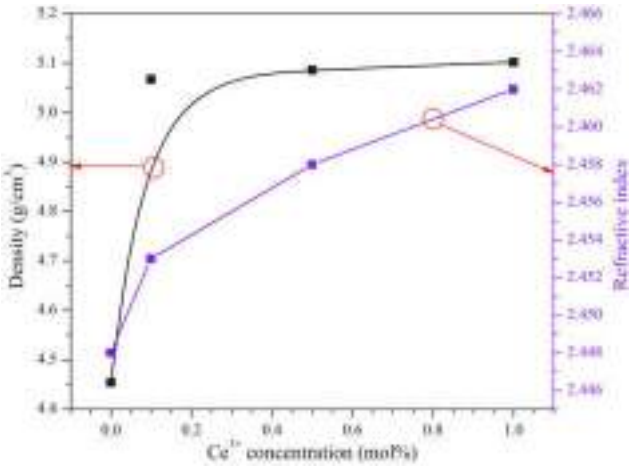

**Fig. 2.** Variation of density and refractive index of TWGCe*x* glasses as a function of $Ce^{3+}$ concentration.

the significant properties to analyze the optical transitions of active ions doped in a glassy matrix and it can be determined using UV–VISabsorption spectra (see Fig. 1**c**). The absorption coefficient (α = Absorbance /optical path length) near the absorption edge and the photon energy (hν)of incident radiation are related as shown below [19].

$$\alpha\,.\,(h\nu) \;=\; B\,(h\nu - E_{opt})^{q} \tag{1}$$

where B is a constant and it is independent of photon energy. The integer q represents the type of transition (direct/indirect) and it has 1/2, 1/3, 2 and 3 for direct allowed, direct forbidden, indirect allowed and indirect forbidden transitions, respectively. This condition is applicable under negligible reflectance. In case of glassy material, the reflectance can be minimized by polishing them to optically high quality [20–24]. The value of indirect and direct band gap energies has been obtained by extrapolating the linear region of Tauc's plots to meet the hν axis as shown in Fig. 3. In the present investigation, both indirect and direct band gap energies found decrease with increase of $Ce^{3+}$ concentration (see Table 1). The addition of low concentrations of dopant ions decreases the energy band gap and it could be due to small separation distance between dopant ions [25].

### 3.2. FTIR and SEM analysis

The FTIR spectra help us to know various structural vibrations present in the glass host. The FTIR spectra of TWGCe0 and TWGCe05 glasses shown in Fig. 4 are similar and they are identical to other tellurite glass [26]. The IR bands at ~ 3437, ~2361 and ~ 1713 $cm^{-1}$ belongs to the symmetric stretching vibrations of $HO^{-}$ group [5,27], the IR band noticed at ~ 871 $cm^{-1}$ is related to asymmetric stretching vibrations of Ge-O-Ge and W-O-W units [26]. The bands at ~ 721 and 642 $cm^{-1}$ have been ascribed to Te-O stretching vibrations in $TeO_4$ and $TeO_3$ units respectively [28]. The presence of $OH^{-}$ content influence the luminescence properties of RE active ions in a glassy matrix [29] and it can be evaluated using the equation,$\alpha_{OH} = \ln(T_0/T_D)/l$, where $T_o$ is the maximum transmittance, $T_D$ is transmittance corresponding to 3000 $cm^{-1}$by assuming the reflectance as zero and *l* is the optical path length.

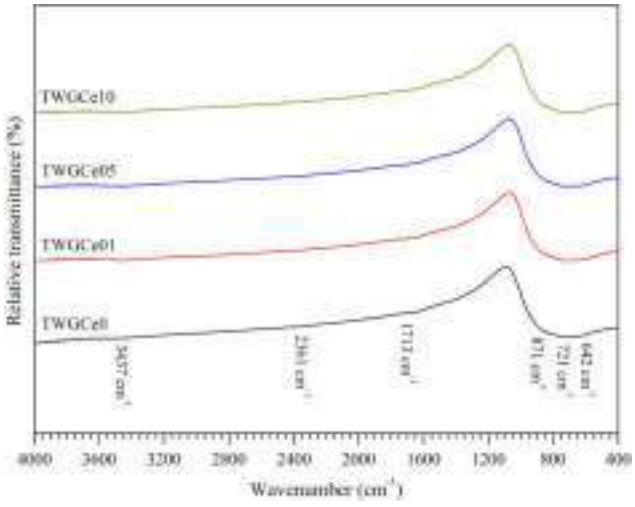

**Fig. 4.** FTIR spectra of TWGCe*x* glasses.

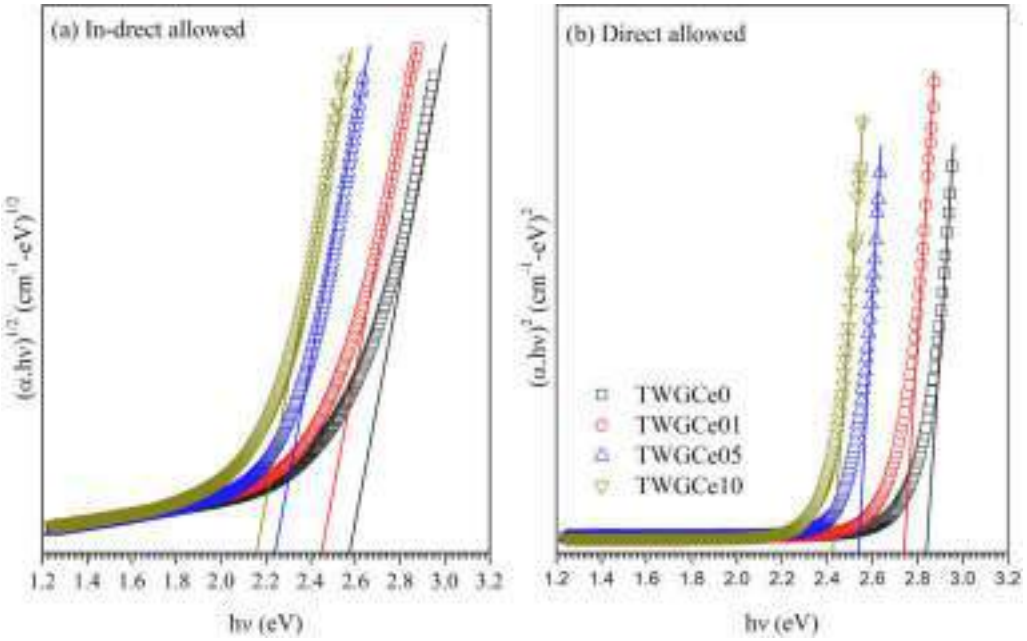

**Fig. 3.** Tauc's plots for indirect (a) and direct (b) allowed transition in TWGCe*x* glasses.

Lower the $OH^-$ content lesser will be the non-radiative losses. The value of $\alpha_{OH}$ is found to be 0.51 and 0.48 ± 0.02 $cm^{-1}$ for TWGCe0 and TWGCe05 glasses, respectively. The addition of $Ce_2O_3$ content reduces the $\alpha_{OH}$ value resulting to enhance the luminescence properties.

The SEM micrograph with EDS spectrum of TWGCe05 glass is shown in Fig. 5. As can see the SEM micrograph, one can notice that the prepared glass samples have good amorphous phase and they are free from air-bubbles, clusters and defects. The EDS spectrum shows the presence of all elements distributed uniformly indicating the proposed chemical composition. The atomic weight percentages of different elements present in the TWGCe05 glass are 61.77 at%, 4.52 at%, 31.53 at%, 1.69 at% and 0.49 at% for oxygen (O), germanium (Ge), tellurium (Te), tungsten (W) and cerium (Ce) and the corresponding mole percentages are 23.98 mol%, 23.60 mol%, 30.81 mol%, 16.87 mol% and 4.74 mol%.

### 3.3. Luminescence properties

The excitation and emission spectra of TWGCe*x* glasses are shown in Fig. 6. The excitation spectra monitoring the emission at 408 nm consists of a broad band extended from 243 nm to 360 nm and has been assigned to $Ce^{3+}$: $4f \rightarrow 5d$ transition [see Fig. 6**(a)**]. This broad band appears having three sub-peaks with maximum at ~ 255, ~274 and ~ 323 nm. The emission spectra recorded at 323 nm excitation consists of a broad and intense band due to $Ce^{3+}$: $5d \rightarrow 4f$ (408 nm) transitions. The intensity of excitation band increases with increase of $Ce^{3+}$ concentration, while the intensity of emission bands increases with increase of $Ce^{3+}$ concentration reach to maximum at × = 0.5 mol% and then decrease for further rise of concentration showing luminescencequenching phenomenon beyond × = 0.5 mol% due to energy transfer (ET) among the excited $Ce^{3+}$ ions at higher concentrations. The emission profiles of TWGCe glasses are similar to those reported for gadolinium oxyfluoroborate [5] and $P_2O_5$-$Li_2CO_3$-$GdBr_3$-$Al_2O_3$ [30] glasses.

As can see the normalized emission spectra shown as inset of Fig. 6 **(b)**, one can notice a red-shift in emitted luminescence with increase of $Ce^{3+}$ concentration. The peak maximum of $Ce^{3+}$: $5d \rightarrow 4f$ transition shifts from 403 nm for × = 0.1 mol% to 408 nm for × = 0.5 mol% and finally to 410 nm for × = 1.0 mol%. The observed red-shift has been ascribed to the site distribution of $Ce^{3+}$ ions in the ligand fields [31]. It is well known that when the energy of incident light photons is equal or greater than band gap energy of the material then the photons are absorbed by the material and excites the active ions to higher energy levels. When excited at 323 nm wavelength, the ground state $Ce^{3+}$: $4f$ ions get excited to $Ce^{3+}$: $5d$ emission state resulting to exhibit intense luminescence through $Ce^{3+}$: $5d \rightarrow 4f$ transition. The emission mechanism of $Ce^{3+}$ ions in TWGCe*x* glasses at 323 nm excitation is illustrated in Fig. 7**(a)**.

The Commission International de I'Eclairage (CIE-1931) chromaticity coordinates evaluated from the emission spectral profiles have been used to know the colour purity (CP) and correlated colour temperature (CCT) of emitted luminescence. For TWGCe*x* glasses excited at 323 nm, the CIE chromaticity coordinates are obtained as (x = 0.161, y = 0.018).The CP and CCT values have been determined using the equations shown below.

$$CP = \frac{\sqrt{(x - x_e)^2 + (y - y_e^2)}}{\sqrt{(x_d - x_e)^2 + (y_d - y_e^2)}} \times 100 \quad (2)$$

$$CCT = -449\,z^3 + 3525\,z^2 - 6823.3\,z + 5520.33 \quad (3)$$

where $(x_e, y_e)$ represents the coordinates of epicenter point and $(x_d, y_d)$ represents the coordinates for dominant-wavelength-point. Generally, the typical coordinates for equal-energy point are (0.333, 0.333). The constant z can be obtained using the formula, $z = (x - x_e)/(y - y_e)$. The evaluated CIE coordinates are located in the intense blue region of CIE diagram shown in Fig. 7**(b)**. The colour purity is estimated to be 98 % and the corresponding CCT rating is 1802 K. It is well known that the light sources with CCT < 3000 K emit warm light useful for living room illumination. It is known that the generation of white light from phosphor-based LEDs requires blue light excitation. The observed results show that the studied glasses emits intense and warm blue light suitable for decorative lighting sources as well as replacement for blue light source in phosphor-based w-LEDs.

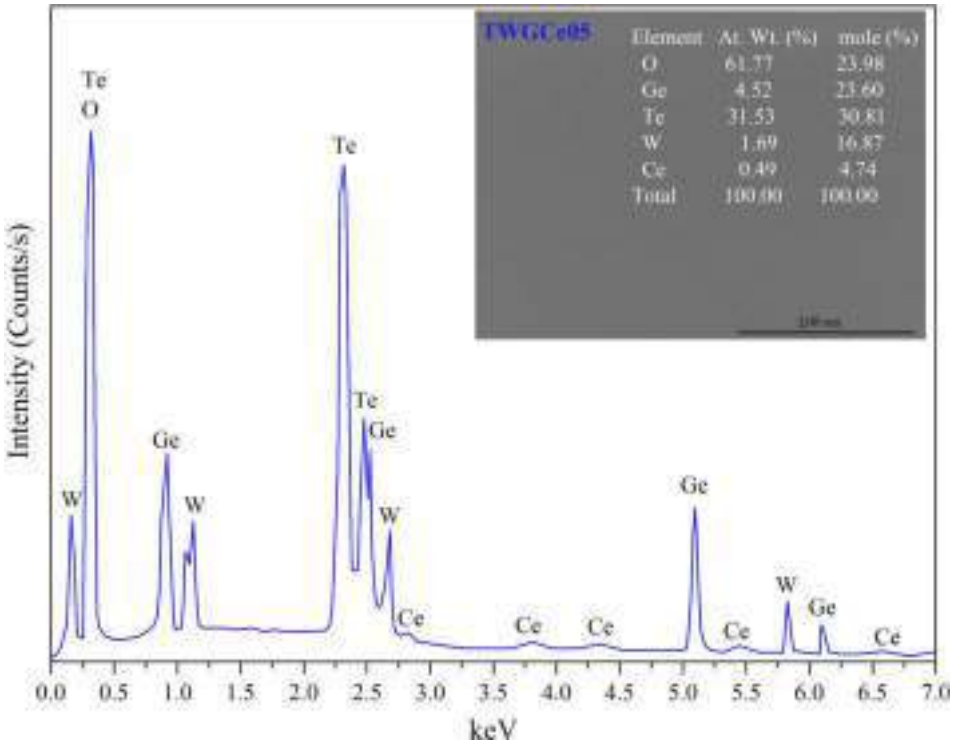

**Fig. 5.** EDS profile of TWGCe05 glass. Insets show the SEM micrograph and elemental analysis.

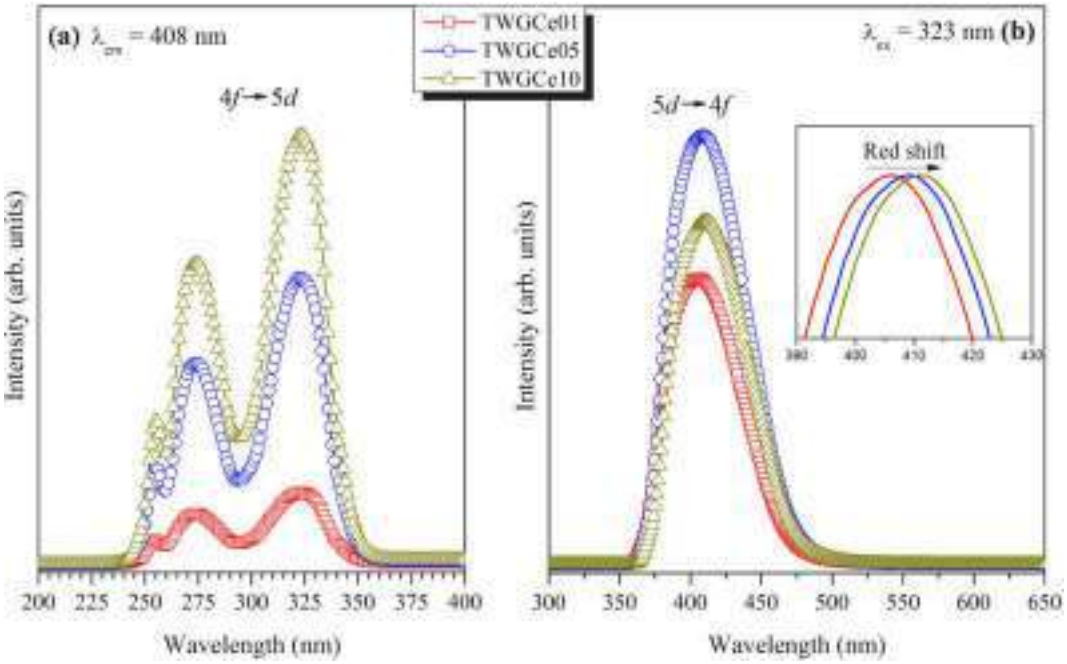

**Fig. 6.** Excitation (a) and emission (b) spectra of TWGCe*x* glasses. Inset shows a red-shift in emission spectra at 323 nm excitation.

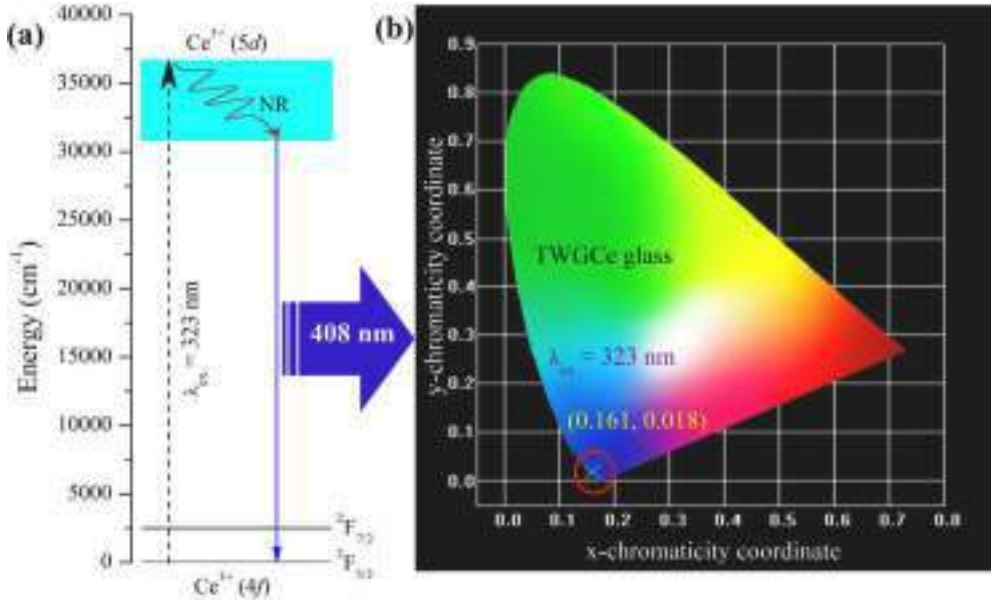

**Fig. 7.** Emission mechanism of $Ce^{3+}$ ions at 323 nm excitations (a) and the chromaticity diagram of TWGCe*x* glasses.

The process of ET among the excited active ions occurs either due to exchange interaction or multi-polar interaction process depending upon the critical transfer distance but not on inter-ionic distance. According to Dexter's theory of sensitized luminescence in solids [32], the exchange interaction type of ET is possible for $R_c \leq 5$ Å and beyond this limit ($R_c >$ 5 Å) the multi-polar interaction come into play for the transfer of energy among the excited ions. The inter-ionic distance ($r_i$) is the average distance among the sites of $Ce^{3+}$ ions in TWGCe glass host matrix, while the critical transfer distance ($R_c$) represents the mean distance among the $Ce^{3+}$ ions for which threshold transfer of energy occurs at suitable excitation. The value of $R_c$ responsible for ET mechanism has been estimated using the following formula [33].

$$R_c = \left(\frac{M}{N_A . d . C}\right)^{1/3} \quad (4)$$

where M is the molar mass, $N_A$ is the Avagadro's number, d is the density and C is the concentration of active ions (in g/mol). The value of $R_c$ is found to be 5.56, 3.82 and 3.03 Å for × = 0.1, 0.5 and 1.0 mol%, respectively. These values suggest that the exchange interaction mechanism play a key role in ET for TWGCe*x* glasses.

### 3.4. Luminescence decay

The luminescence decay curves of $Ce^{3+}$ in TWGCe*x* glasses monitoring the emission and excitation wavelengths at 408 nm and 323 nm

respectively are illustrated in Fig. 8. These decay curves are well fitted to a double exponential function, $I(t) = A_1 . e^{-t/\tau_1} + A_2 . e^{-t/\tau_2}$, where I(t) represent the emission intensity as a function of time t, $A_1$ & $A_2$ are constants and $\tau_1$ & $\tau_2$ are the short and long decay times, respectively. The average decay time $\langle\tau\rangle$ has been estimated using well known equation, $\langle\tau\rangle = \frac{A_1 . \tau_1^2 + A_2 . \tau_2^2}{A_1 . \tau_1 + A_2 . \tau_2}$. In the present case, the values of $\langle\tau\rangle$ are determined as 23.92, 22.15 and 19.32 ns for TWGCe0.1, TWGCe0.5 and TWGCe1.0 glasses, respectively. The gradual decrease in decay time with the addition of $Ce^{3+}$ ions in TWG glass host is an indication of energy transfer among the excited $Ce^{3+}$ ions at higher concentrations.

## 4. Conclusions

The TWGCe*x* glasses have been prepared with perfect amorphous phase by conventional melt-quench method are free from bubbles and impurities. The ratio of molar refraction to molar volume is found lesser than unity [$(R_m/V_m) > 1$] showing non-metallic nature of TWGCe*x* glasses. The $OH^-$ content of the order 0.51 – 0.48 $cm^{-1}$ is favourable to improve the luminescence properties. The SEM micrograph confirms the absence of impurities and bubbles and the EDS results show the presence of all the elements distributed uniformly. These glasses exhibit deep-blue luminescence through $Ce^{3+}$: $5d \rightarrow 4f$ transition when excited at 323 nm wavelength. The observed concentration quenching has been ascribed to the exchange interaction among the excited $Ce^{3+}$ ions at higher concentrations. For all TWGCe*x* glasses, the lifetime is found to be 1.02 ns. The colour perception and CCT rating values are found to be 99 % and 1802 K, respectively are more favourable for decorative lighting sources. The intense and fast luminescence signal is more suitable to be used as a scintillator material. The observed results suggest that the TWGCe05 glass is more favourable to design decorative blue light sources for living rooms and a suitable blue light source to design w-LEDs.

Luminescence properties

ABSTRACT

A series of $Pr^{3+}$ activated $YAl_3(BO_3)_4$ phosphors were fabricated by solid-state reaction technique and they were characterized via phase, morphology and photoluminescence studies. Powder X-ray diffraction peaks were suitably matched to JCPDS No. 72–1978. The presence of various vibrational bonds was identified using Fourier transform infrared spectroscopy. High resolution scanning electron microscopic investigations show that the phosphor particles were distributed uniformly and presented a rod-like shape. The photoluminescence results show that the studied phosphors were easily excited by visible wavelength to produce intense-yellow to pale-yellow tunable emission. The decrease in luminescence intensity and lifetime was assigned to dipole-dipole interaction energy-transfer among excited $Pr^{3+}$ ions. Observed results show that the 0.05 mol% of $Pr^{3+}$ activated phosphor produce intense-yellow luminescence at 480 nm excitation.

## 1. Introduction

Currently, there is a need for new, novel, low power consumption, low pollution and high efficiency materials in the fields of science & engineering, agriculture, medicine, defense, industry and communication [1–3]. Compared to other lighting sources, the light-emitting-diode (LED) based devices are more favorable owing to their high brightness, long lifetime, less energy consumption, low heat production [4]. The phosphor converted LEDs have been the most suitable light sources in various fields owing to their reliability, long-life, low energy consumption, high fluorescence efficiency and environmental friendly behavior as they are free from toxic elements like Cd, S and Cl [5]. The superior qualities of pc-LEDs initiate many researchers to design and develop new red or yellow emitting materials for white-LEDs. Recently, the oxide-based phosphors have been the subject for many applications such as white light generation for screens in PDPs and FEDs, for green emission in horticulture due to their great resistance to moisture, excellent thermal and chemical stability compared to other phosphors like silicates, nitrides and so on[6–9].

Trivalent rare-earth (RE) ions doped $YAl_3(BO_3)_4$ phosphors have been the potential candidates for spectacular optoelectronic applications owing to their extensive iso-morphous substitutions, UV transparency, thermal constancy, chemical strength and non-

linear optical properties [10,11]. In $YAl_3(BO_3)_4$ structure, the $O^{2-}$ ions forms trigonal prisms with $Y^{3+}$ ions at the center and they are separated from each other by $(BO_3)^{3-}$ groups [12]. Thus, the structure of $YAl_3(BO_3)_4$ lattice facilitates to activate relatively huge concentrations of $RE^{3+}$ active ions without considerable agglomeration as they do not require any charge compensation. It is well known that the $Pr^{3+}$ ions show complex emission spectral profiles compared to other RE ions. Since the emission transitions of $Pr^{3+}$ ions are sensitive to the host environment around it, they exhibit blue (~480 nm), green (~540 nm), yellow (~580 nm), red (~600–650 nm), near UV (~800–1500 nm) luminescence through $^1D_2$, $^3P_1$,$^3P_0$ and $^1G_4$ excited energy states to their lower lying energy states [13,14]. The presence of prominent emission levels responsible for outstanding emission transitions in near-UV, visible and near-IR regions facilitate the trivalent praseodymium ($Pr^{3+}$) ions to used in the design of various optoelectronic devices. Based on the diverse applications, the $Dy^{3+}$, $Tm^{3+}$, $Dy^{3+}/Tm^{3+}$, $Dy^{3+}/Ce^{3+}$, $Sm^{3+}/Tb^{3+}$, $Eu^{3+}/Tb^{3+}$ and $Ho^{3+}/Tm^{3+}$ ions activated $YAl_3(BO_3)_4$ phosphors have been prepared and analyzed for various photonic applications [15–21]. The characteristic features of $YAl_3(BO_3)_4$ phosphor matrix initiated to design and investigate the optical properties of $Pr^{3+}$ ions to meet the current technological applications.

The $Ca_9Y(PO_4)_7$:$Ln^{3+}$ (Ln = Ce, Gd, Pr) phosphors for high luminescence efficiency and thermal-stability [22], the $O^{2-}$-$Pr^{2+}$ charge transfer and luminescence properties of $Pr^{3+}$ ions in $YF_3$–$Y_2O_3$ system [23], the YOF:Pr nanoparticles for temperature sensing applications [24] and the $Y_2MoO_6$: $xPr^{3+}$ phosphors for white LED applications [25] were reported. Further, the influence of $Pr^{3+}$ concentration on the luminescence of $BaY_{1.94}Al_4SiO_{12}$:$0.06Ce^{3+}$ phosphor prepared by solid state method has been reported for white LEDs [26]. The present research work explores the fabrication, structural, and optical characterization, optimization of $Pr^{3+}$ concentration for efficient luminescence, color purity of emitted luminescence and the decay analysis of $Pr^{3+}$:$^1D_2$ emission state. The energy transfer (ET) phenomenon among excited $Pr^{3+}$ ions also discussed.

## 2. Experimental procedure

### 2.1. Materials, method of preparation

High purity and analytical grade $Y_2O_3$ (99.99 % purity), $Al_2O_3$ (99.9 % purity), $H_3BO_3$ (≥99.5 % purity), and $Pr_2O_3$ (99.9 % purity) were used directly for the synthesis of YABPr*x* phosphors of composition $Y_{(1-x)}Al_3(BO_3)_4$: $xPr^{3+}$, where $x$ = 0,0.01, 0.02, 0.05,0.1,0.5,1.0 and 2.0 mol% via solid-state reaction technique. A batch composition of about 5.0 g homogeneous-powders (in stoichiometric-amounts) with an additional-amount of 3.0 wt% of $H_3BO_3$ (to avoid its evaporation at higher temperatures) were prepared and heat treated at 200 °C and 600 °C temperatures for 3 h following intermediate grinding. These grinded powders were sintered at 1200 °C for 3 h and cooled to room temperature to produce YABPr*x* phosphors.

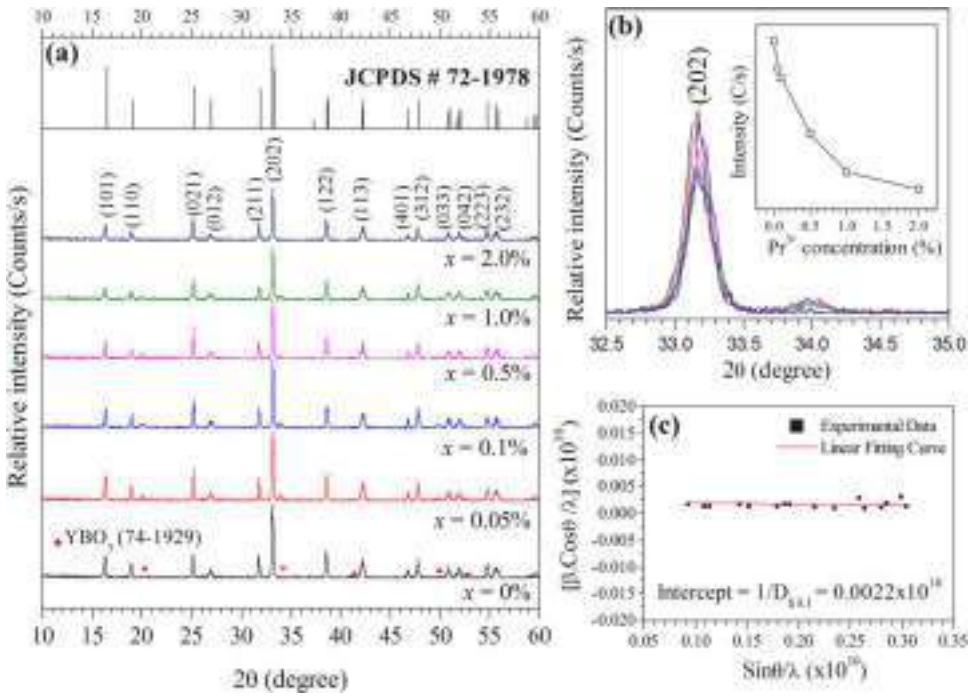

**Fig. 1.** PXRD patterns of YABPr*x* phosphors (a), magnified image of PXRD peak corresponding (202) Miller plane along with intensity vs. $Pr^{3+}$ concentration (b) and the H-W plot for YABPr1.0 phosphor.

### 2.2. Recording of various characteristics

Powder X-ray diffraction (PXRD) measurements were carried out with X′ Pert Pro Materials Research Diffractometer provided with Cu-Kα radiation of wavelength 1.5406 Å. The Fourier transform infrared spectral analysis was carried out by KBr technique with a PerkinElmer FT-IR spectrometer. The morphology of studied samples was examined with FEI-Quanta-FEG-200 F high-resolution scanning electron microscope (HR-SEM). The photoluminescence excitation, emission and decay analysis were carried out with FLS-1000 photoluminescence spectrometer containing xenon flash lamp in pulsed mode as a light source.

## 3. Results and discussion

### 3.1. Structure and morphology

The PXRD profiles of YABPr*x* ($0 \leq x \leq 2.0$ mol%) phosphors are illustrated in Fig. 1(a). These patterns are suitably fitted to JCPDS card No. 72–1978 belonging to $CaMg_3(CO_3)_4$ mineral huntite structure [27]. A two-dimensional crystal structure of $YAl_3(BO_3)_4$ lattice is shown in Fig. 2. As can see the PXRD profiles, one can notice a negligible $YBO_3$ phase and it has fever effect on the optical properties of RE ions and it has been ascribed to loss of boron at higher temperatures and slow reaction of $Al_2O_3$ with $Y_2O_3$ and $H_3BO_3$ [28]. A monotonous decrease in intensity of PXRD patterns with the addition of concentration of $Pr^{3+}$ ions is observed. The magnified image of a PXRD peak corresponding to (202) Miller plane in the 2θ ranges from 32.5 to 35°and the variation of its intensity versus $Pr^{3+}$ ions concentration is described as inset of Fig. 1(b). The close ionic radii of $Y^{3+}$ (0.090 nm) and $Pr^{3+}$ (0.1013 nm) may lead suitable replacement of $Pr^{3+}$ ions in place of $Y^{3+}$ sites. The mean size of crystallite has been determined as ~46 nm using to Debye-Scherrer method [29] and it is very close to the Hall-Williamson's (H-W) method (~45 nm) [30]. The H-W plot (β.cosθ/λ vs. sinθ/λ) for YABPr1.0 phosphor is presented in Fig. 1(c). The small deviation in ionic radii of $Y^{3+}$ and $Pr^{3+}$ may cause negligible lattice distortions resulting micro strains of the order 0.0074 which is found smaller than that of $SrEuMgAl_{10}O_{17}$ (~0.00751 nm) phosphor [31].

The FT-IR spectral profiles of YABPr*x* ($x = 0$ and 0.5 mol%) phosphors shown in Fig. 3 exhibit fourteen IR absorption bands showing the presence of various vibrations responsible for optical properties of RE active ions. A broad-band with a peak utmost at ~3030 $cm^{-1}$ and a group of bands at ~2354, ~2322 and ~2247 $cm^{-1}$ belongs to O–H stretching vibration and moisture in the sample, while the band at ~1355 $cm^{-1}$ is related to phonon frequency of YAB phosphor [32,33]. The IR bands observed at ~1414, ~1252 and ~500 $cm^{-1}$ belongs to B-O asymmetric stretching and asymmetric bending vibrations in orthoborate group, O-B-O bending vibrations, respectively, while the band at ~707 $cm^{-1}$ belongs to both B-O-B bending and Al-O bending vibrations [34,35]. The IR bands positioned at ~1064, 918 and 869 $cm^{-1}$have been related to the $YBO_3$ phase [28,36] and the IR band at ~776 $cm^{-1}$ has been ascribed to Al-O stretching vibrations [37]. The IR bands noticed at ~613, 542 and 461 $cm^{-1}$ have attributed to Y-O stretching vibrations [38].

The shape, size, orientation and distribution of particles have been known by studying the morphology. The HR-SEM micrograph of YABPr0 phosphor shown in Fig. 4 presented a rod-like shape with uniformly distributed particles. From this image one can notice that all the particles are oriented distinctly in a particular direction. This type of morphology helps in improving the optical properties of RE active ions [39]. The mean size of particles is calculated as ~105 nm with length varies from 500 to 1000 nm supporting the nano-crystalline phase of YABPr*x* phosphors.

### 3.2. Photoluminescence analysis

In order to gain access to higher energy states and hence to select appropriate excitation wavelength producing efficient emission, the photoluminescence excitation (PLE) spectrum of YABPr*x* phosphors have been recorded controlling the emission at about 598 nm corresponding to $Pr^{3+}: {}^1D_2 \rightarrow {}^3H_4$ transition. These spectra reveal three excitation bands at around 448, 470 and 480 nm

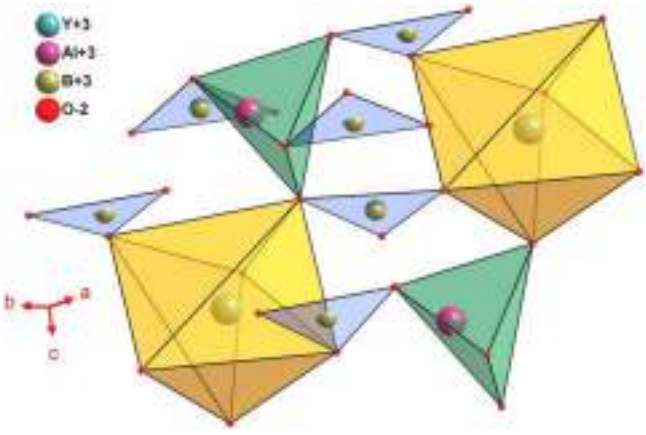

**Fig. 2.** Representation of two-dimensional YAB lattice.

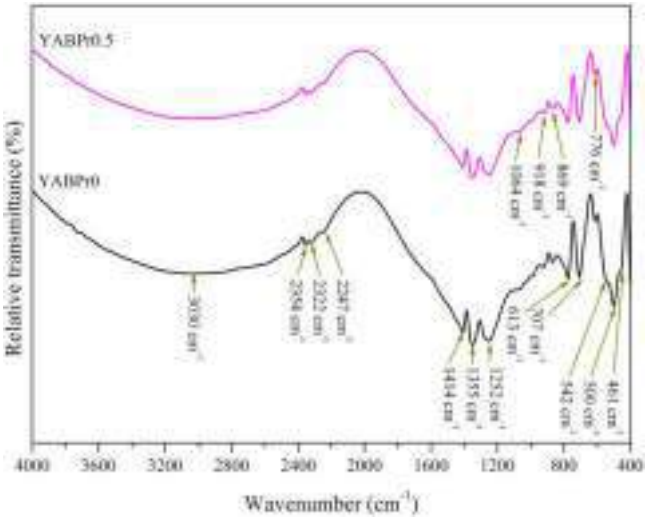

**Fig. 3.** FT-IR spectra of YABPr*x* ($x = 0$ and 0.5 mol%) phosphors.

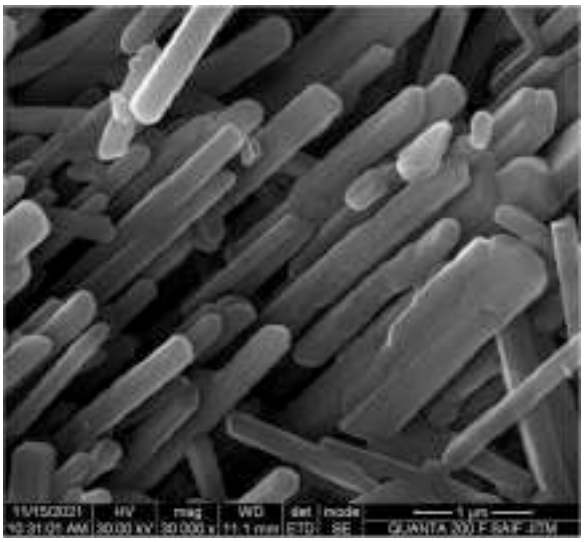

**Fig. 4.** HR-SEM micrograph of YABPr0 phosphor.

corresponding to $Pr^{3+}: {}^3H_4 \rightarrow {}^3P_{2,1,0}$transitions, respectively. The observed spectral profiles are identical to those reported for $Li_2SrSiO_4$: $Ce^{3+}$, $Pr^{3+}$ Phosphors [40]. The excitation spectra of YABPr*x* phosphors with the assignment of PLE bands noticed are depicted in Fig. 5. The intensity of $Pr^{3+}: {}^3H_4 \rightarrow {}^3P_J$ ($J = 0,1,2$) transitions increased with enhancement of concentration of $Pr^{3+}$ ions. The inset of Fig. 5 shows the variation of strength of $Pr^{3+}: {}^3H_4 \rightarrow {}^3P_J$ transitions as a function of $Pr^{3+}$ concentration. Since the PLE band with peak maximum at ~480 nm ($Pr^{3+}: {}^3H_4 \rightarrow {}^3P_0$) is broad and intense, this wavelength can be used to excite YABPr*x* phosphors more efficiently compared to other two wavelengths.

Upon 480 nm excitation, the emission spectra of YABPr*x* phosphors in the spectral region from 500 to 725 nm illustrated in Fig. 6 show different transitions originated from $^3P_0$ and $^1D_2$ emission states. The first group of emission bands (523, 528, 534, 538 and 542 nm) with peak maximum at 528 nm has been attributed to $^3P_0 \rightarrow {}^3H_4$transition, the second group of bands (554, 558 and 563 nm) with maximum at 563 nm has been attributed to $^3P_0 \rightarrow {}^3H_5$ transition, the third group of bands (594, 598, 603 and 611 nm) with maximum at 598 nm has been assigned to $^1D_2 \rightarrow {}^3H_4$ transition, the fourth group of bands (625, 630 and 633 nm) with maximum at 625 nm has been allocated to $^3P_0 \rightarrow {}^3H_6$ transition, the fifth group of bands (637, 647 and 656 nm) with maximum at 637 nm has been allotted to $^3P_0 \rightarrow {}^3F_2$ transition, the sixth group of bands (663, 670, 676 and 684 nm) with maximum at 670 nm has been ascribed to $^1D_2 \rightarrow {}^3H_5$ transition, and the seventh group of bands (696 and 706 nm) with maximum at 696 nm has been assigned to $^3P_0 \rightarrow {}^3F_3$ transition [41].

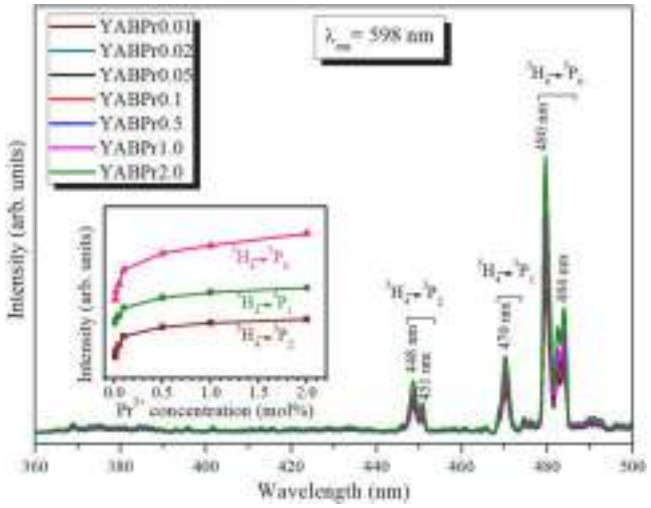

**Fig. 5.** PLE spectra of YABPr*x* phosphors ($\lambda_{em} = 598$ nm). Inset shows the variation of intensity of $Pr^{3+}$ : $^3H_4 \rightarrow {}^3P_{2,1,0}$transitions as a function of $Pr^{3+}$ concentration.

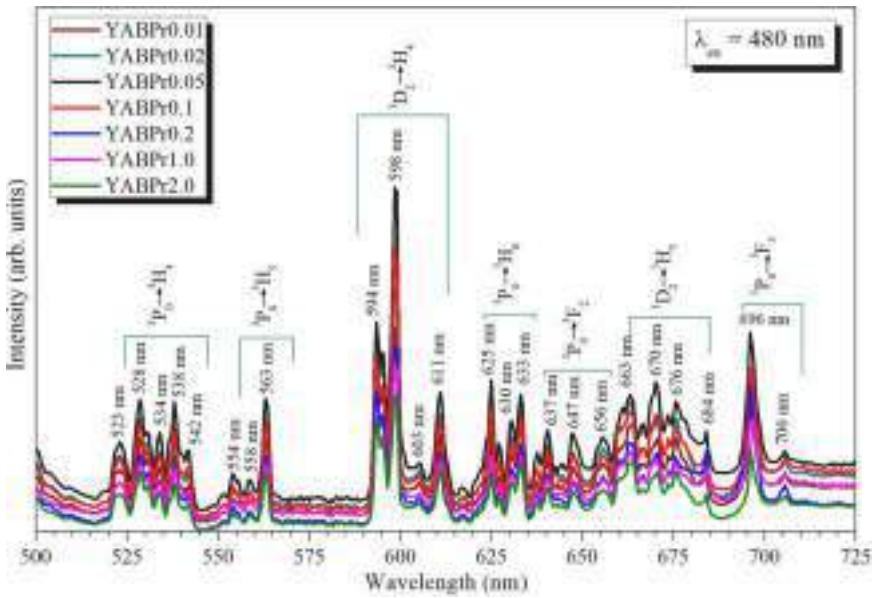

**Fig. 6.** Emission spectra of YABPr*x* phosphors at 480 nm excitation.

From the emission spectra, it is found that the strength of observed transitions increases reaches to maximum at $x = 0.05$ mol% and then decrease monotonically with the enhancement of $Pr^{3+}$ concentration signifying efficient energy transfer (ET) among the exited $Pr^{3+}$ ions at 480 nm excitation. It is due to the reason that at lowest concentrations the absence of energy transfer among the $Pr^{3+}$ active ions initiates feeble interactions resulting to enhance the intensity of emitted luminescence. This process continues up to a limiting concentration called the optimum concentration ($x = 0.05$ mol%). As the concentration increases beyond the optimum, the energy transfer among the $Pr^{3+}$ ions increase slowly due to increased interactions among $Pr^{3+}$ ions enhancing non-radiative transitions resulting a decrease in luminescence intensity with increase of $Pr^{3+}$ concentration. This process of variation in intensity with the concentration of active ions is known as luminescence quenching. To understand the luminescence quenching process, the magnified emission spectra in the spectral region from 590 nm to 604 nm and the variation of intensity of $Pr^{3+}$ : $^1D_2 \rightarrow {}^3H_4$ transition versus $Pr^{3+}$ concentration are described in Fig. 7(a) and Fig. 7(b), respectively.

Upon 480 nm excitation, the incident light photons interact with the ground state $Pr^{3+}$ ions and excite them to $Pr^{3+}$: $^3P_0$ emission state resulting to produce radiative transitions through $^3P_0 \rightarrow {}^3H_{4,5,6}$ and $^3P_0 \rightarrow {}^3F_{2,3}$transitions along with non-radiative (NR) transitions through $^3P_0 \rightarrow {}^1D_2$transition. The population of $^1D_2$ emission state increases enormously due to its long lifetime compared to

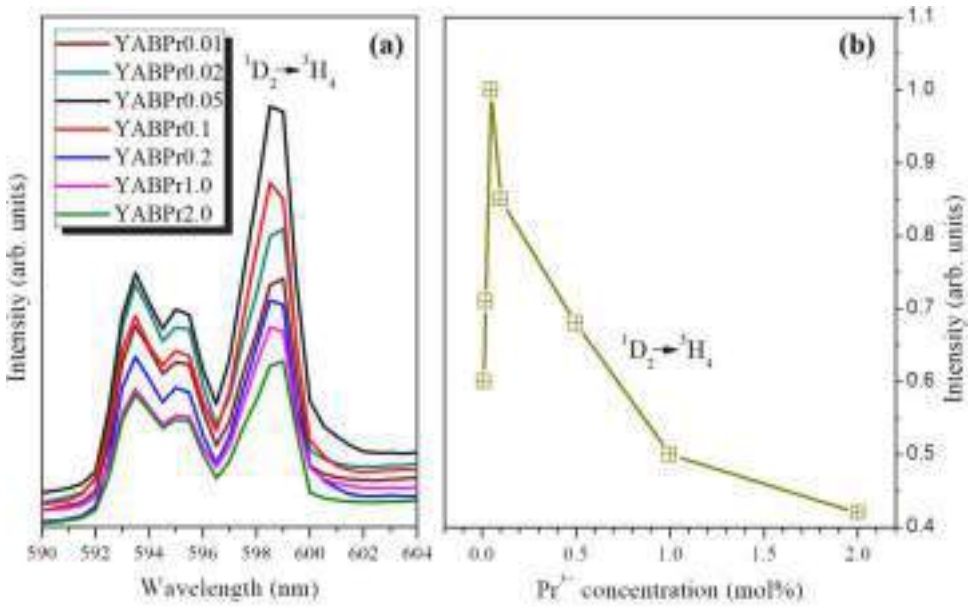

**Fig. 7.** Magnified image of $^1D_2 \rightarrow {}^3H_4$transition of YABPr*x* phosphors at $\lambda_{ex} = 480$ nm (a) and its intensity variation as a function of $Pr^{3+}$ concentration (b).

$^3P_0$ state. It is well known that the intensity of emitted luminescence due to $\Psi J \rightarrow \Psi^{|}J^{|}$ transition varies proportionally to the population density of higher energy state ($\Psi J$). The higher population of $^1D_2$ energy state results a maximum intensity for 598 nm ($^1D_2 \rightarrow {}^3H_4$) luminescence. The emission mechanism of $Pr^{3+}$ ions in YABPr*x* phosphors at 480 nm excitation has been described in a partial energy level diagram shown in Fig. 8.

### 3.3. Color-purity and color-temperature

The analysis of *colour purity*(CP) and *correlated colour temperature* (CCT) of emitted-light has been done by evaluating *Commision International de l'Eclairage* $(CIE - 1931)$color coordinates$(x, y)$. The $Pr^{3+}$ ions exhibit either red or yellow or green luminescence depending upon the host environment in which they are located. The $YVO_4$: $Pr^{3+}$ [42] and $CaLaB_7O_{13}$: $Pr^{3+}$ [43] emit red luminescence, the $LaMgAl_{11}O_{19}$: $Pr^{3+}$ [44] emit yellow luminescence and the $Pr^{3+}$: NGW [8] emits green luminescence. The evaluated CIE coordinates show a tunable luminescence from intense-yellow to pale yellow as illustrated in CIE diagram shown in Fig. 9. The YABPr0.05 phosphor with coordinates (x = 0.492, y = 0.485) exhibits an intense yellow luminescence similar to that of $LaMgAl_{11}O_{19}$: $Pr^{3+}$(0.4497, 0.5306) [44] and $Ba_2GdNbO_6$: $Sm^{3+}$ (0.496, 485) [45]. According to McCamy [46], the appearance of color of emitted luminescence has been expressed by CCT and the color sensitivity by CP. The values of CIE coordinates, CCT rating and CP for YABPr*x* phosphors are abridged in Table 1. The *CCT*rating of YABPr*x* phosphors is in the vicinity of warm-white light indicating safer for environmental and human activities.

### 3.4. Luminescence-decay dynamics

Generally, the lifetime ($\tau$) of an emission state will remain constant in the presence of radiative transitions and it decreases due to non-radiative (NR) transitions which cause ET among excited active ions or active and sensitizer ions. The decay curves of $Pr^{3+}$: $^1D_2$ emission state of YABPr*x* phosphors at $\lambda_{em} = 598$ nm and $\lambda_{ex} = 480$ nm are shown in Fig. 10(a). All-these decay-profiles are fitted to one-exponential function, $I = I_0.e^{-t/\tau}$, where $I_0$ represents the intensity at $t = 0$ *s*. Since the deviation in lifetimes of YABPr0.01 (74.8 $\pm$ 0.2 μs) and YABPr0.02 (74.7 $\pm$ 0.2 μs) phosphors are negligible and found almost the same as that of YABPr0.05, the decay profiles of YABPr0.01 and YABPr0.02 phosphors are not depicted in Fig. 10(a). The lifetime values are estimated to be 74.6, 68.7, 47.1, 40.4 and 38.6( $\pm$ 0.2 μs) for different values of *x*, respectively and they shrink with enhance of $Pr^{3+}$ ions concentration. The decrease in strength of luminescence intensity and the value of $\tau$ is mainly due to ET amongst the excited $Pr^{3+}$ ions at higher concentrations. Fig. 10 (b) demonstrates the variation of lifetime as a function of $Pr^{3+}$ ions concentration.

The working performance of an optical material has been estimated by evaluating its quantum efficiency, $\eta = \int I(t).\, dt/\tau$, where I (t) is the integrated emission intensity and τ is the lifetime [47]. For optimized concentration (YABPr0.05), the value of quantum efficiency is estimated to be 38 %. Blasse [48] reported that either exchange or multi-polar interaction mechanisms such as dipole-dipole (d-d), dipole-quadrupole (d-q) and quadrupole-quadrupole (q-q) play a key role for ET among the activators and also activator and sensitizer ions. The exchange interaction mechanism type of ET is possible up to a critical transfer distance ($R_c$) of up to

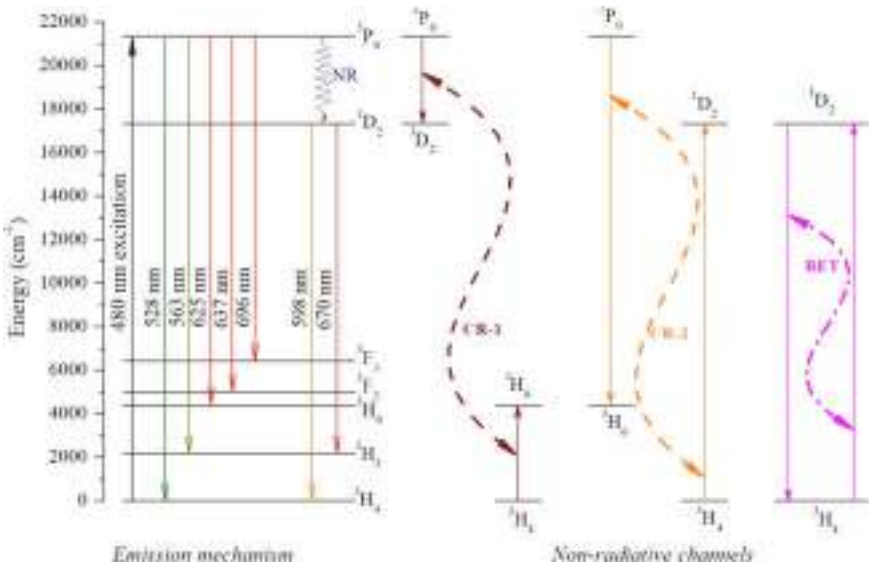

**Fig. 8.** Partial energy level diagram showing the emission mechanism of YABPr*x* phosphors at 480 nm excitation and the possible non-radiative channels responsible for energy transfer among the excited $Pr^{3+}$ ions.

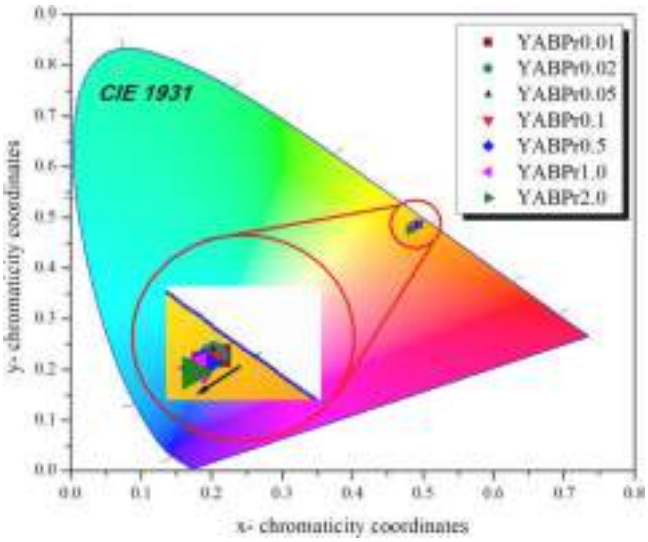

**Fig. 9.** CIE chromaticity diagram of YABPr*x* phosphors at 480 nm excitation.

**Table 1**
Comparison of CIE coordinates, CCT rating and CP values of YABPr*x* phosphors.

| Doping, *x* (mol%) | CIE coordinates (x, y) | CCT rating (K) | CP (%) |
|---|---|---|---|
| $x = 0.01$ | (0.495, 0.486) | 2783 | ~93 |
| $x = 0.02$ | (0.493, 0.484) | 2794 | ~93 |
| $x = 0.05$ | (0.492, 0.485) | 2811 | ~93 |
| $x = 0.1$ | (0.489, 0.483) | 2893 | ~93 |
| $x = 0.5$ | (0.487, 0.481) | 2844 | ~92 |
| $x = 1.0$ | (0.484, 0.478) | 2861 | ~91 |
| $x = 2.0$ | (0.482, 0.475) | 2866 | ~90 |

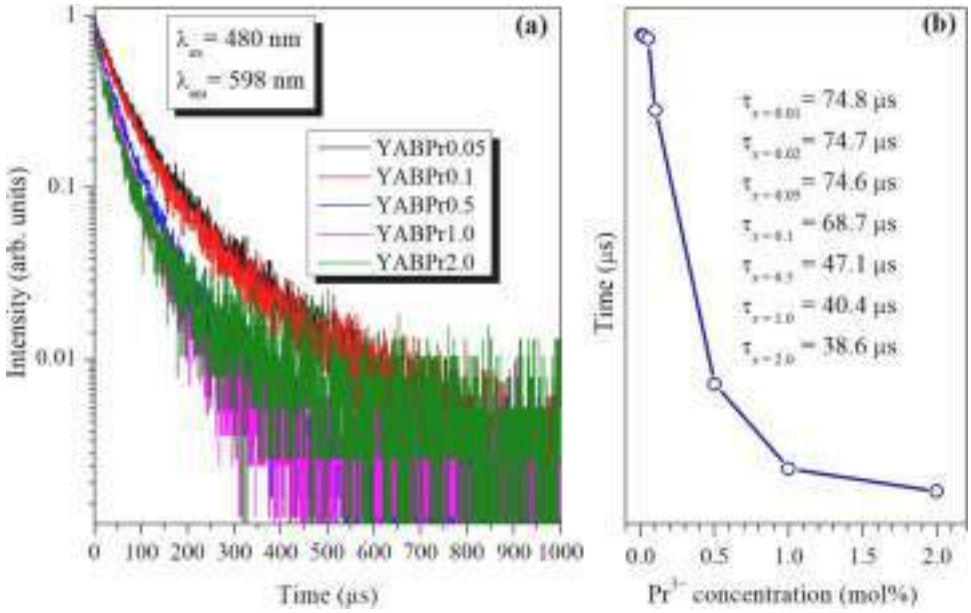

**Fig. 10.** Decay curves of $Pr^{3+}$: $^1D_2$ emission state in YABPr*x* phosphors (a) and the variation of lifetime as a function of $Pr^{3+}$ concentration (b).

5 Å only [49]. In case of YABPr*x* phosphors, the number of available crystallographic sites per unit cell for the active ions is 3, the volume of unit cell is 541.94 Å and the critical concentration is 0.05 mol% and the corresponding value of $R_c$is ~19.0 Å leading to multi-polar interaction mechanism. According to Dexter's theory of sensitized-luminescence in solids [49], the slope of logarithmic plot of emission intensity per activator versus activator concentration [Log(I/C) vs. Log(C)] is equal to Q/3 which helps us to identify the type of interaction mechanism accountable for ET. The ET parameter, Q = 3, 6, 8, 10 for exchange, d-d, d-q, q-q interactions, respectively. From Log(I/C) vs. Log(C) plot presented in Fig. 11, the value of Q is found to be nearly 6 indicating $d-d$ interaction ET among the excited $Pr^{3+}$ ions at 480 nm excitation. This transfer of energy is possible through non-radiative channels like cross-relaxation (CR) and resonant energy transfer (RET) channels. The probable CR and RET channels responsible for ET are shown below and they are illustrated in Fig. 8.

$$CR-1: \left[^3P_0,\ ^3H_4\right] \rightarrow \left[^1D_2,\ ^3H_6\right]$$

$$CR-2: \left[^3P_0,\ ^3H_4\right] \rightarrow \left[^3H_6,\ ^1D_2\right]$$

$$RET: \left[^1D_2,\ ^3H_4\right] \rightarrow \left[^3H_4,\ ^1D_2\right]$$

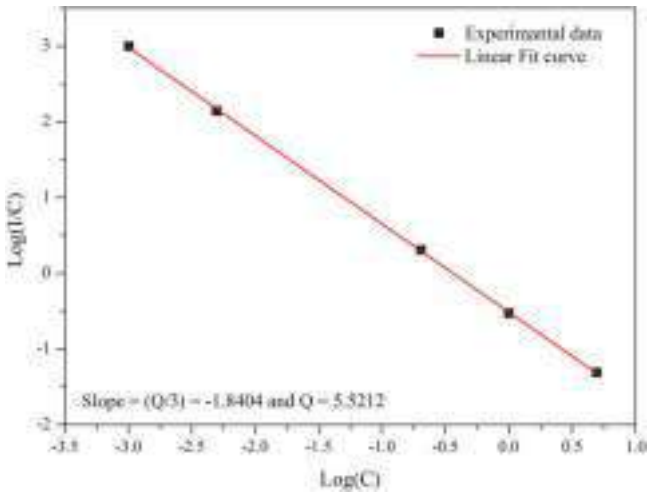

**Fig. 11.** Logarithmic plot of emission intensity per activator versus activator concentration in YABPr*x* phosphors.

## 4. Conclusions

The optical analysis of different concentrations of $Pr^{3+}$ ions activated YABPr$x$ ($0 \leq x \leq 2.0$ mol%) phosphors fabricated by solid-state reaction technique have been investigated. The PXRD analysis state that the studied phosphors are crystallized with an average size of 45–46 nm and suitably matched to JCPDS No. 72–1978. The HR-SEM micrograph presented a rod-like shape with uniform distribution of particles. The PLE spectra obtained by controlling the emission at 598 nm show $^3H_4 \rightarrow {}^3P_{2,1,0}$ transitions positioned at 448, 470 and 480 nm, respectively. Upon 480 nm excitation, the emission spectra exhibit different transitions originated from $^3P_0$ and $^1D_2$ emission states to their lower lying energy states leading to produce tunable luminescence from intense yellow to pale yellow. The decay curves of $Pr^{3+}$: $^1D_2$ emission state are suitably fitted to one exponential function. The addition of $Pr^{3+}$ concentration results a decrease in luminescence intensity and the lifetime of $^1D_2$ emission state due to ET through $d-d$ interaction among the excited $Pr^{3+}$ ions. Based on the observed results it can be concluded that the YABPr0.05 phosphor generates intense and pure yellow luminescence at 480 nm excitation and it is useful for solid state lighting.

## Declaration of Competing Interest

The authors declare that they have no conflict of interest.

## Abstract

A series of trivalent praseodymium ($Pr^{3+}$) ion-activated $SrAl_2O_4$ phosphors were prepared by solid-state reaction and characterized. The morphology of prepared phosphors was examined through SEM and TEM studies. The adjacent spacing of lattice fringes was estimated to be ~0.28 nm for the (310) crystal plane of the $SrAl_2O_4$ structure. The luminescence properties were studied by exciting the prepared phosphors within the host as well as $Pr^{3+}$ ions. For efficient luminescence, the concentration of $Pr^{3+}$ ions was optimized to be 2.0 mol.%. The colour perception of emitted luminescence was examined by evaluating the chromaticity coordinates. The observed quenching in luminescence and the gradual decrease in lifetime with increase of $Pr^{3+}$ concentration was assigned to the multi-polar interaction mechanism among the excited $Pr^{3+}$ ions at higher concentrations. The studied phosphors show more proficiency for solid-state red light sources.

## Introduction

Among the various energy saving materials, the trivalent rare earth (RE) ion-activated phosphors are more useful due to their excellent absorption from vacuum ultraviolet to near infrared (near-IR), good thermal and chemical stability, sharp emission lines, good colour rendering index and eco-friendly properties.[1–4] They are more favourable in designing various photonic devices owing to their low energy consumption, compact size, long lifetime and good quantum efficiency.[5,6] They effectively enhance the working efficiency of different kinds of photonic devices such as solid-state lasers, flat panel displays, optical sensors, surface coatings, energy-storage devices and light emitting devices.[7–10] The selection of $SrAl_2O_4$ host, its importance and applications in solid state lighting (SSL) technology was described in detail in our previous work.[11,12] Different RE ion-activated $SrAl_2O_4$ phosphors have been synthesized and characterized for various technological applications for the benefit of mankind and the environment. $SrAl_2O_4$:$Ce^{3+}$-$Li^{3+}$ co-doped phosphors were investigated to enhance white light emission.[13] The luminescence enhancement of $SrAl_2O_4$: $Eu^{3+}$ phosphors in the presence of $B^+$, $Li^+$, $Na^+$, and $K^+$ was reported for white LED applications.[14,15] $SrAl_2O_4$:$Eu^{3+}$ phosphors[16] prepared by combustion were investigated for the applications of mechanoluminescence dosimetry. Long-lasting and the afterglow photoluminescence properties of $SrAl_2O_4$:$Eu^{3+}$, $Dy^{3+}$ phosphors were studied for the fabrication of various photonic devices.[17,18] $Sm^{3+}$, $Tb^{3+}$ and $Tb^{3+}$/$Bi^{3+}$ -doped $SrAl_2O_4$ phosphors[19–21] were developed and characterized for various lighting applications.

Among the RE ions, the $Pr^{3+}$ ion is a user-friendly luminescent center due to its closely packed energy level structure and prominent emission transitions in ultraviolet (UV), visible and near-IR spectral regions. The emission spectra of $Pr^{3+}$ ions are more sensitive to the host environment and hence significantly differ in different hosts resulting to produce red, yellow, green and blue emissions as well as NIR emission. The emission transitions from $^1D_2$, $^3P_1$ and $^3P_0$ energy states to their lower lying energy states are responsible for red, yellow and green luminescence, the transitions from $^1S_0$ energy state results a blue luminescence while the transitions corresponding to 4f-5d energy state are responsible for UV emission.[22–25] These features have attracted the researchers to investigate $Pr^{3+}$ activated different phosphor materials as colour centers. Different concentrations of $Pr^{3+}$ ions activated $PbGdB_7O_{13}$ phosphors[22] were prepared and characterized for potential red luminescence. Under blue light irradiation, green to yellow tunability with an increase of $Pr^{3+}$ concentration in $BaY_2ZnO_5$:$Pr^{3+}$ phosphors has been reported.[23] $NaGd(WO_4)_2$:$Pr^{3+}$ phosphors[24] synthesized by sol-gel method were investigated for intense green luminescence. Guan et al.[25] studied the concentration-dependent luminescence and energy transfer among the $Pr^{3+}$ ions in $BaGd_2(MoO_4)_4$ crystals.

The broad yellow-orange emitting $SrAl_2O_4$:$Pr^{3+}$ phosphors[26] containing 2.0 to 4.0 mol.% of $Pr^{3+}$ ions mixed with 1.0 wt.% of carbon powder were sintered at 1200°C and investigated through powder X-ray diffraction (PXRD), scanning electron microscopy (SEM), photoluminescence excitation (PLE), emission and time-resoled decay studies for SSL applications. Broad emission through $Pr^{3+}$:($^3P_0$, $^1D_2$) → $^3H_J$ transition has been assigned to the crystal field effect of $SrAl_2O_4$. In the present work, the $SrAl_2O_4$:$Pr^{3+}$ phosphors have been prepared varying the concentration of $Pr^{3+}$ ions from 0.1 to 10.0 mol.% without mixing the carbon powder and sintered at a relatively low temperature on the order of 1050°C for 3 h.

The current research work focused a light on the synthesis and characterization of $SrAl_2O_4$:$Pr^{3+}$ phosphors through PXRD, SEM, transmission electron microscopy (TEM), Fourier transform infrared (FTIR) spectroscopy, FT-Raman spectroscopy, excitation, emission and luminescence decay studies. The concentration dependent luminescence was investigated by exciting the samples within the host matrix as well as dopant ($Pr^{3+}$) ions. The optimization of concentration of $Pr^{3+}$ ions for efficient luminescence was reported. The possible reasons for quenching in luminescence and decay time were also reported. The colour perception studies illustrate that the $SrAl_2O_4$:$Pr^{3+}$ phosphor samples show an efficient red luminescence upon different excitations. The obtained results show that the studied phosphors exhibit quite interesting luminescence properties under different excitations compared to earlier work.[26–28]

## Experimental

### Materials Used and Preparation Technique

Different concentrations of $Pr^{3+}$ ion-activated $Sr_{(1-x)}Al_2O_4$:$x$ $Pr^{3+}$ ($x$ = 0 mol.%, 0.1 mol.%, 0.5 mol.%, 1.0 mol.%, 2.0 mol.%, 4.0 mol.%, 6.0 mol.% and 10.0 mol.%) phosphors were prepared by solid-state reaction using high-grade $SrCO_3$ (99%), $Al_2O_3$ (99.9%) and $Pr_2O_3$ (99.9%). The batch compositions of about 2.0 g of homogeneous powders were prepared with stoichiometric ratios. Additionally, 2.0 wt.% of $H_3BO_3$ (99.5%) was added as a flux material for easy decomposition of $SrCO_3$. These powder samples were heat-treated at 200°C for 3 h and sintered at 1050°C for 3 h following intermediate grinding producing milky-white $Sr_{(1-x)}Al_2O_4$:$x$ $Pr^{3+}$ phosphors. The obtained phosphor

materials were labeled as SAOPr*x*, where *x* stands for the concentration of $Pr^{3+}$ ions (in mol.%).

### Characterizations

The crystalline phase of SAOPr*x* ($0 \le x \le 10.0$ mol.%) phosphors was studied with an X' Pert Pro Materials Research Diffractometer ($\lambda_{CuK\alpha}$ = 1.5406 Å). A KBr pellet was employed to study the Fourier transform infrared (FTIR) absorption spectrum with a Perkin Elmer Spectrum One FTIR spectrometer. A Bruker RFS27 FT-Raman spectrometer using a Nd-YAG laser ($\lambda$ = 1064 nm) was used to record Raman spectra. Morphological study was carried out with a Hitachi SU-70 scanning electron microscope (SEM) and an FEI-TECNAI G2 F20 high-resolution transmission electron microscope (HR-TEM). The photoluminescence excitation and emission studies were carried out witha Jobin Yvon Fluorolog-3 spectrofluorimeter with a xenon lamp of 450 W in continuous mode, while the decay dynamics were carried out on the same instrument with a xenon lamp in pulsed mode. All the characterizations were recorded at room temperature only.

## Results and Discussion

### Structure, Composition and Morphology Studies

The PXRD profiles of SAOPr*x* phosphors for a 2θ range from 15 to 50° are shown in Fig. 1a. These profiles are well fitted to the monoclinic $SrAl_2O_4$ structure (JCPDS No. 34-0379). All the PXRD profiles are found to be identical except in their intensity showing the same crystalline phase. The intensity of PXRD profiles decreases with the increase in concentration of $Pr^{3+}$ ions showing the uniform distribution of $Pr^{3+}$ ions in SAOPr*x* lattice. The variation of intensity of the PXRD peak corresponding to the (310) crystal plane was seen at $2\theta = 35.28°$ as a function of $Pr^{3+}$ ion concentration is shown in Fig. 1b.

The monoclinic crystalline phase of $SrAl_2O_4$ phosphor has been confirmed from the Rietveld refinement following Fullprof software[19] and the corresponding lattice parameters were noted as $a$ = 8.4419 Å, $b$ = 8.8217 Å and $c$ = 5.1592 Å. The mean crystallite size (D) of SAOPr*x* phosphors is estimated to be 36 nm using Debye-Scherrer's

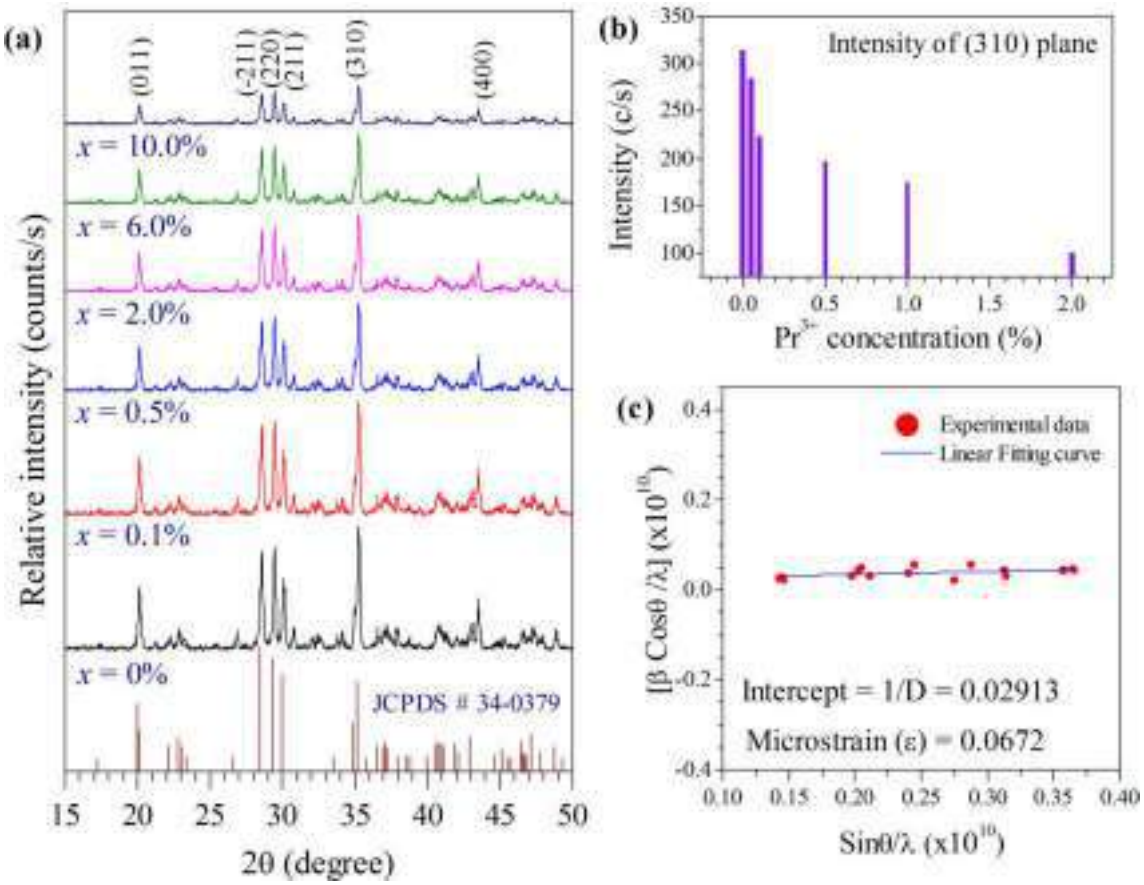

**Fig. 1** PXRD profiles of SAOPrx phosphors (a), variation of intensity of (310) crystal plane as a function of $Pr^{3+}$ concentration (b) and the Williamson–Hall curve of SAOPr1.0 phosphor (c).

formula, $D = \frac{0.89\,\lambda}{\beta\,.\,\cos\theta}$, where λ is the wavelength of x-rays (1.5406 Å), $\beta$ is the full-width at half maximum (in radians) and $\theta$ is the diffraction angle. The size of crystallites has also been obtained using the Williamson–Hall (W–H) equation.[29] According to W–H, the crystallite size (D) and the angle of diffraction ($\theta$) are related as

$$\frac{\beta\cos\theta}{\lambda} = \frac{1}{D} + \frac{\varepsilon\sin\theta}{\lambda} \quad (1)$$

The mean crystallite size and the magnitude of microstrain ($\varepsilon$) present in the material can be found from the $\left(\frac{\beta\cos\theta}{\lambda}\right)$ *versus* $\left(\frac{\sin\theta}{\lambda}\right)$ plot, known as the W–H curve and it is shown in Fig. 1c. The slope and reciprocal of the intercept of the W–H curve represent the microstrain and the mean crystallite size (D), respectively. The magnitude of microstrain and the mean crystallite size are found to be 0.0672 and 34 nm, respectively. The value of D obtained from the W–H curve is close to that obtained from Debye-Scherrer's formula.

The FTIR profile of SAOPr1.0 phosphor in the spectral range from 950 to 400 $cm^{-1}$ shown in Fig. 2a reveals a number of significant vibrational modes associated with Al–O and Sr–O. The IR bands located from 892 to 838 $cm^{-1}$ belong to the formation of $SrAl_2O_4$.[30] The IR peaks identified at 802, 772 and 712 $cm^{-1}$ have been assigned to the $AlO_6$ and $AlO_4$ groups, respectively.[31] The IR peaks noticed at around 668 $cm^{-1}$ and 642 $cm^{-1}$ have been ascribed to the Sr-O vibration.[32] The peaks at around 614, 594 and 556 $cm^{-1}$ have been attributed to the mixed stretching and bending mode of Al-O-Al.[33] The IR bands located at 532, 518 and 502 $cm^{-1}$ have been attributed to the Al–O vibration.[32] The IR peaks observed at 446, 444 and 414 $cm^{-1}$ have been assigned to O–Al–O symmetric vibration.[34] The FT-Raman spectrum of SAOPr1.0 phosphor shown in Fig. 2b reveals the presence of various molecular units as well as the confirmation of monoclinic phase. This spectrum consists of nearly 15 weak Raman modes possible for monoclinic $SrAl_2O_4$. These weak Raman modes have been ascribed to the overlap of certain symmetry vibrations. An intense and sharp peak at around 467 $cm^{-1}$ has also been noticed along with weak modes confirming the monoclinic phase of SAOPr1.0 phosphor and it can be attributed to the O-Al-O bending vibrations.[35,36]

The SEM/TEM analysis provides not only the surface morphology but also the details regarding the distribution of particles and their orientation. The TEM analysis has also been used to confirm the crystallite size, i.e., whether they crystallized into nanoscale or not. The elemental analysis is also possible from both SEM and TEM

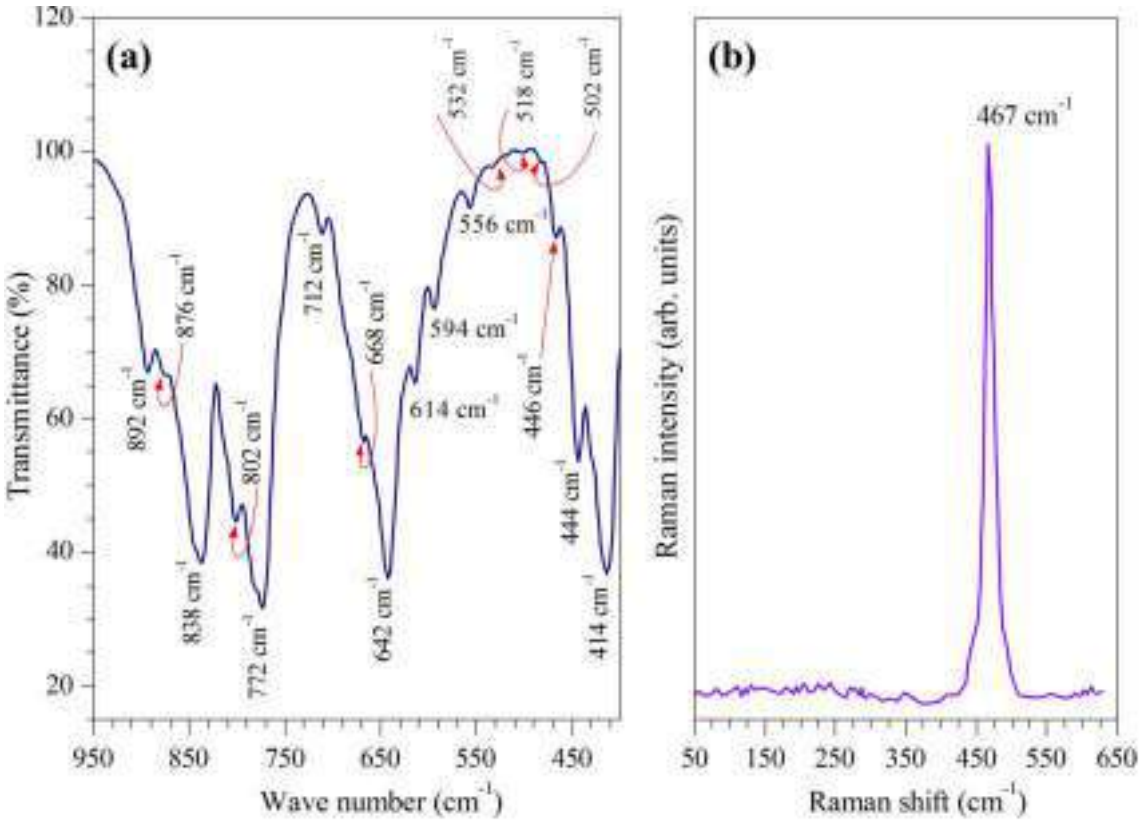

**Fig. 2** FTIR (a) and FT-Raman (b) spectra of SAOPr1.0 phosphor.

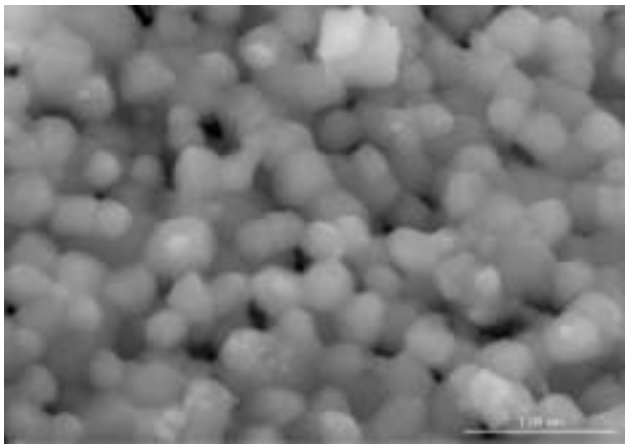

**Fig. 3** SEM micrograph of SAOPr1.0 phosphor.

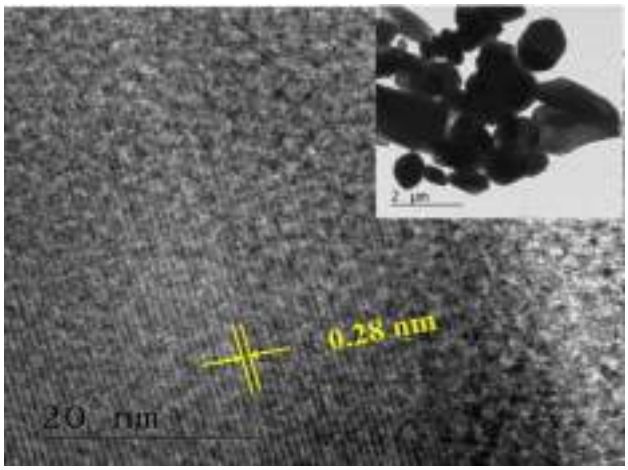

**Fig. 4** HR-TEM image of SAOPr1.0 phosphor. Inset shows its TEM micrograph.

micrographs. The present research work is not focused on the elemental analysis. The SEM image of SAOPr1.0 phosphor shown in Fig. 3 represents homogeneous distribution of particles crystallized into spherical shape with different size. The TEM image of SAOPr1.0 phosphor (see inset of Fig. 4) reveals the uniform distribution of $SrAl_2O_4$ particles that are crystallized into nanoscale. The adjacent spacing of the lattice fringes corresponding to (310) crystal plane is estimated to be 0.28 nm from the HR-TEM image illustrated in Fig. 4. The interplanar spacing was also evaluated using the following equation.[37]

$$\frac{1}{d_{hkl}^2} = \frac{1}{\sin^2\beta}\cdot\left[\frac{h^2}{a^2} + \frac{k^2\sin^2\beta}{b^2} + \frac{l^2}{c^2} - \frac{2hl\cos\beta}{a.c}\right] \quad (2)$$

For the monoclinic SAOPr1.0 phosphor, the lattice parameters have been obtained as $a = 8.4419$ Å, $b = 8.8217$ Å and $c = 5.1592$ Å from the Rietveld refinement (not shown) and $\beta$ is on the order of 93.415º. For the (310) crystal plane, the value of $d_{hkl}$ is found to be 0.267 nm which is very close to that obtained from the HR-TEM analysis.

## Photoluminescence Excitation

The photoluminescence (PL) analysis has been carried out through excitation, emission and lifetime studies. The excitation spectra of SAOPr2.0 phosphor has been recorded controlling the emission at 488 nm, 548 nm, 609 nm, 648 nm and 658 nm and presented in Fig. 5a. These spectra are comparable to other reports[28] and they contain a broad excitation band in the spectral region from 240 to 300 nm which can be assigned to the $SrAl_2O_4$ host excitation band.[11] These spectra reveal five excitation bands due to $Pr^{3+}$: $^3H_4 \rightarrow {}^3P_2$ (~441 nm), $Pr^{3+}$: $^3H_4 \rightarrow {}^1I_6$ (~448 nm), $Pr^{3+}$: $^3H_4 \rightarrow {}^3P_1$ (~466 nm), $Pr^{3+}$: $^3H_4 \rightarrow {}^3P_0$ (~482 nm) and $Pr^{3+}$: $^3H_4 \rightarrow {}^1D_2$ (~583 nm) transitions.[22,37–40] To study the effect of $Pr^{3+}$ concentration, the excitation spectra of SAOPr*x* phosphors have been recorded monitoring the emission at 648 nm ($Pr^{3+}$: $^3P_0 \rightarrow {}^3F_2$) wavelength (not shown). The intensity of observed excitation bands increases with increase of $Pr^{3+}$ concentration showing uniform distribution of $Pr^{3+}$ ions in SAOPr lattice. The variation of intensity of $^3H_4 \rightarrow {}^3P_1$ (466 nm) transition as a function of $Pr^{3+}$ ions concentration is shown in Fig. 5b. Since, the wavelengths corresponding to $Pr^{3+}$: $^3H_4 \rightarrow ({}^3P_J, {}^1D_2)$ transitions are covered by the emission of commercial InGaN LED chip (440 nm – 490 nm), the SAOPr*x* phosphors can be suitably excited by it. From the excitation spectra, it is also clear that the SAOPr phosphors can be suitably excited within the host and the dopant ($Pr^{3+}$) ions at 441 nm ($Pr^{3+}$:$^3H_4 \rightarrow {}^3P_2$), 466 nm ($Pr^{3+}$:$^3H_4 \rightarrow {}^3P_1$) and 482 nm ($Pr^{3+}$:$^3H_4 \rightarrow {}^3P_0$) wavelengths.

## Host Excited Luminescence Properties

Upon different excitations within the host matrix (250 nm ≤ $\lambda_{ex}$ ≤ 330 nm), the emission spectra of SAOPr2.0 phosphor in the spectral region from 460 to 740 nm are presented in Fig. 6a. These spectra reveal a broad and strong emission band corresponding to the host emission[11] with sub-peaks at about 468 nm , 488 nm, 548 nm, 609 nm, 648 nm and 658 nm corresponding to $^3P_1 \rightarrow {}^3H_4$, $^3P_0 \rightarrow {}^3H_4$, $^3P_2 \rightarrow {}^3F_2$, $^1D_2 \rightarrow {}^3H_4$, $^3P_0 \rightarrow {}^3F_2$ and $^1D_2 \rightarrow {}^3H_5$ transitions, respectively. The intensity of observed emission transitions increases with the increase of excitation wavelength reaching a maximum at $\lambda_{ex}$ = 270 nm and then decreases for higher excitation wavelengths. This could be due to variation in population of $Pr^{3+}$ ions at various emission states. The variation of intensity of $^3P_0 \rightarrow {}^3F_2$ (648 nm) transition as a function of

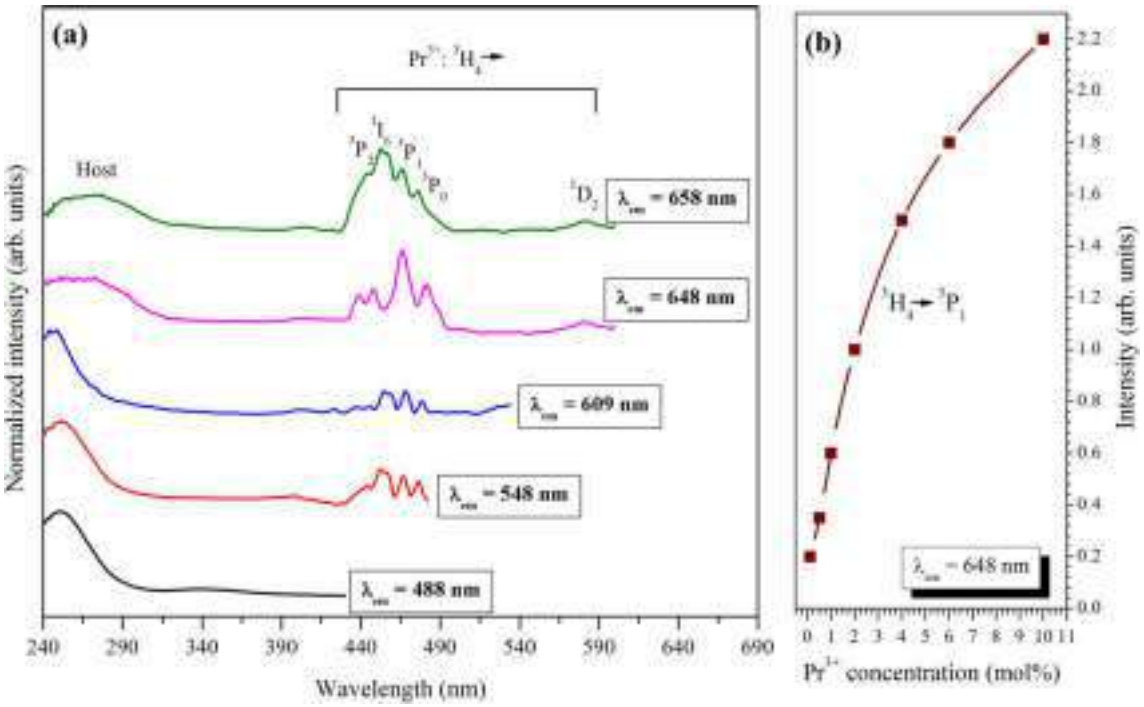

**Fig. 5** Excitation spectra of SAOPr2.0 phosphor at different emission wavelengths (a) and the variation of intensity of $^3H_4 \rightarrow {}^3P_1$ (466 nm) transition as a function of $Pr^{3+}$ concentration at $\lambda_{em} = 648$ nm.

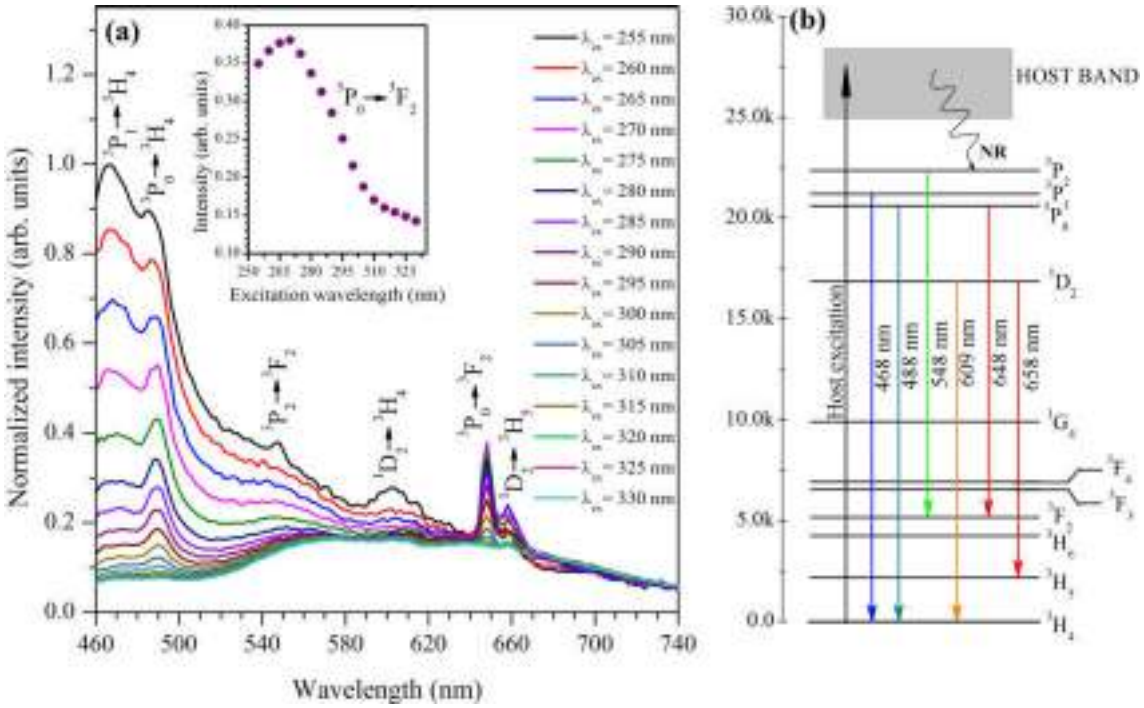

**Fig. 6** Emission spectra of SAOPr2.0 phosphor under different host excitations (a) Inset shows the variation of intensity of $^3P_0 \rightarrow {}^3F_2$ (648 nm) transition as a function of $Pr^{3+}$ concentration. The partial energy level diagram showing the emission mechanism of $Pr^{3+}$ ions under host excitation (b).

$Pr^{3+}$ ions concentration is described as inset of Fig. 6a. The emission mechanism of SAOPr2.0 phosphor under different host excitation wavelengths is illustrated in a partial energy level diagram shown in Fig. 6b.

The colour perception of emitted luminescence has been studied by evaluating the Commission International de I'Eclairage (CIE) 1931 chromaticity coordinates ($x$, $y$), which are summarized in Table I, and they are represented in the CIE diagram shown in Fig. 7. From this figure one can notice that the colour of emitted luminescence varies from bluish-green to yellow when the excitation wavelength changes from 255 to 330 nm. The variation in population density at different emission energy states results the tunability in emitted luminescence.

## Dopant ($Pr^{3+}$) Ion Excited Luminescence Properties

### Luminescence Properties at 466 nm Excitation

When excited at 466 nm ($Pr^{3+}$: $^3H_4 \rightarrow {}^3P_1$), the SAOPr$x$ phosphors show emission profiles as shown in Fig. 8a. These spectra reveal six emission bands at about 598, 609, 622, 638, 648 and 656 nm corresponding to $^3P_1 \rightarrow {}^3H_6$, $^1D_2 \rightarrow {}^3H_4$, $^3P_1 \rightarrow {}^3F_2$, $^3P_1 \rightarrow {}^3F_3$, $^3P_0 \rightarrow {}^3F_2$ and $^1D_2 \rightarrow {}^3H_5$ transitions, respectively. The intensity of emitted transitions originating from $Pr^{3+}$: $^3P_J$ emission states show a luminescence quenching beyond $x = 2.0$ mol.%, while the transitions originating from the $Pr^{3+}$: $^1D_2$ emission state shows luminescence quenching beyond $x = 4.0$ mol.%. The variation in intensity of $^3P_1 \rightarrow {}^3H_6$ and $^1D_2 \rightarrow {}^3H_4$ transitions as a function of $Pr^{3+}$ ion concentration is presented in Fig. 8b. From the literature, it is well known that the emission from the $Pr^{3+}$: $^1I_6$ energy state is not significant in many hosts.[22–28]

When excited at 466 nm, the interacting photons stimulate the ground state $Pr^{3+}$ ions and excite to $^3P_1$ state (~21460 $cm^{-1}$). These excited $Pr^{3+}$ ions transit to lower lying $^3P_0$ and $^1D_2$ emission states through a fast non-radiative (NR) process producing $^3P_0 \rightarrow {}^3F_2$ (648 nm), $^1D_2 \rightarrow {}^3H_4$ (609 nm) and $^1D_2 \rightarrow {}^3H_5$ (656 nm) transitions. However, some of the $Pr^{3+}$ ions decay radiatively resulting $^3P_1 \rightarrow {}^3H_6$ (598 nm), $^3P_1 \rightarrow {}^3F_2$ (622 nm) and $^3P_1 \rightarrow {}^3F_3$ (638 nm) transitions. These emission spectral profiles are similar to $CaTa_2O_6$:$Pr^{3+}$[39] phosphors. The emission mechanism of SAOPr$x$ phosphors at 466 nm excitation is described in the partial energy level diagram shown in Fig. 9a.

To study the colour perception, the CIE chromaticity coordinates have been calculated using the emission spectra shown in Fig. 8a and they are summarized in Table II. These chromaticity coordinates are close to those reported for National Television Standard Committee (NTSC) ($x = 0.67$, $y = 0.33$), $Y_2O_3$:$Eu^{3+}$ commercial red emitting phosphor ($x = 0.655$, $y = 0.345$), $Ca_{2.96}Sm_{0.02}Na_{0.02}B_2O_6$ ($x = 0.608$, $y = 0.365$),[41] $NaSrPO_4$:$Sm^{3+}$ ($x = 0.60$, $y = 0.39$),[42] SAOSm10 (x = 0.605, y = 0.362)[21] phosphors. The location of these chromaticity coordinates is presented in Fig. 10. From this figure it is clear that all the samples show an intense red luminescence when excited at 466 nm wavelength.

**Table I** CIE chromaticity coordinates of SAOPr2.0 phosphor at different excitation wavelengths

| S. No. | Excitation wavelength (nm) | CIE chromaticity coordinates | |
|---|---|---|---|
| | | $x$ | $y$ |
| 1 | 255 | 0.269 | 0.357 |
| 2 | 260 | 0.274 | 0.360 |
| 3 | 265 | 0.87 | 0.366 |
| 4 | 270 | 0.304 | 0.375 |
| 5 | 275 | 0.329 | 0.386 |
| 6 | 280 | 0.353 | 0.397 |
| 7 | 285 | 0.373 | 0.407 |
| 8 | 290 | 0.391 | 0.417 |
| 9 | 295 | 0.405 | 0.426 |
| 10 | 300 | 0.418 | 0.435 |
| 11 | 305 | 0.428 | 0.442 |
| 12 | 310 | 0.436 | 0.446 |
| 13 | 315 | 0.441 | 0.448 |
| 14 | 320 | 0.444 | 0.447 |
| 15 | 325 | 0.446 | 0.448 |
| 16 | 330 | 0.447 | 0.449 |

### Luminescence Properties at 482 nm Excitation

In the case of 482 nm ($Pr^{3+}$: $^3H_4 \rightarrow {}^3P_0$) excitation, the SAOPr$x$ phosphors show a different emission profile. These emission spectra show six emission bands at about 600, 612, 623, 638, 647 and 656 nm corresponding to $^3P_1 \rightarrow {}^3H_6$, $^1D_2 \rightarrow {}^3H_4$, $^3P_0 \rightarrow {}^3H_6$, $^3P_0 \rightarrow {}^3F_3$, $^3P_0 \rightarrow {}^3F_2$ and $^1D_2 \rightarrow {}^3H_5$ transitions, respectively. For reference, the emission spectrum of the SAOPr2.0 phosphor is shown in Fig. 11a. Among the observed emission transitions, the $^1D_2 \rightarrow {}^3H_4$ (612 nm) transition is found to be more intense and broader compared to other transitions. The variation of intensity of the $^1D_2 \rightarrow {}^3H_4$ transition as a function of $Pr^{3+}$ ion concentration is presented as the inset of Fig. 11a.

The colour perception of SAOPr$x$ phosphors has been investigated by evaluating the CIE chromaticity coordinates using the emission spectra obtained by exciting the samples at 482 nm wavelength and they are also summarized in Table II. These chromaticity coordinates are close to those obtained at 466 nm excitation and they are well located in the red region of the CIE diagram shown in Fig. 12.

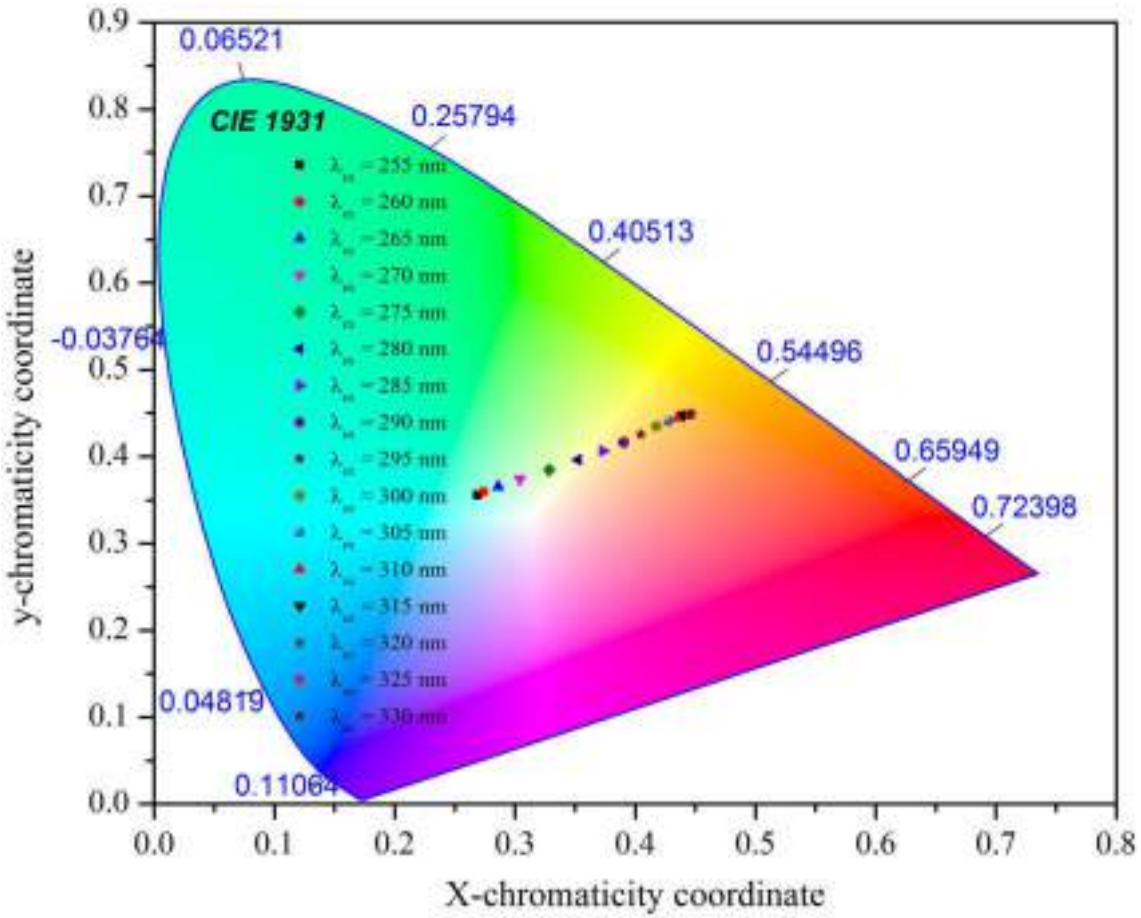

**Fig. 7** CIE chromaticity diagram of SAOPr2.0 phosphor under different host excitations.

### Luminescence Properties at 441-nm Excitation

Upon 441 nm ($Pr^{3+}$: $^3H_4 \rightarrow {}^3P_2$) excitation, the SAOPr*x* phosphors show interesting emission properties. These emission spectra reveal six transition peaks at around 598, 609, 623, 638, 647 and 657 nm corresponding to $^3P_1 \rightarrow {}^3H_6$, $^1D_2 \rightarrow {}^3H_4$, $^3P_0 \rightarrow {}^3H_6$, $^3P_0 \rightarrow {}^3F_3$, $^3P_0 \rightarrow {}^3F_2$ and $^1D_2 \rightarrow {}^3H_5$ transitions, respectively. For reference, the emission spectrum of SAOPr2.0 phosphor in the region from 580 to 680 nm is shown in Fig. 13a. Among the observed emission transitions, the $^1D_2 \rightarrow {}^3H_4$ (609 nm) transition is found to be more intense compared to other transitions. The variation of intensity of $^1D_2 \rightarrow {}^3H_4$ transition as a function of $Pr^{3+}$ ion concentration is presented in Fig. 13b. Upon 441-nm excitation, the SAOPr*x* phosphors emit red luminescence and the corresponding chromaticity diagram is shown in Fig. 14. The CIE chromaticity coordinates of SAOPr*x* phosphor under 441-nm excitation are also close to those obtained at 466-nm excitation and they are summarized in Table II.

The comparative emission spectra of SAOPr2.0 phosphor under 441-, 466- and 482-nm excitations is shown in Fig. 15. These spectra show that the studied phosphors have different emission profiles with slight deviation in emission peak maxima. Additionally, the $Pr^{3+}$ concentration hardly influences the emission color upon excitation at 441, 466 and 482 nm. The PXRD studies reveal that the crystalline peak positions do not vary with the increase of $Pr^{3+}$ ions concentration indicating suitable occupancy of $Pr^{3+}$ ions in $Sr^{2+}$ ion sites. A slight variation in ionic radii and electronic configuration leads to a slight deviation in emission peak maxima at different excitation wavelengths.[43]

### Luminescence Quenching

As seen the Figs. 8b, 11a and 13b, one can notice a quenching in luminescence at higher $Pr^{3+}$ ion concentration. Upon 441- and 482-nm excitations, luminescence quenching has been observed beyond 2.0 mol.% of $Pr^{3+}$ ion concentration for all the emitted energy states. When excited at 466 nm, the luminescence quenching is noticed beyond 4.0 mol.% of $Pr^{3+}$ ion concentration for $^1D_2$ emission state and beyond 2.0 mol.% for other excited energy states. This quenching

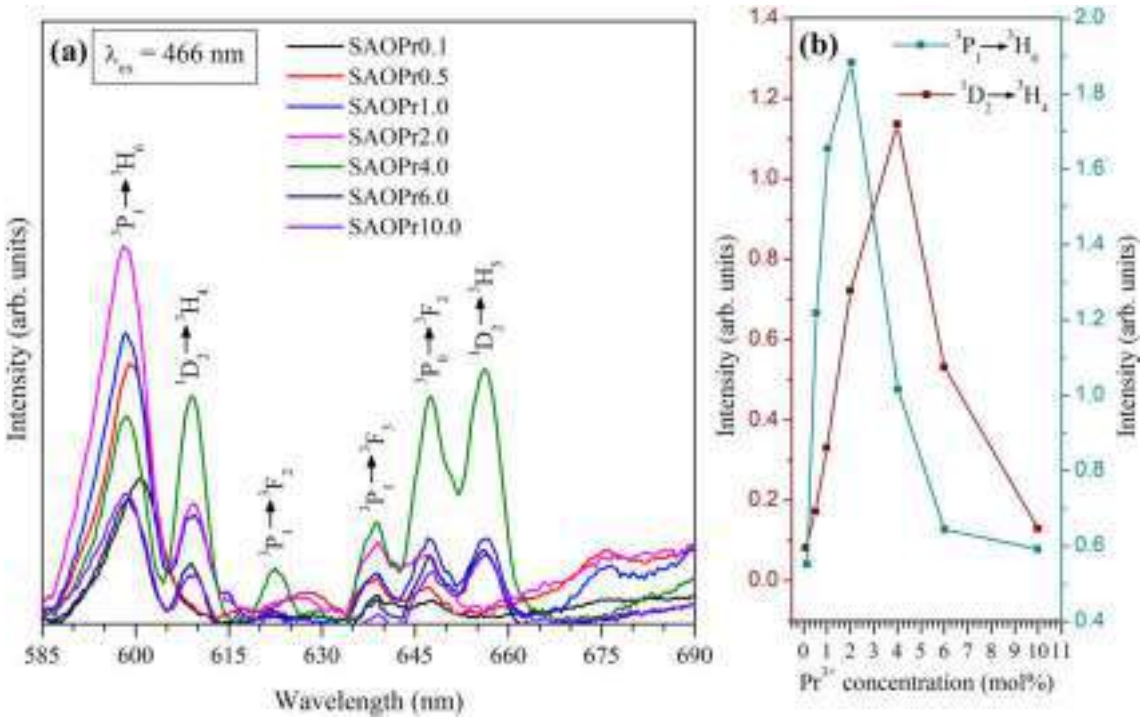

**Fig. 8** Emission spectra of SAOPrx phosphors at $\lambda_{ex}$ = 466 nm (a) and the variation of intensity of $^3P_1 \rightarrow {}^3H_6$ and $^1D_2 \rightarrow {}^3H_4$ transitions as a function of $Pr^{3+}$ concentration (b).

in luminescence is mainly due to the efficient energy transfer (ET) among the excited $Pr^{3+}$ ions at higher concentrations. It is well known that the transfer of energy among the exited RE ions at higher concentration is mainly due to the exchange and/or multi-polar interaction mechanism such as dipole-dipole (d-d), dipole-quadrupole (d-q) and quadrupole-quadrupole (q-q) mechanisms. Based on the critical transfer distance ($R_c$), the exchange or multi-polar interaction mechanism play a key role in ET.[44] The magnitude of $R_c$ can be obtained using the formula shown below.

$$R_c = 2\left(\frac{3V}{4\pi x_c N}\right)^{1/3} \tag{3}$$

where $V$, $x_c$ and $N$ represents the volume of unit cell, critical concentration of active ions and number of crystallographic-sites available for the occupation of active ions. The exchange interaction mechanism has been responsible when the value of $R_c$ is less than 5 Å only.[45] In case of SAOPr phosphors, the volume of unit cell is found to be 383.68 $Å^3$, the critical concentration of $Pr^{3+}$ ions is around 2.0 mol.% and the number of crystallographic-sites occupied by $Pr^{3+}$ ions is 6. The value of $R_c$ is found to be 18.28 Å which indicates that the multi-polar interaction mechanism is responsible for the transfer of energy among the excited $Pr^{3+}$ ions.

When the migration of energy among the excited RE active ions becomes prominent than the direct energy transfer, then the luminescence quenching is a function of the concentration of active ions.[46] The type interaction mechanism responsible for ET among the excited RE active ions has been known using the following equation considering the relationship between the emission intensity and the concentration of active ions.

$$\ln\left(\frac{I}{C}\right) = K - \left(\frac{S}{3}\right).\ln(C) \tag{4}$$

where I is the emission peak intensity, C is the concentration of RE active ions and the constant K belongs to a particular excitation of the material. The parameter S = 3 for exchange interaction, S = 6 for d-d interaction, S = 8 for d-q interaction and S = 10 for q-q interaction. The value of S has been found from the slope (S/3) of $\ln\left(\frac{I}{C}\right)$vs. $\ln(C)$ plot. Upon 466-nm excitation, the $\ln\left(\frac{I}{C}\right)$ vs. $\ln(C)$ plots are drawn for $^3P_1 \rightarrow {}^3H_6$ (598 nm) and $^1D_2 \rightarrow {}^3H_4$ (609 nm) transitions and they are illustrated in Fig. 16a and Fig. 16b, respectively. From these plots the value of the slope is found to be 1.76 ± 0.13 and 3.38 ± 0.25 for $^3P_1 \rightarrow {}^3H_6$ (598 nm) and $^1D_2 \rightarrow {}^3H_4$ (609 nm) transitions and the corresponding S values are 5.28 and 10.14, respectively. These results confirm that both d-d and q-q interaction mechanisms are responsible for ET among the excited $Pr^{3+}$ ions when excited at 466-nm radiation.

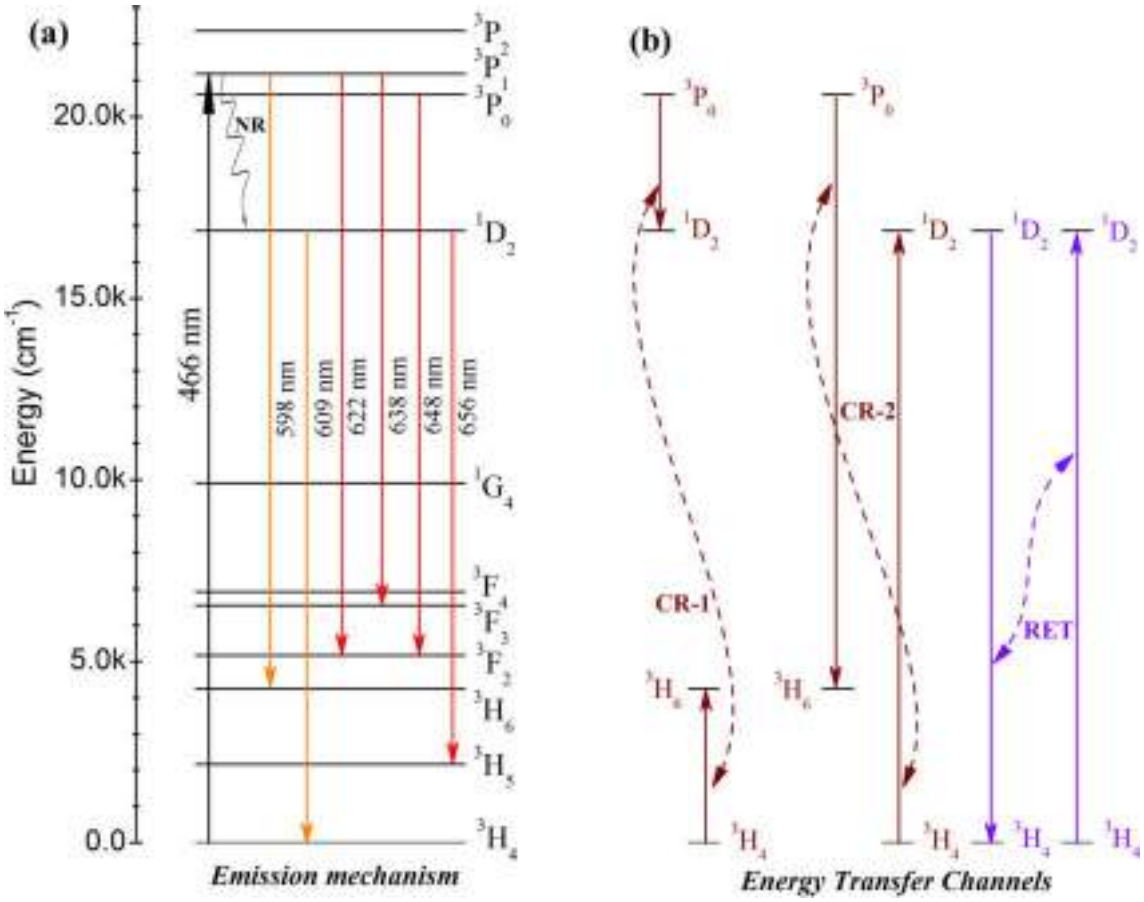

**Fig. 9** Partial energy level diagram showing the emission mechanism of $Pr^{3+}$ ions at 466 nm excitation (a) and the possible energy transfer channels (b).

**Table II** CIE chromaticity coordinates of SAOPrx phosphors

| Doping *x* (mol%) | CIE chromaticity coordinates | | | | | |
|---|---|---|---|---|---|---|
| | $\lambda_{ex}$ = 441 nm | | $\lambda_{ex}$ = 466 nm | | $\lambda_{ex}$ = 482 nm | |
| | *x* | *y*- | *x* | *y*- | *x* | *y*- |
| 0.1 | 0.633 | 0.367 | 0.637 | 0.363 | 0.641 | 0.359 |
| 0.5 | 0.632 | 0.368 | 0.645 | 0.354 | 0.632 | 0.368 |
| 1.0 | 0.633 | 0.366 | 0.631 | 0.368 | 0.637 | 0.362 |
| 2.0 | 0.633 | 0.366 | 0.629 | 0.370 | 0.631 | 0.368 |
| 4.0 | 0.634 | 0.365 | 0.637 | 0.363 | 0.642 | 0.358 |
| 6.0 | 0.633 | 0.367 | 0.642 | 0.357 | 0.646 | 0.354 |
| 10.0 | 0.632 | 0.367 | 0.642 | 0.358 | 0.646 | 0.353 |

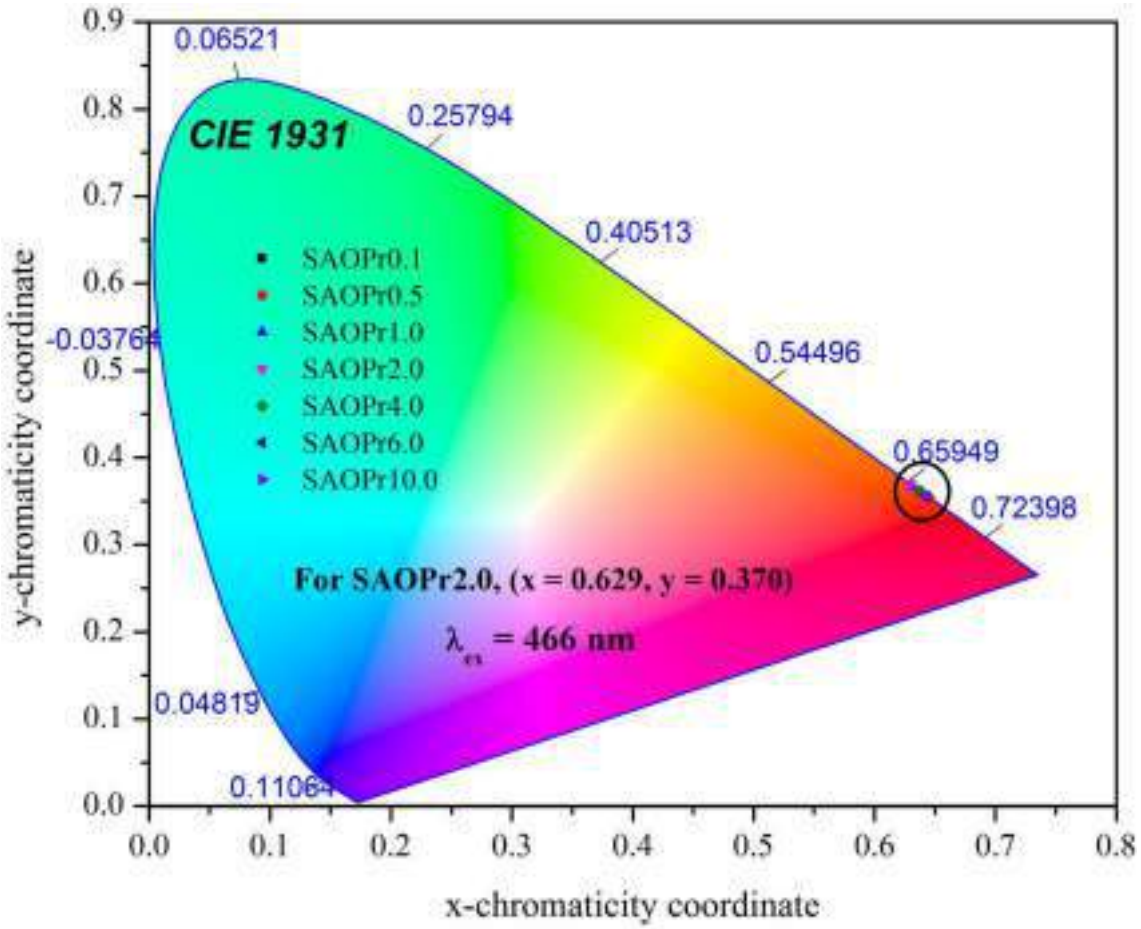

**Fig. 10** CIE chromaticity diagram of SAOPrx phosphors at 466 nm excitation.

When excited at 482 nm, the slope of $\ln\left(\frac{I}{C}\right)$ vs. $\ln(C)$ plot for $^1D_2 \rightarrow {}^3H_4$ (612 nm) transition (see Fig. 11b) is noted as 1.82 ± 0.13 and the corresponding value of S is on the order of 5.37 confirming the d-d interaction mechanism type of ET among the excited $Pr^{3+}$ ions. Similarly, when excited at 441-nm radiation, the slope of $\ln\left(\frac{I}{C}\right)$ vs. $\ln(C)$ plot for $^1D_2 \rightarrow {}^3H_4$ (609 nm) transition (see Fig. 13c) is noted as 1.68 ± 0.10 and the corresponding S value is of the order of 5.04 confirming the d-d interaction mechanism type of ET among the excited $Pr^{3+}$ ions. From this discussion it can be concluded that the d-d interaction mechanism plays a significant role for ET among the excited $Pr^{3+}$ ions.

## Lifetime Analysis

The luminescence decay profiles of $Pr^{3+}$: $^1D_2$, $^3P_0$ and $^3P_1$ emission states in SAOPrx phosphors have been studied by exciting the phosphors at 466-nm wavelength monitoring the emission at 609 nm, 648 nm and 598 nm, respectively, and they are shown in Fig. 17. The decay times of SAOPr0.1, SAOPr0.5 and SAOPr1.0 are found to be almost the same. Therefore, the decay profiles of SAOPr0.1 and SAOPr0.5 are

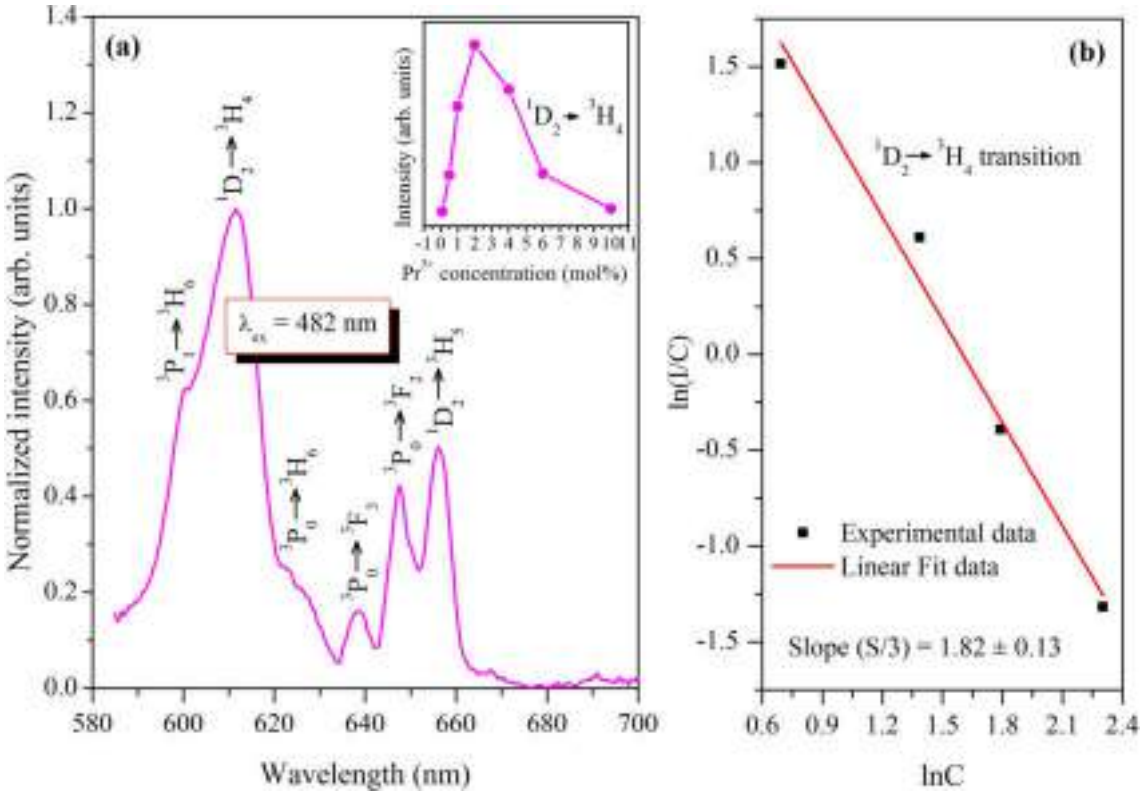

**Fig. 11** Emission spectrum of SAOPr2.0 phosphor at $\lambda_{ex} = 482$ nm (a). Inset shows the variation of intensity of $^1D_2 \rightarrow {}^3H_4$ transition as a function of $Pr^{3+}$ concentration. The ln (I/C) vs. ln(C) plot for $^1D_2 \rightarrow {}^3H_4$ transition (b).

not shown. All the decay profiles of $Pr^{3+}$: $^1D_2$, $^3P_0$ and $^3P_1$ emission states are well fitted to a two-exponential function, $I = I_0 + A_1.\exp(-t/\tau_1) + A_2.\exp(-t/\tau_2)$, where $I$ describes the intensity as function of time $t$ and $I_0$ is the intensity at $t = 0$ s. $\tau_1$ and designates the long and short decay time components. The average decay time has been evaluated using the equation, $\langle\tau\rangle = \frac{A_1\tau_1^2 + A_2\tau_2^2}{A_1\tau_1 + A_2\tau_2}$ where $A_1$ and $A_2$ are constants corresponding to $\tau_1$and, respectively.[47,48] The lifetime of a particular emission state at different concentrations is summarized in Table III. As seen Table III, one can notice that the lifetime of $Pr^{3+}$: $^1D_2$, $^3P_0$ and $^3P_1$ emission states decrease with increase of concentration of $Pr^{3+}$ ions as illustrated in Fig. 18. The values of decay time are comparable to those reported for $Pr:SrAl_2O_4$ crystals.[27]

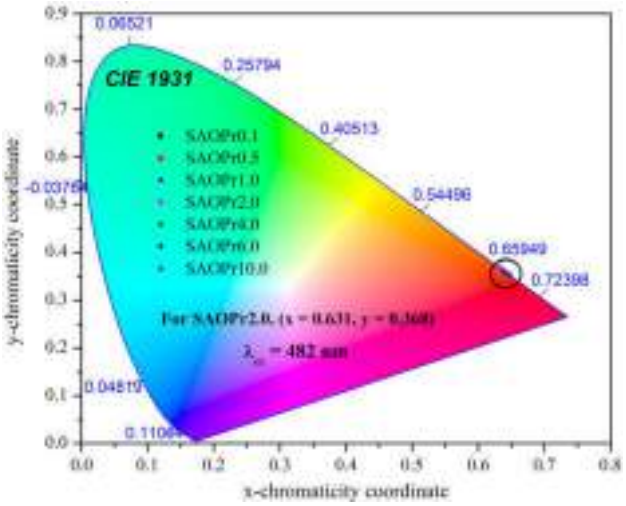

**Fig. 12** CIE chromaticity diagram of SAOPrx phosphors at 482 nm excitation.

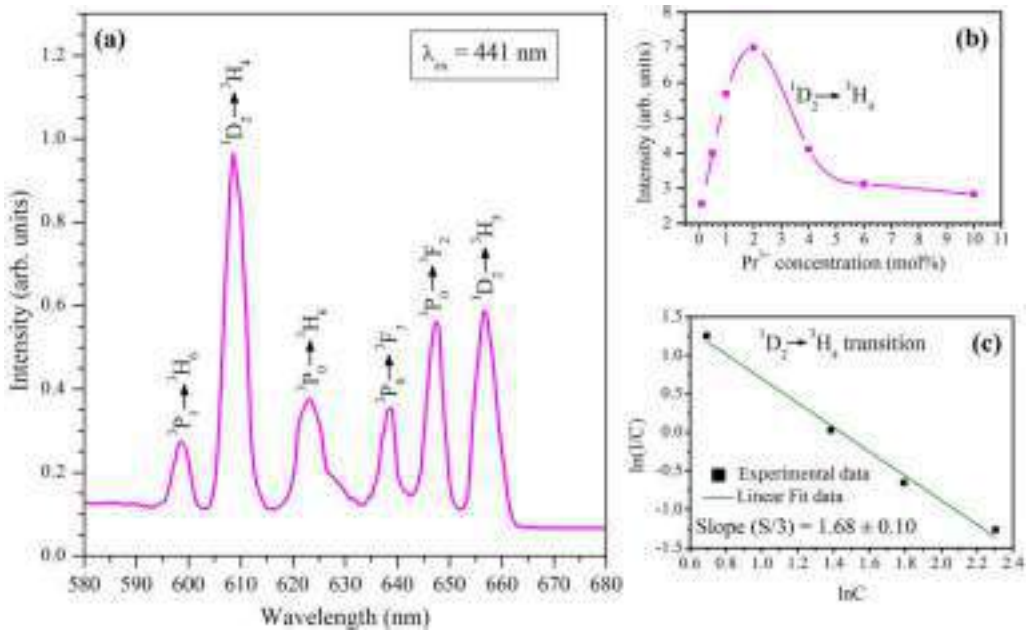

**Fig. 13** Emission spectrum of SAOPr2.0 phosphor at $\lambda_{ex}$ = 441 nm (a) the variation of intensity of $^1D_2 \rightarrow {}^3H_4$ transition as a function of $Pr^{3+}$ concentration (b) the ln (I/C) vs. ln C plot for $^1D_2 \rightarrow {}^3H_4$ transition (c).

The self-absorption and the non-radiative ET among the excited $Pr^{3+}$ ions cause a monotonic decrease in lifetime and hence luminescence quenching. The self-absorption and non-radiative ET can be ascribed to the following possible cross-relaxation (CR) and resonant energy transfer (RET) channels which are clearly illustrated in Fig. 9b.

$$\mathrm{CR}-1:\ \left({}^3P_0, {}^3H_4\right) \rightarrow \left({}^1D_2, {}^3H_6\right)$$

$$\mathrm{CR}-2:\ \left({}^3P_0, {}^3H_4\right) \rightarrow \left({}^3H_6, {}^1D_2\right)$$

$$\mathrm{RET}:\ \left({}^1D_2, {}^3H_4\right) \rightarrow \left({}^3H_4, {}^1D_2\right)$$

The photoluminescence emission studies at visible excitation (441, 466 nm and 482 nm) show that the $Pr^{3+}$ ions emit efficient red luminescence when $x = 2.0$ mol.%. It can be concluded that the optimum concentration for intense and efficient luminescence is 2.0 mol.%. The studied phosphors can suitably excite either at 441 nm or 466 nm or 482 nm to generate red luminescence while they produce feeble bluish-white luminescence at 255 nm excitation. From the literature, it is clear that LEDs coated with phosphor enhances their working efficiency and hence lowers the surface temperature.[49,50] Therefore, the SAOPr*x* phosphors would be the best choice to fabricate red light emitting solid-state light sources.

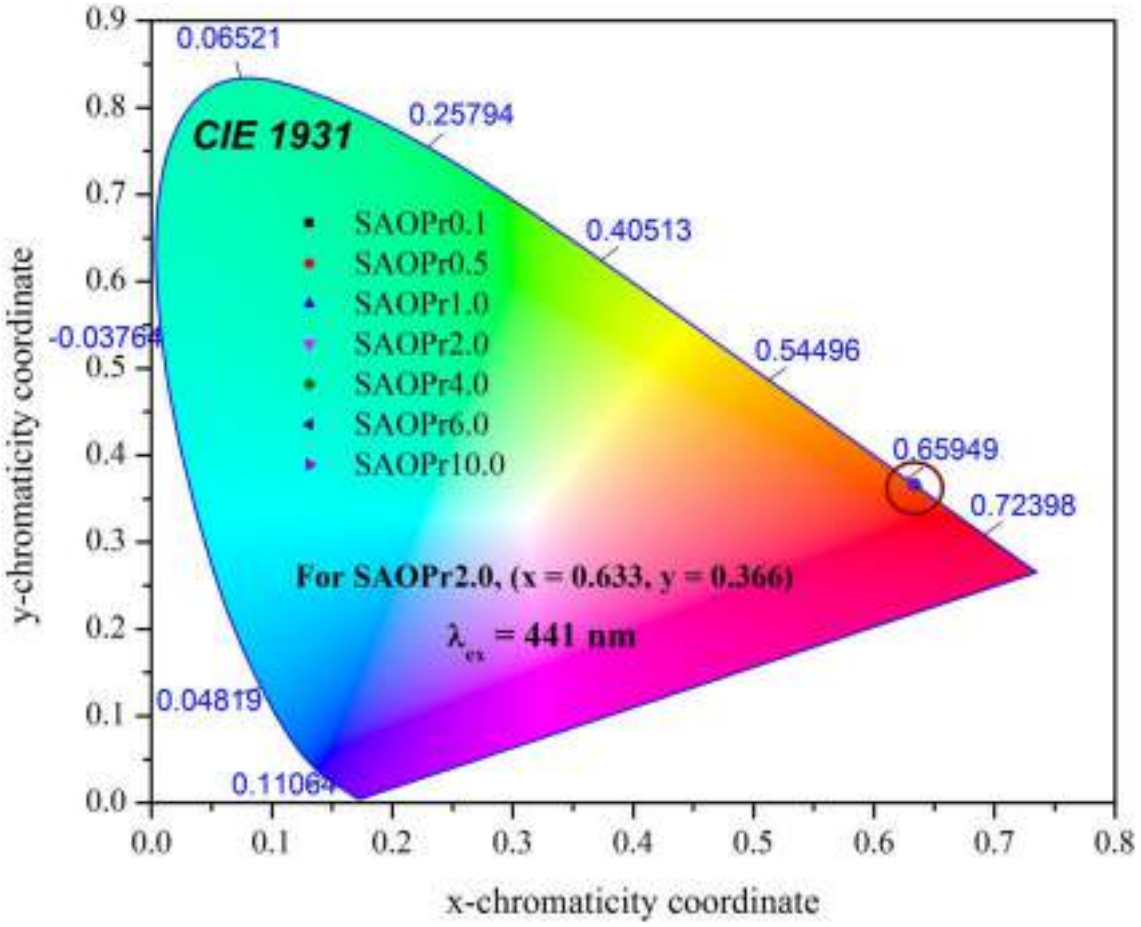

**Fig. 14** CIE chromaticity diagram of SAOPrx phosphors at 441-nm excitation.

## Conclusions

The $SrAl_2O_4$:$x$$Pr^{3+}$ phosphors have been prepared by conventional solid-state technique sintering at 1050°C for 3 h with average crystallite size of 34–36 nm. The SEM image establishes homogeneous distribution of particles of spherical shape with different sizes. The adjacent spacing of the lattice fringes corresponding to (310) crystal plane is estimated as 0.28 nm from the HRTEM image. The concentration of $Pr^{3+}$ ions has been optimized to be 2.0 mol.% for efficient luminescence. The quenching in luminescence and lifetime has been ascribed to the ET among the excited $Pr^{3+}$ ions through d-d and q-q multipolar interaction mechanism. The colour perception of emitted luminescence has been investigated by evaluating chromaticity coordinates. The studied phosphors generate strong red luminescence at 441, 466 and 482 nm excitations, while they produce feeble bluish-white luminescence at 255 nm excitation. Based on the observed results it can be concluded that the SAOPr2.0 phosphor could be the best choice for solid state red light emitting sources.

ABSTRACT

The inorganic phosphors doped with different rare earth ions are of more significant to develop new class of lighting devices to fulfill the present technological desires owing to their compact size, high colour rendering index with high luminescence efficiency, eco-friendly behaviour. The present research work reports the synthesis, structural, morphological and optical analysis of $Sr_3Gd(PO_4)_3$: $Tb^{3+}$ phosphors for lighting applications. These phosphors were synthesized *via* modified citrate gel-combustion technique with varied concentrations of $Tb^{3+}$ and they were crystallized into BCC phase. The morphological investigations reveal an agglomeration of particles distributed non-uniformly in the crystal lattice. Upon excited at near UV radiation, the phosphors emit intense green luminescence through $^5D_4 \rightarrow {}^7F_J$ transitions. The colour perception studies were carried out by evaluating the chromaticity coordinates (x, y). The experimental investigations explore that the studied phosphors are more suitable for lighting applications.

## 1. Introduction

Now-a-days, trivalent rare earth (RE) ions activated phosphors play a key role in solid state lighting (SSL) technology due to their high brightness with significant luminescence efficiency, low-energy consumption with eco-friendly and non-toxic nature and stable luminous output with relatively long-life [1–3]. The light emitting diode (LED) based light show tremendous advantages compared to conventional incandescent blubs and fluorescent lamps. However, the use of LEDs has become difficult due to their low colour rendering index (CRI) of the order 85 and high colour temperature (CCT) of the order 7615 K. The phosphor-converting LEDs can meet the requirement of LED-based lighting due to their relatively low CCT rating with good CRI [4,5]. Therefore, the researchers have focused a light to design and develop better, efficient and novel phosphor materials for LED sources.

The $A_3M(PO_4)_3$ (A–divalent cation and M–trivalent RE cation) orthophosphate phosphor has been the most noteworthy as it can be synthesized easily at low temperature with good chemical and thermal stability and its non-toxic nature. Among the available orthophosphate phosphors [6–8], the $Sr_3Gd(PO_4)_3$ phosphor has single-phase with good RE ion solubility. The modified citrate-gel combustion method of synthesis of $Sr_3Gd(PO_4)_3$ phosphor is possible at very low temperatures leading to environmental friendly by consuming low electric power. This method of synthesis yields good yields of final products with single phase that enables the optical properties of $RE^{3+}$ activators which suitably replace the $Gd^{3+}$ sites without disturbing the BCC structure of $Sr_3Gd(PO_4)_3$ lattice. The $Sr_3Gd(PO_4)_3$ phosphors doped with different RE ions and co-doped with transition metal-ions were reported for white light generation and solar cell applications [9–11]. The $Tb^{3+}$ ions exhibit their characteristic emission bands corresponding to ($^5D_3$, $^5D_4$) $\rightarrow {}^7F_J$ transitions under suitable excitation. These ions are capable of exhibiting luminescence quenching and concentration ($x$) dependent optical properties in different host environments. In general, they emit blue light through $^5D_3 \rightarrow {}^7F_J$ transitions for $x < 0.5\%$ and green light through $^5D_4 \rightarrow {}^7F_J$ transitions for $x \geq 0.5\%$. Therefore, $Tb^{3+}$ ions have been used for green to blue tunable emission resulting to generate white light [12,13]. They can also be used as effective sensitizers to improve the luminescence efficiency of certain RE ions [11,14,15].

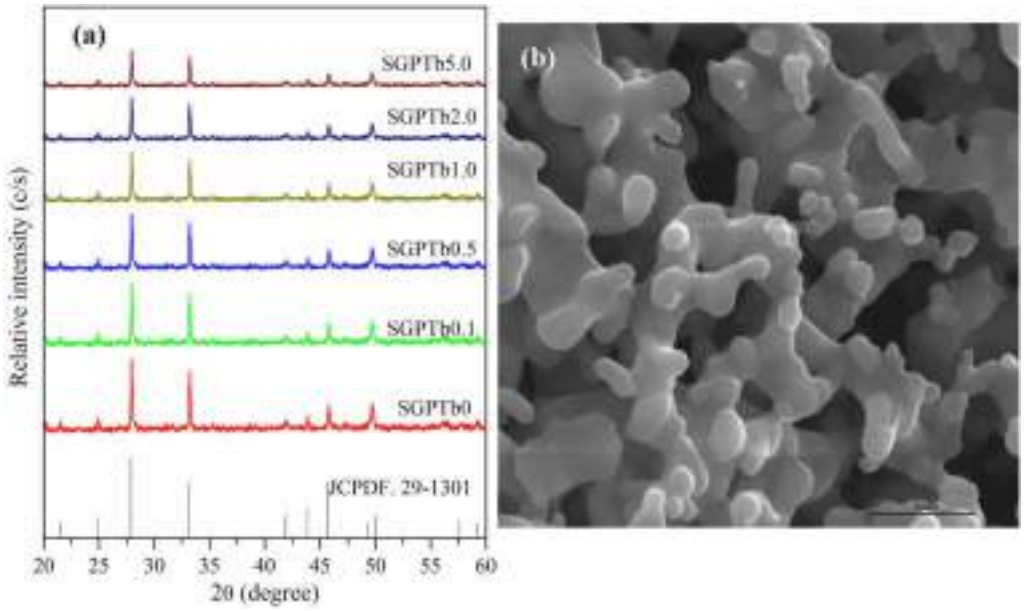

**Fig. 1.** The PXRD profiles of SGPTb*x* phosphors (a) and the HR-SEM micrograph of SGPTb2.0 phosphor (b).

The luminescence and energy transfer properties of $Ce^{3+}$ and $Tb^{3+}$ co-doped $Sr_3Gd(PO_4)_3$ phosphors synthesized through solid-state reaction method were examined for white LEDs by J. Sun et al. [16]. The study describes that the spectral overlap of $Ce^{3+}$ emission band and $Tb^{3+}$ excitation band results an effective sensitization of $Tb^{3+}$ by $Ce^{3+}$ producing improved luminescence. The present research work reports on the synthesis, concentration dependent luminescence and energy transfer properties of a series of different concentrations of $Tb^{3+}$ doped $Sr_3Gd(PO_4)_3$ phosphors for various lighting applications. The crystalline phase, surface morphology, presence of various functional groups that help to enhance the optical properties were discussed. The photoluminescence excitation, emission, decay and energy transfer properties were explored. The enhanced luminescence of $Tb^{3+}$ ions in $Sr_3Gd(PO_4)_3$ phosphors due to the effect of sensitization of $Tb^{3+}$ active ions by host lattice was discussed in detail.

## 2. Experimental techniques

### 2.1. Materials and method of synthesis

Different concentrations of $Tb^{3+}$ activated SGPTb*x* phosphors of composition $Sr_3Gd_{(1-x)}(PO_4)_3$:$xTb^{3+}$, where $x = 0$, 0.1, 0.5, 1.0, 2.0, 3.0 and 5.0 mol% were synthesized by modified citrate-gel combustion method using high pure nitrates such as $Sr(NO_3)_2$, $Gd(NO_3)_3.6H_2O$ and $Tb(NO_3)_3.5H_2O$, ammonium dihydrogen phosphate ($NH_4H_2PO_4$) and citric acid ($C_6H_8O_7.H_2O$) without further purification. 1.0 M solution of each was prepared by dissolving stoichiometric amounts of starting materials in double-distilled water and stirred well for 30 min using magnetic stirrer operating at 500 rpm. The citric acid solution was prepared in 10 mL of double-distilled water taking into account the starting materials and citric acid in the ratio 1:2. All these compound solutions were mixed in drop-wise and stirred well for 30 min resulting to produce homogeneous solution which turned into light-brown coloured powder upon dried at 80 °C for 24 h and it was heat treated at 200 and 400 °C for 3 h with intermediate grinding producing black-foamy material. The fine powder of black-foamy material was sintered at 1250 °C for 5 h producing milky-white SGPTb*x* phosphors.

### 2.2. Characterization

The crystalline phase of SGPTb*x* phosphors were carried out with BRUCKER USA D8 advance diffractometer using CuKα radiation of wavelength 1.541 Å. Fourier-transform infrared (FT-IR) analysis (KBr technique) was carried out with PerkinElmer FT-IR spectrometer using a pellet consisting of KBr:Sample = 300:1. The morphological investigation was carried out on **FEI-Quanta FEG 200F** high resolution-scanning electron microscope (HR-SEM). The photoluminescence excitation and emission studies were carried out with FP-8300 JASCO Fluorescence Spectrometer. The decay analysis was done using FLS 1000 photoluminescence spectrometer provided with Xe-flash lamp in pulsed mode. All the measurements were carried out at room temperature only.

## 3. Results and discussions

### 3.1. Structure and morphology

The crystalline phase of SGPTb*x* ($0 \leq x \leq 5.0$ mol%) phosphors has been analyzed using the powder X-ray diffraction (PXRD) studies shown in Fig. 1(a). These PXRD profiles are suitably matched to the JCPDS No. 29–1301 showing body-centered cubic (BCC) crystal structure with lattice parameters $a = b = c = 10.11$ Å, $\alpha = \beta = \gamma = 90°$. The intensity of PXRD peaks found to be decreased with the addition of $Tb^{3+}$ ions concentration with out any deviation in their positions. Earlier reports reveal that the $Tb^{3+}$ ions occupy the $Gd^{3+}/La^{3+}$ sites in $Ba_3Ln(PO_4)_3$:$Tb^{3+}$ (Ln = La, Gd) phosphor [17] and $Y^{3+}/Gd^{3+}/Lu^{3+}$ sites in $K_2Ln(PO_4)(WO_4)$:$Tb^{3+}$, $Eu^{3+}$ (Ln = Y, Gd and Lu) phosphor [18]. In the present research work also there is more probability for $Tb^{3+}$ ions to replace $Gd^{3+}$ sites as the ionic radius of $Tb^{3+}$ (~0.0923 nm) is very close to that of $Gd^{3+}$ (~0.0938 nm). According to Debye-Scherrer's equation, the average crystallite size (D) has been estimated to be 52 nm and it is very close to that obtained from the Hall-Williamson's method (55 nm) [19,20]. Considerably small variation in ionic radii of $Tb^{3+}$ and $Gd^{3+}$ results a lattice distortion leading to micro-strains of the order ~0.00064 which is found smaller than that of $SrEuMgAl_{10}O_{17}$ phosphor (~0.00751 nm) [21].

The HR-SEM is a powerful tool for materials characterization and it provides the information regarding the presence of various microstructures and a qualitative chemical analysis. The HR-SEM micrograph of SGPTb2.0 phosphor shown in Fig. 1(b) reveals that the particles are appeared to be agglomerated and interconnected together making a continuous structure of irregular shape. The FT-IR spectra of SGPTb*x* ($x = 0$ and 1.0 mol%) phosphors in the spectral region from 500 to 1600

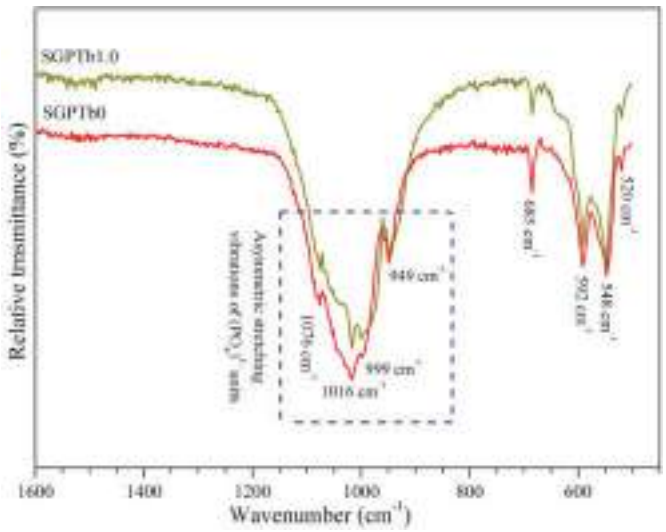

**Fig. 2.** FT-IR spectra of SGPTb$x$ ($x$ = 0 and 1.0 mol%) phosphors.

**Table 1**
Assignment of FT-IR bands in SGPTb$x$ phosphors.

| S. No. | FT-IR band position (cm$^{-1}$) | Assignment | Reference |
|---|---|---|---|
| 1 | 1076<br>1016<br>999<br>949 | Asymmetric stretching vibrations of $(PO_4)^{3-}$ units | [22,23] |
| 2 | 685 | Sr–O symmetric stretching vibrations | [24] |
| 3 | 592 | O–P–O asymmetric bending vibrations | [25] |
| 4 | 548 | Gd–O symmetric stretching vibrations | [26] |
| 5 | 520 | P–O asymmetric stretching vibrations | [27] |

cm$^{-1}$ shown in Fig. 2 reveals eight IR absorption bands at about 1076, 1016, 999, 949, 685, 592, 548 and 520 cm$^{-1}$ corresponding to various functional groups [22–27] and their assignment has been summarized in Table 1.

### 3.2. Photoluminescence analysis

The photoluminescence excitation (PLE) spectra help us to obtain suitable excitation wavelength and hence to have access to higher energy states of RE ions leading to get efficient emission from a luminescent material. The PLE spectra monitoring the emission at 543 nm ($Tb^{3+}$: $^5D_4 \rightarrow {}^7F_5$) in the spectral range 220–500 nm shown in Fig. 3 reveal three groups of transitions corresponding to $PO_4^{3-}$, $Gd^{3+}$ and $Tb^{3+}$. A broad and intense host excitation band (HEB) with a peak maximum at about 224 nm has been assigned to $PO_4^{3-}$ [14]. The PLE bands positioned from 246 to 312 nm have been related to both $Gd^{3+}$ and $Tb^{3+}$, while the bands from 318 to 486 nm to $Tb^{3+}$ ions only [28,29] and their assignments are summarized in Table 2. The $PO_4^{3-}$, $Gd^{3+}$: $^8S_{7/2} \rightarrow {}^6I_{11/2}$ and $Tb^{3+}$: $^7F_6 \rightarrow {}^5D_3$ transitions are found to be more prominent and the wavelengths

**Table 2**
Assignment of PLE band positions in SGPTb$x$ phosphors.

| PLE band position (nm) | Assignment | |
|---|---|---|
| | $Tb^{3+}$ ions | $Gd^{3+}$ ions |
| 246 | $^7F_6 \rightarrow {}^5K_8$ | $^8S_{7/2} \rightarrow {}^6D_{7/2}$ |
| 253 | $^7F_6 \rightarrow ({}^3P, {}^5D)_2$ | $^8S_{7/2} \rightarrow {}^6D_{9/2}$ |
| 273 | $^7F_6 \rightarrow {}^5F_3$ | $^8S_{7/2} \rightarrow {}^6I_{11/2}$ |
| 276 | – | $^8S_{7/2} \rightarrow {}^6I_{9/2}$ |
| 280 | $^7F_6 \rightarrow {}^5F_4$ | $^8S_{7/2} \rightarrow {}^6I_{7/2}$ |

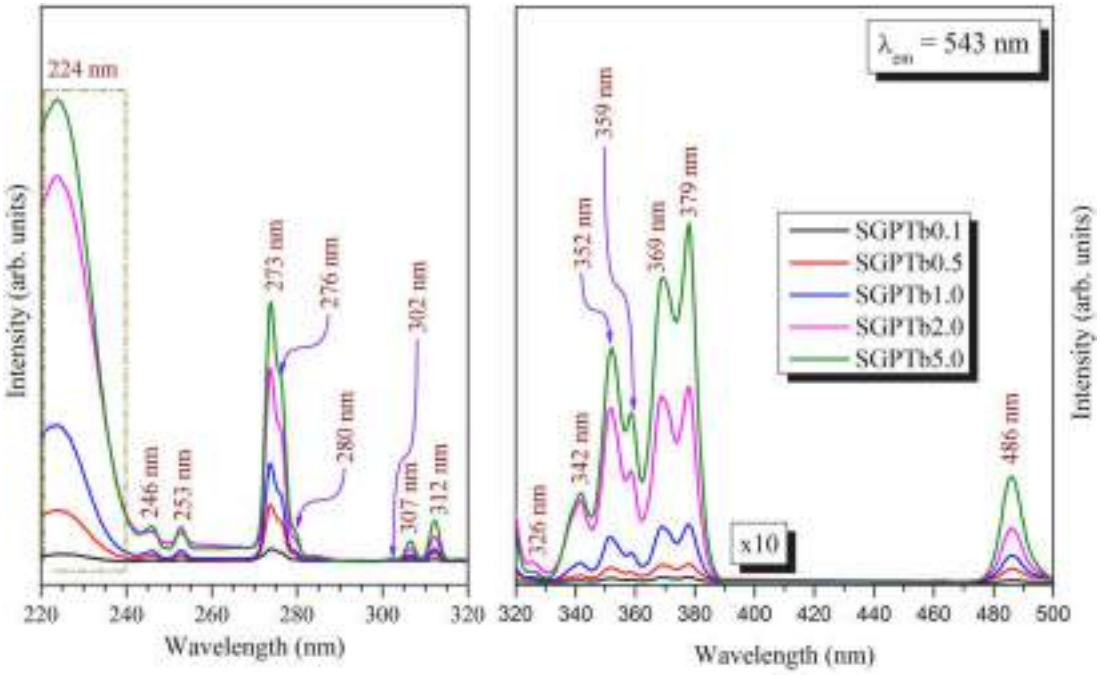

**Fig. 3.** PLE spectra of SGPTb$x$ phosphors monitoring the emission at $\lambda_{em}$ = 543 nm.

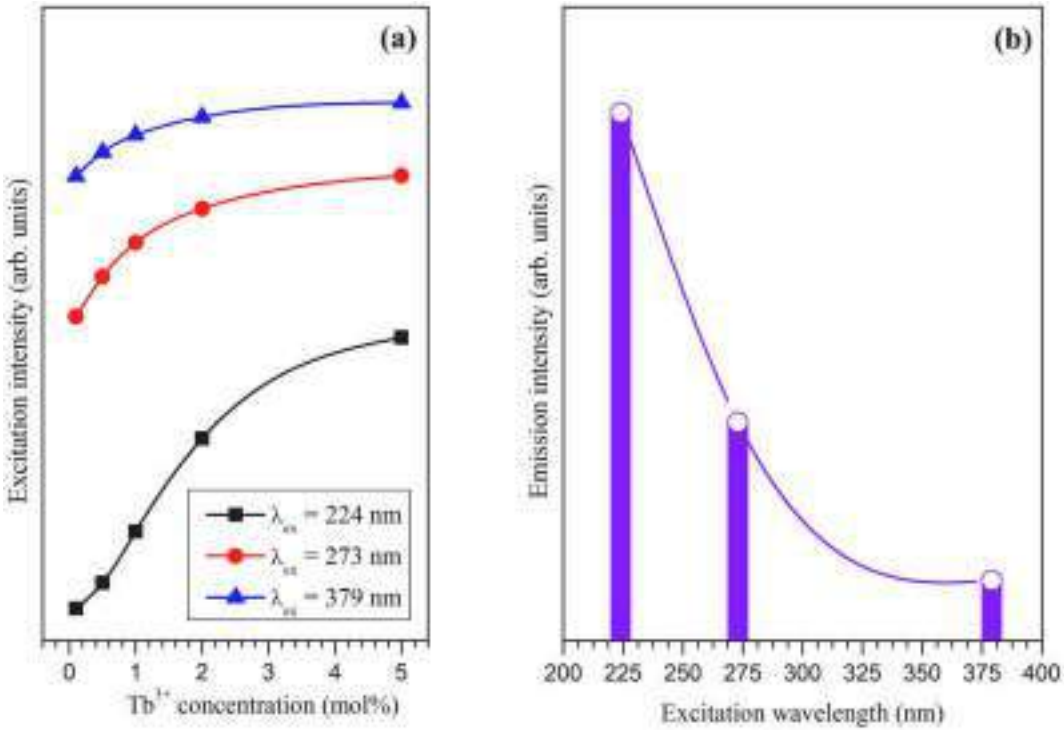

**Fig. 4.** The variation of excitation intensity of different PLE bands (a) and the emission intensity of $Tb^{3+}$: $^5D_4 \rightarrow {}^7F_5$ transition (b) as a function of $Tb^{3+}$ ions concentration in SGPTb*x* phosphors.

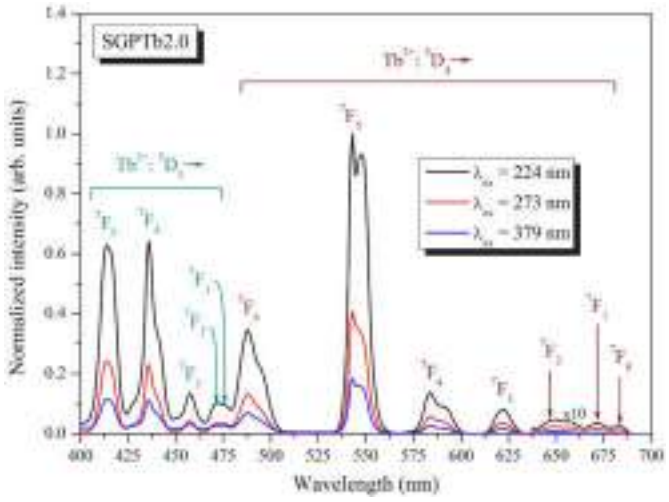

**Fig. 5.** Emission spectra of SGPTb2.0 phosphors at different excitation wavelengths.

corresponding to these probably produce intense luminescence from SGPTb*x* phosphors. From the PLE spectra it is clear that the intensity of observed transitions increases with increase of $Tb^{3+}$ ions concentration. The variation of intensity of 224 nm ($PO_4^{3-}$), 273 nm ($Gd^{3+}$: $^8S_{7/2} \rightarrow {}^6I_{11/2}$) and 379 nm ($Tb^{3+}$: $^7F_6 \rightarrow {}^5D_3$) bands as a function of $Tb^{3+}$ ions concentration is shown in Fig. 4(a).

To optimize the suitable excitation wavelength for efficient emission of $Tb^{3+}$ ions, the emission spectra of SGPTb2.0 phosphor have been recorded at 224, 273 and 379 nm excitations and they are shown in Fig. 5. These spectra reveal two groups of emission transitions originated from $Tb^{3+}$: $^5D_3 \rightarrow {}^7F_J$ (blue region) and $Tb^{3+}$: $^5D_4 \rightarrow {}^7F_J$ (green-red region) transitions. The positions of these transitions remain unchanged except in their intensity which decrease with increase of excitation wavelength as illustrated in Fig. 4(b). The SGPTb*x* phosphors show strong and intense luminescence when excited at 224 nm ($PO_4^{3-}$) compared to 273 nm ($Gd^{3+}$: $^8S_{7/2} \rightarrow {}^6I_{11/2}$) and 379 nm ($Tb^{3+}$: $^7F_6 \rightarrow {}^5D_3$). The observed emission transitions have been ascribed to $^5D_3 \rightarrow {}^7F_5$ (414 nm), $^5D_3 \rightarrow {}^7F_4$ (436 nm), $^5D_3 \rightarrow {}^7F_3$ (458 nm), $^5D_3 \rightarrow {}^7F_2$ (472 nm), $^5D_3 \rightarrow {}^7F_1$ (476 nm), $^5D_4 \rightarrow {}^7F_6$ (488 nm), $^5D_4 \rightarrow {}^7F_5$ (543 nm), $^5D_4 \rightarrow {}^7F_4$ (583 nm), $^5D_4 \rightarrow {}^7F_3$ (622 nm), $^5D_4 \rightarrow {}^7F_2$ (648 nm), $^5D_4 \rightarrow {}^7F_1$ (673 nm) and $^5D_4 \rightarrow {}^7F_0$ (683 nm) transitions [29].

The emission spectra of SGPTb*x* ($0 \leq x \leq 5.0$ mol%) phosphors at 224 nm excitation shown in Fig. 6(a) exhibit interesting emission results i.e., the $Tb^{3+}$: $^5D_3 \rightarrow {}^7F_J$ transitions show luminescence quenching beyond $x = 2.0$ mol%, while the intensity of $Tb^{3+}$: $^5D_4 \rightarrow {}^7F_J$ transitions increase with increase of $Tb^{3+}$ concentration. The variation of intensity of $^5D_3 \rightarrow {}^7F_5$ (414 nm) and $^5D_4 \rightarrow {}^7F_5$ (543 nm) transitions as a function of $Tb^{3+}$ concentration is illustrated in Fig. 6(b). It is well known that the quenching of luminescence depends on the concentration of active ions and the host environment. For example, the $Tb^{3+}$: $^5D_4 \rightarrow {}^7F_J$ transitions exhibit luminescence quenching at higher concentrations in $SrAl_2O_4$: $Tb^{3+}$ nanophosphors [30]. The process of luminescence quenching is mainly due to the energy transfer (ET) among the excited $Tb^{3+}$ ions at higher concentrations through non-radiative (NR) transitions. The green-to-blue luminescence ($I_G/I_B$) intensity ratio represents the clustering and/or homogeneous distribution of $Tb^{3+}$ ions in a unit cell in any host matrix i.e., $(I_G/I_B) > 1$ indicates uniform distribution and $(I_G/I_B) < 1$ shows clustering of $Tb^{3+}$ ions [31]. In the present research work, the value of $(I_G/I_B)$ is found to be higher than unity and it increases with increase of $Tb^{3+}$ concentration showing the uniform distribution of $Tb^{3+}$ ions in SGPTb*x* lattice.

Upon 224 nm excitation, some of the incident light photons has been absorbed by $PO_4^{3-}$ and get excited to higher energy states. These excited $PO_4^{3-}$ transfer their energy to $Gd^{3+}$ *via* Stoke's shift resulting to excite them to $Gd^{3+}$: $^6D_J$ and $^6I_J$ states. These excited $Gd^{3+}$ ions decays to $Gd^{3+}$:$^6P_J$ energy states through a quick non-radiative process and excite $Tb^{3+}$ ions to higher energy state above the $Tb^{3+}$: $^5D_3$ energy state by transferring their energy. Due to host sensitization, efficient energy

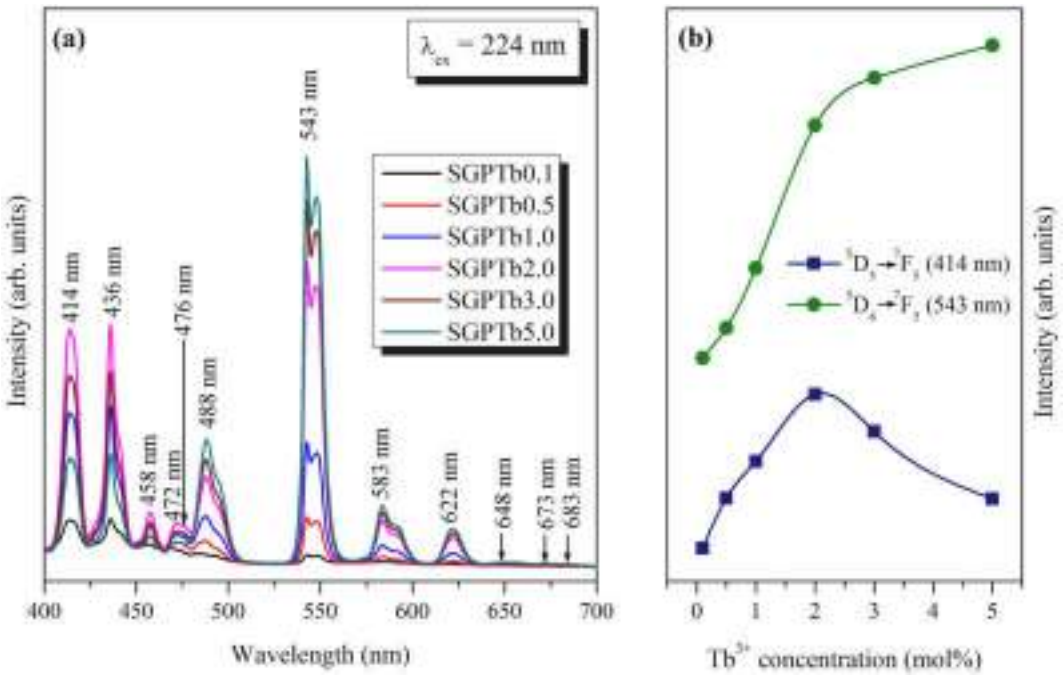

**Fig. 6.** Emission spectra of SGPTb*x* phosphors at 224 nm excitation (a) and the variation of intensity of ($^5D_3$, $^5D_4$) → $^7F_J$ transitions as a function of $Tb^{3+}$ concentration (b).

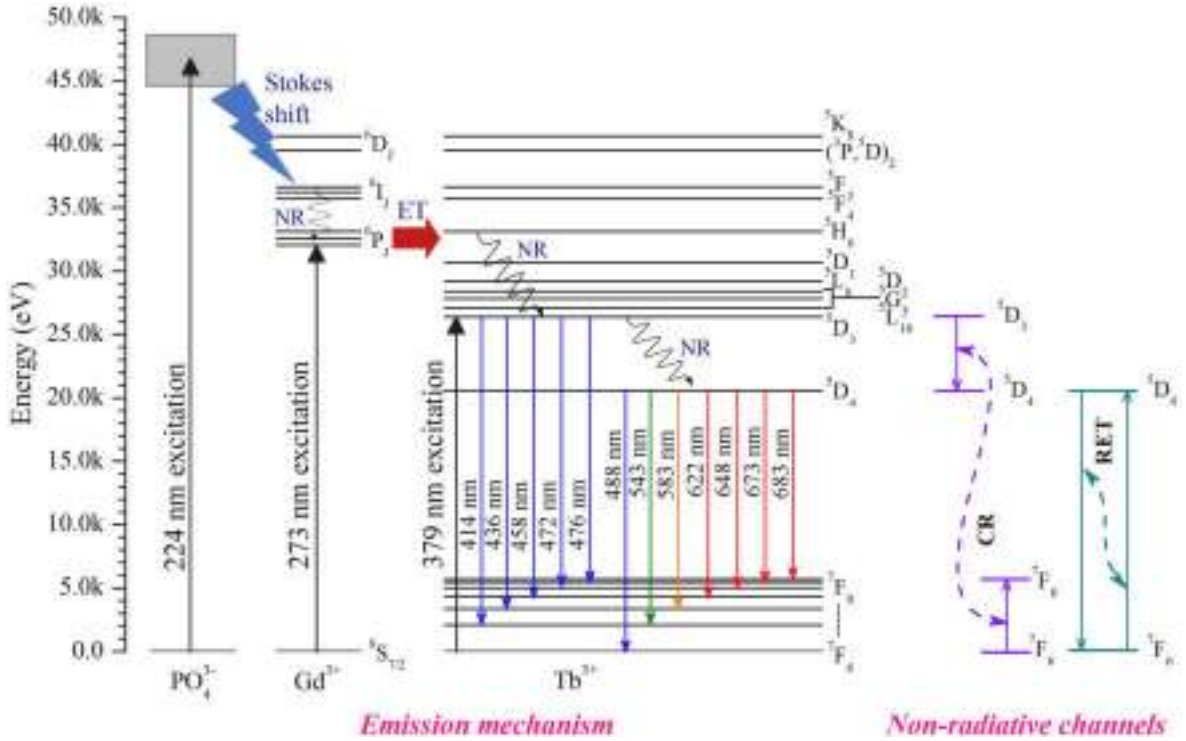

**Fig. 7.** Partial energy-level diagram illustrating emission mechanism of $Tb^{3+}$ ions at 224 nm excitation and possible non-radiative channels responsible for energy transfer in SGPTb*x* phosphors.

transfer takes place causing to improve population densities of $Tb^{3+}$:$^5D_{3,4}$ emission states. Since, the lifetime of $Tb^{3+}$:$^5D_4$ level is relatively higher than that of $Tb^{3+}$:$^5D_3$ level, the population density of $^5D_4$ emission state becomes more furnish to exhibit intense luminescence through $^5D_4 \rightarrow {}^7F_J$ transitions. The emission mechanism of $Tb^{3+}$ ions at 224 nm excitation through Stoke's shift and ET process is illustrated in Fig. 7.

### 3.3. Colour perception analysis

The colour perception of emitted luminescence of SGPTb*x* phosphors has been obtained using Commission International de l'Eclairage (CIE-1931) chromaticity coordinates (x, y). For SGPTb2.0 phosphor, the CIE chromaticity coordinates are found to be (0.282, 0.331), (0.306, 0.338) and (0.311, 0.328) at 224, 273 and 379 nm excitations, respectively. The

**Table 3**
Comparison of CIE coordinates, colour purity and correlated colour temperature (CCT) values of SGPTb*x* phosphors at 224 nm excitation.

| Doping (mol%) | CIE coordinates | colour purity (%) | CCT (K) |
|---|---|---|---|
| $x = 0.1$ | (0.303, 0.289) | 15.0 | 7768 |
| $x = 0.5$ | (0.291, 0.281) | 19.4 | 9198 |
| $x = 1.0$ | (0.286, 0.291) | 19.8 | 9224 |
| $x = 2.0$ | (0.282, 0.331) | 17.4 | 8349 |
| $x = 3.0$ | (0.291, 0.362) | 13.8 | 7314 |
| $x = 5.0$ | (0.301, 0.380) | 10.4 | 6720 |

CIE coordinates of SGPTb*x* phosphors at 224 nm excitation are listed in Table 3. The observed chromaticity coordinates are found close to those reported for SNYPF: $Ce^{3+}$, 0.5%$Tb^{3+}$ phosphors (0.223, 0.387) [32], LGW: 2%$Tm^{3+}$, 4%$Tb^{3+}$ (0.279, 0.418) and LGW: 2%$Tm^{3+}$, 4%$Tb^{3+}$, 5%$Eu^{3+}$ (0.377, 0.296) [33] phosphors. The identification of chromaticity coordinates is illustrated in Fig. 8.

As seen in the chromaticity diagram, it is clear that the coordinates of SGPTb2.0 phosphor at different excitations have been located in greenish-white region [see Fig. 8(a)], while the SGPTb*x* phosphors show a colour tunability at 224 nm excitation. The colour of emitted luminescence has been tuned from bluish-white for $x \leq 1.0$ mol% to greenish-white for $x \geq 2.0$ mol% [see Fig. 8(b)]. The colour purity (CP) and the correlated colour temperature (CCT) rating values of SGPTb*x*

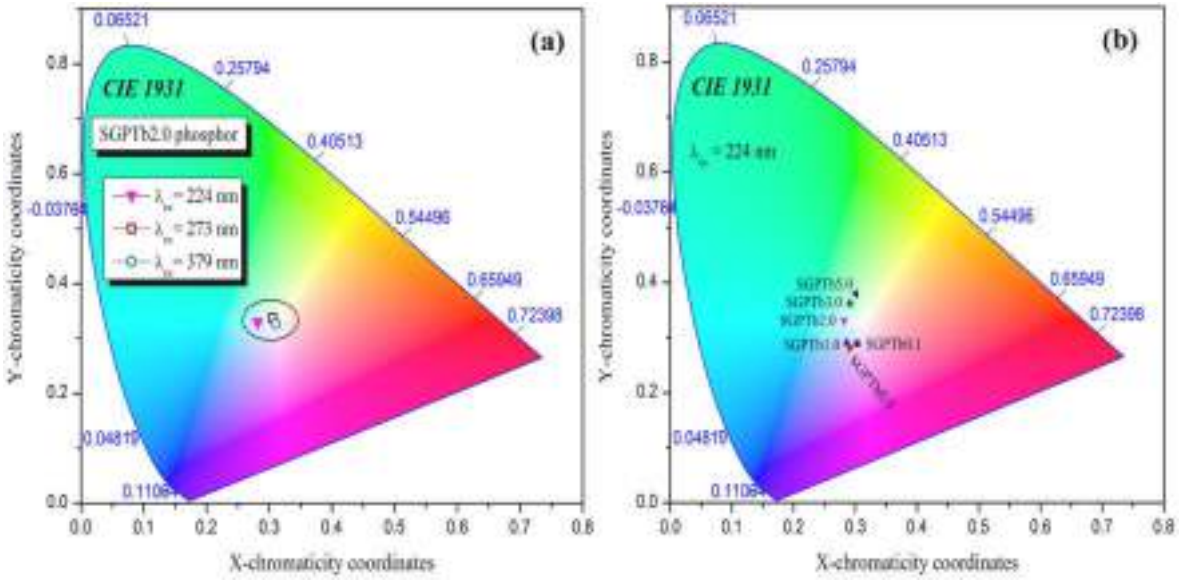

**Fig. 8.** CIE diagram of SGPTb2.0 at different excitations (a) and SGPTb*x* at 224 nm excitation (b).

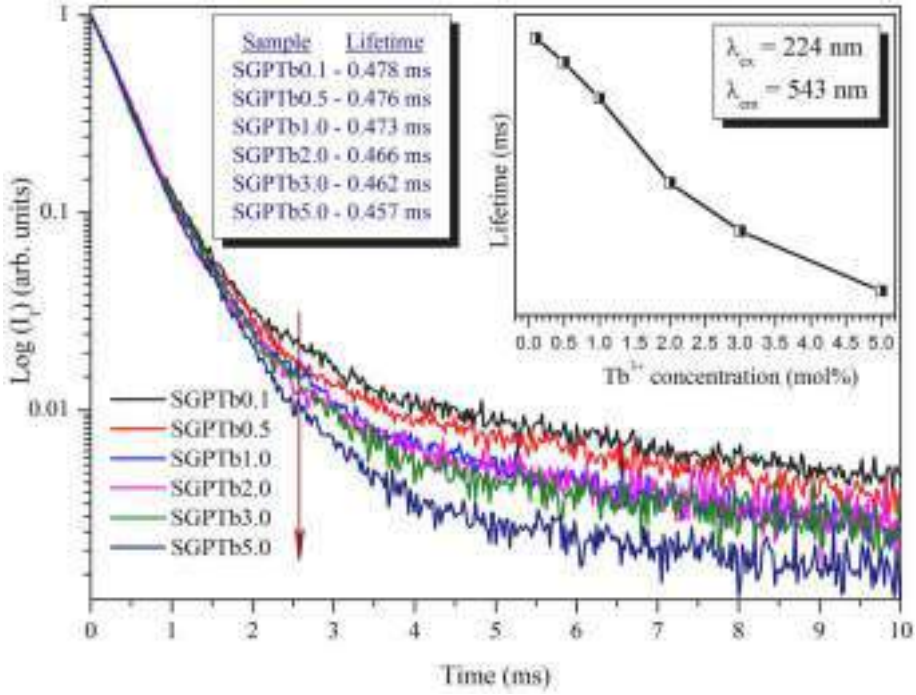

**Fig. 9.** Decay curves of $Tb^{3+}$: $^5D_4$ emission state in SGPTb*x* phosphors. Inset shows the variation of lifetime as a function of $Tb^{3+}$ concentration.

phosphors at 224 nm excitation have been determined following McCamy [34] and they are summarized in Table 3. The CCT rating of 6720 K is close to cool-white light and it has been suitable for lighting applications particularly to illuminate living rooms and lounges [35]. The values of CP for SGPTb2.0 phosphor are found to be 17.4, 9.0 and 7.8% for 224, 273 and 379 nm excitations, respectively. These results show that the percentage of green colour is found higher for SGPTb2.0 phosphor excited at 224 nm.

### 3.4. Luminescence decay analysis

The lifetime of $Tb^{3+}$: $^5D_4$ emission state of SGPTb*x* ($0 \leq x \leq 5.0$ mol %) phosphors has been determined controlling the excitation and emission wavelengths at 224 and 543 nm, respectively and they are described in Fig. 9. All these decay curves are well suited to single exponential function, $I = I_0.e^{-t/\tau}$, where $I_0$ indicates the initial intensity and $\tau$ indicates the lifetime. The values of $\tau$ are found to be 0.478, 0.476, 0.473, 0.466, 0.462 and 0.457 ms for $x = 0.1$, 0.5, 1.0, 2.0, 3.0 and 5.0 mol%, respectively considering the first e-fold times the initial intensity at $t = 0$ s.

The observed values of lifetime decrease gradually with increase of concentration of $Tb^{3+}$ ions confirm the presence of non-radiative (NR) transitions responsible for quenching of lifetime. The variation of lifetime of $Tb^{3+}$: $^5D_4$ emission state as a function of $Tb^{3+}$ concentration is shown in inset of Fig. 9. Since the concentration quenching has not been observed even for $x = 5.0$ mol% for $Tb^{3+}$: $^5D_4 \rightarrow {}^7F_J$ transitions, the exchange interaction mechanism among the excited $Tb^{3+}$ ions at higher concentrations through either cross-relaxation (CR) or resonant energy transfer (RET) or both channels might be responsible for the decrease of lifetime. The possible CR and RET channels responsible for quenching of lifetime at higher $Tb^{3+}$ concentrations are shown below and they are described in Fig. 7.

CR: $[^5D_3, {}^7F_6] \rightarrow [^5D_4, {}^7F_0]$

RET: $[^5D_4, {}^7F_6] \rightarrow [^7F_6, {}^5D_4]$

## 4. Conclusions

A series of SGPTb*x* ($0 \leq x \leq 5.0$ mol%) phosphors have been synthesized via modified citrate-gel combustion method. They have been crystallized into BCC structure with an average size of ~52–55 nm. The presence of different vibrational bonds Sr–O, Gd–O, O–P–O and P–O have been identified using FTIR studies. The HR-SEM image reveals agglomeration and non-uniform distribution of particles. The PLE spectra monitoring the emission at 543 nm ($Tb^{3+}$: $^5D_4 \rightarrow {}^7F_5$) show three kinds of transitions corresponding to $PO_4^{3-}$, $Gd^{3+}$ and $Tb^{3+}$ supporting efficient energy transfer among the excited $Tb^{3+}$ ions. The SGPTb*x* phosphors exhibit strong and intense luminescence when excited at 224 nm ($PO_4^{3-}$) compared to 273 nm ($Gd^{3+}$: $^8S_{7/2} \rightarrow {}^6I_{11/2}$) and 379 nm ($Tb^{3+}$: $^7F_6 \rightarrow {}^5D_3$) excitations due to Stokes shift. Upon these excitations, the $Tb^{3+}$ ions exhibit their characteristic emission bands due to $^5D_3 \rightarrow {}^7F_J$ and $^5D_4 \rightarrow {}^7F_J$ transitions. The colour of emitted luminescence has been tuned from bluish-white for $x \leq 1.0$ mol% to greenish-white for $x \geq 2.0$ mol% at 224 nm excitation. The observed results suggest that the SGPTb5.0 phosphor exhibit great potentiality to be use in the design of lighting devices for living rooms and lounges.

## Abstract

Medicinal plants have been used as therapeutic agents since the origin of mankind. Many medicinal plants like *Tinospora cordifolia, Andrographis paniculata, Curcuma longa, Withania somnifera, Zingiber officinale,* etc. are used to treat cancer. Ginger is reported to show anticancer effect in many cancer types like liver cancer, gastric cancer, oral cancer, prostate cancer, breast cancer, and ovarian cancers in animal models and cell lines. To date, over 400 bioactive compounds have been identified in ginger, they are gingerols, shogaols, and paradols. These compounds possess antioxidant, anti-inflammatory, antimicrobial, and anticancer properties. Gingerol especially shows anticancer effects in different cancer subjects. Gingerol

may act on the TNF-α, IL-6, NF-κB, cyclooxygenase-2 (COX-2), and caspase-3, and other tumor-metabolic pathway factors in the prevention of cancer. We hope that this chapter will attract more attention on ginger's therapeutic potential and impact on cancer subjects.

# Introduction

The biological term cancer refers to a set of diseases in which the cells of an organ or tissue split uncontrollably and acquire the ability to attack other tissues. Cancer is a global health problem, and it is the top cause of deaths in the world. Cancer occurs through the mutations by stepwise process which results in malignancies. Metastasis is the process whereby cancer cells rupture from a malignant tumor and travel to and invade other tissues in the body (Butt and Sultan 2009).

The most common types of cancer are liver cancer, esophageal cancer, breast cancer, oral cancer, lung cancer, prostate cancer, ovarian cancer, and stomach cancer. According to GLOBOCAN 2020 database in 2020, there were 19.1 million new cases of cancer and 10 million deaths from cancer worldwide, and the new cases will be upto 20 million globally by 2025 (Ferlay et al. 2019). The principle malignant conditions of the cancer are breast cancer (2.26 million cases), lung cancer (2.20 million cases), stomach cancer (1.08 million cases), liver cancer (0.90 million cases), esophagus cancer (0.60 million cases), pancreatic cancer (0.49 million cases), and colorectum cancer (0.73 million cases) in 2020 (Table 1).

**Table 1**

New cancer cases and deaths as per global cancer statistics 2020

| S. no | Cancer type | No of cases (2020) | No of deaths |
|---|---|---|---|
| 1. | Breast cancer | 2,261,419 | 684,996 |
| 2. | Lung cancer | 2,206,771 | 1,796,144 |
| 3. | Prostate cancer | 1,414,259 | 375,304 |
| 4. | Skin cancer | 1,198,073 | 63,731 |
| 5. | Colon cancer | 1,148,515 | 576,858 |
| 6. | Liver cancer | 905,677 | 830,180 |
| 7. | Cervical cancer | 604,127 | 341,831 |
| 8. | Esophageal cancer | 604,100 | 544,076 |
| 9. | Thyroid cancer | 586,202 | 43,646 |
| 10. | Pancreatic cancer | 495,773 | 466,003 |
| 11. | Leukemia | 474,519 | 311,594 |
| 12. | Kidney | 431,288 | 179,368 |
| 13. | Oral cancer | 377,713 | 177,757 |

India has 1.32 lakh new cancer cases in 2020, also the lowest rates of cancer in the world. Breast cancer, oral cancer, cervical cancer, and lung cancer are the top four cancers in India. Cancer deaths in India doubled from 1990 to 2016. It has been reported that genetic mutations, viruses, smoking, heavy metal ingestion, and dietary patterns are actively involved in cancer pathogenesis (Noonan et al. 2007). Despite huge progress and efforts have been made in the field of medicine for the prevention and treatment of cancer for years, cancer still remains the leading cause of deaths around the world (Figure 1).

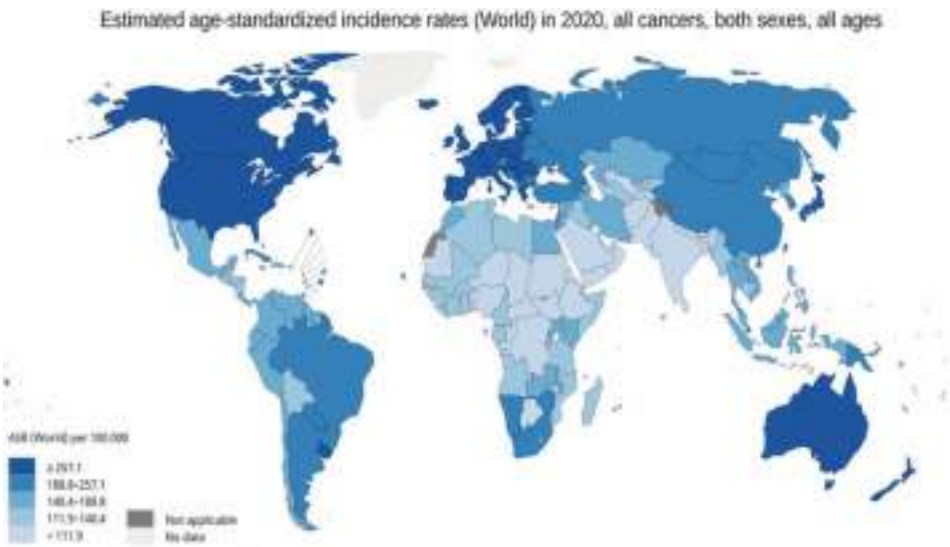

**Figure 1**

## Carcinogenesis

Carcinogenesis is the process by which a normal cell is transformed into a tumor cell and its progression to a clinically observable tumor with high probability of metastasis. Cancer is considered a process with three steps: 1. initiation, 2.promotion, and 3. progression (Weston and Harris 2003). This process can vary depending on the etiology of cancer. Normally, cancers are caused by chemical agents, viruses, and others by mutations of DNA, epigenetic changes of DNA (Baylin and Jones 2016).

## Mechanism of Cancer

**Cancer: Reactive Oxygen Species (ROS)**

Cancer is one of the stress-related disorders. During cancer condition, many free radicals or reactive oxygen species (ROS) are produced. The existence of oxidative stress resulting from increased free radicals has been postulated in cancer. Animal models and human studies and *in vitro* experiments suggest a role for oxidative stress, via an increased formation of free radicals in the pathophysiology of many complications, such as neurological, cardiovascular, renal, cancer, rheumatoid arthritis, cancer, and diabetes (Brownlee 2001). According to Sies (Sies et al. 2017), oxidative stress is defined as a shift in balance in cellular oxidation-reduction reactions in favor of oxidation, which leads to damage to the cell and formation of molecular products that are indicators of oxidative stress.

Reactive oxygen species are radicals or ions or molecules that have a one unpaired electron in their outermost shell of electrons. Due to this nature, ROS are highly reactive. Examples of ROS are superoxide ($O_2$-), hydrogen peroxide ($H_2O_2$), hydroxyl radicals (OH), and nitric oxide (•NO). ROS and oxidative stress have been implicated in many diseases like cancer, diabetes, and hepatitis. ROS plays an important role in various cascading of the signals for the cancer cells to survival, proliferation, resistance to apoptosis, neovascularization, invasion, and extravacation. (Cullen et al. 2003). In order to survive from oxidative stress condition, cancer cells adapt and acquire many mechanisms to counteract the potential toxic effects

of ROS stress in order to promote proximal protumorigenic signals. ROS also alters the DNA-binding sites of redox-sensitive transcription factors such as hypoxia-inducible factor-1 alpha (HIF-1α), NFκB, activator protein-1 (AP-1), and p53 (Trachootham et al. 2008). The antioxidant enzymes like SOD, CAT, GPx, GR, and GSH may act on these ROS, and hence these antioxidant enzymes activities are depleted in various cancer subjects.

Warburg (Liberti and Locasale 2016) described about cancer as metabolic alterations that represent a hallmark of cancer cells. Metabolic alterations and redox alterations which are important steps of cancer cell transformation make the mitochondria an attractive therapeutic target. Increased knowledge in the field of redox biology, its reactions, signaling networks, and interplay in disease and physiology has enabled not only a better realization of potential benefits but also grave dangers of ROS with respect to cancer phenotypes and drug resistance.

### Cancer Biomarkers

A thorough understanding of the roles of cancer biomarkers is essential for diagnostic purposes. A biomarker is "a characteristic that is objectively measured and evaluated as an indicator of normal biological processes, pathogenic processes, or pharmacologic responses to a therapeutic intervention." Because early diagnosis of cancer will treat cancer patients early, we can save the patient's life. Cancer biomarkers are produced by tumors or by the body in response to the presence of cancer. Cancer biomarkers can be used to determine the presence of malignancy and for the study of disease transmission. The important cancer biomarkers are Urokinase plasminogen activator (uPA), Carbonic anhydrase XII (CAXII), Cyclooxygenase (COX), Cytochrome P450 (CYP450), Telomerase, and Matrix metalloproteinases (MMPs).

The medical treatments for cancer are surgery, radiotherapy, and chemotherapy. These types of treatment are usually accompanied by a large number of side effects on patient health, like nausea, loss of appetite, weight loss, anemia, spinal cord injury, kidney damage, and mucositis. Hence, there is need for alternative therapy for cancer. So herbal medicine is practiced to treat cancer.

## Medicinal Plants for the Treatment of Cancer

Medicinal plants are used to treat many diseases like diabetes, cancer, epilepsy, alzheimer's, cough, fever, and other diseases. Drugs from medicinal plants focus on the most important active principles in terms of the quantity and the pharmacological actions. The information available on these medicinal plants has allowed the quantification of the active principle and the production of bioactive compounds. The bioactive compounds of medicinal plants have different chemical, pharmacological properties and actions. This has enabled us to evaluate the anticancer drugs from medicinal plants.

Many medicinal plants have been reported to possess anticancer properties. Due to the development of resistance against cancer effects, various plant-derived drugs have gained much attention in the recent years. Hence, it is of importance to focus on medicinal plants with anticancer properties that are easily available, culturally acceptable, and economically free. Herbal medicine has been used for thousands of years to cure cancer. Chemotherapeutic and chemopreventive effects of many herbal plants are attributed to phytochemicals, quinines, which are reported to induce antitumor effects *in vovo* and *in vitro* of cancer cells.

Recently, many well-known plant-derived compounds have been studied in animal models and cell lines. Among the above described plants and their formulations, *Terminalia chebula, Panax ginseng, Arachis hypogaea, Rauwolfia vomitoria, Azadirachta indica, Zingiber officinale, Commiphora mukul,* and *Rosa rugosa* are reported to be beneficial for cancer with less side effects as compared to conventional drugs. Hence, these medicinal plants could be a relatively safer and better therapeutic alternative for cancer treatment (Figure 2).

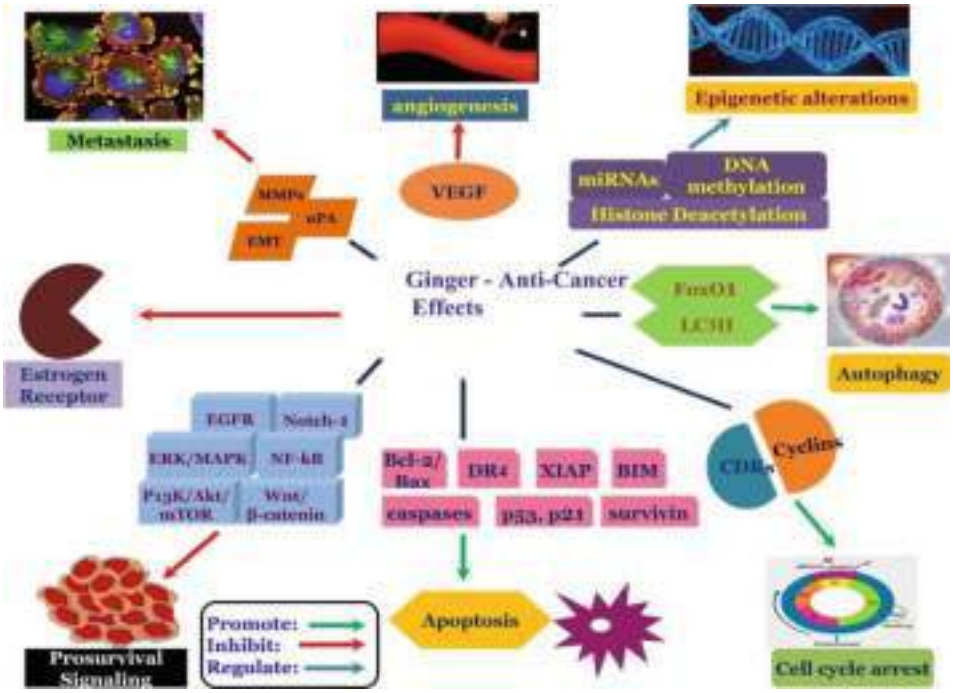

**Figure 2**
Ginger and anticancer mechanism

## Ginger

Ginger is the rhizome of *Zingiber officinale*. Roscoe belongs to the family Zingiberaceae. Ginger has been used as a spice, food, supplement, and flavoring agent. Ginger is used to cure diseases and symptoms, such as headache, nausea, cold, rheumatism, diarrhea, and arthritis. It is also used as a carminative, digestant, and antiflatulent (Ali et al. 2008). Ginger and its compounds are used as medicine in India, China, Burma, Germany, Japan, Indonesia, and the United States.

Ginger is reported to possess various medicinal properties like antibacterial, antiviral, antifungal, antiparasitic, anti-insecticidal, antianalgesic, antimutagen, anticarcinogenic, antispasmolytic, and anti-inflammatory and antioxidant activities (Shanmugam et al. 2021). Ginger have radioprotective, hepatoprotective, gastroprotective, nephroprotective, and neuroprotective properties, and its mechanism of action at the cellular level has been studied by many scientists (Ali et al. 2008; Shanmugam et al. 2009, 2021) (Figure 3).

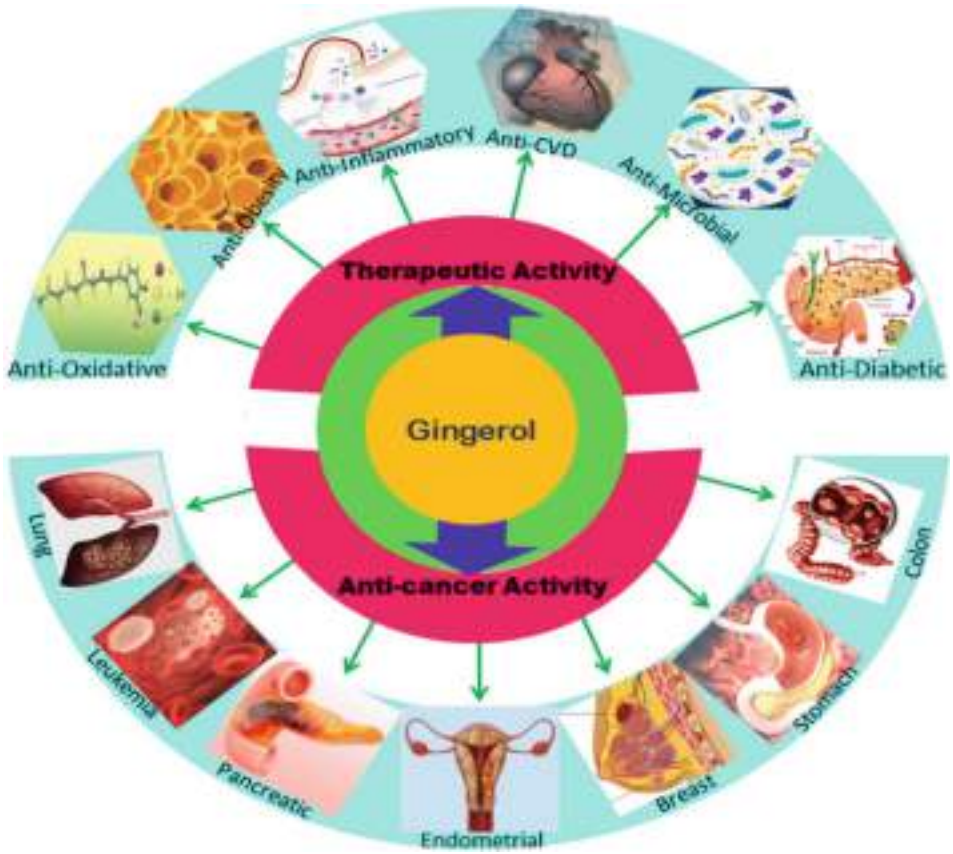

**Figure 3**
Pharmacological and anticancer properties of Gingerol

## Compounds of Ginger

The main constituents in ginger are terpenes, phenolic compounds, carbohydrates (50–70%), and lipids (3–8%). The terpenes (monoterpenes, sesquiterpenes, and sesquiterpene alcohols) are of 20–25%. The terpene compounds of ginger are zingiberene, $\alpha$-farnesene, $\beta$-sesquiphellandrene, $\beta$-bisabolene, and $\alpha$-curcumene. It has been identified that ginger has monoterpenes (such as $\alpha$-pinene, camphene, myrcene, $\alpha$-phellandrene, geranial, citronellal, neral, linalool, borneol, and alpha-terpineol). Phytosterols, amino acids, minerals, proteins, vitamins (vitamin A and nicotinic acid), and raw fiber, ash, are present in ginger (Shukla and Singh 2007).

The phenolic compounds of ginger are gingerol, shogaol, and paradols. In ginger, gingerols are in higher concentration. Ginger-specific smell and odor are due to the presence of gingerol and shogaols. The other compounds of ginger are 6-paradol, 1-dehydrogingerdione, 8-gingerdiol, 10-gingerdiol, 4-gingerdiol, 6-gingerdiol, 6-gingerdione, and 10-gingerdione. Ginger also contains diterpenes, galanolactone, diterpenoid, and ginger glycolipids (Yeh et al. 2014). Ginger has ascorbic acid, alkaloids, beta-carotene, and polyphenols. Ginger also has key volatile oils such as oleoresins, bisabolene, cineol, phellandrene, citral, borneol, and citronellol, vitamin B6, vitamin c, and linoleic acid. As per the available information, there are more than 400 bioactive compounds in ginger (Shukla and Singh 2007) (Figure 4).

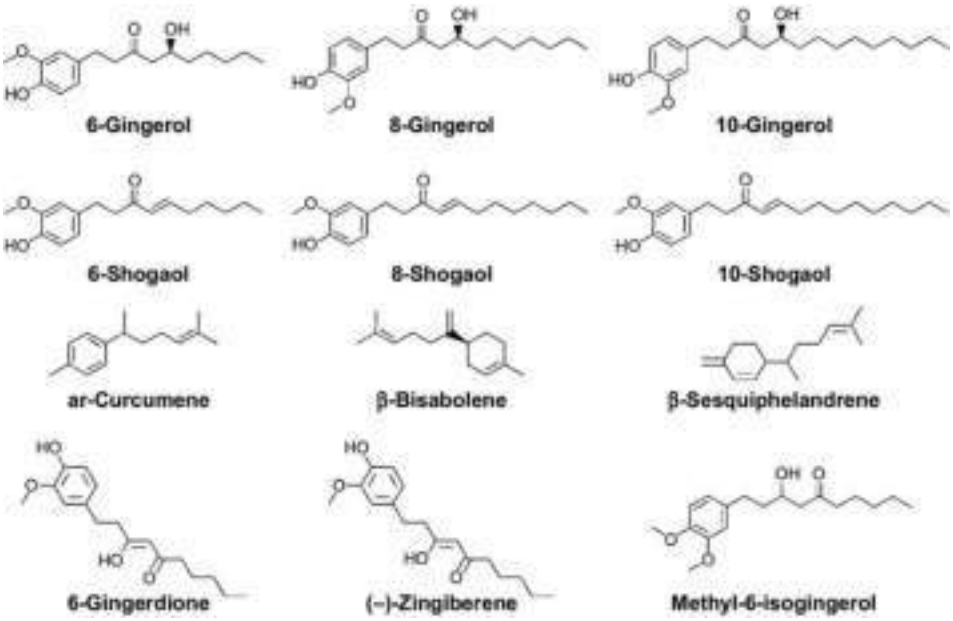

**Figure 4**
Compounds of Ginger

## Anticancer Effects of Ginger

Ginger has anticancer properties. In the methanolic, ethanolic, aqueous, n-hexane, and ethyl acetate, benzene extracts of ginger, many bioactive compounds are present which show antiproliferative, cytotoxic, and antiangiogenic activities. These pharmacological effects are due to bioactive compounds of ginger, which show antioxidant, anti-inflammatory, antioxidant, antihyperglycemic, antitumorigenic, and antilipidemic activities. These compounds may modulate the genetic expression and cause induction of apoptosis in cancer cells.

The anticancer effect of ginger may be due to the reduction of initiation, promotion, and progression. Hence, ginger can be used as anticancer agent (Zhang et al. 2017). Ginger has been reported to show its positive effects against many cancers, like liver cancer, gastric cancer, pancreatic cancer, breast cancer, prostate cancer, and other types of cancers. Ginger also has anticancer effects in different cancer cell lines in vitro, like lung, ovarian, liver, colon, cervical, and prostate cancer, through the stimulation of apoptosis and the reticence of cell proliferation (Zhang et al. 2017) (Table 2).

**Table 2**
Effect of ginger and its compounds on different cancer subjects

| S. no. | Ginger extract/compounds of ginger | Study type | Subjects | Dose | Potential mechanisms | Referen |
|---|---|---|---|---|---|---|
| 1 | Ginger ethanolic extract | *In vivo* | Wistar rats | 50 mg/kg | NADH dehydrogenase activity elevated | Ali et al. 2008) |
| 2 | Ginger extract | *In vitro* | HepG2 human hepato-cellular carcinoma cells | 1.11 mg/mL | Increasing the level of ROS levels increased and elevated p53 levels, thus promoting apoptosis | Li et al. ( 2013) |
| 3 | 6-gingerol | *In vitro* | He La human adenocarcinoma cervical cells | 60, 100, and 140μM | Cyclin A, cyclinD1, and cyclin E1 levels decreased, and caspase levels increased | Zhang et al. (2017 |
| 4 | 10-gingerol | In vitro | Human and mouse breast carcinoma cells | 50, 100, and 200μM | Cell growth and cell division are reduced | Bernard et al. ( 2017) |
| 5 | 6-gingerol,10-gingerol,6-shogaol, and 10-shogaol | *In vitro* | PC-3 human prostate cancer cells | 1,10, and 100μM | Inhibiting prostate cancer decreased, and the expression of MRP1 and GSTπ are lowered | Liu et al. (2017) |

| S. no. | Ginger extract/compounds of ginger | Study type | Subjects | Dose | Potential mechanisms | Referen |
|---|---|---|---|---|---|---|
| 6 | 6-shogaol | *In vitro* | LNCaP, DU145, and PC-3 human prostate cancer cells | 10, 20, and 40μM | Cyclin D1, surviving, c-Myc, and Bcl2 expression are decreased Inhibition of STAT3 and NF-κB signals | Saha et al. (2014 |

Ginger has an antitumor activity by modulating of genetic pathways. It helps for the activation of suppressing gene of the tumor. Furthermore, ginger can inhibit the vascular endothelial growth factors and modulate apoptosis; thus, ginger supplementation can reduce cancer. Ginger extract prevents the initial stage of colon cancer. Supplementation of ginger to the mice with carcinogen 1,2-dimethylhydrazine (DMH) inhibited the levels of tissue cholesterol, HMG CoA reductase, free fatty acids, and triglycerides (Manju et al. 2006). Hence, ginger treatment reduces the risk of cancer by antioxidative compounds.

For instance, it has been identified that the terpenoids, compound of ginger, induce apoptosis in uterus cancer cells via the activation of tumor protein p53. Water and organic solvent extracts of ginger reported to show anticancer activities in THP-1 AMoL cells in vitro. These reports show that ginger has anticancer activity (Prasad and Tyagi 2015).

Ginger constituents ([6]-gingerol, [10]-gingerol, [6]-shogaol, and zerumbone) show anticancer effects. They are effective against many cancers (Habib et al. 2008). Habib et al. (2008) reported that ginger extract inhibits liver carcinogenesis in wistar rat through the downregulation of elevated NF-$\kappa$B and TNF-$\alpha$. Hence, ginger may act as an anticancer agent, which may be helpful in treatment of cancer subjects. Ginger ingredients inhibit the development of diethylnitrosamine-(DEN-) induced premalignant phenotype in rat hepato-carcinogenesis. It has been reported that supplementation of ginger prevented decrease of the content of metallothionein and endostatin in the liver and elevated the growth factors induced by the carcinogen in wistar albino rats. Ginger also reverses the altered serum-hepatic tumor markers (Mansour et al. 2010).

Wang et al. (2008) reported that beta-elemenean compound of ginger induces caspase-3, −7, −9 activities, decreases Bcl-2 expression, which releases cytochrome c, and elevated the levels of cleaved caspase-9 and poly (ADP-ribose) polymerase in cells. Application of ginger extract to mouse skin afforded significant inhibition of TPA-caused epidermal edema (56%) and hyperplasia (44%) (Katiyar et al. 1996). Kim et al. ( 2005) also reported that ginger induces programmed cell death in cell lines. Ethanol extract of ginger has antitumor-promoting effects in mouse skin tumorigenesis model, and it was concluded that animals pretreated with ginger showed depleted tumor compared with unginger-treated rats.

Zingerone with a dose of 100 mg mL suppressed LPS-induced NF-kB activities in cells. Dietary zingerone reduces proinflammatory cytokines. This study reports zingerone anti-inflammatory activity due to suppressing the activation of NF-kB, production of IL-1b, and the infiltration of inflammatory cells (Ganaie et al. 2019). Ganaie et al. (2019) also reported the anticancer effect of zingerone due to activation of cytochrome P4502E1 and suppression of NF-kB-p65, iNOSCOX-2, and PCNA in cancer subjects.

Zerumbone, seen in ginger, shows antiproliferative and anti-inflammatory effects and mediates its activity through the modulation of NF-kB activation (Takada et al. 2005). Zerumbone also inhibits the activation of NF-kB, and this inhibition may provide basis for the prevention and treatment of cancer. The antihepato-carcinogenic effect of zerumbone was due to suppression of PCNA and elevation of Bax and depletion of Bcl-2 protein expression (Gross et al. 1998). Hence, zerumbone may act as anticancer agent in liver cancers

(Fuzer et al. 2017). Fuzere et al. (2017) reported that zerumbone induces the phase II detoxification enzymes depletion in rat liver epithelial cell line RL34. Hence, Zerumbone may act as a potential activator for the Nrf2-dependent detoxification pathway and provides a new insight into cancer management (Tsuboi et al. 2014) (Figure 5).

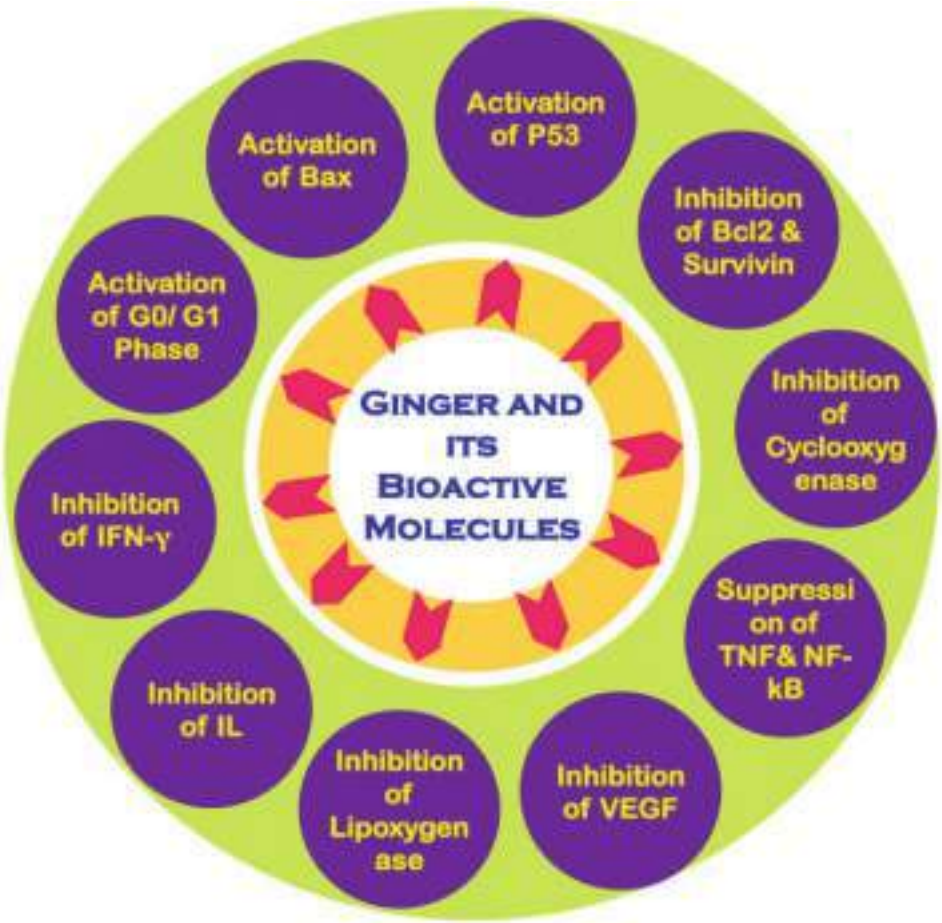

**Figure 5**
Suppression of tumors markers by ginger and its compounds

## Ginger-Bioactive Compound: Gingerol and Its Anticancer Effects

Gingerols are part of the phenolic compounds and volatile organic compounds of ginger. 4-, 6, 8-, 10-, and 12-gingerol are types of gingerol. 6-gingerol is the main compound which is responsible for the strong aroma of ginger. The biological properties of gingerols are antimicrobial, anticancer, antioxidant, anti-inflammatory, and antiallergic (Akinyemi et al. 2015).

6-gingerol has been identified to show anticancerous effects. Gingerol helps in the suppression of the hyperproliferation, inflammatory processes, and transformation that engaged in various steps of angiogenesis and metastasis. For instance, through the activation of CD8+ T cells, it inhibited B16F10 melanoma cells of pulmonary metastasis in mice. Antitumoral activity showed by 6-gingerol through induction of reactive oxygen species (ROS) which, trigger p53 activation, apoptosis, and arrest the cell cycle (Lee et al. 2008). The study found that 6-G induced arrest of the cell cycle in both cell lines by reducing the expression of cyclin A and CDKA. In addition, Radhakrishnan et al. (2014) reported that 6-G induced cell death by apoptosis in the cell line with the mutated p53 gene. [6]-gingerol stimulated death receptor-mediated apoptosis in glioblastoma cells or p53-mediated apoptosis in skin tumor cells (Nakamura et al. 2004).

6-gingerol demonstrates an important potential to treat pancreatic cancer and has been shown to have a potential inhibitor of metastasis in *in vitro* and *in vivo* studies by different mechanisms, including a reduction in the expression of MMP and inhibiting angiogenesis (Kim et al. 2005). 6-gingerol targets many cellular molecules which promote cancer, for cell survival, cell proliferation, invasion, and angiogenesis. 6-Gingerol supplementation alters STAT3, NF-κB, Rb, MAPK, Akt, ERK, PI3K, and caspase-3/7, cIAP1. Thus, gingerol treatment may modulate molecular targets of cancer components, so gingerol may have the therapeutic potential for preventing and treating many cancers.

*In vitro* and *in vivo* analysis of [10]-gingerol has been reported against the metastatic triple negative breast cancer (TNBC) [97]. In addition, it was experimented that 10-gingerol inhibits cervical cancer (Zhang et al. 2017). A study carried out by Martin et al. (2017) showed the anticancer activity of 10-G *in vivo* and *in vitro* in triple negative breast cancer models through proapoptotic activity and the inhibition of metastasis. The activity of 10-G in vitro was dose dependent, finding that at the highest concentration (100μM) colony formation was completely inhibited and extensive cell death occurred. 10-gingerol caused a considerable upsurge in the initiation of caspase-3 and inhibited orthotopic tumor growth of spontaneous breast cancer metastasis. Zhang et al. (2017) reported that 10-gingerol inhibits metastasis to multiple organs like lung, bone, and brain.

## Therapeutical Potential of Gingerol and Its Effect on Metabolic Pathways in Cancer

Anticancer mechanisms of gingerol include free radical scavenging effect, antioxidant effect, modulation of various enzymes of inflammation, modulation of cell cycle proteins, induction of apoptosis, and arrest the cell cycle at G2/M phase in carcinoma which will provide basis for inhibition of tumor progression in experimental animals. TNF-α, IL-6, NF-κB, cyclooxygenase-2 COX-2, and caspase-3 are the most important cancer metabolic factors.

### Free Radical Scavenging and Antioxidant Activity of Gingerol

Gingerol possesses antioxidant activity due to their free radical scavenging activity. It has been investigated that gingerol may modulate the antioxidant enzymes and suppress the lipid peroxidation products in cancer subjects. Hence, gingerol may prevent the pathogenesis of cancer-related disorders by its free radical scavenging activity. Alsahli et al. (2021) reported anticancer activity of gingerol in colon cancer, breast cancer, by elevating antioxidant enzymes and depleting lipid peroxidation in cancer condition.

### Effect of Gingerol on Apoptotic Genes

Apoptosis is one of the prerequisites to maintain the normal and healthy internal milieu. Alteration in the normal process of apoptosis may raise cell survival and support the tumor growth and progression (Kim et al. 2005). Gingerol plays a vital role in the elevation of different proapoptotic genes and at the same time depletion of the antiapoptotic genes and by this way balances the apoptosis process. An interesting study showed that gingerol induces apoptosis in scleroderma lung fibroblasts without affecting normal lung fibroblasts. Furthermore, gingerol has shown an antitumor activity and was involved in the apoptosis induction and the modulation of key apoptotic proteins such as Bax and bcl-2 (Yu et al. 2011).

A study has reported that growth arrest and apoptosis of B cell lymphoma occur through the downregulation of c-myc, bcl-XL, and p53 with the treatment of gingerol. Another report in human breast cancer cell line showed that CD437 induces G0-G1 arrest and apoptosis via regulation of p21WAFI/CIPI, Bcl-2, and Bax in a p53-independent manner after treatment with gingerol. Another study on p53-null cells, as well as TR9-7 cells, reported that gingerol induces apoptosis in tumor cells via a p53-dependent pathway, and Bax acts as downstream effectors of p53.Gingerol induces apoptosis in a range of tumor cell lines through activation of caspase-3, cytochrome c release, and depletion of bcl-2 (de Lima et al. 2018).

Gingerol has shown an apoptotic effect by inhibiting various genes such as proteintyrosine kinase, protein kinase C, c-myc mRNA expression, and bcl-2 mRNA expression and also mitochondrial pathway. Earlier studies have shown that gingerol possesses an apoptotic activity in different types of cancer cells such as human colon cancer cells, stomach, and skin tumors, breast cancer cells, and prostate cancer cells (Nakamura et al. 2004). Gingerol may lower the incidence of various cancers and also induce apoptosis in MBT-2 cells and G2/M arrest of T24 cells (Park et al. 2014). Experimental studies showed that the downregulation of the expression of antiapoptotic protein occurs with gingerol treatment (Nakamura et al. 2004).

### Effect of Gingerol on Tumor-Suppressor Genes

Tumor-suppressor genes play a vital and significant role in the inhibition of cancer formation and its progression. An alteration or mutations may occur in a gene, then tumor suppressor gene loses its ability to perform normal function and it transforms into tumor gene. p53 is one of the important suppressor genes, and it is the guardian of all genes and regulates the various cellular and molecular pathways and prevents the formation of cancer.

Numerous *in vivo* and *in vitro* reports showed that gingerol has a significant role in cancer prevention or inhibition. Another study showed that gingerol downregulates the expression of p53, as well as the survival genes egr-1,c-mycandbcl-XL in B cells. Another report also indicated that gingerol inhibits cell cycle progression of immortalized human umbilical vein-endothelial cells via upregulating the CDK inhibitors p21WAF1/CIP1, p27KIP1, and p53 (Park et al. 2014).

Another tumor-suppressor gene, phosphatase and tensin homolog deleted on chromosome ten (PTEN), has a role in the progression of the cell cycle and apoptosis. The alteration or mutation of PTEN gene has been noticed in several types of cancers. A study of the gingerol has shown that PTEN increases the gingerol-induced apoptosis, whereas inactive PTEN decreases/inhibits the gingerol-induced apoptosis.

In mice, [6]-gingerol suppressed the promotion of skin cancer. Park et al. (Park et al. 2014) reported that [6]-gingerol inhibited TPA skin tumor promotion in addition to the inhibition of epidermal ornithine decarboxylase activity in ICR mice. In a study, Surh et al. [1999] reported antitumor-promoting properties of both [6]-gingerol and [6]-paradol. [6]-gingerol treatment attenuated the skin papilloma genesis and inhibited the tumor-promoter genes, TNF-alpha production, and activation of epidermal ornithine decarboxylase in ICR mice (Nakamura et al. 2004).

### Effect of Gingerol on Cycloxygenase Enzyme

COX is an inducible enzyme in the conversion of arachidonic acid to prostaglandins (PGs). There are two types of cyclooxygenase COX-1 that play a vital role in physiological functions and COX-2, an enzyme responsible for inflammation and pain. COX-2 is upregulated or overexpressed in various types of cancers (Pournaderi et al. 2017). It was previously stated that gingerol inhibits the critical stage of tumor initiation and promotion stages and COX inhibition. Gingerol also inhibits the COX2 expression on colon cancer cell lines (Nonn et al. 2007). Previous reports states that gingerol plays an important role in the downregulation of the expression of COX-2 and finally suppresses the cancer progression (Kim et al. 2005). Gingerol plays a significant role in the cancer prevention via controlling the activities of various genes in the initiation, promotion, and progression stage of tumor development and progression.

### NF-$\kappa$B and Gingerol in Cancer Prevention

NF-$\kappa$B family of transcription factors shows an important role in immune, inflammatory response and also stimulates the development and progression of cancer. In this regard, an important study demonstrated that gingerols have anticancer, antioxidant, and anti-inflammatory effects via the downregulation of the transcription factors NF-$\kappa$B, AP-1, and Egr-1 (Han et al. 2002) and repression of the genes for cell adhesion molecules (chemokines, TNF, Cox-2, and MMP-9). Another study showed that gingerol has been involved in the suppression of NF-$\kappa$B activation and NF-$\kappa$B gene products (Plummer et al. 1999). An important study in pancreatic cancer cells reported that gingerol shows a vital role in the suppression of NF-$\kappa$B activation by inhibiting I$\kappa$B kinase, ultimately induces I$\kappa$B$\alpha$ phosphorylation, and inhibits the NF-$\kappa$B downstream gene expression. [6]-gingerol inhibited both the vascular endothelial growth factor (VEGF) and basic fibroblast growth factor(b-FGF)-induced proliferation of human endothelial cells and caused cell cycle arrest in the G1 phase (Vijaya Padma et al. 2007). Recently, anticancer and anti-inflammatory potential of 6-gingerol was reported by inactivating NF-kB through the suppression of the proinflammatory TNF-alpha (Kim et al. 2005 ; Habib et al. 2008). Numerous studies have shown that gingerol is a potent inhibitor of NF-$\kappa$B activation.

Kim et al. (2005) reported that 6-gingerol regulates tight junction-related proteins and suppresses invasion and metastasis of pancreatic cancer cells. 6-gingerol mediated through NF-$\kappa$B inhibition via inhibition of the extracellular signal-regulated kinases (ERK) pathway. Thus, 6-gingerol suppresses the invasive activity of PANC-1 cells.

### Impact of Gingerol on Angiogenesis

Angiogenesis is a complex process involving widespread interaction between the cells, soluble factors, and ECM components. During cancer development, tumor growth is triggered by many signals in chain reaction manner. In cancer formation, there are stages and angiogenic factors such as vascular endothelial growth

factor (VEGF), basic fibroblast growth factor (bFGF), angiogenin, transforming growth factor (TGF-$\alpha$, TGF-$\beta$), and epidermal growth factors, which play vital role in tumor angiogenesis through cancerous tumor cells by releasing molecules and sending signals to surrounding normal host tissue. VEGF is a crucial survival factor for endothelial cells in the process of physiological, tumor angiogenesis, and it induces the expression of antiapoptotic proteins in the endothelial cells (Shukla and Singh 2007). Many reports showed that many medicinal plants suppress the VEGF and other factors of cancer. We also reported that gingerol is best inhibitor of VEGF in different types of cancer (Weng et al. 2010).

*In vitro* studies on hepatic cancer cell lines conducted so far have demonstrated that ginger suppressed the growth of human hepatic cancer cell lines by inhibiting the phosphorylation of tyrosine-kinase receptor IGF-1R, inducing apoptosis by activating Caspase 9 and downregulating Bcl-2 and cyclooxygenase-2 (COX-2), modulating the levels of VEGF and its receptor (VEGFR-2), NF-κB, p53, and extracellular signal-regulated kinase 1/2 (ERK1/2), reducing the expression of lipogenic enzymes, certain types of RTKs, and their downstream pathways, and activating adenosine monophosphate-activated protein kinase (AMPK) and ROS-mediated lysosomal membrane permeabilization. Based on various liver carcinogenesis animal models with the intake of ginger, the inhibition of hepatoma growth, restriction of hepatic cancer cell line progression, and activation of apoptosis were observed; the probable mechanisms behind might be associated with suppression of hepatocyte progenitor cell/stem cell population, activation of AMPK protein in the liver, and modulation of self-renewal pathways and their related genes. *In vitro* and *in vivo* studies reported that gingerol suppresses the proliferation of human vascular endothelial cells and also abrogates the FGF-2-induced angiogenic response. Moreover, gingerol has the ability to inhibit both VEGF and its receptor in various cancer types; it might be useful as an antiangiogenic agent. Hence, gingerol acts as anticancer agent against many cancers through suppressing proliferation, angiogenesis, NF-$\kappa$B, and NF-$\kappa$B-regulated gene products.

# Conclusion and Future Perspectives

Cancer is one of the deadliest diseases and a major health problem in the world. The present modes of treatments like chemotherapy and radiotherapy are very expensive and also exhibit many side effects in cancer patients. Ginger and its bioactive compounds are used to treat cancer. Gingerol a bioactive compound of ginger has been shown to target multiple signaling molecules in cancer metabolism and provides a basis for its therapeutic applications for cancer subjects. Moreover, most of the known activities of gingerol are based only on *in vitro* and *in vivo* studies, and some clinical studies in human subjects. Therefore, more extensive and well-controlled animal and human studies are required to demonstrate efficacy of gingerol and other compounds of ginger against cancer.

**Abstract**

Medicinal plants have been used as therapeutic agents since the origin of mankind. Many medicinal plants like *Tinospora cordifolia, Andrographis paniculata, Curcuma longa, Withania somnifera, Zingiber officinale,* etc. are used to treat cancer. Ginger is reported to show anticancer effect in many cancer types like liver cancer, gastric cancer, oral cancer, prostate cancer, breast cancer, and ovarian cancers in animal models and cell lines. To date, over 400 bioactive compounds have been identified in ginger, they are gingerols, shogaols, and paradols. These compounds possess antioxidant, anti-inflammatory, antimicrobial, and anticancer

properties. Gingerol especially shows anticancer effects in different cancer subjects. Gingerol may act on the TNF-α, IL-6, NF-κB, cyclooxygenase-2 (COX-2), and caspase-3, and other tumor-metabolic pathway factors in the prevention of cancer. We hope that this chapter will attract more attention on ginger's therapeutic potential and impact on cancer subjects.

## Introduction

The biological term cancer refers to a set of diseases in which the cells of an organ or tissue split uncontrollably and acquire the ability to attack other tissues. Cancer is a global health problem, and it is the top cause of deaths in the world. Cancer occurs through the mutations by stepwise process which results in malignancies. Metastasis is the process whereby cancer cells rupture from a malignant tumor and travel to and invade other tissues in the body (Butt and Sultan 2009).

The most common types of cancer are liver cancer, esophageal cancer, breast cancer, oral cancer, lung cancer, prostate cancer, ovarian cancer, and stomach cancer. According to GLOBOCAN 2020 database in 2020, there were 19.1 million new cases of cancer and 10 million deaths from cancer worldwide, and the new cases will be upto 20 million globally by 2025 (Ferlay et al. 2019). The principle malignant conditions of the cancer are breast cancer (2.26 million cases), lung cancer (2.20 million cases), stomach cancer (1.08 million cases), liver cancer (0.90 million cases), esophagus cancer (0.60 million cases), pancreatic cancer (0.49 million cases), and colorectum cancer (0.73 million cases) in 2020 (Table 1).

**Table 1** New cancer cases and deaths as per global cancer statistics 2020

| S. no | Cancer type | No of cases (2020) | No of deaths |
|---|---|---|---|
| 1. | Breast cancer | 2,261,419 | 684,996 |
| 2. | Lung cancer | 2,206,771 | 1,796,144 |
| 3. | Prostate cancer | 1,414,259 | 375,304 |
| 4. | Skin cancer | 1,198,073 | 63,731 |
| 5. | Colon cancer | 1,148,515 | 576,858 |
| 6. | Liver cancer | 905,677 | 830,180 |
| 7. | Cervical cancer | 604,127 | 341,831 |
| 8. | Esophageal cancer | 604,100 | 544,076 |
| 9. | Thyroid cancer | 586,202 | 43,646 |
| 10. | Pancreatic cancer | 495,773 | 466,003 |
| 11. | Leukemia | 474,519 | 311,594 |
| 12. | Kidney | 431,288 | 179,368 |
| 13. | Oral cancer | 377,713 | 177,757 |

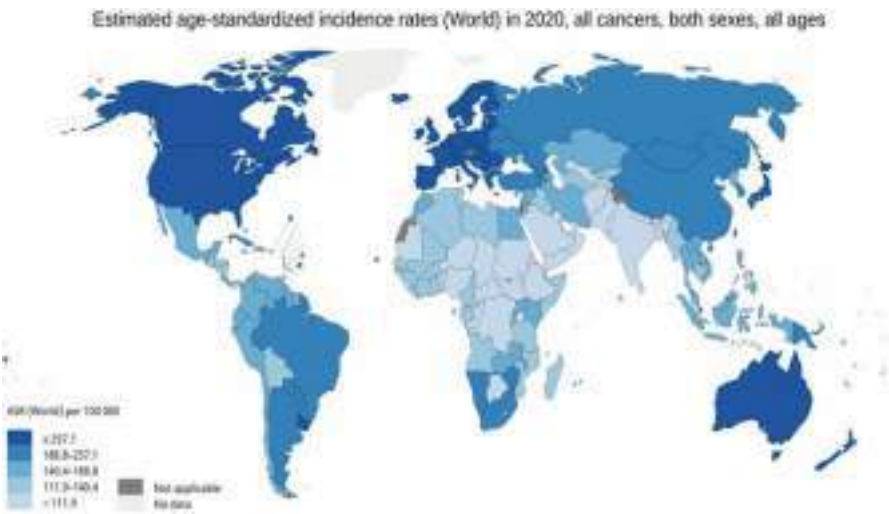

**Figure 1** Cancer patients in the world as per the Global Cancer report 2020 by WHO. Source: https://www.uicc.org/news/globocan-2020-new-global-cancer-data#

India has 1.32 lakh new cancer cases in 2020, also the lowest rates of cancer in the world. Breast cancer, oral cancer, cervical cancer, and lung cancer are the top four cancers in India. Cancer deaths in India doubled from 1990 to 2016. It has been reported that genetic mutations, viruses, smoking, heavy metal ingestion, and dietary patterns are actively involved in cancer pathogenesis (Noonan et al. 2007). Despite huge progress and efforts have been made in the field of medicine for the prevention and treatment of cancer for years, cancer still remains the leading cause of deaths around the world (Figure 1).

## Carcinogenesis

Carcinogenesis is the process by which a normal cell is transformed into a tumor cell and its progression to a clinically observable tumor with high probability of metastasis. Cancer is considered a process with three steps: 1. initiation, 2.promotion, and 3. progression (Weston and Harris 2003). This process can vary depending on the etiology of cancer. Normally, cancers are caused by chemical agents, viruses, and others by mutations of DNA, epigenetic changes of DNA (Baylin and Jones 2016).

## Mechanism of Cancer

### Cancer: Reactive Oxygen Species (ROS)

Cancer is one of the stress-related disorders. During cancer condition, many free radicals or reactive oxygen species (ROS) are produced. The existence of oxidative

stress resulting from increased free radicals has been postulated in cancer. Animal models and human studies and *in vitro* experiments suggest a role for oxidative stress, via an increased formation of free radicals in the pathophysiology of many complications, such as neurological, cardiovascular, renal, cancer, rheumatoid arthritis, cancer, and diabetes (Brownlee 2001). According to Sies (Sies et al. 2017), oxidative stress is defined as a shift in balance in cellular oxidation-reduction reactions in favor of oxidation, which leads to damage to the cell and formation of molecular products that are indicators of oxidative stress.

Reactive oxygen species are radicals or ions or molecules that have a one unpaired electron in their outermost shell of electrons. Due to this nature, ROS are highly reactive. Examples of ROS are superoxide ($O_2$-), hydrogen peroxide ($H_2O_2$), hydroxyl radicals (OH), and nitric oxide (•NO). ROS and oxidative stress have been implicated in many diseases like cancer, diabetes, and hepatitis. ROS plays an important role in various cascading of the signals for the cancer cells to survival, proliferation, resistance to apoptosis, neovascularization, invasion, and extravacation. (Cullen et al. 2003). In order to survive from oxidative stress condition, cancer cells adapt and acquire many mechanisms to counteract the potential toxic effects of ROS stress in order to promote proximal protumorigenic signals. ROS also alters the DNA-binding sites of redox-sensitive transcription factors such as hypoxia-inducible factor-1 alpha (HIF-1α), NFκB, activator protein-1 (AP-1), and p53 (Trachootham et al. 2008). The antioxidant enzymes like SOD, CAT, GPx, GR, and GSH may act on these ROS, and hence these antioxidant enzymes activities are depleted in various cancer subjects.

Warburg (Liberti and Locasale 2016) described about cancer as metabolic alterations that represent a hallmark of cancer cells. Metabolic alterations and redox alterations which are important steps of cancer cell transformation make the mitochondria an attractive therapeutic target. Increased knowledge in the field of redox biology, its reactions, signaling networks, and interplay in disease and physiology has enabled not only a better realization of potential benefits but also grave dangers of ROS with respect to cancer phenotypes and drug resistance.

## Cancer Biomarkers

A thorough understanding of the roles of cancer biomarkers is essential for diagnostic purposes. A biomarker is "a characteristic that is objectively measured and evaluated as an indicator of normal biological processes, pathogenic processes, or pharmacologic responses to a therapeutic intervention." Because early diagnosis of cancer will treat cancer patients early, we can save the patient's life. Cancer biomarkers are produced by tumors or by the body in response to the presence of cancer. Cancer biomarkers can be used to determine the presence of malignancy and for the study of disease transmission. The important cancer biomarkers are Urokinase plasminogen activator (uPA), Carbonic anhydrase XII (CAXII), Cyclooxygenase (COX), Cytochrome P450 (CYP450), Telomerase, and Matrix metalloproteinases (MMPs).

The medical treatments for cancer are surgery, radiotherapy, and chemotherapy. These types of treatment are usually accompanied by a large number of side effects on patient health, like nausea, loss of appetite, weight loss, anemia, spinal cord

injury, kidney damage, and mucositis. Hence, there is need for alternative therapy for cancer. So herbal medicine is practiced to treat cancer.

## Medicinal Plants for the Treatment of Cancer

Medicinal plants are used to treat many diseases like diabetes, cancer, epilepsy, alzheimer's, cough, fever, and other diseases. Drugs from medicinal plants focus on the most important active principles in terms of the quantity and the pharmacological actions. The information available on these medicinal plants has allowed the quantification of the active principle and the production of bioactive compounds. The bioactive compounds of medicinal plants have different chemical, pharmacological properties and actions. This has enabled us to evaluate the anticancer drugs from medicinal plants.

Many medicinal plants have been reported to possess anticancer properties. Due to the development of resistance against cancer effects, various plant-derived drugs have gained much attention in the recent years. Hence, it is of importance to focus on medicinal plants with anticancer properties that are easily available, culturally acceptable, and economically free. Herbal medicine has been used for thousands of years to cure cancer. Chemotherapeutic and chemopreventive effects of many herbal plants are attributed to phytochemicals, quinines, which are reported to induce antitumor effects *in vovo* and *in vitro* of cancer cells.

Recently, many well-known plant-derived compounds have been studied in animal models and cell lines. Among the above described plants and their formulations, *Terminalia chebula, Panax ginseng, Arachis hypogaea, Rauwolfia vomitoria, Azadirachta indica, Zingiber officinale, Commiphora mukul,* and *Rosa rugosa* are reported to be beneficial for cancer with less side effects as compared to conventional drugs. Hence, these medicinal plants could be a relatively safer and better therapeutic alternative for cancer treatment (Figure 2).

## Ginger

Ginger is the rhizome of *Zingiber officinale.* Roscoe belongs to the family Zingiberaceae. Ginger has been used as a spice, food, supplement, and flavoring agent. Ginger is used to cure diseases and symptoms, such as headache, nausea, cold, rheumatism, diarrhea, and arthritis. It is also used as a carminative, digestant, and antiflatulent (Ali et al. 2008). Ginger and its compounds are used as medicine in India, China, Burma, Germany, Japan, Indonesia, and the United States.

Ginger is reported to possess various medicinal properties like antibacterial, antiviral, antifungal, antiparasitic, anti-insecticidal, antianalgesic, antimutagen, anticarcinogenic, antispasmolytic, and anti-inflammatory and antioxidant activities (Shanmugam et al. 2021). Ginger have radioprotective, hepatoprotective, gastroprotective, nephroprotective, and neuroprotective properties, and its

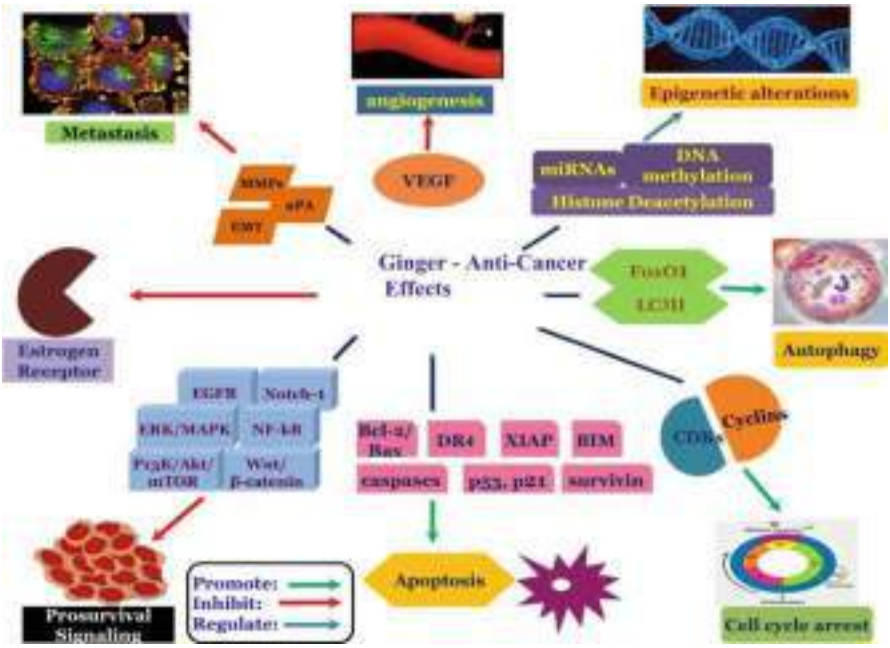

**Figure 2** Ginger and anticancer mechanism

mechanism of action at the cellular level has been studied by many scientists (Ali et al. 2008; Shanmugam et al. 2009, 2021) (Figure 3).

## Compounds of Ginger

The main constituents in ginger are terpenes, phenolic compounds, carbohydrates (50–70%), and lipids (3–8%). The terpenes (monoterpenes, sesquiterpenes, and sesquiterpene alcohols) are of 20–25%. The terpene compounds of ginger are zingiberene, α-farnesene, β-sesquiphellandrene, β-bisabolene, and α-curcumene. It has been identified that ginger has monoterpenes (such as α-pinene, camphene, myrcene, α-phellandrene, geranial, citronellal, neral, linalool, borneol, and alpha-terpineol). Phytosterols, amino acids, minerals, proteins, vitamins (vitamin A and nicotinic acid), and raw fiber, ash, are present in ginger (Shukla and Singh 2007).

The phenolic compounds of ginger are gingerol, shogaol, and paradols. In ginger, gingerols are in higher concentration. Ginger-specific smell and odor are due to the presence of gingerol and shogaols. The other compounds of ginger are 6-paradol, 1-dehydrogingerdione, 8-gingerdiol, 10-gingerdiol, 4-gingerdiol, 6-gingerdiol, 6-gingerdione, and 10-gingerdione. Ginger also contains diterpenes, galanolactone, diterpenoid, and ginger glycolipids (Yeh et al. 2014). Ginger has ascorbic acid, alkaloids, beta-carotene, and polyphenols. Ginger also has key volatile oils such as

**Figure 3** Pharmacological and anticancer properties of Gingerol

oleoresins, bisabolene, cineol, phellandrene, citral, borneol, and citronellol, vitamin B6, vitamin c, and linoleic acid. As per the available information, there are more than 400 bioactive compounds in ginger (Shukla and Singh 2007) (Figure 4).

## Anticancer Effects of Ginger

Ginger has anticancer properties. In the methanolic, ethanolic, aqueous, n-hexane, and ethyl acetate, benzene extracts of ginger, many bioactive compounds are present which show antiproliferative, cytotoxic, and antiangiogenic activities. These pharmacological effects are due to bioactive compounds of ginger, which show antioxidant, anti-inflammatory, antioxidant, antihyperglycemic, antitumorigenic, and antilipidemic activities. These compounds may modulate the genetic expression and cause induction of apoptosis in cancer cells.

The anticancer effect of ginger may be due to the reduction of initiation, promotion, and progression. Hence, ginger can be used as anticancer agent (Zhang et al. 2017). Ginger has been reported to show its positive effects against many cancers,

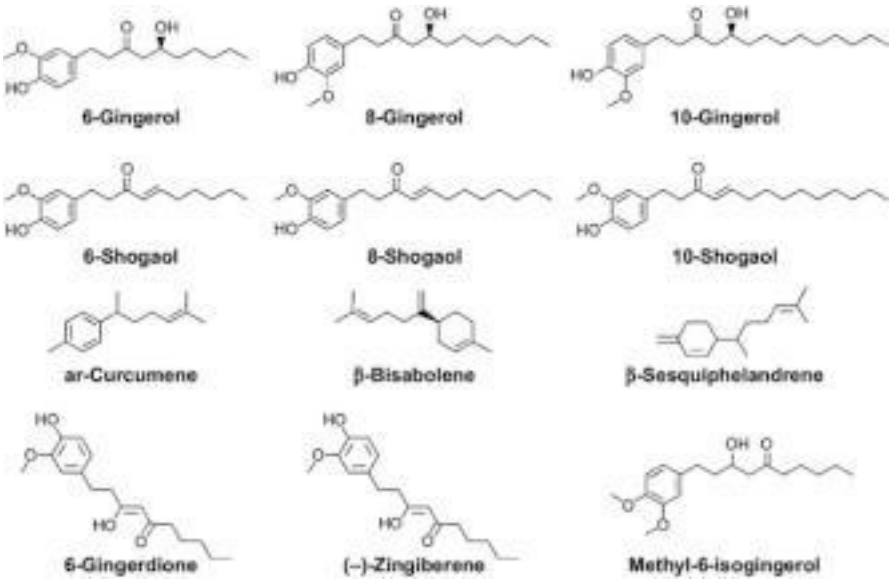

**Figure 4** Compounds of Ginger

like liver cancer, gastric cancer, pancreatic cancer, breast cancer, prostate cancer, and other types of cancers. Ginger also has anticancer effects in different cancer cell lines in vitro, like lung, ovarian, liver, colon, cervical, and prostate cancer, through the stimulation of apoptosis and the reticence of cell proliferation (Zhang et al. 2017) (Table 2).

Ginger has an antitumor activity by modulating of genetic pathways. It helps for the activation of suppressing gene of the tumor. Furthermore, ginger can inhibit the vascular endothelial growth factors and modulate apoptosis; thus, ginger supplementation can reduce cancer. Ginger extract prevents the initial stage of colon cancer. Supplementation of ginger to the mice with carcinogen 1,2-dimethylhydrazine (DMH) inhibited the levels of tissue cholesterol, HMG CoA reductase, free fatty acids, and triglycerides (Manju et al. 2006). Hence, ginger treatment reduces the risk of cancer by antioxidative compounds.

For instance, it has been identified that the terpenoids, compound of ginger, induce apoptosis in uterus cancer cells via the activation of tumor protein p53. Water and organic solvent extracts of ginger reported to show anticancer activities in THP-1 AMoL cells in vitro. These reports show that ginger has anticancer activity (Prasad and Tyagi 2015).

Ginger constituents ([6]-gingerol, [10]-gingerol, [6]-shogaol, and zerumbone) show anticancer effects. They are effective against many cancers (Habib et al. 2008). Habib et al. (2008) reported that ginger extract inhibits liver carcinogenesis in wistar rat through the downregulation of elevated NF-κB and TNF-α. Hence, ginger may act as an anticancer agent, which may be helpful in treatment of cancer subjects. Ginger ingredients inhibit the development of diethylnitrosamine-(DEN-)

**Table 2** Effect of ginger and its compounds on different cancer subjects

| S. no. | Ginger extract/ compounds of ginger | Study type | Subjects | Dose | Potential mechanisms | Reference |
|---|---|---|---|---|---|---|
| 1 | Ginger ethanolic extract | *In vivo* | Wistar rats | 50 mg/kg | NADH dehydrogenase activity elevated | Ali et al. (2008) |
| 2 | Ginger extract | *In vitro* | HepG2 human hepato-cellular carcinoma cells | 1.11 mg/mL | Increasing the level of ROS levels increased and elevated p53 levels, thus promoting apoptosis | Li et al. (2013) |
| 3 | 6-gingerol | *In vitro* | He La human adenocarcinoma cervical cells | 60, 100, and 140μM | Cyclin A, cyclinD1, and cyclin E1 levels decreased, and caspase levels increased | Zhang et al. (2017) |
| 4 | 10-gingerol | In vitro | Human and mouse breast carcinoma cells | 50, 100, and 200μM | Cell growth and cell division are reduced | Bernard et al. (2017) |
| 5 | 6-gingerol,10-gingerol,6-shogaol, and 10-shogaol | *In vitro* | PC-3 human prostate cancer cells | 1,10, and 100μM | Inhibiting prostate cancer decreased, and the expression of MRP1 and GSTπ are lowered | Liu et al. (2017) |
| 6 | 6-shogaol | *In vitro* | LNCaP, DU145, and PC-3 human prostate cancer cells | 10, 20, and 40μM | Cyclin D1, surviving, c-Myc, and Bcl2 expression are decreased Inhibition of STAT3 and NF-κB signals | Saha et al. (2014) |

induced premalignant phenotype in rat hepato-carcinogenesis. It has been reported that supplementation of ginger prevented decrease of the content of metallothionein and endostatin in the liver and elevated the growth factors induced by the carcinogen in wistar albino rats. Ginger also reverses the altered serum-hepatic tumor markers (Mansour et al. 2010).

Wang et al. (2008) reported that beta-elemenean compound of ginger induces caspase-3, −7, −9 activities, decreases Bcl-2 expression, which releases cytochrome c, and elevated the levels of cleaved caspase-9 and poly (ADP-ribose) polymerase in cells. Application of ginger extract to mouse skin afforded significant inhibition of TPA-caused epidermal edema (56%) and hyperplasia (44%) (Katiyar et al. 1996). Kim et al. (2005) also reported that ginger induces programmed cell death in cell lines. Ethanol extract of ginger has antitumor-promoting effects in mouse skin tumorigenesis model, and it was concluded that animals pretreated with ginger showed depleted tumor compared with unginger-treated rats.

Zingerone with a dose of 100 mg mL suppressed LPS-induced NF-kB activities in cells. Dietary zingerone reduces proinflammatory cytokines. This study reports zingerone anti-inflammatory activity due to suppressing the activation of NF-kB, production of IL-1b, and the infiltration of inflammatory cells (Ganaie et al. 2019). Ganaie et al. (2019) also reported the anticancer effect of zingerone due to activation of cytochrome P4502E1 and suppression of NF-kB-p65, iNOSCOX-2, and PCNA in cancer subjects.

Zerumbone, seen in ginger, shows antiproliferative and anti-inflammatory effects and mediates its activity through the modulation of NF-kB activation (Takada et al. 2005). Zerumbone also inhibits the activation of NF-kB, and this inhibition may provide basis for the prevention and treatment of cancer. The antihepato-carcinogenic effect of zerumbone was due to suppression of PCNA and elevation of Bax and depletion of Bcl-2 protein expression (Gross et al. 1998). Hence, zerumbone may act as anticancer agent in liver cancers (Fuzer et al. 2017). Fuzere et al. (2017) reported that zerumbone induces the phase II detoxification enzymes depletion in rat liver epithelial cell line RL34. Hence, Zerumbone may act as a potential activator for the Nrf2-dependent detoxification pathway and provides a new insight into cancer management (Tsuboi et al. 2014) (Figure 5).

## Ginger-Bioactive Compound: Gingerol and Its Anticancer Effects

Gingerols are part of the phenolic compounds and volatile organic compounds of ginger. 4-, 6, 8-, 10-, and 12-gingerol are types of gingerol. 6-gingerol is the main compound which is responsible for the strong aroma of ginger. The biological properties of gingerols are antimicrobial, anticancer, antioxidant, anti-inflammatory, and antiallergic (Akinyemi et al. 2015).

6-gingerol has been identified to show anticancerous effects. Gingerol helps in the suppression of the hyperproliferation, inflammatory processes, and transformation that engaged in various steps of angiogenesis and metastasis. For instance, through the activation of CD8+ T cells, it inhibited B16F10 melanoma cells of pulmonary

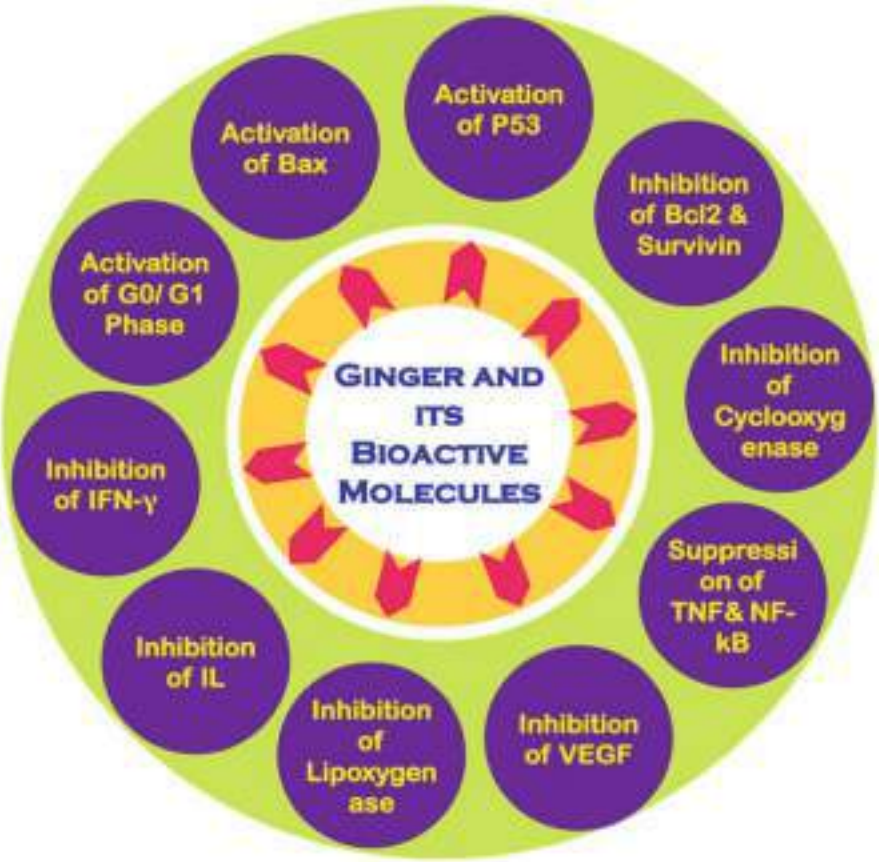

**Figure 5** Suppression of tumors markers by ginger and its compounds

metastasis in mice. Antitumoral activity showed by 6-gingerol through induction of reactive oxygen species (ROS) which, trigger p53 activation, apoptosis, and arrest the cell cycle (Lee et al. 2008). The study found that 6-G induced arrest of the cell cycle in both cell lines by reducing the expression of cyclin A and CDKA. In addition, Radhakrishnan et al. (2014) reported that 6-G induced cell death by apoptosis in the cell line with the mutated p53 gene. [6]-gingerol stimulated death receptor-mediated apoptosis in glioblastoma cells or p53-mediated apoptosis in skin tumor cells (Nakamura et al. 2004).

6-gingerol demonstrates an important potential to treat pancreatic cancer and has been shown to have a potential inhibitor of metastasis in *in vitro* and *in vivo* studies by different mechanisms, including a reduction in the expression of MMP and inhibiting angiogenesis (Kim et al. 2005). 6-gingerol targets many cellular molecules which promote cancer, for cell survival, cell proliferation, invasion, and angiogenesis. 6-Gingerol supplementation alters STAT3, NF-κB, Rb, MAPK, Akt, ERK,

PI3K, and caspase-3/7, cIAP1. Thus, gingerol treatment may modulate molecular targets of cancer components, so gingerol may have the therapeutic potential for preventing and treating many cancers.

*In vitro* and *in vivo* analysis of [10]-gingerol has been reported against the metastatic triple negative breast cancer (TNBC) [97]. In addition, it was experimented that 10-gingerol inhibits cervical cancer (Zhang et al. 2017). A study carried out by Martin et al. (2017) showed the anticancer activity of 10-G *in vivo* and *in vitro* in triple negative breast cancer models through proapoptotic activity and the inhibition of metastasis. The activity of 10-G in vitro was dose dependent, finding that at the highest concentration (100μM) colony formation was completely inhibited and extensive cell death occurred. 10-gingerol caused a considerable upsurge in the initiation of caspase-3 and inhibited orthotopic tumor growth of spontaneous breast cancer metastasis. Zhang et al. (2017) reported that 10-gingerol inhibits metastasis to multiple organs like lung, bone, and brain.

## Therapeutical Potential of Gingerol and Its Effect on Metabolic Pathways in Cancer

Anticancer mechanisms of gingerol include free radical scavenging effect, antioxidant effect, modulation of various enzymes of inflammation, modulation of cell cycle proteins, induction of apoptosis, and arrest the cell cycle at G2/M phase in carcinoma which will provide basis for inhibition of tumor progression in experimental animals. TNF-α, IL-6, NF-κB, cyclooxygenase-2 COX-2, and caspase-3 are the most important cancer metabolic factors.

### Free Radical Scavenging and Antioxidant Activity of Gingerol

Gingerol possesses antioxidant activity due to their free radical scavenging activity. It has been investigated that gingerol may modulate the antioxidant enzymes and suppress the lipid peroxidation products in cancer subjects. Hence, gingerol may prevent the pathogenesis of cancer-related disorders by its free radical scavenging activity. Alsahli et al. (2021) reported anticancer activity of gingerol in colon cancer, breast cancer, by elevating antioxidant enzymes and depleting lipid peroxidation in cancer condition.

### Effect of Gingerol on Apoptotic Genes

Apoptosis is one of the prerequisites to maintain the normal and healthy internal milieu. Alteration in the normal process of apoptosis may raise cell survival and support the tumor growth and progression (Kim et al. 2005). Gingerol plays a vital role in the elevation of different proapoptotic genes and at the same time depletion of the antiapoptotic genes and by this way balances the apoptosis process. An interesting study showed that gingerol induces apoptosis in scleroderma lung fibroblasts without affecting normal lung fibroblasts. Furthermore, gingerol has shown an antitumor activity and was involved in the apoptosis induction and the modulation of key apoptotic proteins such as Bax and bcl-2 (Yu et al. 2011).

A study has reported that growth arrest and apoptosis of B cell lymphoma occur through the downregulation of c-myc, bcl-XL, and p53 with the treatment of gingerol. Another report in human breast cancer cell line showed that CD437 induces G0-G1 arrest and apoptosis via regulation of p21WAFI/CIPI, Bcl-2, and Bax in a p53-independent manner after treatment with gingerol. Another study on p53-null cells, as well as TR9-7 cells, reported that gingerol induces apoptosis in tumor cells via a p53-dependent pathway, and Bax acts as downstream effectors of p53.Gingerol induces apoptosis in a range of tumor cell lines through activation of caspase-3, cytochrome c release, and depletion of bcl-2 (de Lima et al. 2018).

Gingerol has shown an apoptotic effect by inhibiting various genes such as proteintyrosine kinase, protein kinase C, c-myc mRNA expression, and bcl-2 mRNA expression and also mitochondrial pathway. Earlier studies have shown that gingerol possesses an apoptotic activity in different types of cancer cells such as human colon cancer cells, stomach, and skin tumors, breast cancer cells, and prostate cancer cells (Nakamura et al. 2004). Gingerol may lower the incidence of various cancers and also induce apoptosis in MBT-2 cells and G2/M arrest of T24 cells (Park et al. 2014). Experimental studies showed that the downregulation of the expression of antiapoptotic protein occurs with gingerol treatment (Nakamura et al. 2004).

### Effect of Gingerol on Tumor-Suppressor Genes

Tumor-suppressor genes play a vital and significant role in the inhibition of cancer formation and its progression. An alteration or mutations may occur in a gene, then tumor suppressor gene loses its ability to perform normal function and it transforms into tumor gene. p53 is one of the important suppressor genes, and it is the guardian of all genes and regulates the various cellular and molecular pathways and prevents the formation of cancer.

Numerous *in vivo* and *in vitro* reports showed that gingerol has a significant role in cancer prevention or inhibition. Another study showed that gingerol downregulates the expression of p53, as well as the survival genes egr-1,c-mycandbcl-XL in B cells. Another report also indicated that gingerol inhibits cell cycle progression of immortalized human umbilical vein-endothelial cells via upregulating the CDK inhibitors p21WAF1/CIP1, p27KIP1, and p53 (Park et al. 2014).

Another tumor-suppressor gene, phosphatase and tensin homolog deleted on chromosome ten (PTEN), has a role in the progression of the cell cycle and apoptosis. The alteration or mutation of PTEN gene has been noticed in several types of cancers. A study of the gingerol has shown that PTEN increases the gingerol-induced apoptosis, whereas inactive PTEN decreases/inhibits the gingerol-induced apoptosis.

In mice, [6]-gingerol suppressed the promotion of skin cancer. Park et al. (Park et al. 2014) reported that [6]-gingerol inhibited TPA skin tumor promotion in addition to the inhibition of epidermal ornithine decarboxylase activity in ICR mice. In a study, Surh et al. [1999] reported antitumor-promoting properties of both [6]-gingerol and [6]-paradol. [6]-gingerol treatment attenuated the skin

papilloma genesis and inhibited the tumor-promoter genes, TNF-alpha production, and activation of epidermal ornithine decarboxylase in ICR mice (Nakamura et al. 2004).

### Effect of Gingerol on Cycloxygenase Enzyme

COX is an inducible enzyme in the conversion of arachidonic acid to prostaglandins (PGs). There are two types of cyclooxygenase COX-1 that play a vital role in physiological functions and COX-2, an enzyme responsible for inflammation and pain. COX-2 is upregulated or overexpressed in various types of cancers (Pournaderi et al. 2017). It was previously stated that gingerol inhibits the critical stage of tumor initiation and promotion stages and COX inhibition. Gingerol also inhibits the COX2 expression on colon cancer cell lines (Nonn et al. 2007). Previous reports states that gingerol plays an important role in the downregulation of the expression of COX-2 and finally suppresses the cancer progression (Kim et al. 2005). Gingerol plays a significant role in the cancer prevention via controlling the activities of various genes in the initiation, promotion, and progression stage of tumor development and progression.

### NF-κB and Gingerol in Cancer Prevention

NF-κB family of transcription factors shows an important role in immune, inflammatory response and also stimulates the development and progression of cancer. In this regard, an important study demonstrated that gingerols have anticancer, antioxidant, and anti-inflammatory effects via the downregulation of the transcription factors NF-κB, AP-1, and Egr-1 (Han et al. 2002) and repression of the genes for cell adhesion molecules (chemokines, TNF, Cox-2, and MMP-9). Another study showed that gingerol has been involved in the suppression of NF-κB activation and NF-κB gene products (Plummer et al. 1999). An important study in pancreatic cancer cells reported that gingerol shows a vital role in the suppression of NF-κB activation by inhibiting IκB kinase, ultimately induces IκBα phosphorylation, and inhibits the NF-κB downstream gene expression. [6]-gingerol inhibited both the vascular endothelial growth factor (VEGF) and basic fibroblast growth factor (b-FGF)-induced proliferation of human endothelial cells and caused cell cycle arrest in the G1 phase (Vijaya Padma et al. 2007). Recently, anticancer and anti-inflammatory potential of 6-gingerol was reported by inactivating NF-kB through the suppression of the proinflammatory TNF-alpha (Kim et al. 2005; Habib et al. 2008). Numerous studies have shown that gingerol is a potent inhibitor of NF-κB activation.

Kim et al. (2005) reported that 6-gingerol regulates tight junction-related proteins and suppresses invasion and metastasis of pancreatic cancer cells. 6-gingerol mediated through NF-κB inhibition via inhibition of the extracellular signal-regulated kinases (ERK) pathway. Thus, 6-gingerol suppresses the invasive activity of PANC-1 cells.

### Impact of Gingerol on Angiogenesis

Angiogenesis is a complex process involving widespread interaction between the cells, soluble factors, and ECM components. During cancer development, tumor growth is triggered by many signals in chain reaction manner. In cancer formation, there are stages and angiogenic factors such as vascular endothelial growth factor (VEGF), basic fibroblast growth factor (bFGF), angiogenin, transforming growth factor (TGF-α, TGF-β), and epidermal growth factors, which play vital role in tumor angiogenesis through cancerous tumor cells by releasing molecules and sending signals to surrounding normal host tissue. VEGF is a crucial survival factor for endothelial cells in the process of physiological, tumor angiogenesis, and it induces the expression of antiapoptotic proteins in the endothelial cells (Shukla and Singh 2007). Many reports showed that many medicinal plants suppress the VEGF and other factors of cancer. We also reported that gingerol is best inhibitor of VEGF in different types of cancer (Weng et al. 2010).

*In vitro* studies on hepatic cancer cell lines conducted so far have demonstrated that ginger suppressed the growth of human hepatic cancer cell lines by inhibiting the phosphorylation of tyrosine-kinase receptor IGF-1R, inducing apoptosis by activating Caspase 9 and downregulating Bcl-2 and cyclooxygenase-2 (COX-2), modulating the levels of VEGF and its receptor (VEGFR-2), NF-κB, p53, and extracellular signal-regulated kinase 1/2 (ERK1/2), reducing the expression of lipogenic enzymes, certain types of RTKs, and their downstream pathways, and activating adenosine monophosphate-activated protein kinase (AMPK) and ROS-mediated lysosomal membrane permeabilization. Based on various liver carcinogenesis animal models with the intake of ginger, the inhibition of hepatoma growth, restriction of hepatic cancer cell line progression, and activation of apoptosis were observed; the probable mechanisms behind might be associated with suppression of hepatocyte progenitor cell/stem cell population, activation of AMPK protein in the liver, and modulation of self-renewal pathways and their related genes. *In vitro* and *in vivo* studies reported that gingerol suppresses the proliferation of human vascular endothelial cells and also abrogates the FGF-2-induced angiogenic response. Moreover, gingerol has the ability to inhibit both VEGF and its receptor in various cancer types; it might be useful as an antiangiogenic agent. Hence, gingerol acts as anticancer agent against many cancers through suppressing proliferation, angiogenesis, NF-κB, and NF-κB-regulated gene products.

## Conclusion and Future Perspectives

Cancer is one of the deadliest diseases and a major health problem in the world. The present modes of treatments like chemotherapy and radiotherapy are very expensive and also exhibit many side effects in cancer patients. Ginger and its bioactive compounds are used to treat cancer. Gingerol a bioactive compound of ginger has been shown to target multiple signaling molecules in cancer metabolism and provides a basis for its therapeutic applications for cancer subjects. Moreover, most of

the known activities of gingerol are based only on *in vitro* and *in vivo* studies, and some clinical studies in human subjects. Therefore, more extensive and well-controlled animal and human studies are required to demonstrate efficacy of gingerol and other compounds of ginger against cancer.

## ABSTRACT

*The present study was designed to explore the hypolipidemic and hepatoprotective effects of Phyllanthus Niruri (PN) bioactive compound (-)-Epicatechin in D-galactosamine induced hepatitis in rats. Rats were distributed into normal controls (NC), (-)-epicatechin treated (Et), hepatitis control (Hc), hepatitis+ (-)-epicatechin (H+Et), hepatitis+silymarin treated (H+St). After 21 days of treatment, lipid peroxidation (MDA), total cholesterol (TC), triglyceride (TG), low-density lipoprotein cholesterol (LDL), very low-density lipoprotein cholesterol (VLDL), high-density lipoprotein cholesterol (HDL), bilirubin (BL), urea (UR), creatinine (CR) are estimated in serum. In D–galactosamine-induced hepatitis rats, we observed increased levels of MDA, TC, TG, LDL, VLDL, BL, and decreased levels of HDL, UR, CR. However (-)-epicatechin supplementation normalized all the lipid metabolic profiles and also hepatic stress*

*markers. Furthermore, histopathological examinations have also proved that (-)-epicatechin pre-treatment decreased the tissue damage in hepatitis conditions. This is the first reported data on the hypolipidemic activity of (-)-epicatechin. Our experimental findings indicate the potential benefits of (-) epicatechin in hepatitis conditions.*

**Keywords**: (-) Epicatechin, Hepatitis, Hypolipidemic activity, Hepatic damage, Rats.

Ageing is characterized by reduced skeletal muscle mass and increased adiposity. Physiological ageing is characterized by a gradual loss of cognitive performance, expressed as a decline in memory, reasoning, mental capacity, and spatial ability. In addition, age-related changes in body composition intrinsically connect with the biology of ageing resulting in frailty, dementia, Alzheimer's, diabetes, cardiovascular diseases, liver-related disorders. The proportion of the population over 65 years has been increasing worldwide, and low birth rate and longevity have contributed to this growth of the aged population. According to a report by United Nations, in the next 35 years, the number of people aged 60 and above around the world is projected to get more than double, reaching almost 2.1 billion people. Demographic projections also suggest that the world's 60+ population is expected to be around 2 billion by 2030, up from 900 million in 2015.

Hepatitis is a major cause of liver disease leading to many health consequences, like liver cirrhosis and hepatic carcinoma. There is also a global concern due to its high impact on the older population´s health in terms of mortality and morbidity (Fyiad *et al.,* 2012). World Health Organization reported 130 to 150 million people infected with hepatitis worldwide representing a global prevalence of 3 per cent (WHO, 2014).

A recent estimation showed that hepatitis infection was the tenth leading cause of death and accounted for 7,86,000 deaths each year around the world but the death rate for older people is higher when compared to younger people. (GBD, 2013). During hepatitis condition, several organs appear affected in aged people and liver being the worst affected organ. Hepatitis also alters protein, lipid, and

antioxidant enzyme systems. Hence, hepatitis remains a serious clinical challenge and a health problem of major concern.

There are several traditional medicines recommended for the treatment of hepatitis. It has been reported that many herbs and their bioactive compounds possess hypolipidemic, hepatoprotective, and other beneficial substances. In the present study, we selected *Phyllanthus niruri* as a therapeutic plant against hepatitis in old rats. PN contains a series of phenols, alkaloids, terpenoids, and tannins (Shanmugam *et al*., 2017), which are reported to show hepatoprotective, anti-hepatitis, anti-inflammatory, antidiabetic, antiviral, and other properties. (Baiguera *et al.,* 2018). PN contains many compounds like phyllanthin, hypophyllanthin, quercetin, geraniin, fraternusterol, gallocatechin, limonene, lupeol, phyllnirurin, cymene, estradiol, niranthin, mirphyllinastragalin, catechin, (+), (-)-epicatechin, catechin–3-o-gallate, epicorilagin, etc. Our study demonstrated that the administration of (-)-epicatechin may improve the damaged liver tissue in hepatitis rats. Interestingly, (-)-epicatechin treatment in aged rats ameliorated the hepatic tissue in hepatitis rats.

(-)-Epicatechin is a flavonol belonging to the group of flavonoids. (-)-Epicatechin is present in many plants. High quantities can be found in cocoa, tea, grapes, and phyllanthus. The present study was designed to explore the hypolipidemic and hepatoprotective effect of (-)-epicatechin in D-galactosamine-induced hepatitis in aged rats. This is the first study of the hypolipidemic and hepatoprotective effect of (-)-epicatechin in hepatitis-induced rats of the senile age group.

## Materials and Methods

### *Chemicals*

D-galactosamine were purchased from Sigma Chemical Co. (St. Louis, MO, USA) and all other chemicals obtained from Fisher Scientific (Pittsburg, PA, USA), Merck (Mumbai, India), Ranbaxy (New Delhi, India) and Qualigens (Mumbai, India).

### *Animals and Experimental Design*

Male Wistar rats (3000 ± 20 g) obtained from Indian Institute of Science, Bangalore, were kept under standard laboratory conditions (temperature (27 ± 2°C), natural light-dark cycle (photoperiod of 12 h light and 12 h), and humidity 55–60 per cent. The rats were maintained on a standard pellet diet (M/s Hindustan Lever Ltd., Mumbai) and provided access to water *ad libitum*. The study design was approved by the animal ethical committee (Resolution No. 10/08/a/CPCSCA/IAEC/SVU/09–10/ZOOL/KRS/Dt.25.09.2009). After 7 days of acclimatization, animals were divided into five groups of six rats each.

*Group I Normal Control (NC):* Old rats received saline for 21 days and served as normal control.

*Group II Bioactive ((-)-Epicatechin) compound control treatment (Et):* old rats were given bioactive compound of *Phyllanthus niruri* ((-)-epicatechin–50 mg/kg b/w) for 21 days.

*Group III Hepatitis Control (Ht):* A single injection of D-galactosamine (800 mg/kg b/w) was given intraperitoneally to the old rats for the induction of hepatitis 48 hours before sacrifice.

*Group IV Hepatitis + Bioactive compound ((-)-Epicatchin–50mg/Kg b/w) treatment (H+Et):* Pre-treatment of (-)-epicatechin was administered orally to the old rats for 21 days and a single injection of D-galactosamine (800 mg/kg b/w) was given intraperitoneally for the induction of hepatitis 48 hours before sacrifice.

*Group V Hepatitis + Silymarin treatment (H+St):* Pre-treatment of standard drug silymarin (100 mg/kg b/w) was administered orally to the old rats for 21 days and a single injection of D-galactosamine (800 mg/kg b/w) was given intraperitoneally for the induction of hepatitis 48 hours before sacrifice.

After 21 days of treatment, all the aged rats were sacrificed for blood sampling and serum was separated and frozen at –80EC for further analysis.

### *Estimation of Lipid Metabolic Profiles*

Total cholesterol, triglyceride, low-density lipoprotein cholesterol, very-low-density lipoprotein cholesterol, and high-density lipoprotein cholesterol were estimated in the serum using kit methods.

### *Estimation of the thiobarbituric acid reactive substances TBARS*

The extent of serum lipid peroxidation in terms of thiobarbituric acid reactive substance formation was measured as described by Ohkawa *et al.,* (1979).

### *Estimation of Serum Markers*

The biochemical parameters like bilirubin (BL), urea (UR), creatinine (CR) were measured in serum by using commercially available kits following the manufacturer′s protocol.

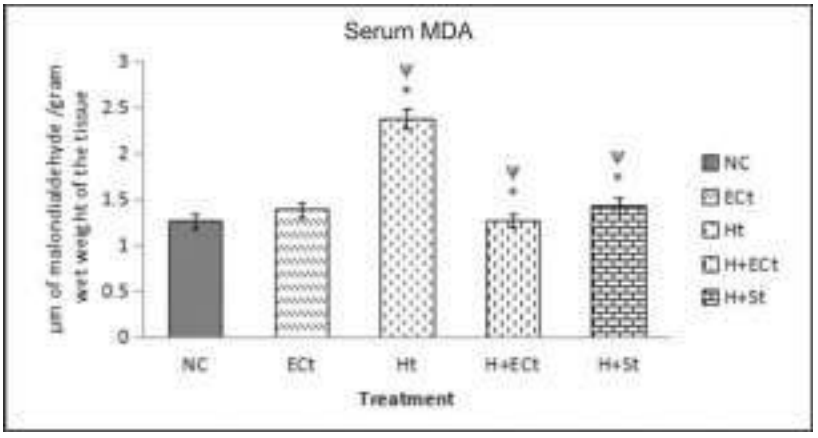
### *Protein Estimation*

Protein content was estimated by the method of Bradford, (1976).

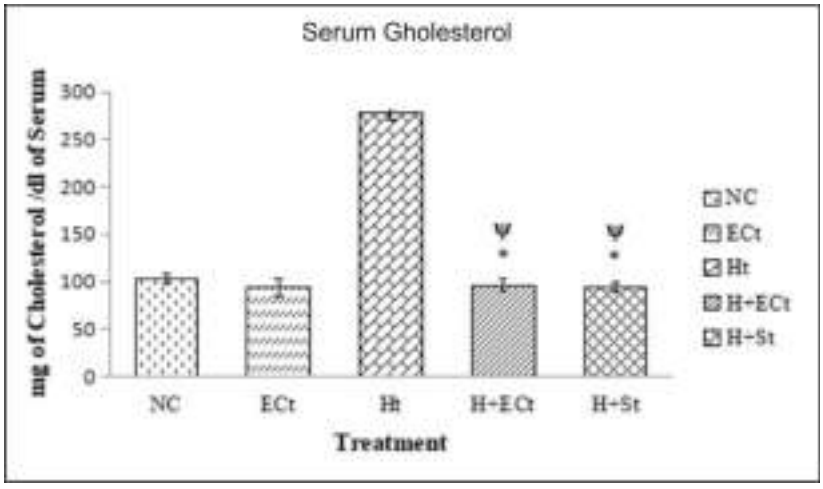
### *Statistical Analysis*

Results are expressed as means ± standard deviation (SD). Variance analysis was done with Duncan's multiple comparison Tests on data were carried out using the SPSS (Version 15; SPSS Inc., Chicago, IL, USA) and M.S. Office, excel software for the significance of the main effects (factors), and treatments along with their interactions. Statistical significance was set at $P < 0.05$. The p-values are presented with obtained data.

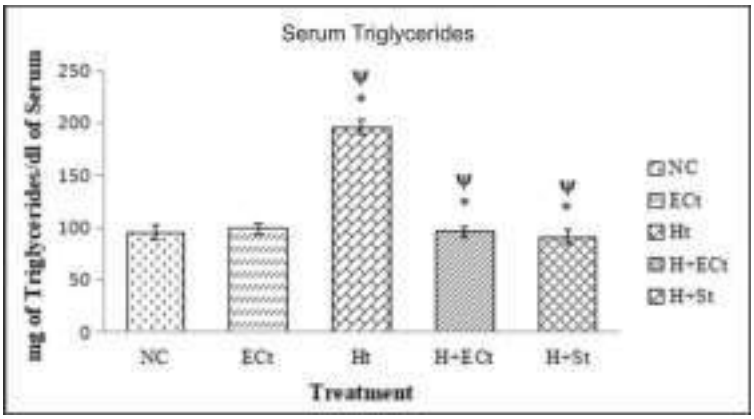
## Results



### *Effect of (-)-Epicatechin on Lipid metabolic Profiles*



In this study, the lipid metabolic profiles total cholesterol, triglycerides, LDL, VLDL levels are increased and HDL levels are decreased in the serum of aged hepatitis subjects. However, with (-)-epicatechin pre-treatment in old-aged hepatitis rats, these lipid metabolic profile levels came near to normal levels. (Figure 1). Insert here



MDA levels are also upregulated in aged hepatitis rats. However with (-)-epicatechin supplementation MDA level downregulated in aged hepatitis rats. (Figure 1).

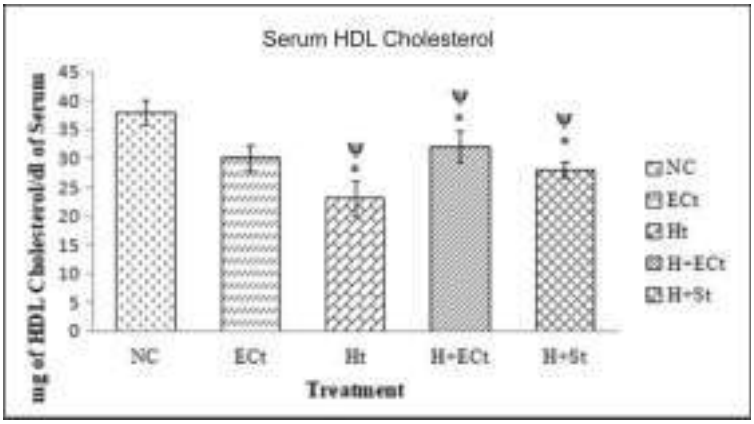


**Figure 1**

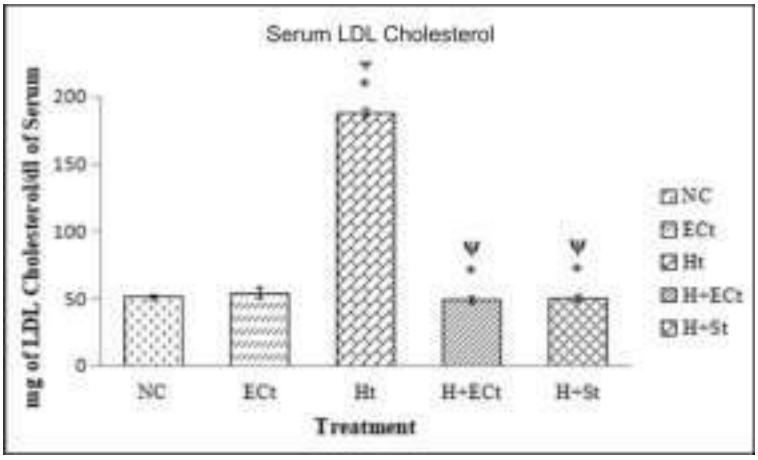

*Effects of (-)-Epicatechin and silmyrin on Lipid Metabolic Profiles (MDA, Cholesterol, Triglycerides, HDL, LDL & VLDL) levels in the serum of aged hepatitis rats. Data are expressed as means ± SD (n = 6). * The values are significant compared to the following: control (* p < 0.001), hepatitic (*p < 0.01) (Dunnett's multiple comparison test).*

### *Effect of (-)-Epicatechin on BL, UR & CR in Hepatitis Rats*

In the present investigation, urea (UR) and creatinine (CR) levels decreased and bilirubin (BL) levels increased in aged hepatitis rats. Whereas with (-)-epicatechin supplementation in old hepatictic rats, we observed elevated levels of UR & CR and depleted levels of BL suggestive of hepatoprotective effect of (-)-epicatechin.

**Table 1**

*Effect of (-)-Epicatechin on Serum markers (BL, Urea, Creatinine) in aged hepatitis rats*

| *Groups* | *Bilirubin (mg/dL)* | *Urea (mg/dL)* | *Creatinine (mg/dL)* |

All the values are means ± SD of six individual observations.
* Significant at $p < 0.001$ with respect to normal control.

## Discussion

Increasing evidence indicates that oxidative stress causes liver injury, cirrhosis development, and carcinogenesis (Farzaei *et al*., 2018). The present study was focused on investigating the hypolipidemic role of (-)-epicatechin against D-galactosamine-induced hepatitis and finding its possible mode of action in aged hepatitis rats.

The liver is the major site of cholesterol and phospholipid synthesis and metabolism. Lipid-related abnormalities are most common in hepatitis conditions. Alterations in lipid metabolism have been reported in D-GalN induced hepatitis conditions in rats. In this study, we observed elevated levels of MDA, total cholesterol, triglycerides, LDL, VLDL, and reduced levels of HDL in old hepatitis rats, when compared to control rats. These lipid disorders are due to alterations in lipid metabolism in hepatitis.

Malondialdehyde (MDA) is a natural metabolic product of lipid peroxidation. In this study, we observed higher levels of MDA in old hepatitis rats. But pre-treatment with the (-)-epicatechin protected the liver from D-galactosamine-induced hepatitis. This may be due to the suppression of toxic free radical production during hepatitis conditions. Hence, with (-)-epicatechin pre-treatment, MDA levels decreased in old hepatitis rats. This is the first reported data on the effect of (-)-epicatechin on MDA in aged hepatitis rats.

Higher levels of LDL, VLDL are due to decreased activity of lipoprotein lipase. Increased VLDL levels in old hepatitis rats are due to the increased concentration of free fatty acids. These lipid abnormalities in hepatitis rats may be due to alterations in lipid metabolism. Numerous studies have reported the increased levels of LDL, VLDL, and reduction in the HDL levels during D-galactosamine-induced liver injury (Arain *et al.,* 2017). Lipid disorders, most often encountered in liver diseases also include increased levels of LDL and VLDL (Arain *et al.,* 2017). (-) Epicatechin may reduce the activity of lipoprotein lipase in old hepatitis conditions. This may cause a reduction in LDL, VLDL levels in hepatitis rats. (-)-Epicatechin treatment has a profound effect on the lipid and lipoprotein metabolism in aged hepatitis rats. So, LDL, VLDL decreased with (-)-epicatechin in old-aged hepatitis rats.

HDL one of the beneficial lipoprotein (Brown *et al.*, 2010), could be helped through the scavenging of cholesterol from the extrahepatic tissues. In our study, we reported decreased levels of HDL in old hepatitis rats. HDL depletion might be attributed to an alteration in lipoprotein lipase and LCAT activity during hepatitis conditions. However, with (-)-epicatechin pre-treatment HDL levels are increased in old hepatitis rats. These alterations may be due to the hypolipidemic effect of (-)-epicatechin. Hence, all the lipid metabolic profiles MDA, TC, TG, LDL, VLDL, HDL are normalized with (-)-epicatechin supplementation in hepatitis condition.

Bilirubin, urea, and creatinine are indicators of liver function because a majority of proteins are synthesized in the liver. In this study, we reported that urea, creatinine levels are decreased and total bilirubin levels increased in old hepatitis rats. It shows the hepatotoxicity in hepatitis rats, supporting the previous study of Arvind Kumar and Sangeeta 2017. In hepatitis condition, the liver cell is unable to excrete bilirubin, urea, creatinine and therefore all these substances are mixed in the serum (Ibid.). So, higher total bilirubin (BL) levels are reported in hepatitis rats.

An increase in BL in hepatitis rats appears indicative of hepatic cell damage and disturbance of hepatocellular functions. As a result, BL levels increased in aged rats in contrast to decreased CR level and UR levels. Depletion in CR levels might be due to increased production of free radicals and a decrease in the breakdown of creatinine phosphate during the hepatitis condition. UR levels might have decreased due to the failure of the liver to convert amino acids and ammonia to urea. There are several reports on the depletion of urea during hepatitis conditions (Glavind *et al.*, 2016). D-galactosamine induction may alter the urea cycle and lead to depletion of urea in hepatitis rats. Whereas (-)-epicatechin pre-treatment urea, creatinine levels elevated and bilirubin levels depleted in old hepatitis rats. This may be due to the modulation of serum markers by (-)-epicatechin in old hepatitis rats. (Table 1).

## Conclusion

This is the first reported data on the hypolipidemic and hepatoprotective effect of (-)-epicatechin in hepatitis conditions. In

conclusion, (-)-epicatechin bioactive compound isolated from *Phyllanthus niruri* shows hypolipidemic and hepatoprotective effects against hepatitis in aged rats. But, the mechanism of its protective and hypolipidemic action is not known. Further studies are, therefore needed to know the mechanism and other related metabolic pathways alterations by (-)-epicatechin in aged hepatitis condition.

# Effect of *Ocimum sanctum* in Sodium fluoride (NaF) induced Fluorosis in Rats: A Study with Respect to Antioxidant Enzymes and Fluorosis Markers

**Kondeti Ramudu Shanmugam[1,*] Bhasha Shanmugam[2], Mavulapati Siva[2], Sahukari Ravi[2], Kesireddy Sathyavelu Reddy[2]**

[1]Department of Zoology, PRR & VS Government Degree College, Vidavalur, SPSR Nellore, Andhra Pradesh, INDIA.
[2]Division of Molecular Biology and Ethnopharmacology, Department of Zoology, Sri Venkateswara University, Tirupati, Andhra Pradesh, INDIA.

## ABSTRACT

**Introduction:** Fluoride contamination was observed in groundwater's of India, Pakistan, China, Indonesia and several other countries. In India the states like Andhra Pradesh, Telangana, Rajasthan, Haryana etc are contaminated with fluoride. Approximately 68 million people are suffering from fluorosis in India. The current study was done to know the antioxidant effect, anti-fluorosis and free radical scavenging property of *Ocimum sanctum* (OS). **Methods:** Superoxide dismutase (SOD), glutathione peroxidase (GPx), glutathione (GSH), glutathione reductase (GR), glutathione-s-transferase (GST), catalase (CAT), malondialdehyde (MDA), alanine aminotransferase (AAT), alkaline phosphatase (ALKP), aspartate aminotransferase (AST) and flurosis markers phosphorus ($P_4$) and calcium (Ca) are estimated in all groups. 1,1-diphenyl-2-picryl hydrazyl radical (DPPH), hydroxyl radical, hydrogen peroxide ($H_2O_2$), Gas chromatography–mass spectrometry (GC-MS) was analyzed in methanolic extract of *Ocimum sanctum*. **Results:** SOD, GR, GSH, GPx CAT, activities and Ca levels are decreased in sodium fluoride (NaF) intoxicated rats. Whereas MDA, ALKP AST, AAT, and $P_4$ levels are increased in NaF rats. However, *Ocimum* phenolic fraction treatment normalized the antioxidant enzymes, hepatic markers and flurosis markers in NaF intoxicated rats. DPPH, $H_2O_2$ and hydroxyl radical of ocimum posses potent free radical scavenging activities. GC – MS studies of *Ocimum sanctum* showed the presence of many bioactive compounds like Caryophyllene oxide, 2-(2-Propenyl)-m-anisidine, 2H-Pyan-2-one, 5,6-Dihydro-4-(2-methyl-3-methylene-1-buten-4-yl etc. Further, histopathological observations prove that ocimum protects the hepatic tissue from NaF intoxication. **Conclusion:** Our study proves that *Ocimum sanctum* phenolic fraction protects the hepatic tissue from Na F induced fluorosis in rats.
**Key words:** *Ocimum sanctum*, Antioxidant Enzymes, Fluorosis markers, Liver markers, GC-MS analysis, Rats.

## INTRODUCTION

Fluorosis is a worldwide health problem resulting from excess consumption of fluoride through food products, ingesting water, and industrial contaminants over a long period. Fluorosis affects teeth, liver, bone, kidney and other parts of human body.[1,2] The major complications of fluorosis are dental fluorosisand skeletal fluorosis.

The practice of herbs to cure diseases was observed, since the dawn of civilization. Plant derived drugs are used to treat diseases like cancer, hepatitis, diabetes etc. The World Health Organization reported that traditional medicines like Ayurveda, sidda, unani use plant drugs to treat many health problems, because they are cheap and have no side effects.[3,4]

*Ocimum sanctum* is known as Tulasi. *Ocimum sanctum* has antiseptic, antimicrobial, anti-bactericidal, anti-inflammatory, antioxidant, antiulcer, anti-diarrheal and anti-diabetic

properties.[5-8] However, no study was carried on the anti-fluorosis property of *Ocimum sanctum*.

The aim of current study was to explore the anti-fluorosis, antioxidant activity of phenolic fraction of *Ocimum sanctum* in NaF toxicity rats. Our study is the first reported research investigation on the effect of phenolic fraction of *Ocimum sanctum* in fluorosis intoxicated rats.

## MATERIALS AND METHODS

### Collection of plant material and Preparation of extracts

Fresh and good *Ocimum sanctum* leaves are collected from Tirupati, A. P, India. The methanol extract of OS leaves are prepared as per the experimental protocol and was used for the study of free radical scavenging assay and GC MS analysis.

### Chemicals and reagents

The chemicals are purchased from Himedia, Merck and Sigma–Aldrich.

### Extraction of Phenols from *Ocimum Sanctum*

Phenolic fraction was extracted from *Ocimum sanctum* by the method of Magalhães *et al.* 2010.[9]

### Treatment Groups

The young rats are divided into five groups.

**Normal Control - Group I (NC):** Six rats were treated with saline (0.9% NaCl) for the period of 60 days.

**Ocimum Control - Group II (Ot):** Six rats were treated with *Ocimum sanctum* phenolic fraction (100mg/kgBW) for the period of 60 days.

**NaF treatment - Group III (Na F):** Six rats were treated with sodium fluoride (10mg/kgBW) dissolved in water for the period of 60 days.

**NaF + Ocimum treatment - Group IV (NaF+Ot):** Six rats were treated with fluoride and Ocimum phenolic fraction for the period of 60 days.

**Na F+ Vitamin treatment - Group V (NaF+Vit C):** Six rats were treated with fluoride and Vitamin C for the period of 60 days.

After completion of last treatment i,e after sixty days treatment the rats are sacrificed by cervical dislocation and the liver tissue was collected in ice cold condition at 4°C. The liver tissues are stored in deep freezer at -80°C and later liver tissue was used for the estimation of antioxidant enzymes and other parameters. Blood sample was collected and used for analysis of liver markers and fluorosis makers.

### Estimations of Antioxidant Enzymes

The antioxidant enzymes like superoxide dismutase (SOD), glutathione reductase (GR), glutathione –s–transferase (GST), glutathione (GSH), catalase (CAT), glutathione peroxidase (GPx), activities, and MDA levels were estimated by the methods of Misra and Fridovich,[10] Carlberg and Mannervik,[11] Akerboom and Sies,[12] Habig *et al.*,[13] Aebi,[14] Flohe and Gunzler,[15] Ohkawa *et al.*,[16] respectively.

Liver markers AST, ALT and ALP activities and Fluorosis markers Calcium, phosphorus levels are measured by standard kits.

### Estimation of Free radical scavenging activity

DPPH, hydroxyl radical and hydrogen peroxide ($H_2O_2$) radical activities of ocimum are estimated by the methods of Koleva *et al.*,[17] Halliwell *et al.*[18] and Rosen and Rauckman.[19]

### GC-MS Analysis for Bioactive compounds in *Ocimum sanctum*

The phytochemical compounds like polar, semi polar, nonpolar and other compounds are present in *Ocimum sanctum* are recognized by GC- MS instrument. Gas Chromatography (GC) peaks obtained for compounds in this study are coupled with Mass Spectroscopy (MS) and compound structures present in ocimum are searched in National Institute of Standard and Technology (NIST) library and their structures are drawn by using Marvin Sketch a Chemo informatics (*in silico*) tool.

### Histopathological studies

Liver tissue was immediately fixed in 4 % paraformaldehyde phosphate buffer solution, after collection and process, it is used to assess the histopathology.

### Statistical study

The results of our study are expressed as mean values ± standard deviation. Statistical comparison was carried with five groups by using one-way ANOVA with Dunnett's multiple comparison Test. Differences are considered significant at $p < 0.01$.

## RESULTS

### Free radical scavenging assay of *Ocimum sanctum*

DPPH activity expressed by methanolic extract and ascorbic acid are depicted in Figure 1. In the current study, *Ocimum* at the estimated concentrations showed significant DPPH scavenging activity, which shows free radical scavenging activity of *Ocimum sanctum*.

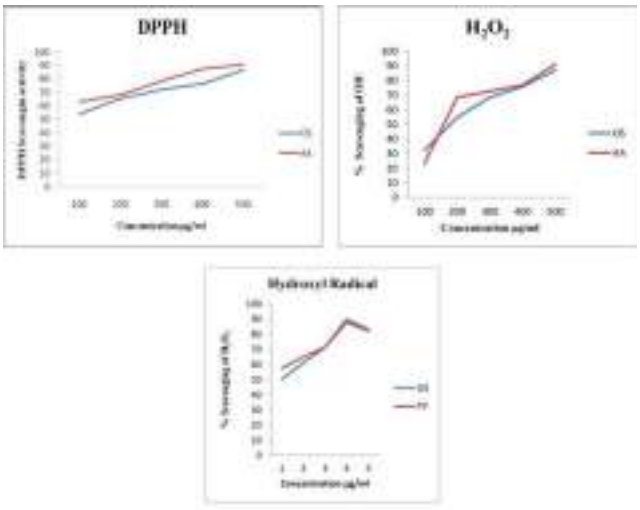

**Figure 1: Free radical scavenging activity (DPPH, Hydrogen peroxide and Hydroxy Radicals) of metaholic extract of *Ocimum sanctum* with ascorbic acid and α tocopherol as standards.**

The deoxyribose assay is a used to determine the hydroxyl radical activity of OS at different concentrations. (Figure 1). In the current study *Ocimum sanctum* at different concentrations posses significant hydroxyl radical scavenging potential.

Our results represents that the $H_2O_2$ scavenging activity of OS decreases than that of α-tocopherol. Hydrogen peroxide converts to water due to the antioxidant compounds in the methanolic extract of OS.

## GC–MS Analysis for phytochemical profile identification

GC–MS can discover many chemical compounds in the plants, food, and other samples. GC–MS analyse the structure of different bioactive compounds. In our analysis, we reported 14 compounds in *Ocimum sanctum* methanolic extract. GC–MS chromatogram reported the presence of bioactive compounds like 2H-Pyan-2-one, 5,6-Dihydro-4-(2-methyl-3-methylene-1-buten-4-yl, Tricyclo[6.3.3.0] tetradec-4-ene, 10,13-dioxo, Perhydrohistrionicotoxin, 2-methylthio-2-depentyl,Trans-Z-à-Bisaboleneepoxide,2-(2-Propenyl)-m-anisidine, Patchoulene, 1,2,4-Triazol-4-amine 5-methyl-3-(3,5-dimethylpyrazol-1-yl)-Naphthalene,1,2,3,4,4a,5,6,8a-octahydro-4a,8-dimethyl-2-(1-methylethenyl-, [2R-(2à,4aà,8aà)], Caryophyllene oxide, 9-Octadecenoic acid [Z], (tetrahydro-3-furanyi)methyl ester, 5-methyl-3-(3,5-dimethylpyrazol-1-yl), 7,10-Octadecadienoic acid, methyl ester, Z-10-Methyl-11-tetradecen-1-ol propionate, Nonadecanoic acid, 18-oxo-, methyl ester, 4-Piperi-dineacetic acid, 5-ethylidene-2-[3-(2-hydroxyethyl)-1H-indol-2-yi]-à methylene-, methyl ester, [2S-(2à, 4à, 5E)]. (Figure 2, 3 and Table 1).

## Effect of Phenolic fraction of *Ocimum* on Hepatic antioxidant enzymes in Sodium Fluoride treatment rats

In the current investigation, SOD, GPx, GR, CAT, activities, GSH levels are decreased in NaF intoxicated rats. However, with phenolic fraction of Ocimum supplementation in Na F rats, we observed significant elevation. But MDA content and GST activity are significantly increased in NaF intoxicated rats, however Ocimum supplementation decreased GST activity and MDA content in NaF rats. This shows the potential antioxidant effect of *Ocimum* (Figure 4).

## Effect of Phenolic fraction of *Ocimum* on Serum and Fluorosis markers in Fluorosis rats

In the present study, AST, ALT, ALP activities and phosphorus levels are elevated in sodium fluoride intoxicated rats. But Calcium levels depleted in NAF rats. This indicates severe liver injury in Fluorosis condition. However phenolic fraction of Ocimum for 60 days supplementation significantly altered all the liver parameters and fluorosis markers in fluorosis rats. (Table 2).

## Effect of Phenolic fraction of Ocimum on Liver tissue in Fluorosis rats

In this study, liver of normal rats and *Ocimum* treated rats exhibited normal central vein, hepatocytes and sinusoids. Where as in NaF rats, degeneration of central vein, hepatocytes and sinusoids are observed. However with Ocimum treatment for 60 days regenerated the central vein, hepatocytes and sinusoids in NaF toxicity rats. This study showed the hepatoprotective effect of Ocimum. (Figure 5).

# DISCUSSION

The current investigation was carried to know the pharmacological effect *of Ocimum sanctum* phenolic faction in NaF induced fluoosis in rats.

DPPH activity is one of the important free radical scavenging assay which actually depend on the 1,1-diphenyl-2-picrylhydrazyl, which decolorize in presence of antioxidants, such asantioxidant compounds in *Ocimum sanctum*.[20] The antioxidant compounds in *Ocimum sanctum* reacts with DPPH and convert it into1-1-diphenyl-2-picrylhydrazine and this scavenging activity was mainly depends on decolourization potential of methanolic extract of *Ocimum sanctum*. This assay have been used to estimate the free radical scavenging effect of

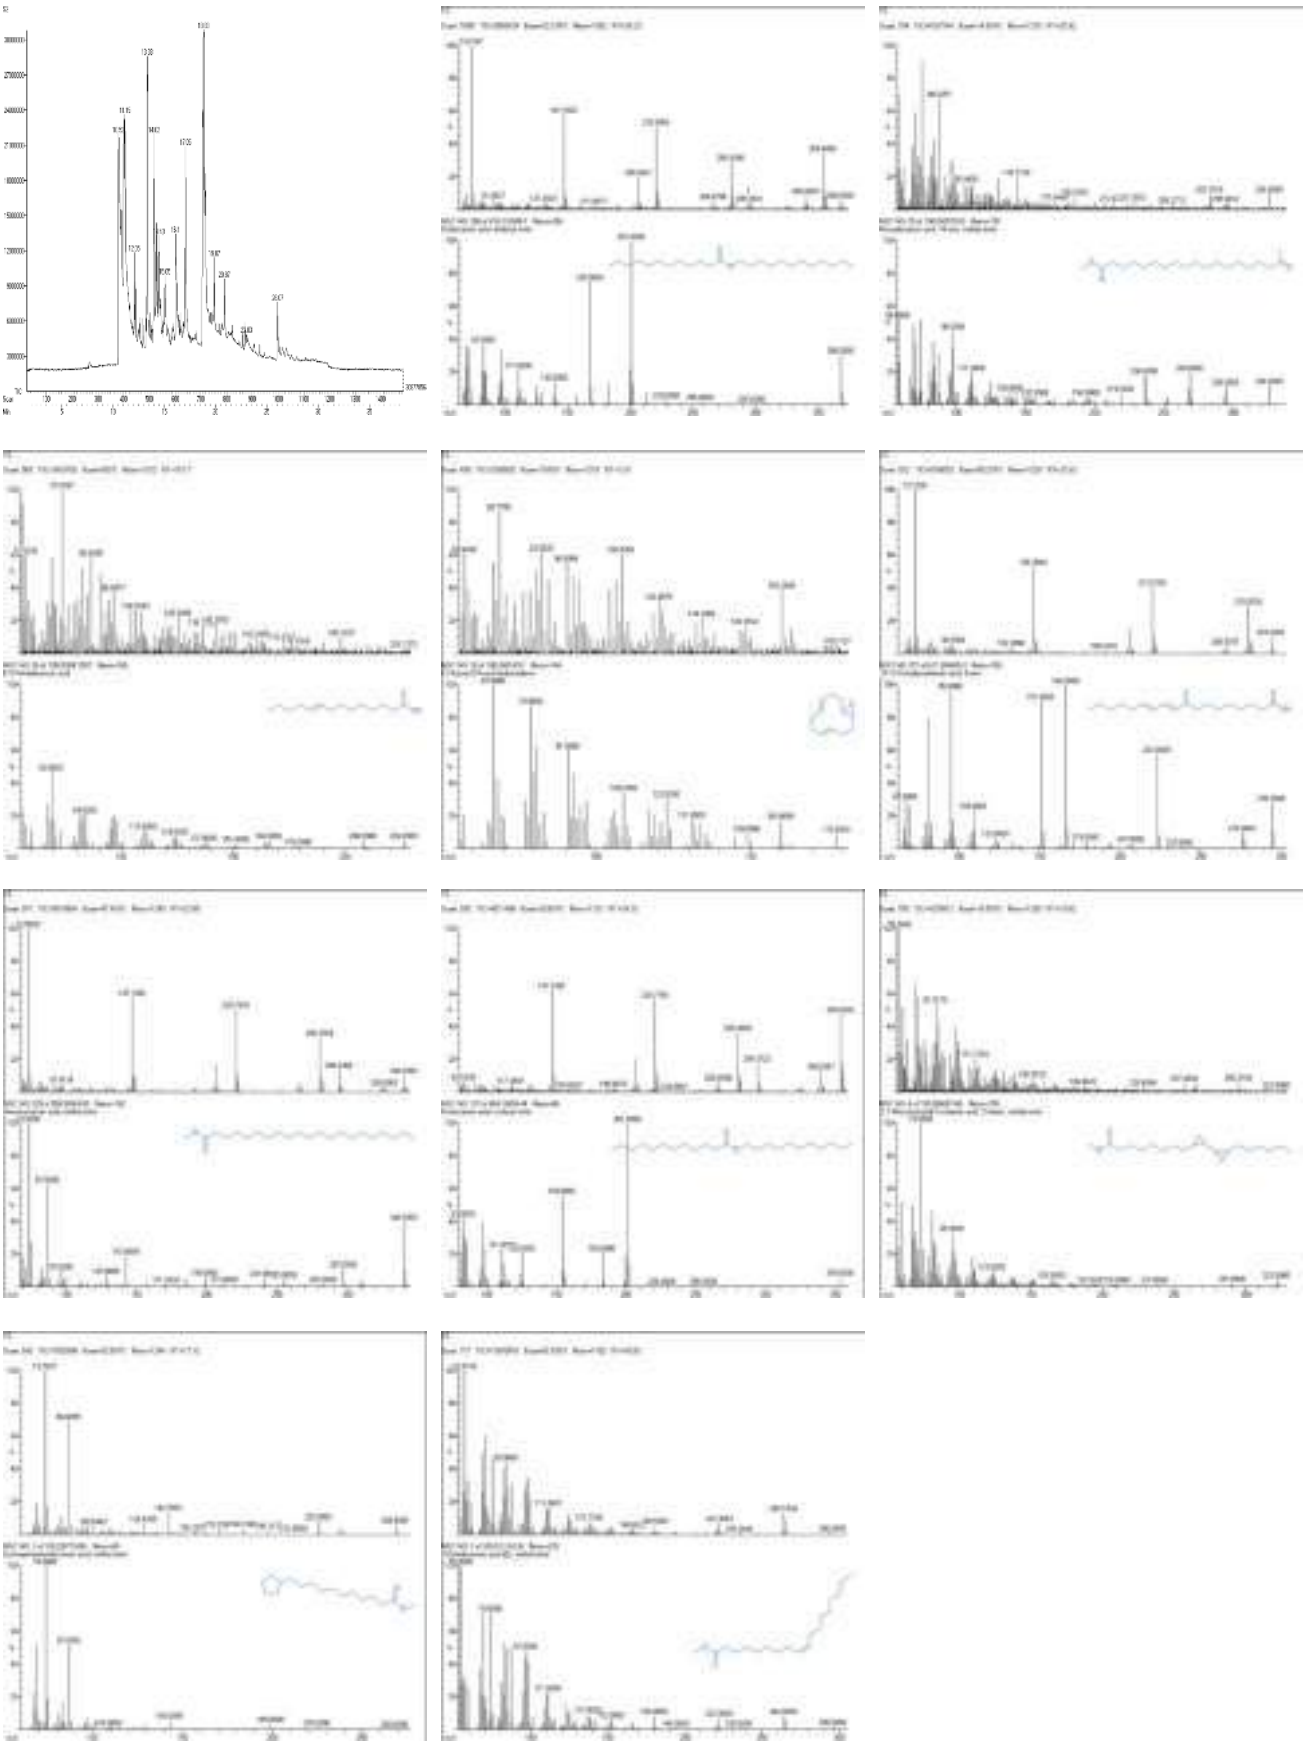

**Figure 2: Pictographic Diagram of GC-MS Analysis of *Ocimum sanctum***

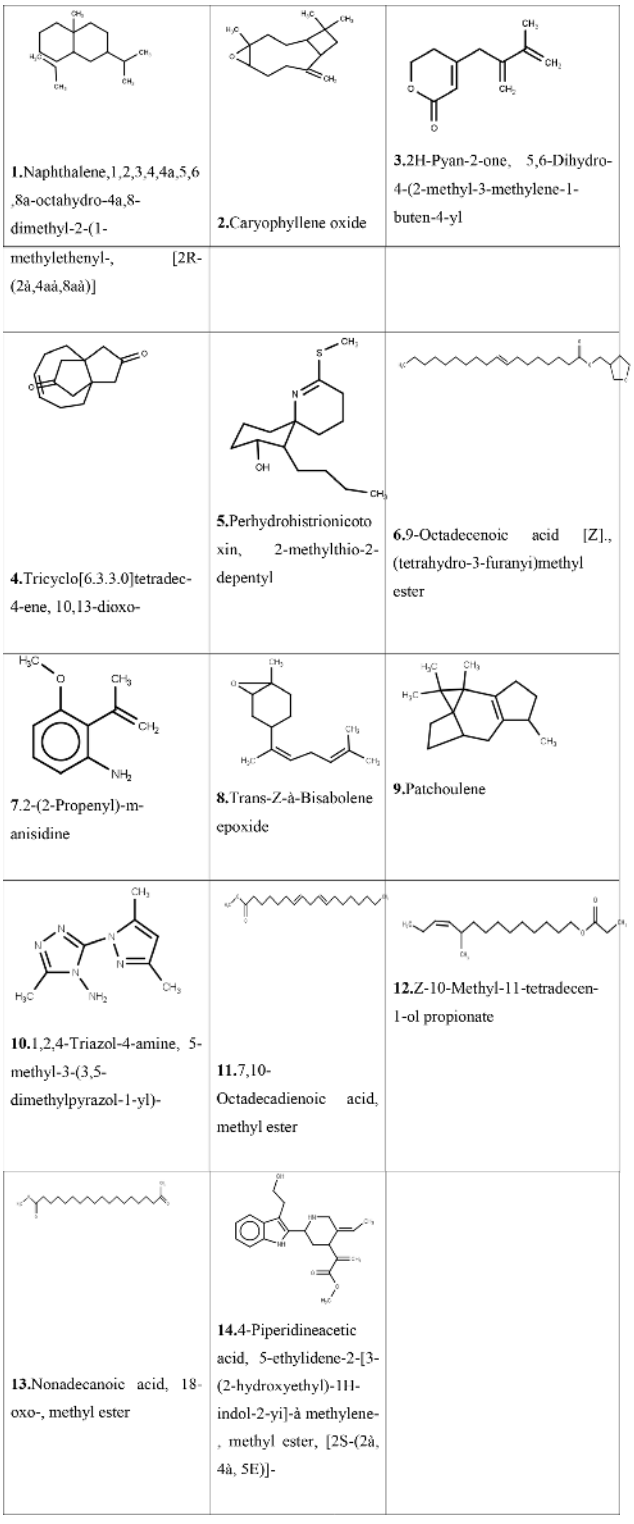

**Figure 3: Chemical structures of the Bioactive compounds of *Ocimum sanctum.***

many medicinal plants.[21] Antioxidant activity of *Ocimum sanctum* have been reported by many researchers.[22,23] The standard ascorbic acid exhibits significant DPPH activity than OS methanolic extract.

**Table 1: GC-MS Analysis of *Ocimum sanctum* showing the Bioactive compounds and their Molecular weights.**

| S.NO | Name of the Bioactive Compounds | R TIME | Molecular Weights |
|---|---|---|---|
| 1 | Naphthalene,1,2,3,4,4a,5,6,8a-octahydro-4a,8-dimethyl-2-(1-methylethenyl-, [2R-(2à,4aà,8aà)] | 12.05 | 238.459 |
| 2 | Caryophyllene oxide | 13.33 | 220.356 |
| 3 | 2H-Pyan-2-one, 5,6-Dihydro-4-(2-methyl-3-methylene-1-buten-4-yl | 11.15 | 178.231 |

| 5 | Perhydrohistrionicotoxin, 2-methylthio-2-depentyl | 17.05 | 269.45 |
| 6 | 9-Octadecenoic acid [Z]., (tetrahydro-3-furanyi)methyl ester | 26.08 | 366.586 |
| 7 | 2-(2-Propenyl)-m-anisidine | 10.55 | 163.220 |
| 8 | Trans-Z-à-Bisabolene epoxide | 14.43 | 220.356 |
| 9 | Patchoulene | 15.05 | 216.368 |
| 10 | 1,2,4-Triazol-4-amine, 5-methyl-3-(3,5-dimethylpyrazol-1-yl)- | 16.1 | 192.226 |
| 11 | 7,10-Octadecadienoic acid, methyl ester | 18.83 | 294.479 |
| 12 | Z-10-Methyl-11-tetradecen-1-ol propionate | 19.87 | 282.468 |
| 13 | Nonadecanoic acid, 18-oxo-, methyl ester | 20.87 | 326.521 |
| 14 | 4-Piperidineacetic acid, 5-ethylidene-2-[3-(2-hydroxyethyl)-1H-indol-2-yi]-à methylene-, methyl ester, [2S-(2à, 4à, 5E)]- | 23.03 | 354.450 |

Hydrogen peroxide involves in various important physiological processes of cells.[24] Methanolic extract of *Ocimum sanctum* convert the hydrogen peroxide to water. *Ocimum sanctum* showed potent $H_2O_2$ scavenging activity at different concentrations.[18] DPPH, $H_2O_2$ and hydroxyl radical scavenging activity of methanolic extract of *Ocimum sanctum* showed lower effect than standard. The standards i,e ascorbic acid and alpha tocopherol are completely independent compounds hence, they posses good antioxidant effect at different concentrations than methanolic extract of *Ocimum sanctum*. (Figure 1). Free radical scavenging effects are due the presence of phytochemicals and secondary metabolites like phenolic, flavonoids, and other compounds[25] in *Ocimum sanctum*. The importance of free radical scavenging activity is to estimate the antioxidant effect because *Ocimum sanctum* has many antioxidant compounds.[26]

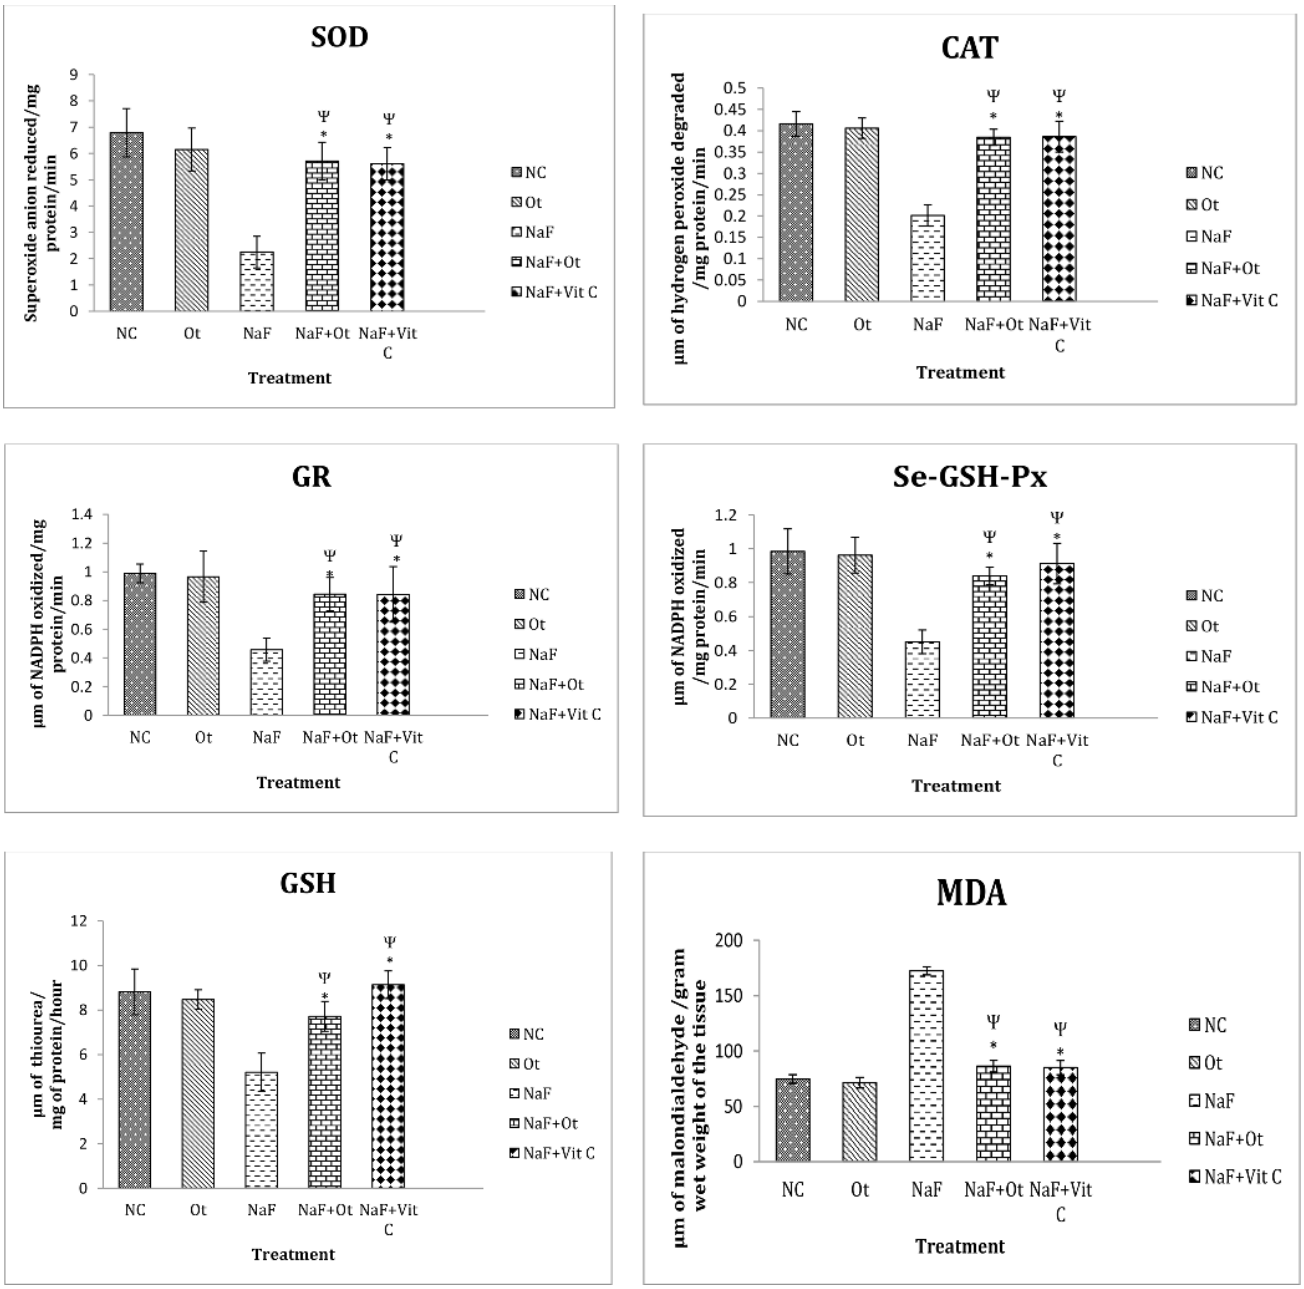

**Figure 4: Impact of *Ocimum sanctum* phenolic fraction on SOD, CAT, GR, GPx, activities and GSH, MDA levels in the liver tissues of Normal and Fluorosis rats. Data are expressed as means ± SD (*n* = 6). * The values are significant compared to the following: control (* *p* < 0.01), Fluorosis (**p* < 0.01) (Dunnett's multiple comparison tests).**

In our study GC-MS analysis of *Ocimum sanctum* reports many bioactive compounds. These bioactive compounds were recognized through mass spectrum analysis connected with GC. The unknown peaks obtained from the chromatogram are examined with the database of known spectrum of components kept in GC-MS library. The bioactive compounds, which are detected by the GC-MS are shown in Table 1.

In our analysis, we have identified 14 compounds in *Ocimum sanctum* methanolic extract. The compounds are 5-methyl-3-(3,5-dimethylpyrazol-1-yl)-Naphthalene, [2R-(2à,4aà,8aà)],Caryophylleneoxide,5,6-Dihydro-4-(2-methyl-3-methylene-1-buten-4-yl, 9-Octadecenoic acid [Z], (tetrahydro-3-furanyi)methyl ester, 2H-Pyan-2-one, Tricyclo[6.3.3.0] tetradec-4-ene, 10,13-dioxo, Perhydrohistrionicotoxin, 2-methylthio-2-depentyl,Trans-Z-à-Bisabo leneepoxide,2-(2-Propenyl)-m-anisidine, Patchoulene, 1,2,4-Triazol-4-amine, 5-methyl-3-(3,5-dimethylpyrazol-1-yl), 1,2,3,4,4a,5,6,8a-octahydro-4a,8-dimethyl-2-(1-methyl ethenyl-,7,10-Octadecadienoic acid, methyl ester, Z-10-

Sodium fluoride +Vitamin C treatment (NaF+Vit C)** 1. Regeneration of central vein, 2. Regeneration of hepatocytes, 3.Regeneration of sinusoids, 4. Regeneration of nucleus.

Methyl-11-tetradecen-1-ol propionate, Nonadecanoic acid, 18-oxo-, methyl ester, 4-Piperidineacetic acid, 5-ethylidene-2-[3-(2-hydroxyethyl)-1H-indol-2-yi]-à methylene-, methyl ester, [2S-(2à, 4à, 5E)]-These compounds may have pharmacological properties, which are unexplored (Figure 2,3 and Table 1).

In the present investigation, the antioxidant enzymes like SOD, GPx, GR, CAT, GSH are depleted in sodium fluoride induced fluorosis rats. Our study reported that depletion of these antioxidant enzymes in Na F treatment rats. This may be due to the oxidative stress and excess free radicals production in NaF intoxicated rats. However, OS phenolic fraction treatment in NaF rats for 60 days reversed these antioxidant enzymes. Ocimum has many pharmacological properties like antioxidant, hepatoprotective and antimicrobial and other properties. *Ocimum* has many bioactive and pharmacological compounds, these may be responsible for the up regulation of antioxidant enzymes in NaF rats. Ocimum treatment considerably recovered the activities of antioxidant enzymes in NaF intoxicated rats. (Figure 4).

Oxidative stress is reported to be associated with more than 100 diseases like cancer, diabetes and hepatitis. There is a strong relationship between TBA (thiobarbituric acid-reactive substances) and products that reflect oxidative damage to DNA. MDA levels depleted in NaF rats, but with Ocimum treatment reversed back MDA levels, near to normal. This shows the antiperoxidative activity. Hepato toxicity is the condition of oxidative stress in liver generating reactive oxygen species as a result, liver MDA levels increased in NaF rats. However, Ocimum treatment, MDA levels decreased in hepatitis rats. (Figure 4).

In rats, which received NaF for 60 days, showed liver damage and also disturbance of liver cell metabolism which lead to alterations in the activities of many enzymes. Serum enzymes AST, ALP and ALT are markers of liver toxicity and their higher levels are representation of cellular damages and loss of hepatic

cell membrane. In the current study, we reported elevation in AST, ALT and ALP activities in NaF intoxicated rats. Our report showed fluorosis leads to hepatic cellular dysfunction, which results in the upregulation of liver markers. However with Ocimum supplementation these serum markers are depleted in NaF rats. Based on our results, the *Ocimum sanctum* methanolic extract have hepatoprotective potential. OS may reduce the formation of toxic free radicals and reduces the hepatocellular injury in NaF rats (Table 2).

Calcium and Phosphorus are important to humans, because, they help in the formation of bone. In the present study, we observed depleted calcium levels and elevated phosphorus levels in sodium fluoride intoxicated rats. These alterations in calcium and phosphorus levels are due changes in the metabolism of phosphorus and calcium. Whereas Ocimum treatment in NaF rats, for 60 days, these fluorosis markers normalized to near normal levels. (Table 2).

In the current investigation, we reported that in normal control rats, *Ocimum* treated rats the liver architecture is normal. Whereas in fluorosis rat liver, degeneration of central vein, hepatocytes, sinusoids and blood coagulation are observed. But with Ocimum treatment in fluorosis rats, regeneration of central vein, hepatocytes and sinusoids are observed. Histopathological studies also prove that the hepatoprotective effect of Ocimum in NaF rats. (Figure 5).

## CONCLUSION

The current study proved that phenolic fraction of *Ocimum sanctum* protects the hepatic tissue from sodium fluoride intoxication in albino rats. We also reported that antioxidant enzymes, hepatic markers and flurosis markers are normalized with *Ocimum* treatment in Fluorosis rats. GC-MS analysis reported many bioactive compounds in *Ocimum sanctum* and these compounds may responsible for anti-fluorosis effect and antioxidant effects. This is the first study on the effect of phenolic fraction of *Ocimum sanctum* in fluorosis rats.

## ACKNOWLEDGEMENT

The Corresponding author is thankful to the University Grants Commission, New Delhi, India for the approve of the Major Research Project 2013-36027 dated 15/10/2015.

## CONFLICT OF INTEREST

The authors declare that there is no conflict of interest.

**Abstract**
Plants have been used since ancient times to cure diseases and to improve health and wellbeing of the populations. Plant diversity is a great source of medicines, while it provides direct economic benefits in the form of timber, food, fibre, industrial enzymes, flavours, cosmetics, emulsifiers, dyes, plant growth regulators, bio-pesticides and biofertilizers etc. The secondary metabolites, alkaloids, saponins, quinones, indoles, anthraquinones, terpenoids, flavonoids, phenolic compounds and amino acids are localised in cells. These have therapeutic properties and responsible for phytochemical markers to identify the genuine drug. *Strychnos colubrina* L. was screened for the presence of secondary metabolites using standard protocols as given by Harborne (1973),Gibbs(1974), Kokate (2001)and Khandelwal (2006), followed by pharmacological evaluation. Methanolic leaf extracts are tested for antioxidant and antimicrobial activities. The results were expressed as standard ± mean deviation (SD) of five replicates. Where ever applicable, the data were subjected to one-way and 2-way ANOVA and differences between samples were determined by with Scheffe's post hoc test, Dunnet's test using the program Statistical Analysis System (SASS V25). P Values < 0.05 were regarded as significant. In the preliminary phytochemical studies, the tannins, phenolic compounds, Alkaloids, flavonoids, Saponins, fats, oils, terpenoids have *shown positive test in Strychnos colubrina.* Glycosides, Lignins, Quinones, Anthraquinones, Anthocyanides, Coumarins, Carbohydrates, reducing sugars and Aminoacids are found to be absent. Sterols are absent in *Strychnos colubrina.* Administration of methanolic leaf extracts of *Strychnos colubrine* (200mg/kg) to have significant detrimental effect on one of 3 bacterial strains used i.e, *Staphylococcus aureus* and it has no effect on other 3 microbes namely, *Bacillus subtilis, Pseudomonas aeruginosa* and a fungal strain namely *Candida albicans.* Methanolic extract of plant leaves of *Strychnos colubrina* has not earlier been reported to have anti-microbial activity. The statistical analysis of the DPPH and $NO_3$ free radical tests with the *Strychnos colubrina* methanol extract has shown significant difference in results with the control groups in both the comparisons. The extracts solution exhibited significant anti-oxidant properties in the both tests Present study is significant and fills the gap in the ethno-medico-botanical repository of Andhra Pradesh.

**Keywords:** methanolic extract, snake wood tree, phytochemicals, antioxidant, antimicrobial, scheffe's post hoc test, dunnet's test

## Introduction

Plants have been used since ancient times to heal and cure diseases and to improve the health and the wellbeing of the populations. Products made out plants for therapeutic or other human health benefits contain either raw or processed ingredients from one or more plants, is the focus of this research. The plant diversity is a great source of medicines, provides direct economic benefits in the form of timber, food, fibre, industrial enzymes, flavours, fragrance, cosmetics, emulsifiers, dyes, plant growth regulators, bio-pesticides and biofertilizers. The biochemicals present in vast majority of the plant species are the great reservoirs of new and potential drugs. They can be used for monitoring the environmental changes. They are the key resources for new genes and biotechnological valuable compounds (Marotrao Dalvi, 2010). Parts of any plant that are used for therapeutic purpose or used a precursor for making a useful drug. This makes it possible to differentiate between medicinal plants whose therapeutic properties and constituents have been established scientifically, and plants that are considered as medicinal but which have not yet been subjected to a thorough scientific study (Sofowora *et al.,* 2013). Medicinal plants are important constitute of flora and are widely distributed in India. The importance of medicinal plants and traditional health systems to solve healthcare problems of the world is gaining increasing attention. Because of this resurgent interest, the research on plants of medicinal importance is growing phenomenally across the world, often to the detriment of natural habitats and mother populations in the countries of origin. In most of the developing countries traditional medical practices have adopted as an integral part of their culture. Medicinal plants form an important pool for the identification of novel drug leads which have proven their value as a source of molecules with therapeutic potential since ancient time (Atanasov *et al.,* 2015). According to Harshberger (1896) the study on ethnobotany has now become a critical need of time.

### India-An 'Emporium of Ethnomedicinal Plants'.

India has been one of the oldest countries having well-orchestrated medical practices based on plant resources. So

far on the globe about 4, 80, 000 plant species are discovered. India is known as an 'Emporium of Medicinal Plants' due to occurrence of more than 48,000 plant taxa, of which 18,000 are flowering plants, among these 10,000 plant species are estimated to be used by 4635 ethenic communities for human and veterinary health care.

The plant materials and recipes from herbs used traditionally by various human societies is a challenging field of research in ethnobotanical studies. The indigenous systems of medicine have their roots in folk medicine still practiced in remote tribal and rural areas and aboriginal societies where modern civilization has not yet made in roads. There are some miraculous medicines known to the tribals and rural folk and much acquired knowledge through experience of ages is usually passed on from one generation to other generation as a guarded secret of certain families. Recent studies have shown that groups having common or similar climate and environments but different ethnic and /or religion backgrounds have a very different knowledge and use of medicinal plant. It is not yet clear what factors influence this diversity in utilization.

**Fig 1:** Strychnos colubrina Plant

## Materials and Methods

Leaves of *Strychnos colubrina* were collected from Penchalakona forest of Nellore district Andhrapradesh, India. The plants were identified by comparing with herbarium specimens. The plant material was purified with distilled water and was shade dried for one month. Leaf sample of the material was ground into fine powder and stored in air tight containers at room temperature. The powdered material was then extracted using solvent, methanol in the ratio 1:10 using Soxhlet apparatus. (Khan *et al*., 1988). The solvent was evaporated under reduced pressure in rotatory evaporator to get methanol and ethanol extracts. After extracting all colouring material, the solvent was removed by evaporating in a water bath, which gave rise to a solid isolate of extract used for antimicrobial and antioxidant activities along with phytochemical analysis.

**I. Phytochemical analysis:** The phytochemical analysis of the leaves was done to find out the presence of bioactive compounds with the help of standard qualitative protocols. (Harborne, 1973 and Gibbs, 1974, Kokate, 2002.)

**Tests performed for the presence of phytochemicals**

**A. Tests for Flavonoids**

- **Shinoda test (Magnesium hydrochloride reduction test):** To the test solution few fragments of magnesium ribbon and concentrated hydrochloric acid were added drop wise and reddish to pink colour was resulted.
- **Zinc Hydrochloride reduction test:** To test the sample solution for the flavonoids added a mixture of zinc dust and concentrated hydrochloric acid results in red colour.
- **Lead acetate test:** When aqueous basic lead acetate was added to test sample produces reddish brown precipitate.

**Ferric chloride test:** To few ml of test samples taken separately, few drops of ferric chloride were added which resulted in the formation of blackish red precipitate.

- **Alkaline reagent test**: To detect the presence of flavonoids, sodium hydroxide solution is added to turn the test sample solution green. When few drops of diluted acid is added the solution turns colourless to indicate the presence of flavonoids.

**B. Tests for Saponins**

- Foam test: 5ml of extract was vigorously shaken to obtain a stable froth, which was added with olive oil (3 drops). Presence of emulsion indicates the existence of saponins.

**C. Tests for Glycosides**

- **Kellar Kiliani test:** 1ml of concentrated sulphuric acid was taken in a test tube then 5ml of extract and 2ml of glacial acetic acid and ferric chloride (one drop) and observed for blue color formation.
- **Raymond's test:** Test solution when treated with dinitrobenzene in hot methanolic alkali giving a violet colour.
- **Molisch test:** Alpha naphthol with conc.H2SO4 when added to test sample gives reddish violet ring at the junction of 2 layers.
- **Conc.H2SO4 test:** Conc.H2SO4 was added to test sample which resulted in appearance of reddish colour.
- Legal's test: The test samples when treated with pyridine and sodium nitroprusside solution blood red colour will be developed.
- **Bromine water test:** When bromine solution is added the test solution gives yellow precipitate.

**Tests for Alkaloids**

- **Dragendorff's test:** 1 ml of the sample solution is taken in a test tube, and few drops of potassium bismuth iodide solution (Dragendorff's reagent) was added. The presence of alkaloids was determined by the appearance of reddish-brown precipitate.
- **Meyer's test:** 1ml of the sample solution is added with few drops of potassium mercuric chloride solution (Meyer's reagent). A creamy white precipitate was formed indicating the presence of alkaloids.
- **Hager's test:** To 1 ml of each of the sample few drops of Hager's reagent (Picric acid) was added. Yellow precipitate was formed reacting positively for alkaloids.
- **Tannic acid test:** When few ml of 10% Tannic acid was added to 1ml of each sample, a buff colour precipitate was formed giving positive result for alkaloids.

- **FeCl 3 test:** One drop of FeCl 3solution was added to each of the test sample, formation of yellow precipitate was resulted reacting positively for alkaloids.

**D. Tests for Sterols**

- **Libermann-Buchard test:** When few drops of acetic anhydride and few drops of concentrated sulphuric acid were added to the test samples if a brown ring shows up at the junction of two layers, it indicates presences of steroids. 2. Salkowski test: The presence of sterols can be detected by adding few drops of concentrated sulphuric acid to the test samples in chloroform, the lower layers of solution turns green on sterols presence.

**E. Tests for Tannins and Phenolic Compounds**

- **Gelatin test:** When gelatine and water were added to test samples formation of white precipitate was resulted.
- **Lead acetate:** Few ml of test samples were taken in different test tubes followed by the addition of aqueous basic lead acetate. It results in the formation of reddish brown bulky preceipitate.
- **Alkaline reagent:** The test solution will give a yellowish red precipitate when sodium hydroxide solution was added.
- **Ellagic acid test:** Presence of phenols in the test solution can be detected by adding 5% each of glacial acetic acid and Sodium Nitrite. If the solution turn Niger brown colour, it indicates phenols in solution.

**F. Tests for Fats and Oils**

- **Stain test:** when we a small quantity of extract between two filter papers, the stain on filter papers gives the presence of the oils.
- **Saponification test:** Added a few drops of 0.5N alcoholic potassium hydroxide to various extracts with a drop of phenolphthalein separately and heat on water bath for 1-2hours. If the solution produces soap or partial neutralization of alkali, it's a sign of presence of oils and fats.

**G. Tests for Lignins**

- **Labat test:** The test sample turns olive green colour on addition of gallic acid when lignins are present.
- **Furfuraldehyde test:** The test sample turns red colour on addition of fur furaldehyde when lignins are present.

**H. Tests for Quinones**

- **Alcoholic KOH test:** When alcoholic KOH was added to the test samples red to blue colour appears reacting positively for quinones.

**I. Terpenoids and steroids test**

- 50% $H_2SO_4$ is added along the sides of the test tube containing a mixture of methanolic HCl and acetic anhydride. If there is any change in color, from green to blue-green (sometimes via red or blue) indicates the presence of terpenoids and steroids Anthraquinones test
- 5 g plant powder was shaken with 20 ml of benzene and filtered. To the filtrate 5 ml of 10% ammonium hydroxide solution was added and shaken well. Presence of pink red or violet color, in the ammonical phase indicates the presence of free anthroquinones (Fransworth, 1966).

**J. Anthocyanidin test**

- To the plant extract was added equal volume of methanolic HCl. Appearance of red or purple color indicates the presence of anthocyanidins.

**K. Coumarin test**

- When few drops of sodium hydroxide are added to the methanolic extracted test solution, if the solutions turning yellow indicates presence of coumarins.

**L. Proteins test (Millions test)**

- 2 ml of methanolic extract was boiled with a few drops of Million's reagent (Millions reagent is a solution of mercuric nitrate in nitric acid) results in the formation of red color indicates the presence of proteins.

**M. Carbohydrate test (Molish test)**

- To the methanolic extract, c-naphthol solution (1gm dissolved in 100 ml of ethanol w/v) was added. Then conc. $H_2SO_4$ is added gently along the walls of the inclined test tube. Appearance of a red to violet color at the interface is taken as a positive reaction.

**N. Indole test**

- If a violet color was developed on adding Ehrlich reagent to the alcoholic extract, it is considered as a positive reaction for indoles.

**O. Test for reducing sugars**

- To the 5 ml of methanolic extract, 5 ml of Benedict's reagent was added in a boiling test tube. The test tubes were incubated in boiling on water bath for 15-30 minutes. The formation of an orange red precipitate indicated the presence of reducing sugars.

**P. Test for amino acids**

- To the methanolic extract, was added few drops of Ninhydrin solution and boiled. The formation of violet colour indicates the presence of amino acids.

**Determination of In vitro Antioxidant Activity of *Strychnos colubrina* methanolic leaf extracts Using DPPH Scavenging Method, Nitric oxide radical scavenging method.**

**A. DPPH (1, 1-Diphenyl-2picrylhydrazyl) free radical scavenging activity**:(**Blois, 1958)**

1. The ability of the sample to scavenge DPPH radicals were determined
2. 0.5 ml of aliquot of test at different concentrations (100 µg/ml and 200 µg/ml) in methanol was taken and to this, 100mM methanolic solution (0.5 ml) of 1, 1-Diphenyl-2picryl hydrazyl (DPPH) was added.
3. The mixture was incubated for 30 min in darkness and at ambient temperature.
4. Absorbance was recorded at 517 nm.

**B. Nitric oxide radical scavenging activity: (Ganesh *et al.*, 2004).**

- The standard used here was Ascorbic acid. 100 µg/ml and 200 µg/ml solution of standard in methanol and ethanol were used for assay.
- Sample solution was prepared by dissolving the sample in methanol and ethanol

- 10 mg of each extract were dissolved in methanol and ethanol and solutions of 100 µg/ml and 200 µg/ml concentrations were prepared.
- In this assay 0.5 ml of Sodium nitro prusside (Ganesh *et al*., 2004). (5 mmol) in phosphate buffered saline pH 7.4, was mixed with different concentration of the sample and incubated at 25°C for 3 hrs.
- A control without the test compound, but an equivalent amount of methanol and ethanol were taken. Buffer solution containing tube is acted as control.
- Then 1.5 ml of Griess reagent (1% sulphonyl amide, 2% phosphoric acid and 0.1% N-1-naphthyl ethylene diamine dihydrochloride) was added and incubated for 30 minutes.
- The absorbance of the chromophore formed during diazotization of nitrite ions with suphanilic acid and its subsequent coupling with Napthyl ethyl enediamine was read at 546 nm. The experiment was repeated in triplicate.
- Absorbance was measured at 546 nm and the percentage scavenging activity was measured.

$$\text{Percentage inhibition} = \frac{\text{Absorbance of Control} - \text{Absorbance of Test X 100}}{\text{Absorbance of Control}}$$

- The percentage of inhibition for each reaction was then calculated, and EC50 values (µg/mL) were calculated from the linear equation from the curve between the percentage of inhibition and the solution's concentration. Each experiment was conducted in triplicate. The EC50 value of each extract was expressed as the mean˘SD. The assays were performed as previously described.

**Determination of Antibacterial Activity activity of *Strychnos colubrina* methanolic leaf extracts using Disc Diffusion Assay**

Kirby-Bauer method (Bauer *et al* 1966) was followed to perform sensitivity test using disc diffusion with standard antibiotics. The assessment of antimicrobial activity was done based on the measure of diameter of inhibition zones, Sensitivity tests were performed by disc diffusion (*NCCLS, 1998*). The assays were performed against three clinically pathogenic bacteria *Bacillus subtilis MTCC 441, Staphylococcus aureus MTCC 737, Pseudomonas aeruginosa MTCC 1035* and a fungal pathogen *Candida albicans MTCC 3018.* Each extract was dissolved in 95% Methanol or sterile water at different concentrations (250, 500 and 1000 mg/mL). Then each solution was impregnated on to a small disc of filter paper and placed on the top of agar containing 100 µL of bacterial solution at a concentration of 1.5ˆ108 CFU/mL per plate (adjusted by comparing to 0.5 McFarland). In the same manner each plate has carried a blank disk by keeping solvent control only in the centre, and antibiotic discs (6mm diam) of 20 µg/ml, Streptomycin sulphate (for bacteria) and Nystatin 20 µg/ml, (for fungal) were used as positive control. All of the plates were incubated at 37°C for 18 hours for bacteria and at 28°C for 48 hours for fungi. The zones of growth inhibition around the discs were measured after 18 hours of in incubation at 37°C for bacteria and 48 hours for fungi at 28°C, respectively. The size of inhibitory zone is taken as a measure of sensitivity of micro-organism to the plant extract.

**Statistical Analysis**

Each test is conducted in three sets. The average value is calculated duly following statistical methods. Experimental results were expressed as standard ± mean deviation (SD) of five replicates.

Where ever applicable, the data were subjected to one-way analysis of variance (ANOVA), 2-way analysis of variance (ANOVA) methods and differences between samples were determined by with Scheffe's post hoc test, Dunnett's post hoc test using the Statistical Analysis System (SAS, 1999) programme. P Values < 0.05 were regarded as significant.

## Results

**Phytochemical studies**

## Conclusion

**The phytochemical studies:** These studies have been carried out during the present study for preliminary screening of secondary metabolites and qualitative analysis of whether these compounds are present or not in various taxa. These studies act as an identification marker of genuine plant-based drugs. In the preliminary phytochemical studies, the tannins, phenolic compounds, alkaloids, flavonoids, saponins, fats, oils, terpenoids are known to present in *Strychnos colubrina.* Whereas glycosides, lignins, quinones, anthraquinones, anthocyanides, coumarins, carbohydrates, reducing sugars and aminoacids and Sterols are found to be absent in this plant

**The anti-oxidant activity of *Strychnos Colubrina:*** Phytochemical analysis of the extracts has shown the presence of some flavonoids and phenolics. These compounds give antioxidant effect, and this can be used for drug extractions from *Strychnos colubrina* in the future. Quantitative analysis of these bio-active constituents in *Strychnos colubrina* leaves have to be further investigated in the future. They can become potent antioxidants.

**Anti-microbial activity of *Strychnos Colubrina:*** The present study reveals that *Strychnos Colubrina* leaf extracts have significant detrimental effect on one of three bacterial strains used i.e, *Staphylococcus aureus* and it shows no effect on other two bacteria namely, *Bacillus subtilis, Pseudomonas aeruginosa* and a fungal strain namely *Candida albicans.* Methanolic plant extract generally contain various potent phytochemicals in mixed form. This may be the reason for the lesser inhibitory effect shown by leaf extract when compared to that exerted by proven antibiotics. For the study of plant extracts, the number of microbial strains was reduced in accordance with their known function as food destroying agents and human pathogens. The methanolic extract of plant leaves of *Strychnos colubrina* has not earlier been reported to have anti-microbial activity.

As discussed above, medicinal plants are at the mainstay in the treatment of diseases for the vast majority of tribal and rural people. As the present study reveals the potential of these medicinal plants, further research can be directed to probe into the structure and mechanism of action of the bioactive therapeutic principles for development of drugs to treat various diseases that affect the mankind. Phytochemical screening of ethno-medico-botanical species indicated the presence of numerous potential chemical constituents which have high therapeutic value. Thus, the phytochemical studies of this species may lead for further investigations to find out drugs of importance. The present study concludes that the plant species with numerous highly effective phytochemical compounds like saponins, alkaloids, terpenoids, steroids, lignins, tannins, indoles, anthroquinones and several types of anthocyanidins, phenolic compounds, flavonoids and lipid compounds having many medicinal applications, used in wide range of formulations, commercial, higher therapeutic and economic values. Biological activity conducted in screening the medicinal properties of selected plant material of methanolic extracts of leaves of *Strychnos colubrina* has proven as antibacterial and anti-oxidant, agent. It is, therefore, implied that the isolation and proper characterization of the active

constituents from the extracts of the select plant species as possible antioxidant, antimicrobial agent is possible. Quantitative analysis of the active compounds in *Strychnos colubrina L.* leaf extracts should be further studied. Hence this report provides insights into the therapeutic potential of the phytomedicine and scope for further research on these drugs. Further investigations must be carried out from this research for the benefit of human welfare. The present screening may also be useful for continuing, future research mainly in the field of pharmaco toxicology.

**ABSTRACT**
*Due to the sudden pandemic outbreak across the globe, global physicians have witnessed the necessity of implementing Deep Learning Applications to save a life more quickly and efficiently. Researchers in the research study have pointed out the implementation of deep learning applications from an effective angle. Researchers have outlined a series of relevant survey questions to gather and understand almost 60 participants' perspectives about the utilization of deep learning methods in healthcare more accurately. It has been observed that deep learning can be highly used to satisfy the growing requirements for diagnosis and medicines during the pandemic outbreak. However, by applying a positivism research philosophy, researchers have effectively conducted the primary analysis through a probability data sampling technique. From the research findings, it can be analyzed that around 60% of the participants strongly support the idea of utilizing deep learning for mitigating more error percentages while predicting necessary treatment procedures. On the other hand, around 57% of the people can be traced to highly support the implementation of deep learning approaches for enhancing overall industrial efficiency during the time of crisis. Moreover, around 25% of the participants also can be spotted who only agreed with the use of DL approaches in medical imaging for better patient-care approaches. From the survey results, it can be determined that selected participants possess a lack of proper understanding regarding the beneficial use of deep learning applications in enhancing future healthcare practices in the post-COVID situation.*
***Keywords:*** *Deep-learning applications, patient-care, global pandemic, healthcare survey, researchers, participants, and efficiency.*

Received 13.02.2022 Revised 20.03.2022 Accepted 20.04.2022

## INTRODUCTION

Modern-day medical science has witnessed several benefits in patient-care facilities after utilizing machine learning and deep learning applications. Detecting critical symptoms of diseases, predicting proper treatment procedures and medical image recognition have become easier than before with the applications of deep learning approaches [1]. During the time of the global pandemic, the demand for deep learning applications has increased for evaluating the accurate medical history of patients, detecting symptoms of diseases, and necessary tests [2]. Researchers have investigated that Natural language processing through DL language offers better insights regarding relevant clinical information during the virus outbreak to determine the most accurate clinical treatments. It has been highly observed that deep learning approaches can quickly acquire COVID-affected patient insights that at once provide utter benefits to the healthcare industry while discovering major aspects across patient care.

The ML-based deep learning algorithms played a major role in enhancing the overall efficiency of the UK-based healthcare industry, by almost 89.97% from 2019 to 2021 [3]. Regarding the harmful effects of the pandemic outbreak, numerous online surveys, as well as clinical resources, have been gathered from various patient-care sectors of the UK. During the past few years, the entire world has experienced a strong blow from the COVID-19 global pandemic. Surveys and reports reflected that the rapidly spreading virus at once raised the death rate to around 82.83% across entire Europe during the time [4]. Besides,

deep learning alos helps in corona virus imaging from the large medical image database. Moreover, the DL applications can raise the overall efficiency of patient-care facilities during the virus outbreak that leads to an almost ***80%*** drop in the global economy over those years [5].

**LITERATURE REVIEW**

Researchers opine that only the effective applications of the DL approaches can remove around ***37%*** of the economic slump due to the uncertainty that has engulfed the healthcare sector [6]. Moreover, the application of AI-based machine learning approaches also helped physicians to conduct proper tests and diagnose Corona virus's effects in the host's body. Various researches conducted across the UK-based healthcare industry reflect that around ***78%*** of the medical practitioners strongly support the implementation of DL insights in analyzing relevant clinical information [7]. In order to undertake proper diagnosis and treatment procedures for patients' easy recovery, DL approaches provide utter assistance to global healthcare professionals.

Scientists have discovered various applications of deep learning in global healthcare practices while tracking essential medical devices and equipment. During the time of the global pandemic, physicians widely utilized deep learning applications to predict the level of patients' illness through COVID tests [8]. Apart from this, DL approaches also aided physicians to undertake proper treatment methods by keeping the patient in isolation and providing him with necessary clinical assistance [9]. The disease can spread with high contacts, so physicians use deep learning techniques while sanitizing and providing COVID-affected patients with proper medical help.

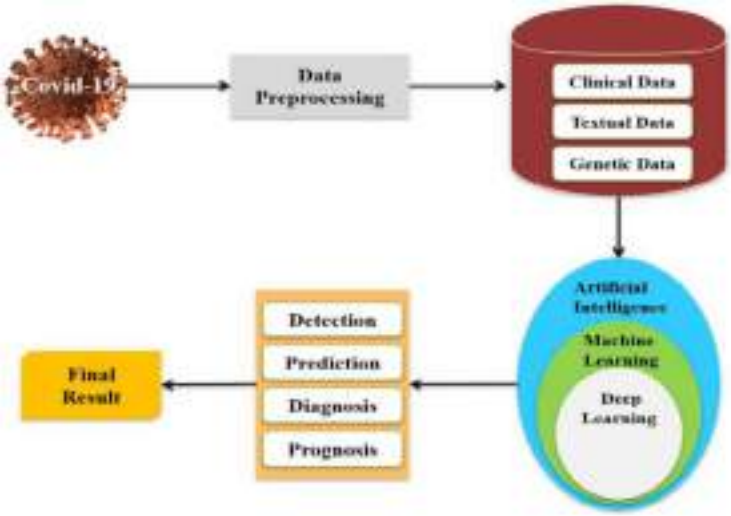

**Figure 1: Deep learning framework for detecting and diagnosing Corona virus syndromes**[9]

On the other hand, medical scientists have placed their opinions and research findings on the use of ML and DL approaches for offering people vaccines to combat the harmful virus. Based on their decade-covering research findings, researchers have come to a satisfactory point that deep learning approaches can be highly used in the vaccination and immunization process. As a result, accurate use of DL techniques can enhance the overall efficiency rate of the healthcare industry by around ***91.26%*** in the sustainable future [10]. With the proper use of DL algorithms, physicians can easily predict the reasons and symptoms of population health threats by determining the virus' patterns (Fig. 2). On the contrary, deep learning can also help doctors to treat the ways of mitigating the high risk of surfacing rates towards a pandemic disease progression in the future patient-care delivery.

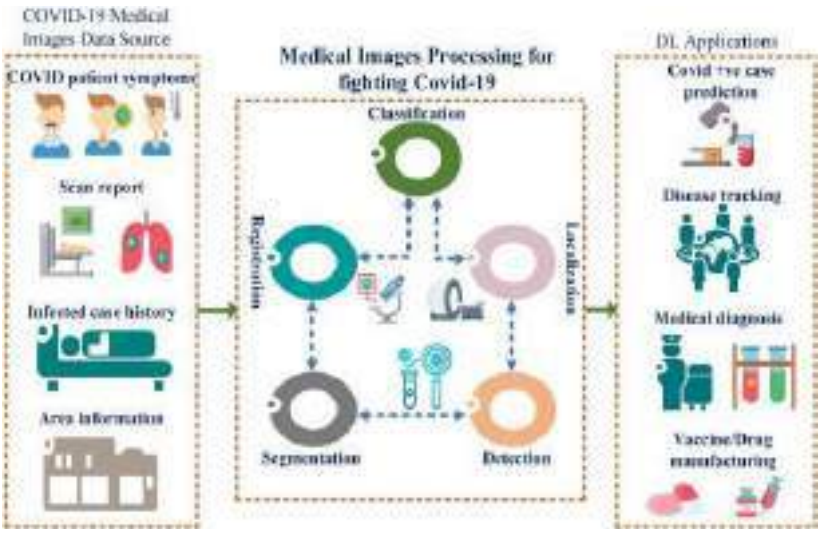

**Figure 2: Medical image processing by using deep learning methods during the pandemic**[10]

Effective use of DL techniques at once leads the entire healthcare industry towards a more accurate predictive analysis that can mitigate the death rate by ***41%*** more in the upcoming years [11]. The growing implementations of DL learning during the years ***2019-2021***, aided healthcare practitioners to recover ***52.83%*** of the pandemic loss more efficiently [12]. With the growing cases of Corona, physicians feel a need to conduct more innovation, development, and improvement in the application procedures of deep learning in the recent era (Fig. 3). During the detection and diagnosis of COVID-19 disease syndromes, ***63.85%*** of scientists and doctors prefer the use of relevant wearable clinical technology incorporated with AI systems [13]. From a remote place and with the help of neural networks across the vast Internet, efficient healthcare practices can be easily regulated by DL algorithms.

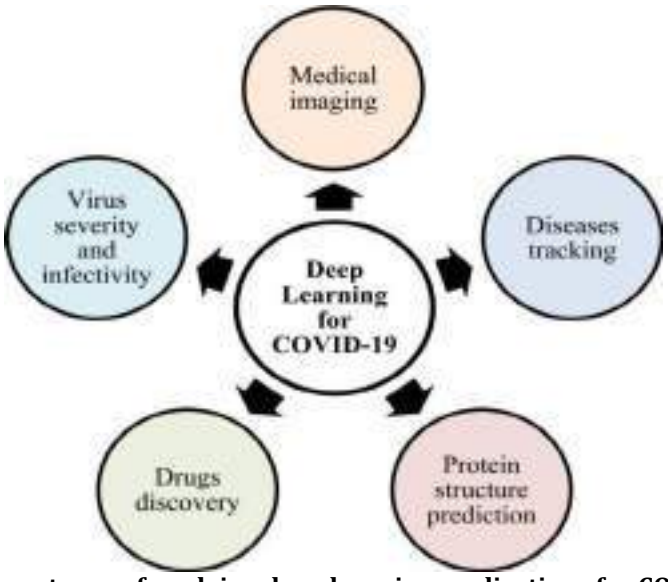

**Figure 3: Importance of applying deep learning applications for COVID-19**[13]

However, to serve patients in a better way during the global crisis, deep learning offers physicians the acquisition of meaningful as well as long-lasting language-based learning [14]. Apart from this, deep learning also enhances critical disease diagnosis operations at cheaper expenses during the global pandemic [15]. As a result, researchers show genuine interest to examine the role of DL applications in treating Corona cases more precisely besides offering more personalized patient care during the current era.

## MATERIAL AND METHODS

It has been also observed that proper use of deep learning has escalated the entire economic growth by ***47%*** much bigger than the COVID-years' revenue collection [16]. Researchers in this research paper thus

utilized various effective research methodological approaches to determine the role played by DL in enhancing patient care during the pandemic period. Researchers while scrutinizing the research study have undertaken a Primary Quantitative method for relevant medical collection for understanding the current research topic more clearly.

Researchers have applied quantitative methods for both collecting and analyzing current medical records to get an idea about the harmful impacts of the Corona virus [17]. In order to investigate more on the usefulness of using DL approaches during pandemic times, researchers have framed relevant survey questions by incorporating a positivism research philosophy in the research paper. They have also applied a deductive research method while gathering authentic and valid clinical data. On the other hand, during carrying out relevant research on the use of DL in healthcare, researchers have also pointed out the significance of incorporating a descriptive research design to collect and evaluate necessary patient-care records related to the research topic more accurately. However, the primary data involvement would be highly beneficial for conducting the research by reducing relevant challenges faced by the researchers during the global pandemic crisis.

After collecting relevant opinions from physicians, clinical practitioners, patient-care professionals, healthcare staff, and hospital nurses, researchers focused much on comprehending the consequences of implementing DL for acquiring more proper results. Researchers have focused much on collecting relevant responses from around 70 participants through survey analysis. However, around 10 participants did not help researchers during the conduction of the research study regarding the role of the DL approach for increasing better healthcare deliveries through virtual mediums. Researchers have outlined three important survey questions while collecting virtual binary responses through options from around 60 participants. Besides, the detailed survey analysis at once involves the accuracy as well as the relevance connection with the use of DL approaches in healthcare during the pandemic outbreak. Researchers have performed probability methods during gathering sampling. However, all opinions of the participants have been gathered and analyzed through undertaking a random selection of people directly linked with the topic of the research. After collecting their responses, all the survey outcomes have been analyzed in detail by the researchers.

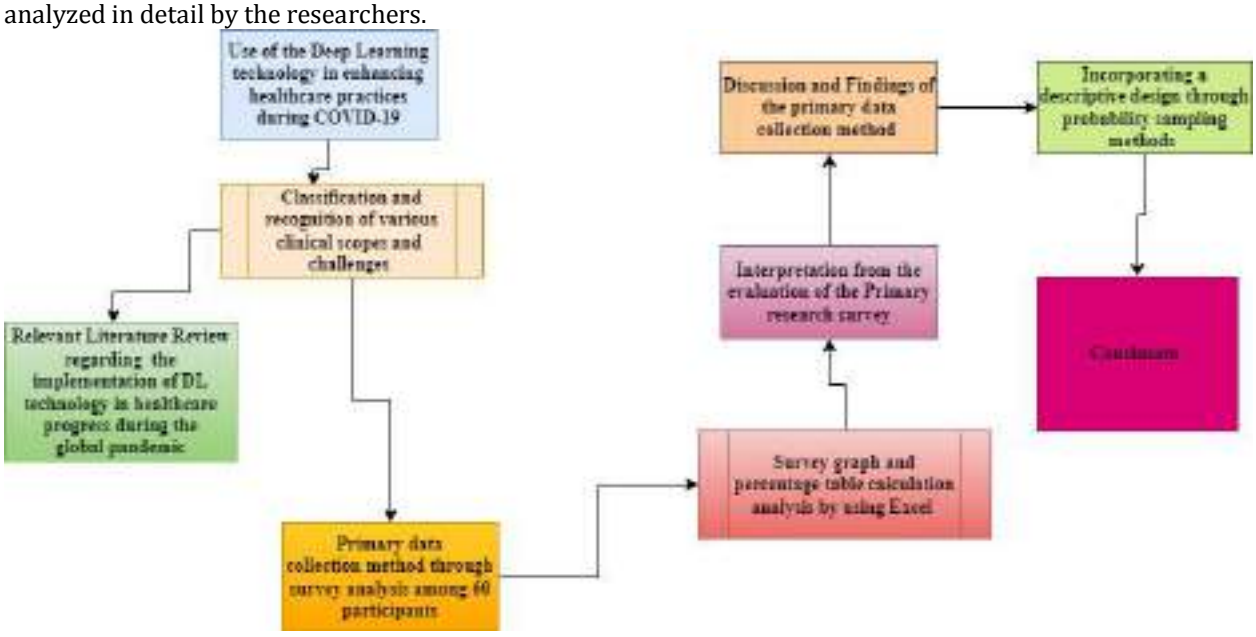

**Figure 4: Flowchart diagram of the research**

## RESULTS

Researchers have focused on acquiring relevant medical records by applying probability techniques while comprehending the necessities of analyzing participants' responses from an effective perspective. Apart from the survey questionnaires, researchers have framed two additional research questions for evaluating all the survey outcomes more efficiently. The important questions created by the researchers regarding the particular topic are-

- What are the benefits and scopes offered by deep learning approaches towards increasing the efficiency rate of better healthcare services during the global pandemic?

- How can deep learning applications enhance the accuracy detecting rate in healthcare by mitigating errors and risks in the sustainable future?

***Survey-related questions***

**Q1.** Do you think that deep learning applications can reduce error percentage rates during predicting treatment analysis regarding Corona virus detection across the healthcare industry?

**TABLE I. ERROR MITIGATION RATE CALCULATION IN HEALTHCARE BY USING DL TECHNIQUES**

(SOURCE: CREATED BY THE RESEARCHERS)

| Participants' choice | Overall Participants | Response gathered | Percentage |
|---|---|---|---|
| **Strongly Agreed** | 60 | 19 | 31.66 |
| **Supported** | 60 | 17 | 28.33 |
| **Remained Neutral** | 60 | 3 | 5 |
| **Disagreed** | 60 | 11 | 18.33 |
| **Disagreed Strongly** | 60 | 10 | 16.66 |

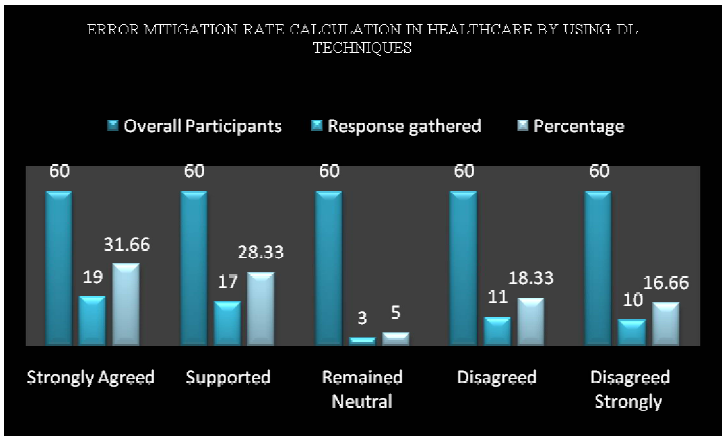

**Figure 5: Error mitigation rate calculation in efficient healthcare practices during the pandemic by using DL approaches**

Researchers have analyzed the first survey question by evaluating all the collected responses from the ***60 participants***. From the above percentage table, it can be highly evident that around ***31.66%*** of the people have strongly supported the validity of the question. Besides, around ***28.33%*** of the participants positively supported this approach. However, only ***5%*** of the people remained neutral regarding the error mitigation rate measurement due to deep learning approaches in healthcare. During the time of the global pandemic, it has been found that around ***18.33%*** of the participants denied the idea of using DL approaches in detecting Corona virus by eliminating the conventional process. On the contrary, researchers have traced around ***16.66%*** of people who strongly disagreed with the relevancy of the first survey question. Relevant calculation gaps and percentage differences have been highly evaluated from the calculation table.

**Q2.** Do you support that accurate application of deep learning can enhance the overall efficiency of healthcare towards improved patient care during the pandemic outbreak?

**TABLE II. HEALTHCARE EFFICIENCY RATE MEASUREMENT BY APPLYING DEEP LEARNING**

| Options of the Participants | Total Participants | Response Collected | Percentage |
|---|---|---|---|
| **Strongly Supported** | 60 | 21 | 35 |
| **Agreed** | 60 | 13 | 21.66 |
| **Stayed Neutral** | 60 | 5 | 8.33 |
| **Disagreed** | 60 | 12 | 20 |
| **Strongly Disagreed** | 60 | 9 | 15 |

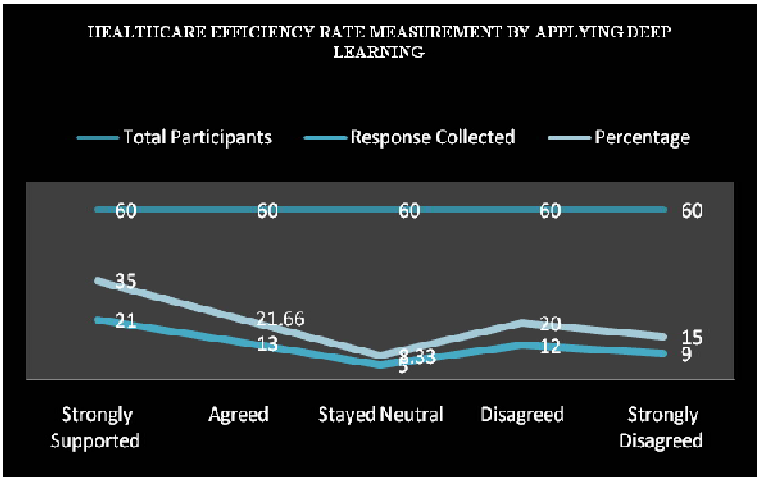

**Figure 6: Healthcare efficiency rate measurement in healthcare during the COVID outbreak by applying deep learning techniques**

In order to discuss the role of deep learning in increasing the overall effectiveness of the healthcare sectors, researchers have focused more on analyzing the second survey question. After analyzing participants' responses regarding the particular survey question, researchers have pointed out that around ***35%*** of the people strongly support the use of DL technology in mitigating corona virus-related death risks. On the other hand, among *60 potential participants*, around ***21.66%*** of the people supported the idea of the second survey topic. However, from the table, it can be highlighted that only ***8.33%*** of the participants did not provide any positive response regarding the use of DL techniques for better patient-care approaches. Apart from this, researchers have also spotted almost ***20%*** of the people who disagreed with the relevancy of the second question. Further, among the participants, almost ***15%*** of people can be identified who strongly rejected the validity of the second survey question related to the research topic. All the major percentage gaps can be minutely analyzed from the percentage calculation table to understand the importance of applying deep learning approaches in healthcare aspects.

**Q3.** Will proper deep learning implementation help in better corona virus disease imaging from large datasets for more improved patient-care service delivery?

**TABLE III. MEDICAL IMAGING EFFICIENCY RATE CALCULATION BY USING DEEP LEARNING**

| Participants' options | Total number of Participants | Collected Opinions | Percentage |
|---|---|---|---|
| **Supported Strongly** | 60 | 8 | 13.33 |
| **Supported** | 60 | 7 | 11.66 |
| **Neutral** | 60 | 4 | 6.66 |
| **Did not support** | 60 | 23 | 38.33 |
| **Disagreed Strongly** | 60 | 18 | 30 |

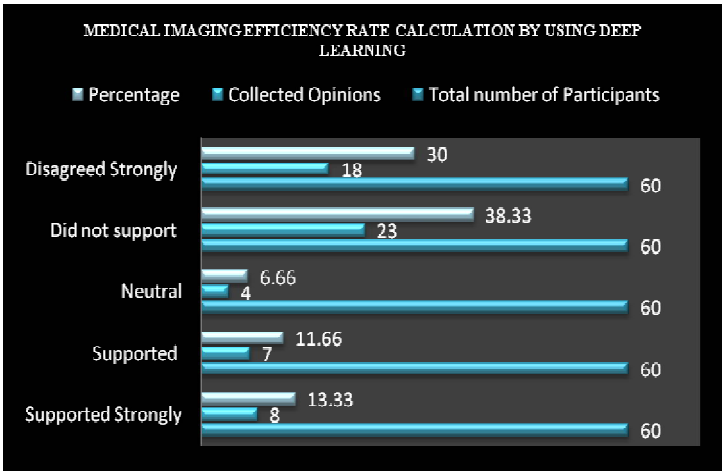

**Figure 7: Medical imaging rate measurement during the pandemic outbreak by using DL methods**

While analyzing the third survey question, researchers have experienced a sudden shift in the opinions of participants from a positive angle to a negative point. In order to investigate the role of DL approaches in combating COVID syndromes, researchers have collected and evaluated opinions from ***60 participants*** regarding the efficient conduction of clinical images. From the above analysis, it can be stated that around ***13.33%*** of the participants have strongly supported the idea of using DL approaches for more accurate medical imaging. Besides, almost ***11.66%*** of the people can be highlighted from the participants who positively agree with the third relevant survey question. However, researchers have pointed out only ***6.66%*** of the participants did not provide any responses positively or negatively related to the research topic. On the contrary, researchers have spotted almost ***38.33%*** of the people who provided negative responses regarding the relevance of the third research question. Moreover, around ***30%*** of the participants strongly denied the usefulness of the third survey topic in healthcare sectors. From the above growth and percentage calculation table, all the key differences can be highly observed to a great extent.

**DISCUSSION**

From the survey findings, it can be analyzed that researchers have successfully analyzed all the perspectives of almost 60 potential participants for understanding the research topic more clearly. After evaluating all the 3 survey results, researchers examined that participants have different changing opinions regarding the scopes offered by deep learning approaches. However, during the pandemic outbreak, all the responses regarding healthcare practices have been conducted effectively through online and contactless mediums. The result from the first question related to the survey at once reflects that almost 60% of the participants agreed with the usefulness of the DL application for more error reduction practices and obtaining more accurate results from a positive approach. With the effective solutions of Deep learning Applications, healthcare professionals can effectively deliver personalized facilities of patient care. Moreover, researchers have also determined that with the growing utilization of deep learning algorithms in healthcare, the overall growth is expected to be around 98% within the year 2026 [18].

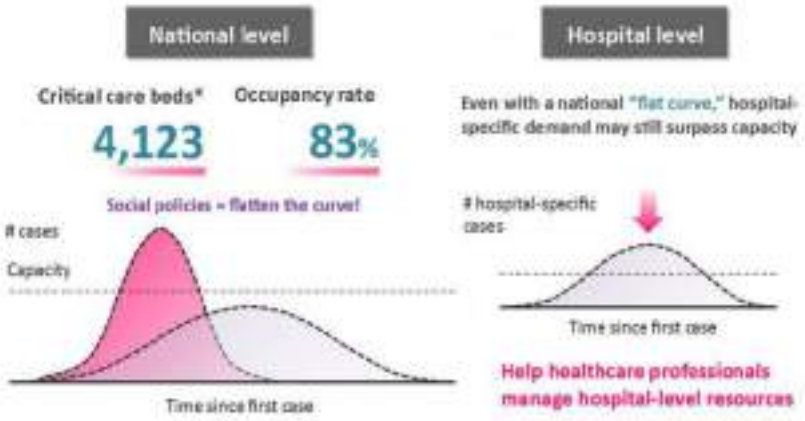

**Figure 8: Graph reflecting the use of deep learning approaches during the global pandemic for better healthcare supports**[18]

On the other hand, from the analysis of the second survey question, researchers can highly identify the causes of applying deep learning. However, in the diagnosis of COVID-related diseases, DL approaches at once can increase the efficiency of the entire industry by almost ***51.26%*** in the sustainable future. It has been analyzed from the second survey outcome that around ***57%*** of the people have supported the idea of utilizing deep learning for better healthcare conduction in the post-COVID future. Scientists have identified that to eradicate life threats and infection risks due to the Corona virus, DL applications can at once be highly beneficial for life-saving clinical practices [19]. Towards enhancing more accurate and beneficial healthcare services across the globe, deep learning benefits at once inspire scientists to investigate more on satisfying the growing demands for medicines.

**TABLE IV: ANALYSIS OF THE SURVEY OUTCOMES REGARDING THE APPLICATIONS OF DEEP LEARNING IN PATIENT-CARE PRACTICES**

| *Topic Discussed* | *Supported* | *Neutral* | *Disagreed* |
|---|---|---|---|
| (a) Deep learning is essential for mitigating error percentage while undertaking relevant healthcare decisions during COVID-19. | **60%** | **13%** | **27%** |
| (b) Relevant use of deep learning can at once increase the overall efficiency of healthcare practices. | **57%** | **9%** | **34%** |
| (c) During the time of the pandemic outbreak, deep learning has helped physicians in detecting proper medical imaging of coronavirus disease. | **25%** | **15%** | **60%** |

From the third survey question analysis, researchers can at once conclude that during the outbreak of the global pandemic, deep learning assisted healthcare practices to some extent. As people have no accurate understanding of the technical implications of deep learning in medical image processing, a large shift from positivity can be seen while collecting participants' opinions. After analyzing the validity of the third survey question, researchers have pointed out that only ***25%*** of the people have shared their positive responses along with the third survey opinion [20]. The deep learning approaches in healthcare practices can help medical professionals to evaluate big medical data sets consisting of patients' history and essential data records. While treating the corona virus syndromes, doctors widely used deep learning medical imaging techniques to pull together the affected person's insights [21]. Deep learning algorithms at once enable healthcare professionals to offer personalized healthcare facilities to global patients by examining a patient's clinical history and records [22]. With the implementation of the deep learning approaches, detecting corona virus symptoms has been more efficient these days. Moreover, the entire evaluation of survey results shows the significant applications of deep learning in increasing more sustainable patient-care practices during the global pandemic outbreak.

## CONCLUSION

Nowadays, machine learning, transfer learning, and deep learning approaches are being broadly used in global healthcare sectors by medical scientists. Previously, physicians faced a lot of challenges while detecting diseases and conventionally predicting necessary treatment procedures. However, with the advent of various AI-based technological approaches, the healthcare industry has experienced huge progress while monitoring patients across the globe. People started being widely affected by the attack of Coronavirus and as a result, the global healthcare industry was adversely affected during the year ***2019-21***. Scientists and physicians have investigated minutely the medical uses of DL applications while detecting proper COVID syndromes or predicting necessary diagnostic procedures [23].

Researchers have identified that with the proper utilization of deep learning algorithms, the overall healthcare efficiency could be amplified much better during the period of the global pandemic. Maintaining proper AI-based deep learning approaches can help physicians to conduct improved patient-care facilities in the sustainable future. However, to combat the global disease, researchers have witnessed the need for applying deep learning language in healthcare practices. However, researchers have gathered and interpreted all the outcomes of COVID-related clinical records through primary sources. Researchers by presenting three relevant survey questions to the participants have asked their opinions about COVID-related medical practices. Survey researchers have submerged themselves into evaluating all the responses collected from the participants for determining accurate results and incorporating them into the study.

## Abstract

High-toughness epoxy biocomposites are made in the current work employing coconut rachilla fibre and biosilica particles recovered from finger millet husk (FMH) for lightweight and affordable technological applications. The purpose of this study is to determine the impact of FMH biosilica particles added at various concentrations on the mechanical and wear properties, as well as the thermal and hydrophobic behaviour, of epoxy composites made from coconut rachilla fibre. The combination of 3 vol.% FMH biosilica particle with surface-treated palmyra sprout fibre as a reinforcing material has the highest tensile strength, impact strength, flexural strength, and hardness with 155 MPa, 6.17 J, 183 MPa, and 92 D-shore, respectively. The coconut rachilla fibre and FMH biosilica-generated epoxy composite have the lowest specific wear rate and coefficient of friction (COF) of 0.006 $mm^3$/Nm and 0.42, respectively, with the addition of 5 vol% FMH biosilica particles. These composites also exhibit excellent thermal properties having maximum first decomposition temperature of 342 °C and glass transition temperature of 102 °C. Additionally, these composites keep their hydrophobic properties indefinitely, and the ERB3 composite has the lowest contact angle at 81°. These epoxy composites having improved mechanical, thermal, and wear properties may be helpful in a range of engineering applications that can use for high load bearing capacity and biodegradability, such as sporting goods, automobiles, home furnishings, food packaging, transport, and aircraft.

## 1 Introduction

In recent years, demand for natural fibres and composites made from them has increased significantly for new advance materials for engineering. Natural fibres are employed primarily for the reason that they are affordable, lightweight, simple to produce, renewable, recyclable, need less energy from fossil fuels, and most importantly they have a high specific strength to weight ratio [1, 2]. Growing demand for environmentally friendly materials has caused a paradigm change in favour of natural fibres alternative to synthetic fibres and culminating in the creation of these materials [3, 4]. Being versatile, the natural fibre composites are particularly desirable in many sectors like automobile, drug or food storing, sporting goods, and light weight applications [5, 6].

However, due to the hydrophilic nature of natural fibres and hydrophobic nature of resin does not yield suitable outcomes in natural fibre polymer composites [7]. As a result, the surface of the natural fibres might be surface treated before being incorporated into the polymer as a main reinforcement. Natural fibres can have their loosely bound cellulose and hemicellulose removed through surface treatment. To improve the quality of the fibre-polymer matrix interface, a variety of chemical processes are used to modify the surface of natural fibres, including alkali treatment, benzoyl peroxide treatment, silane treatment potassium permanganate treatment, acetic acid treatment, isocyanate treatment, bleaching, and graft copolymerization treatment, which will improve the fibre's interface interaction with the matrix [8]. The most used chemical treatment for natural fibres is alkali treatment and silane treatment [9]. Alkali treatment removes the lignin, hemicellulose, wax, and other natural impurities, while during silane treatment, the silane molecules attached to the cellulose improves the interaction between the polymer matrix and fibre by increasing reaction sites and surface roughness [10]. In this research work, the combined alkali-silane treatment is used for the surface treatment of fibre. Researchers have looked into using natural plant fibres such as jute, sisal, bamboo, flax, cornhusk, banana, and ramie as a reinforcement material in composites [11, 12].

Murugan et al. [13] studied the silane-treated aloe vera/hemp/flax-reinforced epoxy composite. They demonstrated that the addition of silane-treated hybrid fibre has the highest normalised strength of 98% and low velocity impact damage. Arun Prakash et al. [14] examined the silane-treated *Caryota urens* fibre as a reinforced material in epoxy composite and study their mechanical, thermal, and fatigue behaviour. They found that the incorporation 30vol% fibre in the resin shows the highest fatigue cycle of 18,315 for 25% of maximum tensile stress and highest interlaminar shear strength of 28 MPa. Likewise, to these natural lignocellulosic fibres, coconut rachilla fibre is a new entry which basically obtained from stem of coconut plant and potentially used as reinforcement material in a polymer composite. Akter et al. [15] investigated the mechanical properties of coconut spathe fibre-reinforced HDPE composite. They revealed that tensile strength, flexural strength, impact strength, and hardness of HDPE are enhanced by 5% with the incorporation of coconut spathe fibre.

Furthermore, in order to achieve the appropriate properties for polymer composites, particle reinforcing may be just as important as fibre reinforcement. The particles might improve the composite distinctive properties such as mechanical, thermal, wear properties, and damping properties. Numerous ceramics, nanoparticles, and metallic particles are frequently employed to form composites; however, innovative bio-based particle types are gaining popularity for usage in multi-dimensional composites [16]. Bio-based particles produced from domestic, animal, or marine waste may also be used as filler in composites [17]. These agricultural wastes might be transformed into beneficial bioceramics, which would minimise pollution, increase process economy, and help with solid waste management [18]. Poomathi et al. [19] conducted a study on red matta rice husk ash-extracted biosilica particles' derived epoxy composites. They found that with incorporation of biosilica particles, there is improvement of mechanical and fatigue behaviour of composite. Jayabalakrishnan et al. [20] evaluated the mechanical, dielectric, and hydrophobic behaviour of epoxy composites fabricated with biochar particle extracted from coconut shell. They found that composites with 5vol.% biochar particles has maximum mechanical strength. While the composite with 7 vol.% has highest dielectric constant with 6.2 and high hydrophobic contact angle of 70°. Similarly, Gairola et al. [21] explore the crop residual waste extracted from finger millet husk (FMH) and barnyard millet husk (BMH) and its potential in thermoplastic composites. They demonstrated the FMH-reinforced composite exhibits better mechanical properties as compared to BMH-reinforced composites.

The objective of the current study is to determine the advantages of employing biosilica extracted from finger millet husk and the development of a unique fibre made from coconut rachilla as a reinforcement material. The main objective of the current study is to determine how the high-performance epoxy composite's mechanical, wear, thermal, and hydrophobic behaviour is affected by coconut rachilla fibre and FMH biosilica particles.

## 2 Material and methods

### 2.1 Materials

As reinforcements, coconut rachilla fibre with dimensions of 300–400 mm in length, 0.2 µm in diameter, and 0.94 g/cc is acquired from regional farms in Tamil Nadu, India. Fig. 1

shows how coconut rachilla fibre is prepared. Usually the green coconut rachilla was soaked in the water for 2 weeks. Then, it was dried in sun light for easy removal of fibre. The top thick lignin layer is removed in the soaking period and the fibre bundle alone remains. Finally the fine fibre was extracted using hammering process. The prepared fibre contains cellulosic content of 30–38%, semi-cellulosic content of 13–18%, holo-cellulose of 8–16%, lignin of 28–38%, and wax content of 1–3%. This fibre has tensile strength of 380 MPa, young's modulus of 9.3GPa, and density of 1.35 g/cc, whereas the other peer group natural fibres such as cotton, flax, hemp, jute, and kenaf have lesser physical properties than this fibre [22]. Finger millet husk is also collected from the local market for preparation of biosilica particles. Huntsman, India Pvt. Ltd. supplied the Araldite Epoxy Resin of grade LY556 and the hardener of grade HY591 used as the resin system. 3-Aminopropyletriethoxysilanesilane is used as a surface enhancer procured from Sigma-Aldrich by the USA (APTES). Another chemical like NaOH, HCl is provided by MERCK India Ltd.

## 2.2 Preparation of biosilica from finger millet husk

The finger millet husk (FMH) biosilica is synthesized using a thermo-chemical process. The FMH biosilica particles are prepared in two stages. The FMH are initially interlaced and lit using a separate air supply mechanism at 750 °C in a thermal reactor. The by-product of burning is FMH ash which has high biosilica content and very few contaminants. Cleaning the FMH ash contaminants is the second stage. To manufacture sodium silicate solution, the produced FMH ash is combined with various concentrations of NaOH solution at 80 °C and continuously agitated for 1 h. To remove sodium silicate, the solution is filtered using filter paper (Whatman grade 41). The sodium silicates are titrated once more in the 1 N (normality) HCl solution at a pH of 7. The silica gels are gathered when the mixing procedure is finished and aged for 24 h. Silica gels will be washed with distilled water to create a silica slurry. This silica slurry is heated in a beaker for roughly 20 h at 70 °C after being periodically rinsed. To obtain a finer particle size, the created xerogel silica is subsequently mashed in a mortar for a number of hours. The FMH biosilica that is obtained has a density of 2.7 g/cc with a simple cubic structure and a diameter of 1–3 µm. The prepared biosilica particles are then surface treated with silane as same as fibre treatment. SEM image of FMH biosilica and coconut rachilla fibre is shown in Fig. 2.

## 2.3 Surface treatment of coconut rachilla fibre

The palmyra sprout fibre is first given an alkali base treatment. Prior to the alkali treatment, the fibres are dried for 2 h at 100 °C in an oven. For alkali treatment, fibres are steeped for 3 h at room temperature in a 1 N NaOH solution using a 1:20 ML ratio. After the procedure, the samples are thoroughly neutralized by being rinsed with water to get rid of any remaining NaOH. The samples are dried for 24 h at room temperature before being oven dried for 2 h at 100 °C [23].

## 2.4 Composite preparation

The epoxy biocomposites are created utilising a rubber mould by hand lay-up approach. Prior to moulding, a consistent volume of epoxy resin is combined with three distinct FMH biosilica particle concentrations (1 vol. %, 3 vol. %, and 5 vol. %), and the mixtures are continually stirred until homogeneous. Then, hardener is added to the epoxy resin and biosilica particle mixture with ratio of 10:1. After precisely measuring out 20 vol. % and 40 vol. % of coconut rachilla fibres, the epoxy resin mixture is then poured into the mould. Cover the mould with a top plate to get rid of any leftover resin. The resin can then

**Fig. 1** Extraction step-by-step process of preparation of coconut rachilla fibre

**Table 1** Composition and designation of composite fabricated

| Composite designations | Epoxy resin (vol.%) | Rachilla fibre (vol.%) | Biosilica (vol.%) |
|---|---|---|---|
| E | 100 | - | - |
| ER1 | 80 | 20 | - |
| ER2 | 60 | 40 | - |

| ERB2 | 57 | 40 | 3 |
| ERB3 | 55 | 40 | 5 |

be post-cured for 12 h at 120 °C after curing for 24 h at room temperature [24]. Table 1 shows the composition and designation of composites fabricated.

## 3 Characterizations

According to ASTM D638 and D790, the tensile and flexural properties of composite materials are assessed using a universal testing machine (UTM), INSTRON 4855, UK, with a 10-ton loading capability. All samples are tested at a transverse speed of 1.1 mm/sec. A micro-impact tester made by Crystal Equipments India Pvt. Ltd. with a maximum energy reading scale of 20 J is used to assess impact toughness. The Shore-D durometer from Bluesteel India is used to measure the microhardness of composites in accordance with ASTM D 2240, 2016. The wear characteristics of epoxy and its composites are examined using the ASTM G99-compliant dry pin-on-disc technique (Magnum, India). The test conditions include a standard weight of 10 kg, a disc speed of 800 rpm, and a worn track diameter of 100 mm. The mass polymer composites lost with the temperature change are examined by thermogravimetric analysis. To conduct the thermogravimetry experiment on epoxy composite, TGA, thermo-scanner from NETZSCH STA Jupiter, 409 PL Luxx, Germany, is used. The temperature raise was controlled as 10 °C/min at $N_2$ gas environment. The glass transition behaviour and thermal stability of composites are investigated using differential temperature analysis. According to ASTM D 2578, contact angle measurement is used to assess the hydrophobicity (sessile drop test) of an epoxy composite coating (Holmarc, India). This included using a high-performance, aberration-corrected CMOS lens to place a water drop on the composite and determine the contact angle between the drop and the composite. Finally, a scanning electron microscope is used to study the epoxy composite micrographs (Hitachi-1500, Japan).

**Table 2** Mechanical properties of epoxy and its derived composites

| Composite designations | Tensile strength (MPa) | Tensile modulus (GPa) | Flexural strength (MPa) | Flexural modulus (GPa) | Izod impact (J) | Hardness (Shore-D) |

## 4 Result and discussion

### 4.1 Mechanical properties

The mechanical characteristics of epoxy composites made with coconut rachilla fibre and FMH biosilica particles are listed in Table 2. The neat epoxy resin has the tensile strength, tensile modulus, flexural strength, flexural modulus, Izod impact toughness, and hardness of 61 MPa, 2.361 MPa, 94 MPa, 3.83 MPa, 0.38 J, and 86 Shore-D, respectively. According to ASTM standard test specimen, the values are almost closer and produced repeatability. Because of its brittle nature, epoxy matrix resin has poor mechanical qualities. The mechanical characteristics of composites improve by 54.1%, 62.8%, 44.6%, 26.1%, 884.2%, and 1.16%, respectively, when coconut rachilla fibre is added, as shown in Table 2. While there is further enhancement observed in mechanical properties when volume percentage of fibre is increased [25], on comparison with the previous article [25], the mechanical properties are improved significantly. The fibre acts as a load-bearing capacity in the composite and is equally disseminated throughout the epoxy matrix resin, which lowers the stress intensity factor and so improves mechanical qualities. Additionally, by lowering the fibre's moisture absorption, surface treatment of the palmyra fibre enhances the contact between the hydrophobic matrix and hydrophilic fibre. Alkali-silane-treated fibre thereby improves the interfacial interaction between the matrix and fibre at the interface, resulting in high adhesion to the resin system and the epoxy matrix. Additionally, it is clear from Fig. 3a that the silane group and epoxy matrix resin have a chemical link that makes the reactive phase of the alkali-silane-treated fibre more compatible with the matrix resin.

Additionally, the mechanical properties of coconut rachilla-reinforced epoxy composites are improved by the dispersion of FMH biosilica particles. The distribution of biosilica particles has a substantial impact on the initial and maximum debonding loads of palmyra sprout fibres from the epoxy matrix. Figure 3 illustrates the rather smooth pull-out behaviour of fibre from the epoxy matrix during the failure of ERB composites. This can be due to a strong chemical link between the alkali-silane-treated fibre and FMH biosilica particles that results in good adhesion between the epoxy matrix resin and coconut rachilla fibre. The composite with the designation ERB2 exhibits the greatest increase in mechanical characteristics. This betterment is due to strong bonding between matrix resin and fibre because of high concentration of biosilica particles as shown in Fig. 3c. It is also interesting to notice that, aside from hardness, the mechanical properties of the biocomposites drastically decrease as the concentration of FMH biosilica particles rises by 5vol%. This is due to the agglomeration that takes place at large biosilica particle volumes, and the voids the agglomerates create have a significant impact on tensile strength as shown in Fig. 3d.

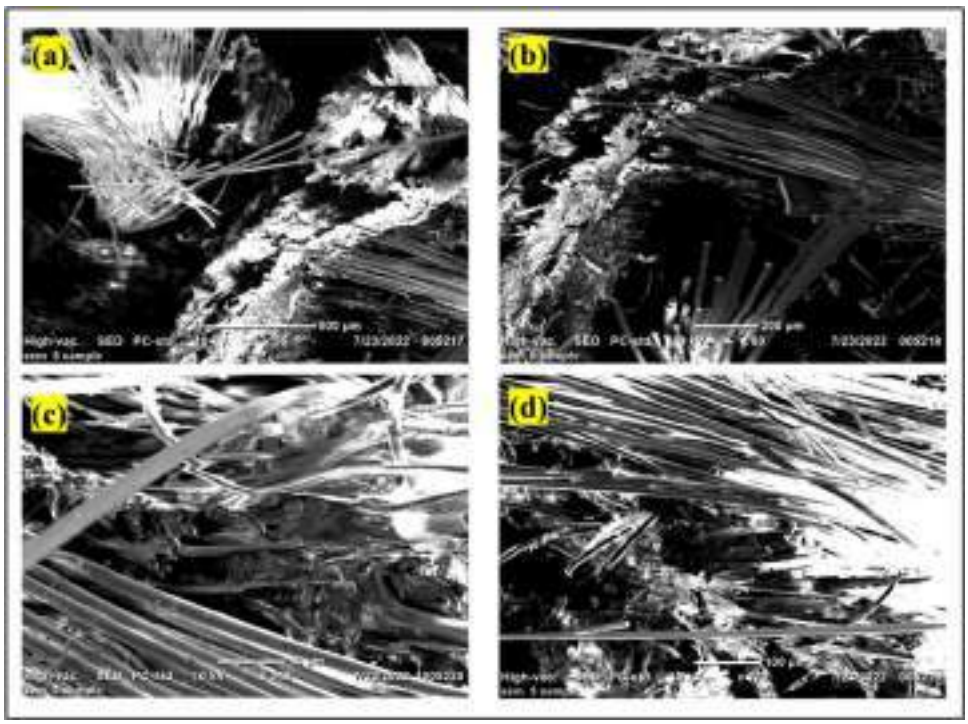

**Fig. 3** SEM images of tensile fractured composite samples: **a** ER2, **b** ERB1, **c** ERB2, and **d** ERB3

### 4.2 Wear properties

Figure 4 demonstrates the wear characteristics of composites made from epoxy reinforced with coconut rachilla fibre and FMH biosilica particles. The increased wear attributes of coconut rachilla fibre-reinforced composites are comparable to the mechanical properties. The specific wear rate and coefficient of friction of pure epoxy resin are 0.028 $mm^3$/Nm and 0.74, respectively, higher than those of other composites. On comparison with the ASTM standard test specimen, the COF and specific wear rate are deviated with 0.02%. The high specific wear rate and coefficient of friction cause a rise in abrasion and adhesion wear loss. Epoxy resin's molecular structure is sticky and adheres to the abrasion disc, removing a lot of material from the work piece in the process. This substance re-adhered to the abrasion disc and provided increased two-body and three-body abrasion [26]. Additionally, a portion of the material is released from the work piece as a result of high frictional heat during a major run in the material, increasing wear loss.

By improving the epoxy system with coconut rachilla fibre, wear loss is reduced. However, wear loss is decreased even further when FMH biosilica particles are added to composites. Both the COF and the specific wear rate decrease as FMH biosilica particle concentration increases. The ERB3 composite has the lowest COF of 0.42 and the lowest specific wear rate of 0.006 $mm^3$/Nm. This significant improvement in wear characteristics results in the strong interfacial adhesion behaviour of the biosilica particles. By reducing adhesion with the abrasion disc, FMH biosilica particles improve the sliding behaviour of composite surfaces. The previous article reported lesser wear resistance of 0.014 $mm^3$/Nm for composite they prepared. However, the present composite holds higher wear resistance. The biosilica particles are converted into cellulose flakes when the biosilica dispersed epoxy composite is abraded in the friction disc. Acting as solid lubricant packets in between the abrasion discs, these flakes lessen wear loss. Additionally, because there is less friction between the surfaces, the rate of heat dissipation is higher [27]. The epoxy resin composite's biosilica particles work as a heat absorber to stop erosion and adhesion wear, lowering the wear rate and COF as a result.

### 4.3 Thermal properties

The TGA and relative DSC arrived Tg values of epoxy and its coconut rachilla fibre and FMH biosilica particles generated composite are shown in Fig. 5. It should be mentioned that the pure resin had a Tg value of 63 °C and breakdown temperatures of 295 °C, 374 °C, and 483 °C at the beginning, middle, and end of the process, respectively. The chemically reacted secondary side polymer branches and the highly cross-linked epoxy molecular structure are the reason for greater Tg and reasonable mass loss stability. Since the primary and secondary molecules of epoxy resin are very reactive, it takes a lot of heat energy for them to move around, which increases the heat flow and raises the Tg as well as mass loss stability [28]. However, it should be emphasised that the Tg and thermal stability at the beginning, middle, and final stages are only little altered by the addition of coconut rachilla fibre alone in to the resin. The Tg and thermal stability of an ER2 composite designated with high concentration of fibre are increased, which might prevent the early evaporation of large amount of fibre molecules when the temperature is raised, is a result of this enhancement.

Additionally, it should be noticed that the incorporation of FMH biosilica particles added to the resin improved the thermal stability as well as Tg. Due to the creation of nanocomposite materials, the softening temperature has

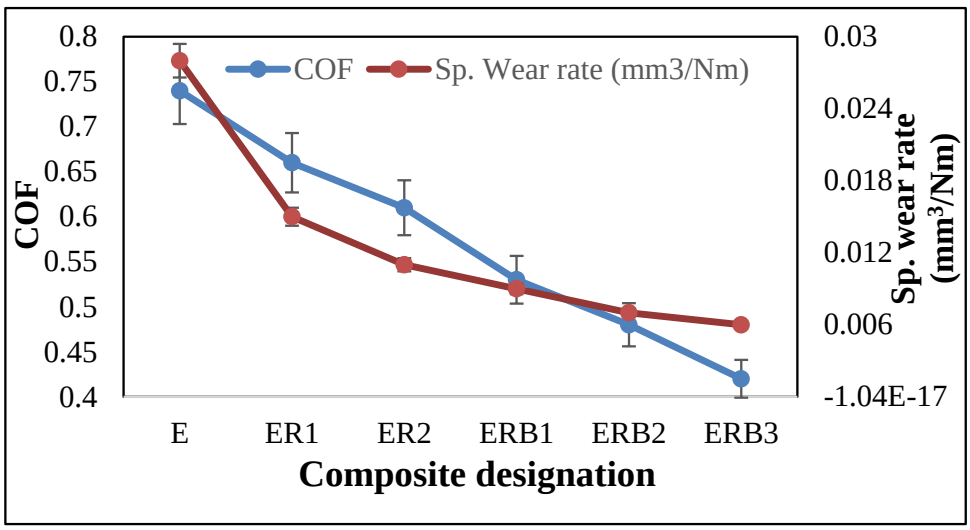

**Fig. 4** Wear properties of epoxy and its derived composites

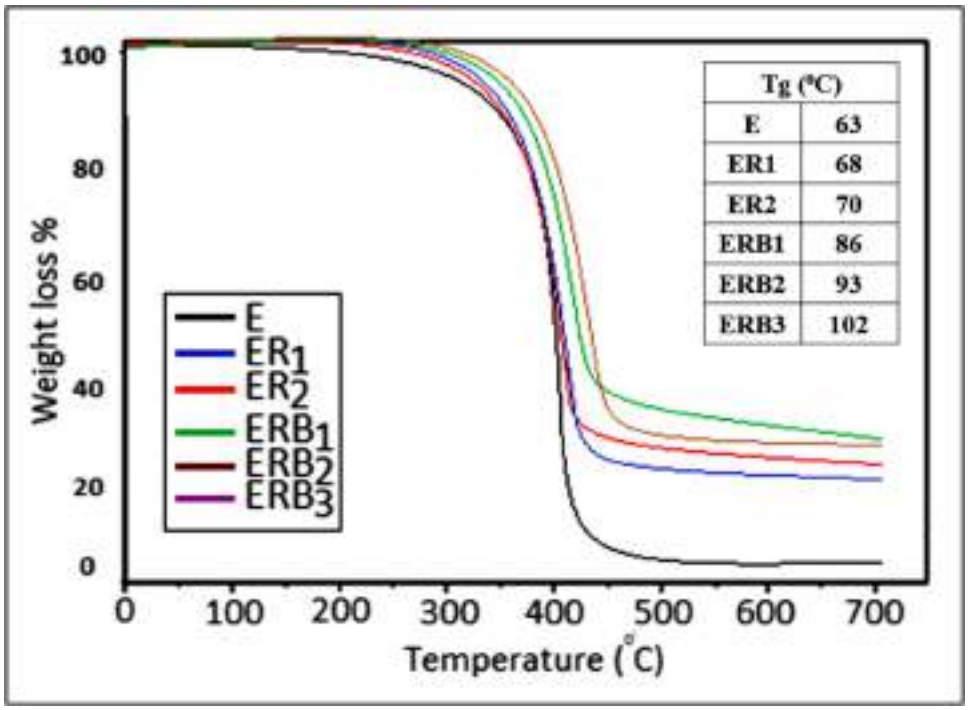

**Fig. 5** Thermal behaviour of epoxy and its derived composites

increased, which has improved heat energy absorption. Biosilica additives neatly filled in the gaps left by the polymer and increased the heat capacity. The unit length and weight of the polymer chain has risen as a result of the additional FMH particle reacting with the multiple polymer chains. Therefore, weight gain in chain during heating may take a lot of energy to rotate itself around the core C–C chain [29]. As a result, the increased Tg is seen. The stability of mass loss is also increased by this improved Tg. The initial, middle, and final decomposition temperatures are raised for the FMH biosilica particle-added composite designations ERB1, ERB2, and ERB3. For EFP3 composite designation, a maximum first decomposition temperature of 336 °C is reported; this represents a 13.8% improvement over the neat epoxy resin system. Suganya et al. [29] reported the thermal stability of composites with an improvement of 8.4% on compare with neat epoxy resin. However, this present composite produced extra 5.4% of improvement.

## 4.4 Hydrophobic behaviour

Figure 6 shows the hydrophobic contact angle of composites made with FMH biosilica and coconut rachilla fibre-reinforced epoxy. Pure epoxy resin has been shown to have the largest contact angle, measuring 102°. High contact angle happens as a result of the free, unsaturated OH molecules in the epoxy primary chain's capacity to fend off water molecules and maintain low surface activation energy. Due to the addition of coconut rachilla fibre by 20 vol%, contact angle is drop by 3.9% because of high water permeability of

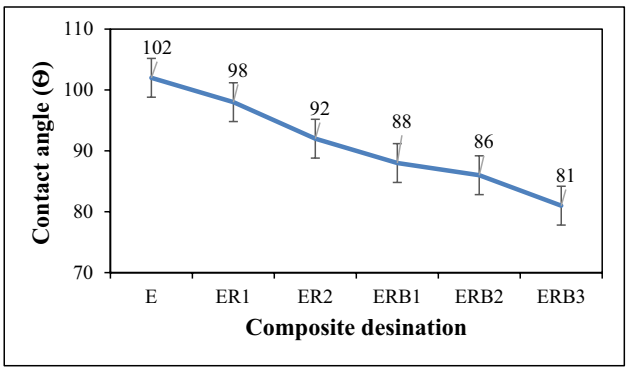

**Fig. 6** Hydrophobic behaviour of epoxy and its derived composites

fibre and hence increases water absorption. Natural fibres are cellulosic; hence, coconut rachilla fibres are incredibly vulnerable to water absorption. With increasing concentration of fibre, contact angle decreases. Also, it is interesting to note that the contact angle continues to decrease with the addition of biosilica particles. Low contact angle is observed as a result of this behaviour, which is brought on by the FMH biosilica particle's high active surface energy and high water permeability. Alshahrani et al. [30] also reported similar effects when adding biosilica particle into the epoxy resin. With a contact angle of 81°, the composite with the designation ERB3 has the lowest value. As a result, despite the addition of natural fibre and biosilica particles, the composite retains its hydrophobic properties indefinitely and does not become more hydrophilic [31 and 32].

## 5 Conclusions

In this study, the role of FMH biosilica and coconut rachilla fibre in the creation of incredibly durable epoxy composites is examined. According to results it is noted that the composite containing 3vol% of FMH biosilica exhibits maximum enhancement and surpasses conventional composites in terms of tensile strength, tensile modulus, flexural strength, flexural modulus, Izod impact strength, and hardness. The mechanical properties of the biocomposite are diminished as a result of the agglomeration caused by the high concentration of biosilica particles (5 vol. %) in the material. The biocomposite contains 5 vol. % of biosilica particle, which has the lowest specific wear rate and COF of 0.003 $mm^3$/Nm and 0.42, respectively. Additionally, it also exhibits the greatest weight loss percentage with temperature and glass transition temperature with 102 °C; hence, it has outstanding thermal properties. These composites also do not become more hydrophilic when natural fibre and biosilica are added, thus maintaining their hydrophobic properties indefinitely. Therefore, for engineering applications, including high load bearing applications as well as in automobiles, the alkali-silane-treated coconut rachilla fibre-reinforced FMH biosilica particle-toughened epoxy composites could be helpful.

**Abstract:** The issue of bacterial diseases is spreading throughout the globe. It is now recognised that bacterial diseases kill more people each year than malaria. Ayurvedic medicine was among the most effective treatments for bacterial infections in antiquity. It was discovered that the plant Malabar nut has a variety of pharmacological qualities after studying the most recent survey on the plant with antibacterial activity. The plant, which is an Acanthaceae member and was endemic to India, was known by the common name Adusa. Through a review of the literature, 102 phytochemical components from the Malabar nut plant were found for the present study project. Only 84 substances have their two-dimensional structure determined using PubChem databases. These compounds were subjected to virtual screening, the results of which indicated that only 28 compounds would be found to contain active drug molecules. Most of the bacterial illnesses that affected humans were brought on by the bacterial protein Cytochrome P450 14-alpha-sterol demethylases (CYP51). The three-dimensional protein structure was acquired from PDB databases and then utilised for the docking procedure. Using docking tools, only 1 chemical, out of 28, predicted the optimal binding relationship with the protein.

## 1. Introduction

Bacterial pathogens have a significant impact on public health. Any part of the body can develop disease, and it can be brought on by the organism itself or by the body's reaction to its existence[1]. Humans can contract bacteria via the air, water, food, or living things. The main means of bacterial infection transmission are contact, aerosol, droplet, vectors, and moving vehicles[2]. Morbidity and mortality are significantly impacted by preventive strategies. As we encroach into new environments, new species and novel variations of well-known species continue to be discovered[3]. Disease-causing pathogenic microorganisms have properties that enable them to sidestep the body's defenses and utilize its resources4. Last but not least, virulence refers to an organism's potential to spread disease through traits including invasiveness and toxin production[5]. In determining whether a disease will spread after a bacterial agent has been transmitted, host factors are crucial[6]. These variables include genetic make-up, nutritional status, age, length of organism exposure, and co-occurring diseases. Antibiotic resistance among bacteria is a rising issue that necessitates careful usage of antibiotics[7,8].

*Adhatoda vasica* Nees (Acanthaceae), sometimes referred to as Adusa or the Malabar nut tree[9]. The Assam, Bangladesh, India, Nepal, and Sri Lankan subcontinents, Laos, and Myanmar make up the natural range of the Malabar nut[10]. Many alkaloids, phenolics, flavonoids, sterols, and their glycoside derivatives have been identified from the well-known medicinal herb Malabar nut. Its wide range of therapeutic effects include hepatoprotective, antimicrobial, antitussive, abortifacient, antitubercular, antimutagenic, antiulcer, antiasthmatic and cardiovascular protection[11,12]. It is commonly used in South-East Asian traditional and folk medical systems, and it is also a well-known plant medication in Ayurvedic and Unani medicine[13]. The protein that was found to cause of the bacterial infections in human was Cytochrome P450 14-alpha-sterol demethylases (CYP51) are important enzymes in sterol in plants biosynthesis and cholesterol biosynthesis in humans[14]. In the pathways leading to the synthesis of ergosterol in fungus, various forms of sterols in plants, and cholesterol in humans, the demethylated products of the CYP51 reaction are essential intermediates[15]. These sterols are found in cells plasma membranes, where they serve a crucial structural function in the control of membrane permeability and fluidity[16]. They also have an impact on the activity of enzymes, ion channels, and other embedded cell components. In an effort to find novel ways to cure bacterial infections, drug researchers have started focusing on the 14-demethylase enzyme in bacteria[17]. By inhibiting the bacteria's production of ergosterol, the pathogen is killed since the breakdown of the plasma membrane causes cellular leakage[18]. The CYP51 family is an intriguing subject for fundamental P450 structure/function studies and is also an important clinical drug target[19]. *In silico* screening, large libraries of drug-like compounds that are commercially accessible are computationally screened against targets of known structure, and those that are predicted to bind well are experimentally tested[20]. Virtual Screening of the compound was excluded by Molinspiration software[21]. The software predicts the calculations of leading molecular properties as well as calculation of bioactivity score for the most important drug targets[22]. Docking method is one of the most important and frequently used methods in structural-based drug designing, which predict the

© ICAS 2022

binding affinity of small molecules to their applicable target binding sites there by inhibiting the target functions[23].

## 2. Materials and Methods

### Ligand selection

Through literature study, 102 phytochemicals were identified from the plant Malabar nut for computational analysis. From the Pubchem database, 2D structures were retrieved for 84 compounds and for remaining 18 compounds, 2D structures was not available in the database.

### Prediction of oral drug activity using Molinspiration server

By using Molinspiration server, the drug likeness filter test was conducted for above 84 phytochemicals. Molinspiration expressed 6 rules (logP, Topological Polar Surface Area (TPSA), Molecular weight (MW), number of hydrogen bond acceptor (No.HA), number of hydrogen bond acceptor No.HD, and volume (Vol)) to determine whether a compound could be orally consummate. The compounds which clear the oral drug properties were further, analyzed for its biological properties using Molinspiration bioactivity server. Bioactivity predicts the 6 properties including GPCR ligand, Ion channel modulator, Kinase inhibitor, nuclear receptor ligand, Protease inhibitor, Enzyme inhibitor. The compound which satisfies all the biological properties could be taken for further docking process.

### Accession of target protein

The protein cytochrome P450 14-alpha-sterol demethylases (CYP51) were found to be most important bacterial protein. The three dimensional structure (1EA1) of that protein was retrieved using Protein Databank database which was resolute by experimental studies through X-Ray Diffraction with the Resolution of 2.21 Å.

### Analysis of target active binding sites

The Binding sites of small molecules present in the protein structure were recognized by SCFBio - Supercomputing Facility for Bioinformatics and Computational Biology (http://www.scfbio-iitd.res.in/dock/ActiveSite.jsp). SCFBioActive Site prediction server which will predict the active site in the 3 dimensional structure of the protein for the binding of the ligand.

### Molecular Docking Interactions using Argus Lab

The docking studies were performed to analyze the structural relationship between receptor and ligand using Argus Lab 4.0.1 docking software program28. The following factors were set for docking process: Population size, Grid resolution, Binding site box size, Maximum generation, Crossover rate, Mutation rate, Elitism, Dock engine used Lamarckian Genetic Algorithm. For the docking calculations, docking mode should be was set as “Dock” and “Flexible” ligand for each docking runs.

### Visualization of docking interaction using PyMol

The best docking result were analyzed using PyMol which is an open source molecular visualization tool to view the hydrogen bond interactions between the protein and ligand and also predict the distance of hydrogen formation between them.

## 3. Results and Discussions

© ICAS 2022

**Preparation of small molecules:**

Through literature survey, totally 102 phytoconstituents were identified from plant Malabar nut. The virtual screening was carried out for 84 phytoconstituents using Molinspiration server. From the result of Drug likeness properties revealed that only 38 compounds pass the Drug likeness screening test (Table 1). Further these compound were screened for its bioactivity test, the result proved that out of 38, only 28 compounds satisfies the oral drug properties (Table 2).

### 3.1 Preparation of protein

The 3D structure of protein (1EA1) was retrieved using Protein Data Bank database. The possible binding site sites of the protein Cytochrome P450 14-alpha-sterol demethylases (CYP51) were predicted using SCFBio. The secondary structure, name, position and of the amino acid present in the protein are as follows: Alpha Helix - SER260, THR261 and PHE399: Coil- GLY94, PRO319, ILE322, GLY388, ARG391, CYS394 and ALA397.

### 3.2 Docking analysis

The predicted 10 active residues were used as the binding sites for 28 natural compounds from the plant Malabar nut for docking studies. The results of the binding interaction between the active site residues of target protein Cytochrome P450 14-alpha-sterol demethylases (CYP51) and 28 compounds were shown in the Table 3.

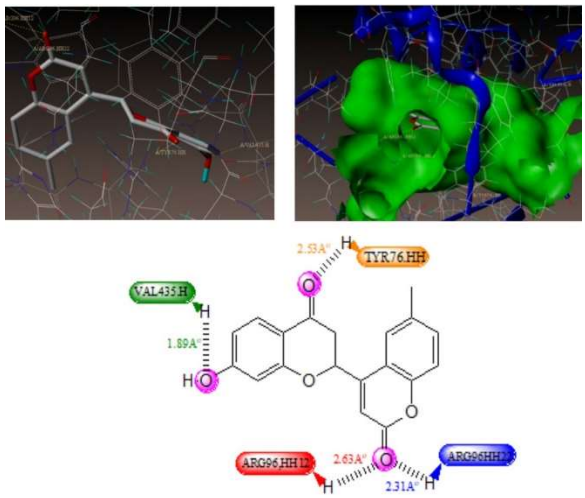

**Table 3: Molecular Docking between Phytochemical Compounds and the Protein (1EA1)**

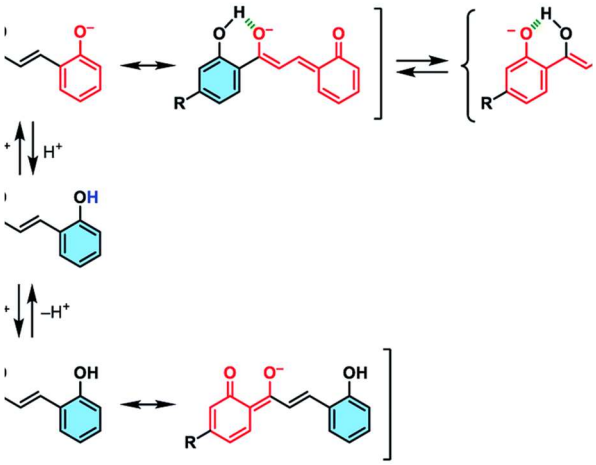
| ***Compound*** | ***Binding Affinity*** | ***Compound*** | ***Binding Affinity*** |
|---|---|---|---|
| Hydroxychalcone | -8.9 Kcal/Mol | Dibutyl Phthalate | -7.4 Kcal/Mol |
| Methanone [4-(Dimethylamino)Phenyl] (4-Methoxyphenyl) | -8.7 Kcal/Mol | Methyl 3-(4-Hydroxy-3-Methoxyphenyl)Prop-2-Enoate | -7 Kcal/Mol |
| 5-Isopropyl-1,3-Cyclohexanedione | -7 Kcal/Mol | 2,4-Dimethyl-2,4-Heptadiene | -5.5 Kcal/Mol |
| Syringic Acid | -6.5 Kcal/Mol | Hydroquinone | -5.3 Kcal/Mol |
| 4-Heptanone | -5.2 Kcal/Mol | Amino-N Butyric Acid | -5.1 Kcal/Mol |
| D-Erythro-Hex-2-Enonic Acid, Gamma-Lactone | -4.7 Kcal/Mol | Glycine | -4 Kcal/Mol |



By analyzing the docking result, 2 compounds: Hydroxychalcone and Methanone [4-(Dimethylamino) Phenyl] (4-Methoxyphenyl) were found to have the highest inhibitory activity of -8.9 Kcal/Mol and -8.7 Kcal/Mol when compared with 10 other compounds which showed the inhibitory activity of $< -8$ Kcal/mol. The remaining 16 compounds do not exhibit any inhibitory activity between protein Cytochrome P450 14-alpha-sterol demethylases (CYP51).

**Table 4: Docking interactions between hydroxychalcone – 1EA1**

© ICAS 2022

Best docking interactions between Hydroxychalcone - 1EA1

Hydrogen distance between Hydroxychalcone - 1EA1

The latest docking study on 1EA1 protein revealed that same binding inhibitory activity towards compounds Emodin when compared with the existing drugs[24]. From the current docking results, it was clearly conveyed that among the 28 plant compounds, Hydroxychalcone exhibits the best binding interaction with the Protein Cytochrome P450 14-alpha-sterol demethylases (CYP51) and further this study could be useful in designing of new preventive and therapeutic drug against bacterial infection.

## Conclusion

The development of novel natural compounds with pharmacological activity is an urgent need in designing effective drug towards bacterial infections. In the present study, docking results revealed the binding interactions between protein Cytochrome P450 14-alpha-sterol demethylases (CYP51) and 28 natural flavonoid compounds. Among those compounds, Hydroxychalcone were found to have the best binding energy of -8.9 Kcal/mol and also satisfies the pharmacological properties which provide the strong recommendation for the compound to be considered for an oral drug. On the whole, this study could be concluded that compound Hydroxychalcone could be potent anti-bacterial drugs activity against the protein Cytochrome P450 14-alpha-sterol demethylases (CYP51). Further In vivo investigations are needed to enrich the bacterial activity of the Hydroxychalcone compound from Malabar nut to determine the dosage for the safety levels.

## Abstract

Origanum vulgare ssp. hirtum is a medicinal herb that promotes antioxidants, anti-inflammatory, antibacterial, and its neuroprotective effects. Here the research investigates the preventative impacts and the procedure of O. vulgare ssp. hirtum essential oil (OEO) on the impairment of cognitive and brain oxidative stress in a scopolaminedecreased uneasy-like behaviour and enhanced mental capacity. Our findings show that exposure to Sco (100 M) causes problems with anxiety, spatial memory, and novelty response. The OEO injection also lessened the impact of Sco on antioxidant stress and acetylcholinesterase (AChE).

The OEO mix was perceived by the gas chromatography-mass being thymol (27.83%), p-cymene (19.22%), and -terpinene (20.59%). These results point to OEO's potential to reverse the cognitive deficiencies caused by Sco by reactivating the cholinergic procedure and boosting brains antioxidant levels. OEO could therefore be employed as a possible source of bioactive chemicals that exhibit beneficial biological actions and have the potential for medicinal usage.

## Overview

Aromatherapy is the supervise application of herbal essential oils that have been condensed, flowers, and other plant materials for therapeutic or preventative purposes. The three primary routes by which essential oils are delivered are orally, topically (aromatherapy massage), and olfactorily (direct and indirect inhalation). Essential oils' antifungal, antiviral, antibacterial, and antioxidant properties are their main pharmacological advantages. Numerous authors have recently emphasised the advantages of aromatherapy for reducing stress, restoring mental well-being, and relieving anxiety and despair.

Origanum majorana L. (Lamiaceae), also known as marjoram, is a herb that is native to the Mediterranean region and is grown in many countries in, North Africa,Europe and Asia.

Popular spice marjoram has a powerful & alluring scent. Asthma, dyspepsia, headaches, and rheumatism are just a few of the diseases for which this herb has been used in folk medicine. Numerous authors have discussed marjoram's impact on various illnesses as well as its antibacterial, antiviral, antioxidant, anti-acetylcholinesterase (AChE), anti-metastatic, and anti-tumor growth properties. Recent research has revealed that Origanum majorana essential oil (OmEO) can mimic the effects of antidepressants by modulating the noradrenergic, dopaminergic, and serotonergic systems. Another group of researchers discovered that OmEO helped bruxism patients feel less anxious, and they hypothesised that this essential oil would be a safe alternative to benzodiazepines in the treatment of bruxism. O. majorana also possesses anti-inflammatory properties. [21].

The structural and functional similarity between the blood-brain & barrier (BBB) of the zebrafish and mammals, as well as the existence of many proteins that are related to human assisted neurodegenerative diseases in the zebrafish, highlight the possibility of molecular cellular features that are easily observable being conserved. Other significant benefits of this animal model are also present.

Zebrafish embryos serve as evidence that mobility is a complex habit, as they continue to posses a foundational capability to swim long after the hatching. The neocortex is deficient in the zebrafish, yet the synapse structures are as yet unblemished and are believed to be engaged with the transmission cycle as well as learning and memory. Even if there is a significant association between the various brain regions' functioning in zebrafish, this is nonetheless the case.

It is generally known that cholinergic signaling contributes to both memory and learning consolidation. Scopolamine (Sco), a nonselective muscarinic acetylcholine receptor antagonist, reduces learning and short-time memory and causes amnesia. In the object identification test, Sco reduces the ability of rodents to establish memories and weakens their cognitive abilities. Zebrafish, who are likewise entirely powerless against Sco, show amnesic impacts in the clever item acknowledgment (NOR) and Y-labyrinth tests. Sco-instigated amnesia models are thusly ordinarily used to assess the potential for neuroprotection of related substances and regular items.

The bulk of the Origanum species are indigenous to the Mediterranean, North Africa and Eurasia and are used in classical medications to cure gastrointestinal, respiratory, and cold-related conditions. The Origanum genus is a part of the Lamiaceae family. O. syriacum L. has been demonstrated to have neuroprotective properties and to be advantageous in the treatment of a range of ailments that impact numerous body systems, including the respiratory, cardiovascular, and neurological systems. Additionally, it improves memory and learning in mouse models of AD. The antioxidant, antibacterial, and anti-inflammatory capabilities of origanum's phenolic parts were traditionally thought to be responsible for the therapeutic actions of the herb in conventional medicine. O. vulgare's anti-inflammatory features have been investigated in numerous studies utilizing two of them cell and animal-based modelling. Avola et al. represented the anti-inflammatory and wound-healing properties of O. vulgare L. essential oil in a person keratinocyte cell culture. Han and Parker have provided affirmation of the anti-inflammatory, tissues re-modelling. Studies into the antioxidant benefits of O. vulgare, especially those of its essential oil derivatives, have been extensive. The chemical combination of O. vulgare essential oil contains carvacrol (35.00%) and thymol (35.19%), which is primarily to blame for Kakhri's demonstration of the oil's highest antioxidant activity.

## Materials and Methods

### Using and Extracting Plant Material

In the Touloum area, fresh Guiera senegalensis leaves were picked in June 2021. (Far North,Cameroon). The plant was identified botanically by comparison to a botanically sample of Sabatié B. No. 698, which was discovered and got registered under No. 49838/HNC, at the National Herbarium of Cameroon.

The extraction process was followed exactly as Imam et al. [40] had previously reported.

Fresh G. senegalensis leaves were reduced to a fine powder after being dried in the shade for 1 week. The powder in result, 300 g, was macerated for 74 hours in a solvent made up of 80% ethanol and 25% distilled water. Whatman paper was used to filter the mixture. The final product was evaporated at 80°C in a rotating vapor to eliminate the ethanol and at 50°C for 45hours in an oven to remove the water. 7.67% (v/v) of the hydroethanolic extraction yield was obtained.

**High-Performance Liquid Chromatograph (HPLC-PDA)**

The extracts was initially diluted in a 3:7 methanol to H2O solution to create a stock solution with an initial concentration of 5 mg/mL. Clarifying the solutions required the use of a 0.2 m Millipore filter

The quaternary pump produced the mobile phase throughout the analysis by combining The sample analysis was done at a rate of flow 0.9 mL/min. Utilizing aliquots, the diluted extract was delivered in linearity gradients. For alignment bends with connection coefficients more noteworthy than 0, standard stock . Identification was done by comparing UV spectra and retention times, taking into account a match index of at least 950/1000. Sigma Aldrich provided all of the HPLC solvents and quality standards (Darmstadt, Germany).

**Treatment and Animal**

Adult fish received commercial flake fish feed twice daily (Gadstrup, Norwin Noryitall, Norwin, Denmark). Prior to the start of the study, fish was acclimated for 1 week.

Before the commencement of the behavioural tests, a 500 mL glass containing GS (1, 4, and 8 g/L) and Sco (100 M) was immersed once daily for an hour All strategies and conventions including the consideration and utilization of lab creatures have been supported by the Workforce of Science's Creature Exploration Morals Board of trustees at Alexandru Ioan Cuza College of Iaşi, Romania (No. 15308/30.07.2019), which found that they completely conformed to Order 2010/64/EU of the European Parliament and Gathering of September 22, 2010 on the insurance of creatures. The utilization of creatures was diminished to a base, and endeavors to improve

.

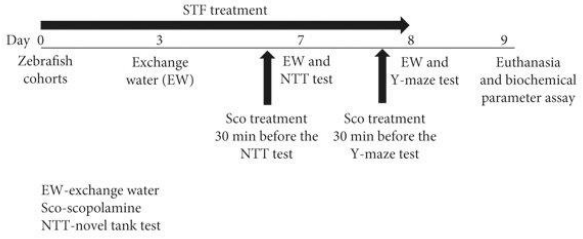

Figure 1: Design Procedure of experiment

**Novel Tank Diving Test (NTT)**

According to Cachat, the NTT is a specialized test utilized to measure zebrafish locomotor activity and anxiety reaction. The NTT was a 1.4 L trapezoidal tank (14.1 x 25.8 x 5.1 cm) with top and bottom parts separated by a virtually horizontal line. Zebrafish were evaluated one at a time for 6 minutes. Distance walked and average speed were the locomotor activity endpoints (measured in m and m/s, respectively). The quantity of passages to the top, time spent at the top (s), normal passage length (s), absolute distance went in the top (m), and freeze term (s) endpoints were evaluated to recognize tension like way of behaving.

**Y-Maze Test**

To find out how the zebrafish would react in an unknown setting, the Y-maze test was utilised. Zebrafish were put in the novel arm of a Y-shaped glass tank to test their recall (27 8 15 cm for each arm, 4 L). The "start" arm, "other" arm (which was consistently open), and "new" arm were the names of the Y-labyrinth arms (obstructed in instructional meeting and opened in test meeting). The fish were each independently positioned in the start arm, and the new arm was shut, for the term of the preparation (5 minutes). The fish were set in the beginning arm once more, yet this time the new arm was opened, and testing for five minutes began following an hour. Outright distance traveled (m) and turn point () were used to evaluate locomotor activity, while time spent in the sharp arm (% of hard and fast arm time) was utilized to survey the reaction to interest.

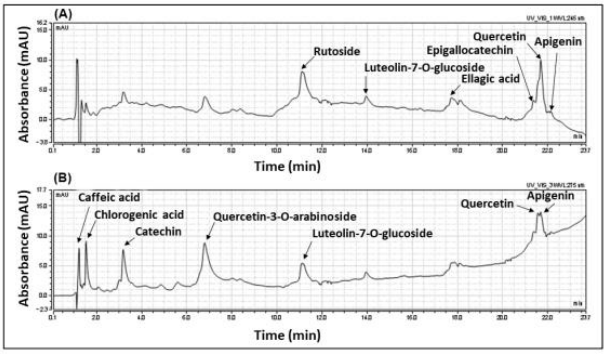
### Novel Object Detection Test

The NOR, a behavioral experiment, is often used to study the memory function of zebrafish. Zebrafish were introduced to the novel tank for a total of 5 minutes over the course of 3 days without the objects (30 cm filled with 6 cm of water). Zebrafish were exposed for ten minutes on the fourth day to two similar objects (training phase).

## Results and Discussion

### Extract from Guiera senegalensis: Chemical Makeup

The study was done to determine the chemical composition of the GS extract. According to the findings, several flavonoids and polyphenolic acids were identified. The following quantities were discovered: rutoside (204.81 g/g of dry extract), quercetin (305.6 g/g of dry extract), quercetin3-O-arabinoside (312.40 g/g of dry extracts), catechin (108.54 g/g of dry extracts), and luteolin-7-Oglucoside (55.35 g/g of dry extracts).



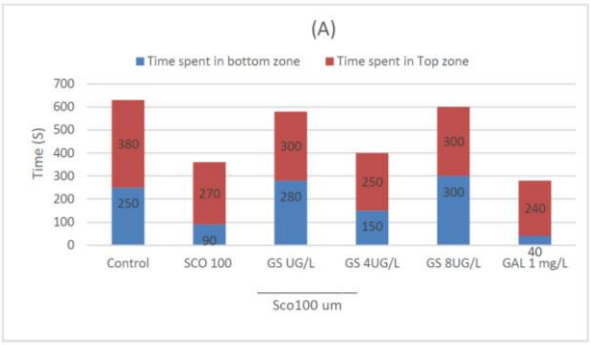


Figure 2: LC-PAD chromatography profile

Various distributions have exhibited that the vegetal material from G. senegalensis utilized in traditional medication contains in excess of 46 mixtures. According to earlier published data, chemicals that are similar to those in our results have been discovered in the leaves of G. senegalensis. In any case, most of the ongoing information just gives a conventional distinguishing proof without the measurements of these mixtures. Extractability is connected with the plant material, the solvent, and the preparation process. The most common combinations described included different polyphenolic acids, flavonoids, and gallic acid derivatives. As per the synthetic arrangement, the examined remove gives off an impression of being rich in polyphenols (flavonoids, catechins, and polyphenolic acids), which are referred to work as normal cell reinforcements. The free hydroxyl moieties likewise enact a safeguard component against free radicals in addition to connecting with cell layers. Additionally, quercetin, apigenin, and catechin derivatives inhibit oxidative enzymes like lipoxygenases to stop the denaturation of cells.

### Impact of the NOR, Y-Maze and NTT Tests on Zebrafish Anxious Behavior and Spatial Memory

Zebrafish are in many cases utilized in the new tank plunging test (NTT) to analyze the impacts of uneasiness. The GS treatment brought about huge changes in the top/base proportion, complete distance went in the top zone, number of sections to the top, and time spent in the highest point of the tank, as per the one-way of ANOVA. Following Sco treatment, there was a sensational decline (p 0.0001) in how much time spent in the top zone of the tank, the top/base proportion, the distance went in the top zone, and the quantity of doorways to the top contrasted with the benchmark group (p 0.0001). Furthermore, the Sco-organization diminished the locomotory design in contrast with the benchmark group. For contrast, GS treatment had anxiolytic-like effects in Sco zebrafish at all dosages (1 g/L, 4 g/L, and 8 g/L). Iripramine (IMP), a favourable reference drug, showed anxiolytic effects.

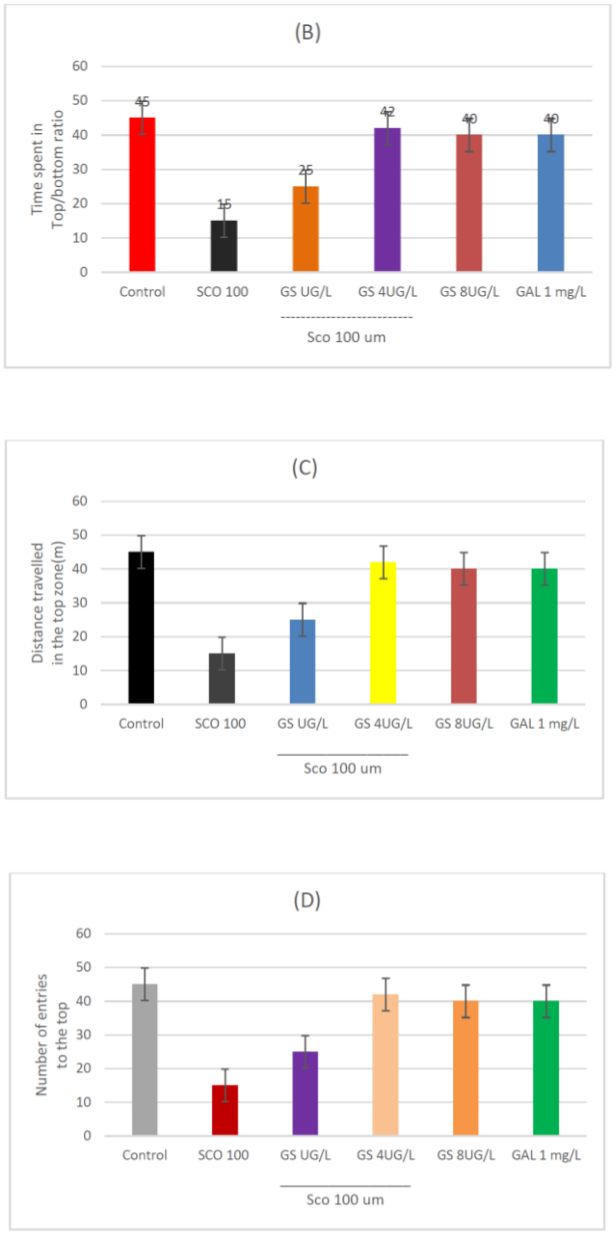

Figure 3: Guiera senegalensis hydroethanolic extract

Our findings confirm past research suggesting GS may have a neuroprotective effect. Sombie suggests a new possible source of naturally occurring neuroprotective and antioxidant components: the galls from G. senegalensis.

Additionally, Somewhat's exploration uncovered that G. senegalensis is as a treatment mental and neuropsychiatric sicknesses in the Hauts-Bassins locale of Burkina Faso. As per the creators, the advantages were achieved by the presence of the neuroprotective mixtures.

These results suggest that GS may be considered a therapeutic medication with a high potential for enhancing cognitive impairments. In fact, we demonstrated that GS has cognitive-improving and anxiolytic properties using the Sco zebrafish model.

**Impact on AChE Activity in the Brain**

AChE activity was investigated to learn more about the GS mechanism in the Sco zebrafish model. In mild cognitive impairment, AChE activity represented cholinergic status. When processing memories, the cholinergic system is crucial, and cholinergic neurons are destroyed. Acetylcholine levels fall as a result of AChE, which causes the learning and memory impairments associated with AD. Additionally, AChE inhibitors are implied in AD therapy, which improves cholinergic neurotransmission.

The AChE activity in the zebrafish treated with Sco was extremely higher than in the control group (p 0.0002). Additionally, the GS treatment significantly decreased the Sco-mediated AChE aggravation at all dosages (p 0.0001). The GS has cholinesterase inhibitory potential, which is connected to zebrafish with superior memory capacity, according to the results of the NTT, Y-maze, and NOR tests. Inhibiting AChE can be used to treat dementia caused by Alzheimer's disease, Parkinson's disease, senile dementia.

Particularly at low doses, GS dramatically reduced the In the zebrafish brain, Sco causes a rise in AChE. Since it modifies mental capability, hippocampal Hurt is a significant supporter of dementia-related cognitive declines and the fundamental component of mental problems..

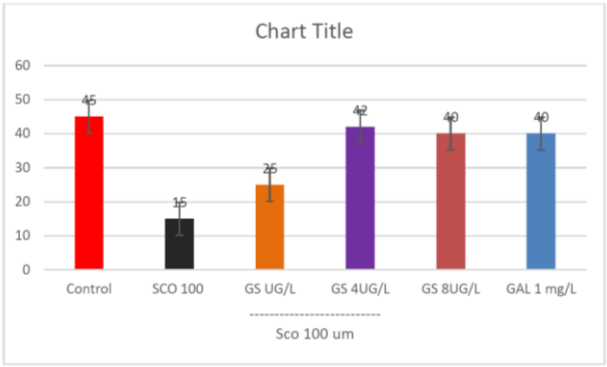

Figure 4: Impact of Guiera senegalensis hydroethanolic extract

**Brain antioxidant capacity effects**

The oxidative stress indicators were assessed to see if GS boosts antioxidant capability in vivo. Following exposure to Sco, Superoxide dismutase (SOD), catalase (CAT), glutathione peroxidase (GPX), total reduced glutathione (GSH), as well as protein carbonyl (p 0.0001) and lipid peroxidation (malondialdehyde—MDA) activities, all extremely decreased (p 0.0003).

Additionally, GS treatment (1 g/L, 4 g/L, and 8 g/L) significantly reversed the fall in CAT,SOD specific activity, GPX, and the overall amount of reduced GSH (p 0.001, 0.0001, and 0.0004, respectively) (p 0.0001). In addition, animals treated with Sco had extremely lower levels of protein carbonyl (p 0.0001) and MDA (p 0.001) after receiving GS therapy, which in turn decreased protein and lipid peroxidation.

**Conclusions**

In this work, the chemical composition of OmEO was first determined, then the proteomes of AD model rats were analysed to look for any molecular alterations. This approach indicated four biological processes as potential OmEO side effects that might affect rat brain (hippocampi) performance: apoptosis, oxidative stress, neuriinflammation and cognitive processes mediated by neurotrophins.

Testing corresponding targets—recognized representatives of the biological processes of interest—led to the determination of the relevance of the biological processes in question. In this work, we discovered that OmEO improved cognition in rats treated with A1-42 and decreased brain oxidative stress. In order to demonstrate that OmEO improves memory performance in rats given A1-42 treatment, we finally connected the cellular and molecular findings with behavioural data.

**Abstract:** The present study investigated the cardioprotective properties of 6-gingerol against alcohol-induced ROS-mediated cardiac tissue damage in rats. Experiments were conducted on 4 groups of rats, orally treated with control, 6-gingerol (10 mg/kg body weight), alcohol (6 g/kg body weight) and combination of 6-gingerol plus alcohol for two-month. In the results, we found 6-ginger treatment to alcohol-fed rats substantially suppressed ROS production in cardiac tissue. Alcohol-induced elevated 8-OHDG and protein carbonyls which represent oxidative modification of DNA and proteins were completely reversed by 6-gingerol. This was further endorsed by restored superoxide dismutase and catalase activities with 6-gingerol against alcohol-induced loss. The elevated cardiac biomarkers (CK-MB, cTn-T, cTn-I) and dyslipidemia in alcohol-intoxicated rats was significantly reversed by 6-gingerol. Furthermore, alcohol-induced apoptosis characterized by overexpression of cytochrome C, caspase-8 and caspase-9 was diminished with 6-gingerol treatment. Transmission electron microscope images conferred the cardioprotective properties of 6-gingerol as we have seen less structural derangements in mitochondria and reappearance of myofilaments. Our findings conclude that 6-ginger effectively protect alcohol-induced ROS-mediated cardiac tissue damage, which may be due to its potent antioxidant efficacy. Therefore, 6-gingerol could be a potential therapeutic molecule that can be used in the treatment of alcohol-induced myocardial injury.

## 1. Introduction

Chronic alcohol consumption is implicated in risk of developing various diseases, including cardiovascular diseases (CVD), and leads to alcohol-related morbidity and mortality [1]. Alcohol and its metabolites can cause mild to severe tissue injuries, mainly due to impaired antioxidant status and oxidative stress [2,3]. The highly unstable free radicals or reactive oxygen species (ROS) that are produced during alcohol metabolism ruins the defensive antioxidant status, and cause destructive damage to cardiac tissue [4]. Excessive accumulation of ROS disrupts the redox homeostasis and leads to the oxidative modification of vital biomolecules, including proteins, lipids and DNA [5–7]. Oxidative stress is considered to be an important factor to promote cell death in response to a variety of signals and pathophysiological situations. Excessive alcohol consumption is linked with abrupt apoptosis of cardiomyocytes via various signaling pathways [8,9]. A study found that alcohol induced mitochondrial apoptosis in cardiomyocytes through stimulated oxidative stress [5,10]. Alcohol-induced cardiac tissue damage was further witnessed by elevated cardiac biomarkers, such as creatine kinase-MB (CK-MB), cardiac troponin-T (cTn-T) and

cardiac troponin-I (cTn-I) in rats [11]. Although ROS scavengers have been shown to inhibit alcohol-induced cardiac tissue damage [11], the mechanism and involved molecules behind this phenomenon remain elusive.

The rhizome of *Zingiber officinale*, known as 'ginger', has been consumed worldwide as a spice and herbal medicine, and cultivated in most tropical regions of the world. Ginger has vital non-volatile pungent phytochemicals, such as gingerols, shogaols, paradols and zingerone, which have shown biological activities [12]. Among them, 6-gingerol (Figure 1A), a phenol phytochemical constituent of fresh ginger, has been reported to possess several pharmacological efficacies, including anticancer, antioxidant, anti-inflammation, anti-platelet aggregation and antifungal [11,13,14]. Sampath et al. reported that 6-gingerol prevents atherosclerosis by inhibiting the oxidative stress biomarkers [15]. Another study showed that 6-gingerol treatment improves antioxidant status and prevents myocardial injury induced by doxorubicin [16]. The protective effects of 6-gingerol against myocardial fibrosis possibly associated with increased antioxidant capacity, decreased inflammation and apoptosis in mice [17].

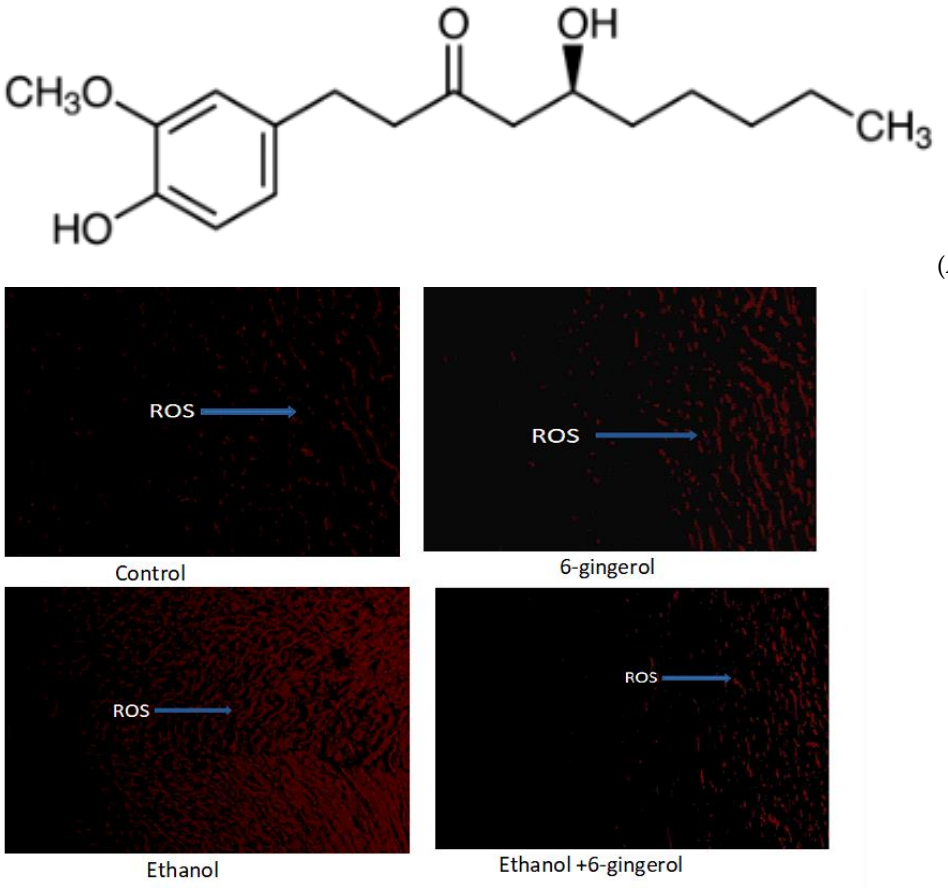

**Figure 1.** (**A**) Chemical structure of 6-gingerol. (**B**) Changes in intracellular ROS production in control, 6-gingerol, ethanol and 6-gingerol plus alcohol-fed rats.

Although previous studies have revealed the pharmacological efficacies of 6-gingerol against oxidative stress and inflammation, the function of 6-gingerol against alcohol-induced myocardial injury and oxidative stress has not yet been established. Therefore, in this study, we investigated the cardioprotective properties of 6-gingerol against alcohol-induced myocardial damage in rats. We examined the changes in key biomarkers that are involved in regulation of antioxidant status, oxidative stress and apoptosis with or without 6-gingerol treatment in alcohol-fed rats.

## 2. Results

### *2.1. Six-Gingerol Suppress ROS Production in Alcohol-Fed Rats*

ROS, which play a crucial role in provocation of oxidative stress, were determined in cardiac tissues of all experimental groups by dihydroethidium (DHE) fluorescent dye. We found ROS distribution in a small area of cardiac tissue in control and 6-gingerol-treated rats (Figure 1B). By contrast, ROS were found in large areas of cardiac tissue in alcohol-treated rats, detected by red fluorescent dye (DHE) under the fluorescent microscope. However, 6-gingerol treatment in combination with alcohol substantially suppressed the ROS generation in cardiac tissue (Figure 1B). These findings reveal that occurrence of ROS-mediated myocardial damage in alcohol-fed rats could be attenuated by 6-gingerol treatment.

### *2.2. Treatment of 6-Gingerol Restores Antioxidant Enzymes against Alcohol-Induced Loss*

The concentrations of intracellular ROS typically dictate the tissue antioxidant status. Therefore, we examined the changes of primary antioxidant enzyme activities in response to alcohol and gingerol treatments. In the results, we found a significant decrease of both superoxide dismutase (SOD) and catalase (CAT) activities in cardiac tissue of alcohol-fed rats (Figure 2A,B). Nevertheless, gingerol treatment considerably restored the SOD ($p < 0.05$) and CAT ($p < 0.05$) activities against alcohol-induced loss. The restored antioxidant enzyme activities with gingerol treatment were further witnessed in the inhibition of excessive ROS production.

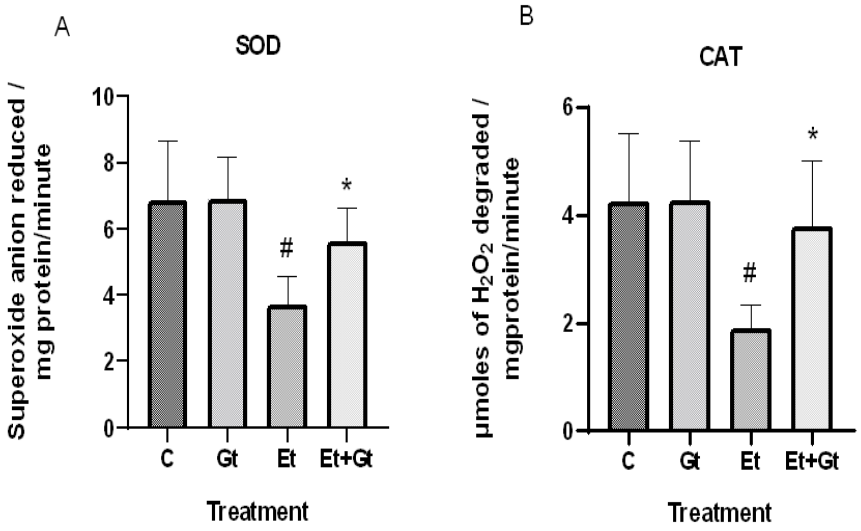

**Figure 2.** Changes in superoxide dismutase (**A**) and catalase (**B**) activities in cardiac tissue of control (C), 6-gingerol (Gt)-, ethanol (Et)- and ethanol + 6-gingerol (Et + Gt)-treated rats. The data were expressed as mean ± standard deviation (SD). $^{\#}$ $p < 0.05$ compared with control and * $p < 0.05$ compared with ethanol treated groups.

### *2.3. Gingerol Treatment Reverses Elevated 8-Hydroxyguanosine (8-OHDG) and Protein Carbonyls*

We next determined the levels of oxidative damage to DNA and proteins in alcohol- and gingerol-treated groups. Our results showed a considerable DNA oxidative damage in cardiac tissue by alcohol intoxication, which was represented by elevated 8-OHDG levels. This was about 3-fold higher compared with normal control (Figure 3A). It is worth noting that gingerol treatment substantially ($p < 0.05$) inhibited the elevated 8-OHDG levels, indicating the protective effects of gingerol against DNA damage.

Furthermore, we found that alcohol intoxication led to oxidative modification of cardiac proteins, which was evidenced by increased protein carbonyl levels. However, gingerol treatment to alcohol-fed rats significantly ($p < 0.05$) suppressed protein carbonyl content in the myocardial tissue (Figure 3B). Taken together, gingerol is able to protect the cardiac tissue by inhibiting the oxidative modification of DNA and proteins against alcohol intoxication.

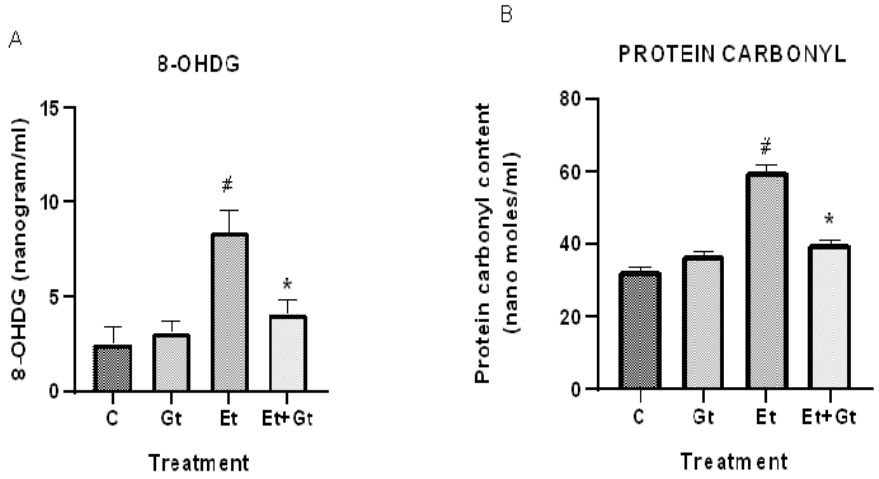

**Figure 3.** Gingerol treatment suppressed 8-OHDG (**A**) and protein carbonyls (**B**). Assessments were done in control (C), 6-gingerol (Gt)-, ethanol (Et)- and ethanol plus 6-gingerol (Et + Gt)-treated rats. The data were expressed as mean ± SD. # $p < 0.05$ compared with control and * $p < 0.05$ compared with ethanol-treated groups.

### *2.4. Antilipidemic Properties of 6-Gingerol in Alcohol-Fed Rats*

To elucidate the antilipidemic effects of gingerol, we measured the changes of total cholesterol (TC), triglyceride (TG), low-density lipoprotein (LDL) and high-density lipoprotein (LDL) levels in all experimental groups. We found that circulating total cholesterol, TG and LDL were significantly increased, while HDL levels were significantly decreased following alcohol drinking. In contrast to these, gingerol treatment to alcohol-fed rats significantly decreased the total cholesterol, TG and LDL levels and restored the HDL levels (Table 1).

**Table 1.** Alcohol-induced dyslipidemia reversed by 6-gingerol. Data were expressed as mean ± SD (N = 6). # $p < 0.005$ compared with control * $p < 0.05$ compared with ethanol groups. Values were shown in control (C), 6-gingerol (Gt)-, ethanol (Et)- and ethanol plus 6-gingerol (Et + Gt)-treated groups.

| Lipid Profile (mg/dL) | Groups | | | |
|---|---|---|---|---|
| | C | Gt | Et | Et + Gt |
| TG | 38.83 ± 5.05 | 39.38 ± 4.17 | 89.20 ± 6.08 # | 44.17 ± 4.98 * |
| TC | 66.94 ± 4.12 | 64.24 ± 5.13 | 119.86 ± 5.45 # | 72.45 ± 6.13 * |
| HDL | 25.13 ± 2.36 | 24.51 ± 2.08 | 12.62 ± 3.06 # | 21.33 ± 1.94 * |
| LDL | 40.48 ± 2.11 | 38.73 ± 1.91 | 109.11 ± 2.37 # | 56.77 ± 1.98 * |

### *2.5. Gingerol Prevents Alcohol-Induced Elevation of Cardiac Biomarkers*

The protective effects of gingerol against alcohol-induced cardiac tissue injury was determined by measuring the important cardiac biomarkers, including CK-MB, cTn-T and cTn-I. As we assumed, alcohol intoxication significantly elevated the circulating levels of CK-MB ($p < 0.05$), cTn-T ($p < 0.05$) and cTn-I ($p < 0.05$), which indicates the cardiac tissue damage (Figure 4A,B,C). Six-gingerol treatment prevents the alcohol-induced cardiac damage through suppressed cardiac biomarkers ($p < 0.05$). The suppressed levels of cTn-T, cTn-I and CK-MB with gingerol treatment were 41.5%, 40.26% and 42.38%, respectively, compared to alcohol-induced elevation (Figure 4). These results revealed the potential cardioprotective effects of 6-gingerol against alcohol intoxication.

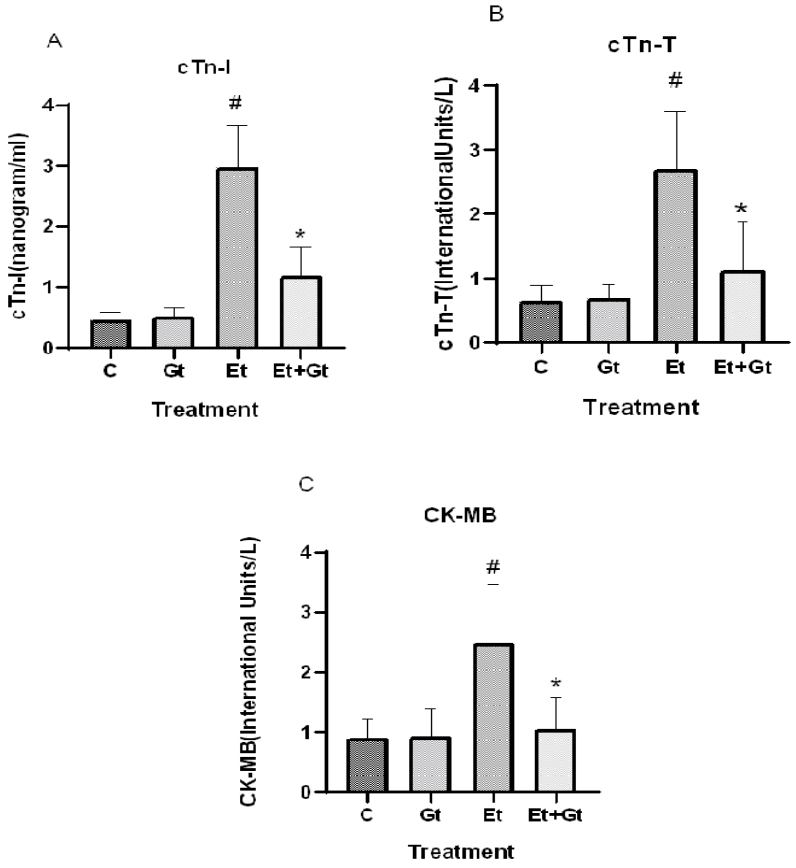

**Figure 4.** Changes in cTn-I (**A**), cTn-T (**B**) and CK-MB (**C**) levels in plasma of control (C), 6-gingerol (Gt)-, ethanol (Et)- and ethanol plus 6-gingerol (Et + Gt)-treated groups. The data are expressed as mean ± SD. # $p < 0.05$ compared with control and * $p < 0.05$ compared with ethanol-treated groups.

### *2.6. Gingerol Treatment Attenuates Upregulated Apoptotic Markers in Alcohol-Fed Cardiac Tissue*

We extended our studies to evaluate the anti-apoptotic properties of 6-gingerol against alcohol-induced induction of apoptosis in cardiac tissue. The studied key apoptotic makers through immunohistochemistry visualized that alcohol drinking triggered the expression of cytochrome C, caspase-8 and caspase-9 in cardiac tissue. Interestingly, 6-gingerole treatment for 60 days along with alcohol diminished the overexpression of cytochrome C, caspase-8 and caspase-9 in cardiac tissue. These findings evidenced that alcohol-induced initiation of apoptosis could be attenuated by 6-ginferol treatment (Figure 5). Similar to antioxidant enzyme activities, the immunohistochemistry images also showed restored expression of SOD and CAT with 6-gingerol co-administration with alcohol (Figure 6A,B).

### *2.7. Transmission Electron Microscopy (TEM) Demonstrates Cardioprotective Effects of Gingerol*

Subsequently, TEM was performed to assess the cardioprotective efficacies of 6-gingerole. As shown in the images, control heart was characterized by typical symmetric myofibrils comprised of Z lines with sarcomeres. Furthermore, packed mitochondria adjacent to the fibers were evidenced in the control group. Gingerol alone treated rats shown mitochondria slightly deviated from the fibers remaining myofibril structure intact. However, alcohol alone treated group represented with altered myofibril structure, disappearance of Z lines, derangement of sarcomeres and mitochondrial swelling. All these destructive features imply the mitochondrial apoptosis with alcohol intoxication. It should be noted that gingerol treatment prominently attenuated these structural derangements. These protective effects were evidenced by less structural alterations in mitochondria, reappearance of myofilaments and Z lines (Figure 7).

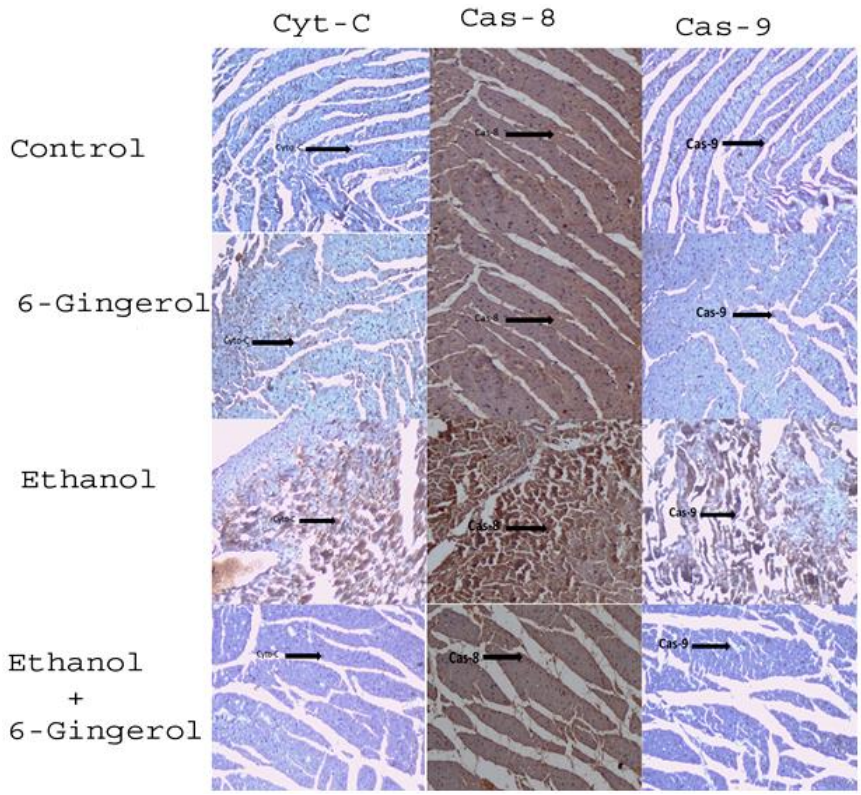

**Figure 5.** Six-gingerol regulates ethanol induced ROS-mediated apoptosis in cardiac tissue. Expressions of mitochondrial cytochrome C, caspase-8 and caspase-9 in cardiac tissues of control, 6-gingerol, ethanol and ethanol plus 6-gingerol groups. The arrow in each panel indicates the expressions of cytochrome C, caspase-8 and caspase-9 in respective groups.

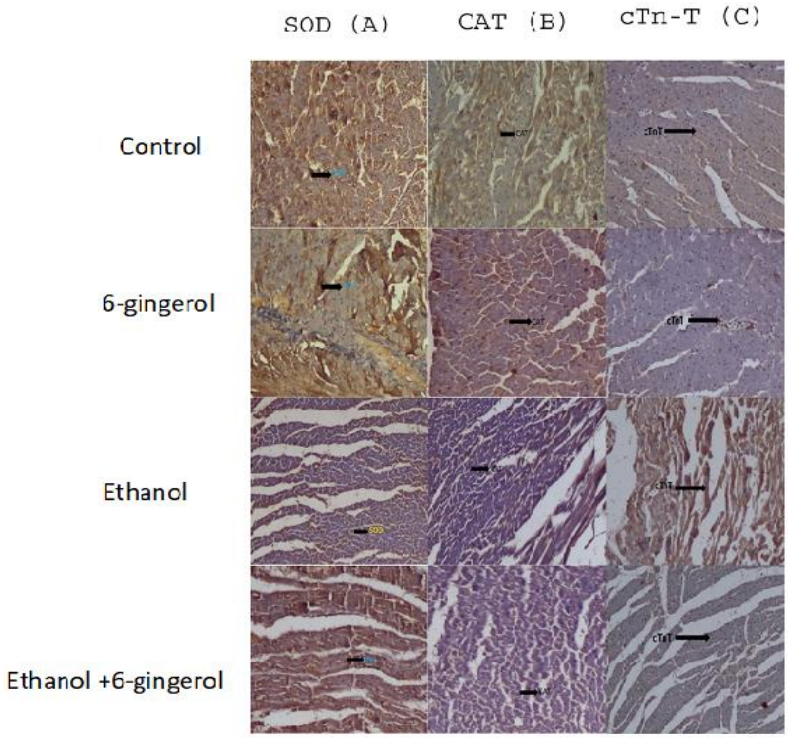

**Figure 6.** Immunohistochemistry images of SOD (**A**), CAT (**B**) and cTn-T (**C**) in all experimental groups. The arrow in each panel indicates the expressions of SOD, CAT and cTn-T in respective groups.

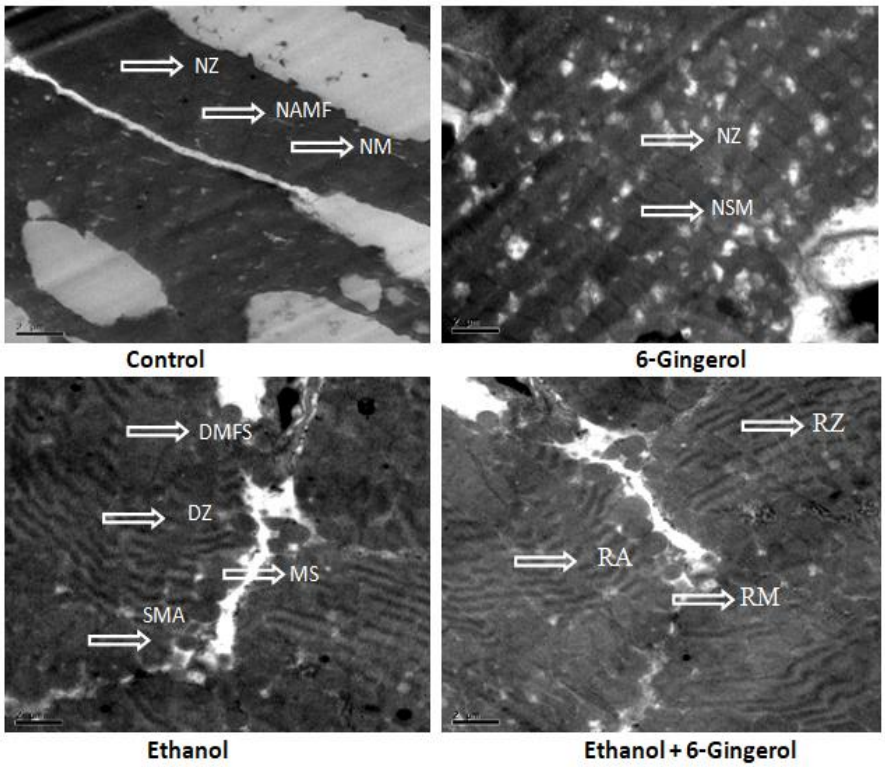

**Figure 7.** Transmission electron microscopy images of cardiac tissue display alcohol-induced tissue damage and 6-gingerol mediated recovery. The arrow indicates normal structure of Z line (NZ), normal architecture of myofibril (NAMF), normal mitochondria (NM) and normal sarcomere (NSM) in control or 6-gingerol groups. The arrow indicates, degeneration of myofibril structure (DMFS), degeneration of Z lines (DZ), sarcomere alteration (SMA) and mitochondria swelling (MS) in ethanol group. The arrows in ethanol plus 6-gingerol group indicate regeneration of Z line (RZ), regeneration of mitochondria (RM) and reappearance of sarcomere (RA).

## 3. Discussion

In this study, for the first time we have demonstrated that 6-gingerol substantially alleviated the alcohol-induced oxidative damage, myocardial injury and apoptosis. Experimental evidence shows that 6-gingerol treatment suppressed alcohol-induced ROS production in cardiac tissue. This therapeutic effect was accompanied by restored myocardial antioxidant status, and decreased DNA oxidative damage and protein carbonyls. In addition, alcohol-induced elevated cardiac biomarkers (CK-MB, cTn-T, cTn-I) and dyslipidemia were significantly reversed by gingerol. Histopathological evidence further confirmed the tissue protective effects of 6-gingerol against alcohol-induced myocardial injury and apoptosis. Since alcohol is typically involved in impairing of antioxidant homeostasis and myocardial injuries, supplementation of antioxidant rich molecules like 6-gingerol could possibly alleviate the myocardial damage. The calculated 6-gingerol dose from our rat model (10 mg/kg) is ~97 mg per adult with an average weight of 60 kg [18]. This dose might be feasible to humans, as a previous study reported no serious adverse effects of 6-gingerol with dose ranges from 100 mg to 2000 mg per adult [19].

It has been documented that alcohol intake, either chronic or acute, alters the cardiomyocyte and whole organ functioning of the heart [20]. ROS or free radicals that are generated during alcohol metabolism are crucially involved in the onset of myocardial disturbances possibly through ruining of intracellular antioxidant homeostasis [21,22]. Accumulations of highly reactive ROS destabilize the myocardial contractility, cause myocardial tissue injury, and induce myocyte apoptosis [23]. In agreement with these findings, we also noticed excessive production of ROS and subsequent myocardial injury in alcohol-fed rats. However, 6-gingerol treatment to alcohol-fed rats for a period of 2 months considerably inhibited

the ROS production in cardiac tissue. Previous studies have shown that 6-gingerol is able to decrease ROS-mediated oxidative stress in the liver [24], and its antioxidant property reduces acute renal toxicity [25]. Our previous in vitro findings also demonstrated the free radical scavenging ability of 6-gingerol [26]. A recent study reported that only 7 days of 6-gingerol treatment to arsenic trioxide injected mice significantly decreased ROS production in heart [27]. These findings indicate that 6-gingerole is able to inhibit intracellular ROS production during ethanol metabolism.

Oxidative stress is an imbalance between the amount of intracellular ROS and antioxidant defense status. Alcohol intoxication is characterized by elevated oxidative stress and decreased antioxidant enzyme status in various tissues, including liver and heart of rodents [6,11,28]. Here, we found alcohol-induced oxidative damage of DNA and proteins as reported by elevated 8-OHDG and protein carbonyl levels, respectively. Chronic ethanol consumption in rats has been shown to increase protein oxidation in parallel with increased free radicals [29]. The uncontrolled-highly unstable ROS that are generated during alcohol metabolism eventually affect the function of cardiomyocytes/heart through irreversible damage of mitochondria, DNA and proteins. These events are clinically associated with pathogenesis of cardiomyopathy [5,30]. Therefore, controlling alcohol-induced oxidative stress by known antioxidants is necessary to prevent the progression of cardiomyopathy. We found that gingerol treatment along with alcohol tremendously inhibited the formation of 8-OHDG and protein carbonyls. Due to their highly reactive nature, hydroxyl radicals or singlet oxygen hydroxylate the deoxyguanosine and formed 8-hydroxy-2′deoxyguanosine. Decreased 8-OHDG levels with 6-gingerol explains that gingerol molecules possibly inhibit the production of intracellular hydroxyl radical and/or singlet oxygen against alcohol toxicity and thereby prevent the oxidative damage to DNA and proteins. Our present findings and previous reports also confirmed the potent free radical scavenging activity or ROS inhibitory efficacy of 6-gingerol [26]. An in vitro study reported that 6-gingerol possess a strong protective ability against the DNA damage caused by mono (2-ethylhexyl) phthalate in human endothelial cells, and the mechanism may be due to its antioxidant activity [31].

Decreased intracellular ROS production or oxidative stress in any context could possibly explained by the antioxidant status of a tissue. Therefore, we determined the primary antioxidant enzyme activities in the heart of alcohol and 6-gingerol-treated rats. In accordance with elevated oxidative stress and ROS production, the primary radical scavenging enzymes SOD and CAT were significantly decreased following alcohol intoxication. Decreased antioxidant enzyme activities with alcohol drinking were repeatedly confirmed by several previous studies [3,5]. Persistent lower grade antioxidant capacity and subsequent oxidative stress perhaps contributes to morphological changes and malfunctioning of cardiac tissue [5]. The important finding in our study is that the decreased SOD and CAT activities were restored with 6-gingerol treatment. In a rat model, 6-gingerol was reported to increase antioxidant enzyme activities and protect the intestinal barrier from ischemia/reperfusion-induced damage [32]. Various doses of gingerol fraction was reported to improve the renal antioxidant enzyme activities and decrease the lipid peroxidation against gentamicin-induced nephrotoxicity in rats [25]. Another study demonstrated that cotreatment of 6-gingerol and ethanol significantly restored the antioxidant enzyme activities against ethanol-induced loss in cultured mouse embryos [33]. Taken together, our findings provided additional knowledge that 6-gingerol treatment for a period of 2 months could protect the cardiac tissue against alcohol-induced oxidative damage through improved antioxidant status.

Chronic alcohol consumption not only impairs the redox homeostasis, but also causes dyslipidemia, a major risk factor for developing cardiovascular diseases. Dyslipidemia is typically represented by abnormal increase of circulating lipid profiles; including TG, TC and LDL, while HDL levels are decreased. Alcohol administration to rats resulted in increased TG, TC and LDL levels and decreased HDL, which confirmed the dyslipidemia status. In our study, 6-gingerol treatment to alcohol-fed rats reversed the dyslipidemia as shown by decreased TG, LDL, and TC levels along with increased HDL levels. Clinical

studies have shown that increasing TG, LDL and TC increases the risk of non-ischemic heart failure, while decreasing serum lipids can reverse the heart dysfunction [34]. In this context, decreased levels of TG, LDL and TC with 6-gingerol treatment perhaps improved the heart function which was deteriorated by alcohol intoxication in rats. Saravanan and colleagues also reported that oral administration of gingerol for 30 days contributed to a significant decrease of lipid profile in obese rats [35]. Another study reported that 6-gingerol treatment for 12 days significantly decreased plasma TG, LDL, and free fatty acid concentrations in db/db mice. This lipid-lowering effect of 6-gingerol was accompanied by an increased antioxidant enzyme activities and suppressed ROS generation in db/db mice [36]. These findings reveal that 6-gingerol is a considerable molecule to lower the lipid profile and prevent the lipid-associated cardiac dysfunction.

Circulating cardiac biomarkers are novel quantitative measures which shed light on occurrence of cardiac pathophysiology [37]. The biomarker troponin I (cTn-I/cTn-T) is a sensitive and specific marker for myocardial injury, which is widely used to diagnose the myocardial infarction [38]. In our study, alcohol-induced elevation of clinical cardiac biomarkers in plasma is another evidence of cardiac tissue damage in alcohol-fed rats. There was a substantial correlation between elevated lipid profile and increased release of cardiac biomarkers in plasma by damaged cardiac cell under ethanol intoxication [11]. In agreement with previous findings, our results also revealed that ethanol intoxication increase the cardiac biomarkers, including CK-MB, cTn-T and cTn-I in plasma. A previous study reported a several-fold rise in serum troponin, myoglobin and CK-MB concentrations after alcohol septal ablation for the treatment of hypertrophic cardiomyopathy [39]. Based on the cardiac biomarker data, a community-based cohort study reported even modest habitual alcohol intake was associated with an increased risk of atrial fibrillation [37]. These results indicate that controlling of cardiac biomarkers is essential in treating the myocardial injuries. Nevertheless, 6-gingerol treatment along with alcohol exerts the cardioprotective effects by diminishing the elevated CK-MB, cTn-T and cTn-I levels. A study by Ren et al., demonstrated that various concentrations of 6-gingerol protects cardiomyocytes from hypoxia-induced injury by suppressing the release of lactate dehydrogenase (LDH) and apoptosis [40]. Cotreatment of ginger to alcohol-fed rats also reported decreased concentrations of cTn-T, LDH and CK-MB in rats [11]. Pretreatment of 6-gingerol has been shown to improve the cardiac function by decreasing the cTnT and CK-MB expressions in ischemia/reperfusion (I/R)-induced myocardial injury model [41]. Lipid-lowering effect and/or improved antioxidant status by gingerol possibly contributed to attenuate the alcohol-induced elevation of cardiac biomarkers.

It has been speculated that overwhelming production of ROS intrinsically involved in initiation and progression of cardiac myocytes apoptosis under chronic ethanol intoxication [42]. Several studies have shown that chronic alcohol consumption promptly associated with occurrence of cardiomyocytes apoptosis by alterations in mitochondria membrane potential [43,44]. Although we haven't detected the mitochondrial membrane potential, the apoptotic proteins in implicated in mitochondrial apoptosis was determined through immunohistochemistry. Our results showed that the apoptotic biomarkers, such as cytochrome C, caspase-9 and caspase-8, were highly expressed in alcohol-intoxicated hearts. Furthermore, elevation of apoptotic proteins were accompanied by decreased cardiac SOD and CAT expressions with alcohol. At molecular levels, ethanol may initiate the apoptosis in cardiac tissue by both intrinsic and extrinsic pathways. In the cascades of apoptosis, ethanol-induced ROS accumulation and decreased antioxidant defense mechanism may play a major role in the expression of caspase-8. Triggering of cytochrome C release by alteration in mitochondrial membrane permeability led to activation of caspase-9 [45,46]. Meanwhile, 6-gingerol treatment profoundly inhibited the apoptosis in cardiac tissue by suppressing the overexpressed cytochrome C, caspase-9 and caspase-8, while restoring the tissue antioxidant status. The earlier reports have shown that ROS scavengers or inhibitors can control the alcohol-induced apoptosis in cardio myocytes [47]. In this context, 6-gingerol was reported to decrease the formation of apoptotic proteins that reserved the myocardial

apoptosis under hypoxia condition [40]. 6-gingerol administration to isoproterenol-treated mice (14-day) resulted in a significant reduction of caspase-3, Bax protein expressions and Bax/Bcl-2 ratio, indicating attenuation of cardiac apoptosis. This anti-apoptotic property of gingerol was accompanied by inhibition of oxidative stress and inflammatory biomarkers [17]. It has been reported that 6-gingerol metabolites may stay about 12 h in the body after oral administration [48]; therefore, we assume that the bioavailability of gingerol may be responsible for its therapeutic efficacies under stress. Taken together, our results suggest that 6-gingerol can inhibit the apoptosis under ethanol intoxication through reduction of ROS production and improvement of antioxidant defense mechanism.

Another important finding of this study is that TEM analyses provided additional convincing evidences that 6-gingerol is a potent tissue protective molecule. TEM visuals demonstrated that ultra-structural derangement in cardiac tissue following ethanol intoxication. We further noticed intense lysis of myofibrils with disruption of Z lines and sarcomere structure, mitochondrial swelling and damage, which collectively results in myocardium apoptosis in ethanol-intoxicated rats. It is worth noting that 6-gingerol attenuate all these destructive changes and retained the ultra-structure of myocardium against cardiotoxic effect of ethanol. In I/R-induced myocardial injury model, 6-gingerol pretreatment to rats reduce myocardial infarction area and degree of cardiac pathological injury followed by lower levels of myocardial enzyme and inflammatory mediators [41]. Some studies have shown that food-based formulations that contain ginger could promote alcohol metabolism and alleviate the alcohol hangover effects [49]. In such case, we assume that 6-gingerol may be involved in rapid alcohol metabolism, which facilitates lower accumulation of toxic alcohol metabolites and then results in less cardiac tissue damage. Despite the lack of experimental evidence to reveal this phenomenon, this is the first report to demonstrate the cardioprotective effects of 6-gingerol against ethanol-induced cardiac tissue damage in rats.

## 4. Materials and Methods

### *4.1. Chemicals and Reagents*

The phytochemical compound, 6-gingerol (purity: >98.0%) was purchased from TCI chemicals (India) Pvt. Ltd. Both dihydroethidium fluorescent dye and SOD primary antibody were obtained from the Sigma-Aldrich (St. Louis, MO, USA). Catalase, caspase-9 and -8, cytochrome C primary antibodies and secondary antibody horseradish peroxidase (HRP)-conjugated goat anti-rabbit IgG were purchased from Invitrogen (Waltham, Thermo Scientific, MA, USA). Troponin-T primary antibody was obtained from Abcam (Cambridge, UK). Creatine kinase–MB (CK-MB), cardiac troponin-T (cTn-T) and cardiac troponin-I (cTn-I) ELISA kits were purchased from the Biocheck, South San Francisco, USA. Triglyceride (TGs), total cholesterol (TC), high-density lipoprotein (HDL) and low-density lipoprotein (LDL) colorimetric kits were obtained from the Merck (Rathway, NJ, USA). All other chemicals and reagents were analytical reagent grade and purchased from Sigma-Aldrich.

### *4.2. Experimental Animals*

A total of 24 Wister strain male albino rats, weighing 200 ± 30 g, were obtained from the Indian Institute of Science, Bangalore, India. All rats were housed in standard polypropylene transparent cages at a controlled temperature (23–27 °C) and humidity (50% ± 5%) with a 12 h light/dark cycle. Rats had free access to food and water. The experimental design and protocols were approved by the Institutional Animal Ethics Committee (IAEC) of Sri Venkateswara University, India, with (10/i/a/CPCSEA/IAEC/SVU/KSR-GVS/dt 15 November 2010).

### *4.3. Animal Grouping and Treatment*

After a week of adaptation to the laboratory conditions, the rats were randomly assigned into 4 groups, control (C), 6-gingerol (Gt), ethanol (Et) and combination of both ethanol plus 6-gingerol (Et + Gt) groups, with 6 rats in each. Rats in the control group received 0.9% saline solution, rats in the Gt group received 6-gingerol by gavage (10 mg/kg

bodyweight, oral administration) and rats in the Et group received ethanol by gavage (20%, 6 g/kg bodyweight, oral administration). The remaining rats in the Et + Gt group received both ethanol and 6-gingerol as described in respective groups. The treatment was given once a day for all groups, and the whole treatment lasted for 2 months. The selective dosage of alcohol and 6-gingerol used in this study was well established by previous studies [11,16]. Blood samples were collected at 10 am into a sterile heparinized tube from the retro-orbital plexus of rats at the end of the treatment period, and plasma was collected by centrifugation at 2000 rpm for 10 min at 4 °C and then stored at −20 °C for further analysis. The heart tissues were isolated from rats after cervical dislocation and immediately washed with ice cold saline and kept on a chilled glass plate. One part of the heart tissue was stored at −20 °C for further biochemical assays, and the remaining was fixed in 4% formaldehyde for histopathological studies.

### *4.4. ROS Detection by Dihydroethidium (DHE) Fluorescent Dye*

ROS in the cardiac tissue was detected using DHE dye as described by Carter et al., (1994) method [50]. Cryostat sections of cardiac tissue was cut into 10 µm thick and incubated with 5M DHE dye at 37 °C for 30 min. The DHE is oxidized by ROS to produce fluorescent ethidium that subsequently binds to nucleic acids, further staining the nucleus a bright fluorescent red. The red fluorescent from DHE was detected by fluorescent microscope.

### *4.5. Determination of 8-Hydroxydeoxyguanosine (8-OHDG)*

Wash solution (20×) in a volume of 15 mL was diluted with 285 mL of distilled water and prepared 1x assay buffer by 14 mL of assay buffer was added to 56 mL of distilled water. To each well, cardiac tissue samples or standard 50 µL and 75 µL of conjugate was added. With the exception of NSB wells, 25 µL of 8-hydroxydeoxyguanosine antibody was added, and then the side of the plate was tapped to mix and incubated for 2 h at room temperature and 100 µL of TMB substrate was added to each well. The substrate solution began to turn blue, was incubated for 30 min at room temperature without shaking, 50 µL of stop solution was added to each well and the absorbance was read at 450 nm. The plate reading was completed within 10 min after adding the stop solution.

### *4.6. Estimation of Protein Carbonyl Content*

Protein carbonyl content in the cardiac tissue was estimated by commercial kit (Sigma-Aldrich). Briefly, 200 mg of tissue was homogenized in 1 mL of tris buffer and centrifuge at 10,000× *g* for 15 min at 4 °C, and the supernatant was stored on ice. A 200 µL sample was added to 800 µL of DNPH, incubated for 1 h in dark at room temperature, and each tube was vortexed briefly for every 15 min during incubation, 1 mL of 20% TCA was added to each tube, and the tubes were vortexed, placed on ice, incubated for 15 min and centrifuged at 10,000× *g* for 10 mint at 4 °C. The supernatant was discarded, the pellet was re-suspended in 1 mL of TCA and the tubes were placed on ice for 5 min and centrifuged at 10,000× *g* for 10 min. The supernatant was discarded, and the pellet was resuspended in 1 mL of (1:1) ethanol and ethyl acetate mixture, then centrifuged at 10,000× *g* for 10 min at 4 °C (Remi C-24 BL/CPR 24 Cooling centrifuge, Mumbai, India). A 220 µL sample was added to each well, and the absorbance was measured at 360–385 nm (Simadzu, UV1800 Spectrophotometer, Kyoto, Japan).

### *4.7. Assessment of Superoxide Dismutase and Catalase Activities*

Changes in SOD activity in the mitochondrial fraction was assessed by the method of Misra and Fridovich (1972) [51] at 480 nm for 4 min on a Simadzu, UV1800 Spectrophotometer (Kyoto, Japan). Activity was expressed as the amount of enzyme that inhibits the oxidation of epinephrine by 50%, which is equal to 1 U per milligram of protein. We then determined the CAT activity at room temperature using the modified version of Aebi [52]. The absorbance of the sample was measured at 240 nm for 1 min in a UV-Spectrophotometer

(Simadzu, UV-Spectrophotometer, Kyoto, Japan). One-unit activity is equal to the moles of $H_2O_2$ degraded/mg protein/min.

### *4.8. Estimation Cardiovascular Risk Factors*

Widely considered lipid based cardiovascular risk factors, including triglyceride (TGs), total cholesterol (TC), high density lipoprotein (HDL) and low-density lipoprotein (LDL) levels, were measured in plasma by commercially available kits (Merck, Rathway, NJ, USA).

### *4.9. Evaluation of Cardiac Biomarkers*

The isoenzyme creatine kinase–MB (CK-MB) levels in plasma were estimated using a commercially available kit (Biocheck, ELISA kit, South San Francisco, CA, USA) in all experimental groups. The absorbance of the sample was measured at 340 nm using iMark Microplate reader (Bio-Rad, Hercules, CA, USA). CK-MB levels were described as international units per liter. Next, changes in cardiac troponin–T (cTn-T) and cardiac troponin–I (cTn-I) in plasma were determined by commercially available kits (Biocheck ELISA kit, South San Francisco, CA, USA) in all experimental groups. The sample absorbance was measured at 450 nm in an iMark Microplate absorbance reader (Bio-Rad, Hercules, CA, USA). The units of cTn-T and cTn-I levels were described as grams per milliliter.

### *4.10. Immunohistochemistry*

Immunohistochemistry study was performed according to the study by Liu et.al., [53]. Briefly, the sections were collected on 3-aminopropyltriethoxysilane (APES)-coated slides, and xylene was added and kept for 15 min. For each slide, alcohol was added in descending concentrations (100–70%), and after 1 min, the slides were washed in tap water for 10 min and distilled water for 5 min. Further, the slides were kept in a presser cooker in 1 mM of citrate buffer (pH 6). After leaving the pressure cooker, placed in sink water for cooling at room temperature, the samples were washed in distilled water for 5 min and with 5 mM of TBS buffer (pH 7.6) twice for 5 min each time. The samples were blocked with peroxidase for 10–15 min, washed three times with TBS buffer and drained. The section was covered with concerned primary antibodies (caspase-8, caspase-9 and cytochrome C) for 1 h (1:1000). Further, the samples were washed three times with TBS buffer for 5 min, andthen incubated with the HRP-conjugated secondary antibody (1:1000). The color was developed within 5–8 min with the use of 3,3′-diaminobenzidine. The samples were washed with TBS buffer three times for 5 min, then incubated in hematoxylin for 1 min. Finally, samples were kept in tap water for 5 min. In the same way, the antioxidants enzymes, such as SOD and CAT, and cardiac biomarkers, such as cTn-T were also assessed in the cardiac tissues of all experimental groups. A microscope (BX51; Olympus, Tokyo, Japan) was used to capture the images of the sections.

### *4.11. Transmission Electron Microscopy*

Heart tissue excised from the rats was perfused with 0.1 M sodium phosphate buffer (pH 7.4) solution containing 2.5% glutaraldehyde and 2% formalin for 15 min at 48 °C according to the protocol described by Watanabe and Yamada [54]. Then the tissue was kept for 2 h at 48 °C in 1% osmium tetroxide contained buffer solution for post fixation. After dehydration, the heart tissue with a various concentration series of alcohol (70–100%), embedded in spurr1 resin. Reichert Ultracut 1 microtome was used for cut the heart tissue with 90 nm thickness. The grids were counterstained with 4% uranyl acetate and 0.4% lead citrate solutions and examined in a Jeol JEM 1010 transmission electron microscope (Peabody, MA, USA) at 80 kV. This assay was performed at the Centre for Cellular and Molecular Biology, Hyderabad, India.

### *4.12. Statistical Analysis*

The experimental data was expressed as means ± standard deviation (SD). One-way analysis of variance (ANOVA) was conducted followed by Duncan's test using SPSS version

19.0 software (Armonk, New York, NY, USA). Statistical significance was considered at $p < 0.05$. Graphs were prepared using GraphPad Prism (Version 5.00, GraphPad Software Inc., San Diego, CA, USA).

## 5. Conclusions

For the first time, our findings demonstrated the potential cardioprotective properties of 6-gingerol against alcohol-induced oxidative stress, apoptosis and architectural damage. The underlying phenomenon may be due to an effective suppression of alcohol-induced ROS protection and/or antioxidant efficacy of gingerol. Further evidence showed that gingerol cotreatment suppressed vital biomarkers of apoptosis and cardiac injury followed by recovered tissue architectural damages. Our findings suggest that 6-gingerol could be a potential therapeutic molecule to use in the treatment of alcohol-induced myocardial injury.

**Author Contributions:** Conceptualization, V.S.G., M.K., R.R.M., V.C. and S.R.K.; methodology V.S.G., R.R.M., S.B. and R.S.; software R.S.; validation M.K., V.S.G., S.K.R. and S.R.K.; formal analysis, M.K. and V.S.G.; investigation, V.S.G., R.R.M., S.B. and R.S.; data curation, V.S.G., Z.Z. and M.K.; writing—original draft preparation, V.S.G., R.R.M., Z.Z. and M.K.; writing—review and editing, M.K. and V.S.G.; visualization, M.K., V.S.G. and R.S.; supervision, S.R.K. and M.K.; project administration and funding acquisition, V.S.G. and S.R.K. All authors have read and agreed to the published version of the manuscript.

**Funding:** The present study was funded by DST-SERB in the Young Scientist Scheme project (No.YSS/2014/000945), New Delhi, and UGC-BSR faculty fellowship (No.F.18-1/2011(BSR) Dated 24 November 2017), India. This research was partially supported by Zhejiang Province Education Science plan (GH2023589), China.

**Institutional Review Board Statement:** The study was carried in accordance with the Institutional Instructions on Animal Care and Use Committee, Sri Venkateswara University, India. The designing of project and protocols which was used the project reviewed and follow the Institutional animal ethical committee (10/i/a/CPCSEA/IAEC/SVU/KSR-GVS/dt 15 November 2010).

**Informed Consent Statement:** Not applicable.

**Data Availability Statement:** The data which were submitted to this journal is available with corresponding author and first author.

**Acknowledgments:** All authors would like to thankful to the DST-PURSE at Sri Venkateswara University, and the Center for Cellular and Molecular Biology, Hyderabad, India for facilitating the immunofluorescence and electron microscopic studies.

**Conflicts of Interest:** All authors declared no conflict of interests.

**Sample Availability:** The samples are available with the first and corresponding authors at the Department of Zoology, Sri Venkateswara University, India.

# Minimax Multi objective Fractional Programming with B-(p, r)-Invexity with Non differentiable functions

**DR.G.VARALAKSHMI**

**In charge Dept.of Statistics, PRR & VS Government Coleege, Vidavaluru**

**Abstract:** In this paper, we derive some theorems and duality theorems on non differentiable Multiobjective Fractional Minimax Programming Under B-(p, r)-Invexity functions.

**Keywords:** B-(p, r)-invex function and Duality.

## Introduction

The necessary and sufficient conditions for generalized minimax programming were first developed by Schmitendorf [1]. Tanimoto [9] applied these optimality conditions to define a dual problem and derived duality theorems. Bector and Bhatia relaxed the convexity assumptions in the sufficient optimality condition in [1] and also employed the optimality conditions to construct several dual models which involve pseudo-convex and quasi-convex functions, and derived weak and strong duality theorems. Yadav and Mukherjee [16] established the optimality conditions to construct the two dual problems and derived duality theorems for differentiable fractional minimimax programming.

Convexity plays an important role in deriving sufficient conditions and duality for non linear programming problems Karush-Kuhn-Tucker type sufficient optimality conditions for nonlinear programming problems. Generalized invexity and duality for multiobjective programming problems are discussed in [5], and inseparable Hilbert spaces are studied by Soleimani-Damaneh [3]. Soleimani-Damaneh [4] provides a family of linear infinite problems or linear semi-infinite problems to characterize the optimality of nonlinear optimization problems. Recently, optimality conditions for a class of generalized fractional minimax programming problems involving B(p, r)-invexity functions and established duality theorems for various duality models.

This paper is organized as follows. In section 2, we give some preliminaries. An example which is B-(1, 1)-invex but convex. In section 3, we establish the sufficient optimality conditions. Duality results are presented in section4 by developing some theorems and duality theorems in non differentiable minimax multi objective fractional programming with B-(p, r)-invexity.

## Notations and Preliminaries

**Definition:** 1. Let $f : X \to R$ ( where $X \subseteq R^n$ ) be differentiable function, and let p, r be arbitrary real numbers. Then f is said to be (p, r)-invex (strictly (p, r)-invex) with respect to $\eta$ at $u \in X$ on X if there exists a function $\eta : X \times X \to R^n$ such that, for all $x \in X$, the inequalities.

$$\frac{1}{r}e^{r(f(x))} \geq \frac{1}{r}e^{r(f(u))}\left[1+\frac{r}{p}\nabla f(u)\left(e^{p\eta(x,u)}-1\right)\right] (>\text{if } x \neq u) \text{ for } p \neq 0,\ r \neq 0$$

$$f(x)-f(u) \geq \frac{1}{p}\nabla f(u)\left(e^{p\eta(x,u)}-1\right) (>\text{if } x \neq u) \text{ for } p \neq 0,\ r = 0 \qquad f(x)-f(u) \geq \nabla f(u)\ \eta(x,u)$$

$(>\text{if } x \neq u)$ for $p = 0,\ r = 0$ hold.

**Definition 2 :** The differentiable function $f : X \to R$ (where $X \subseteq R^n$) is said to be (strictly) B-(p, r)-invex with respect to $\eta$ and b at $u \in X$ on X if there exists a function $\eta : X \times X \to R^n$ and a function $b : X \times X \to R_+$ such that, for all $x \in X$, the following inequalities.

$$\frac{1}{r} b(x, u)\left(e^{r(f(x)-f(u))} - 1\right) \geq \frac{1}{p} \nabla f(u)\left(e^{p\eta(x, u)} - 1\right) (> \text{if } x \neq u) \text{ for } p \neq 0,\ r \neq 0$$

$$\frac{1}{r} b(x, u)\left(e^{r(f(x)-f(u))} - 1\right) \geq \nabla f(u)\, \eta(x, u) (> \text{if } x \neq u) \text{ for } p = 0,\ r = 0$$

$$b(x, u)\left(f(x) - f(u)\right) \geq \frac{1}{p} \nabla f(u)\left(e^{p\eta(x, u)} - 1\right) (> \text{if } x \neq u) \text{ for } p \neq 0,\ r = 0$$

$b(x, u)\left(f(x) - f(u)\right) \geq \nabla f(u)\ \eta(x, u)\ (> \text{if } x \neq u)$ for $p = 0,\ r = 0$ hold. f is said to be (strictly) B-(p, r)-invex with respect to $\eta$ and b on X if it is B-(p, r)-invex with respect to same $\eta$ and b at each $u \in X$ on X.

In this paper, we consider the following non differentiable minimax fractional programming problem:

(FP)

$$\min_{x \in R^n} \sup_{y \in Y} \frac{l_i(x, y) + (x^T Dx)^{\frac{1}{2}}}{m_i(x, y) - (x^T Ex)^{\frac{1}{2}}}$$

Subject to $g(x) \leq 0, \quad x \in X$

where Y is a compact subset of $R^m$, $l(\cdot,\cdot): R^n \times R^m \to R$, $m(\cdot,\cdot): R^n \times R^m \to R$ and $C^1$ functions on $R^n \times R^m$ and $g(\cdot): R^n \times R^p$ is $C^1$ function on $R^n$, D and E are $n \times n$ positive semidefinite matrices.

Let $S = \{x \in X : g(x) \le 0\}$ denote the set of all feasible solutions of (FP)

Any point $x \in S$ is called the feasible point of (FP)

For each $(x, y) \in R^n \times R_m$, we define

$$\Phi(x, y) = \frac{l_i(x, y) + (x^T Dx)^{\frac{1}{2}}}{m_i(x, y) - (x^T Ex)^{\frac{1}{2}}}$$

such that for each $(x, y) \in S \times Y$,

$$l_i(x, y) + (x^T Dx)^{\frac{1}{2}} \ge 0 \quad and \quad m_i(x, y) - (x^T Ex)^{\frac{1}{2}} > 0$$

For each $x \in S$, we define

$$H(x) = \{h \in H : g_h(x) = 0\},$$

where $Y(x) = \left\{ y \in Y : \frac{l_i(x, y) + (x^T Dx)^{\frac{1}{2}}}{m_i(x, y) - (x^T Ex)^{\frac{1}{2}}} = \underset{Z \in Y}{Sup} \frac{l_i(x, z) + (x^T Dx)^{\frac{1}{2}}}{m_i(x, z) - (x^T Ex)^{\frac{1}{2}}} \right\}$

$$k(x) = \Big\{ (s, t, \bar{y}) \in N \times R_+^s X_R^{ms} : 1 \le s \le n+1,\ t = (t_1, t_2, ..... t_{s+}) \in R_+^s$$

with $\sum_{i=1}^{s} t_i = 1, \bar{y} = (\bar{y}_1, \bar{y}_2, ....., \bar{y}_s)\ \bar{y}_i \in Y(x)\ (i = 1, 2, ..., s) \Big\}$

Since $l_i$ and $m_i$ are continuously differentiable and Y is compact in $R^m$, it follows that for each $x^* \in s, Y(x^*) \neq \phi$, and for any $\bar{y}_i \in Y(x^*)$, we have a positive constant.

$$k_0 = \phi\left(x^*, \bar{y}_i\right) = \frac{l_i(x^*, \bar{y}_i) + (x^{*T} Dx^*)^{\frac{1}{2}}}{m_i^*(x^*, \bar{y}_i) - (x^{*T} Ex^*)^{\frac{1}{2}}}$$

**Generalized Schwartz Inequality**

Let A be a positive-semi definite matrix of order n. Then, for all $x, w \in R^n$,

$$x^T Aw \leq (x^T Ax)^{\frac{1}{2}} (w^T Aw)^{\frac{1}{2}} \qquad 1)$$

Equality holds if for some $\lambda \geq 0$

$$Ax = \lambda Aw$$

Evidently, if $(w^T Aw)^{\frac{1}{2}} \leq 1$, we have

$$x^T Aw \leq (x^T Ax)^{\frac{1}{2}}$$

If the functions $l_i$, $g_i$ and $m_i$ in problem (FP) are continuously differentiable with respect to $x \in R^n$, then Lai et al [52] derived the following necessary conditions for optimality of (FP).

**Theorem 1 (Necessary Conditions):**

If $x^*$ is a solution of (FP) satisfying $x^{*T}Dx^* > 0,\ x^{*T}Ex^* > 0$ and $\nabla g_h(x^*),\ h \in H(x^*)$ are linearly independent, then there exist $(s, t^*, \bar{y}) \in k(x^*),\ k_0 \in R_+,\ w, v \in R^n$ and $\mu^* \in R_+^p$ such that

$$\sum_{i=1}^{s} t_i^* \left\{\nabla l_i(x^*, \bar{y}_i)\right\} + Dw - k_0\left\{\nabla m_i(x^*, \bar{y}_i) - EV\right\} + \nabla \sum_{h=1}^{p} t_i^*\ \mu_h^* g_h(x^*) = 0 \tag{2}$$

$$l_i(x^*, \bar{y}_i) + \left(x^{*T}\ Dx^*\right)^{\frac{1}{2}} - k_0\left(m\left(x^*, \bar{y}_i\right) - \left(x^{*T}\ Ex^*\right)^{\frac{1}{2}}\right) = 0, i = 1, 2, \ldots, s \tag{3}$$

$$\sum_{h=1}^{p} \mu_h^*\ g_h(x^*) = 0 \tag{4}$$

$$t_i^* \geq 0\ \ (i = 1, 2, \ldots, s),\ \sum_{i=1}^{s} t_i^* = 1, \tag{5}$$

$$\left.\begin{aligned} &w^T Dw \leq 1,\ v^T EV \leq 1, \\ &\left(x^{*T}\ Dx^*\right)^{\frac{1}{2}} = x^{*T}\ Dw, \\ &\left(x^{*T}\ Ex^*\right)^{\frac{1}{2}} = x^{*T}\ EV \end{aligned}\right\} \tag{6}$$

## Sufficient Conditions:

Under smooth conditions say, convexity and generalized convexity as well as differentiability, optimality conditions for these problems have been studied in the past few years. The intrinsic presence of nonsmoothness (the necessity to deal with nondifferentiable functions, sets with nonsmooth boundaries, and set-valued mappings) is one of the most characteristic features of modern variational analysis. The optimality conditions for nondifferentiable multiobjective case by Kim et al [49]. Now, we prove the sufficient condition for optimality of (Fp) under the assumptions B-(p, r)-invexity.

## Theorem 2 (Sufficient condition):

Let $x^*$ be a feasible of (FP) and there exist a positive integer $s, 1 \le s \le n+1$, $t^* \in R_+^s$, $\bar{y}_i \in Y(x^*)\,(i = 1, 2, ...., s)$, $k_0 \in R_+$, $w, v \in R^n$ *and* $\mu^* \in R_+^p$, Assume that

(i) $\sum_{i=1}^{s} t_i^* \left( l_i(\cdot, \bar{y}_i) + (\cdot)^T Dw - k_0 \left( m_i(\cdot, \bar{y}_i) \right) - (\cdot)^T EV \right)$ *is* $B-(p,r)$-invex at $x^*$ on s with respect to $\eta$ and b satisfying $b(x, x^*) > 0$ for all $x \in s$.

(ii) $\sum_{h=1}^{p} \mu_h^* g_h(\cdot)$ is $B_g-(p,r)$-invex at $x^*$ on s with respect to the same function $\eta$, and with respect to the function $b_g$, not necessarily, equal to b.

Then $x^*$ is an optimal solution of (FP).

**Proof:** Suppose to the contrary that $x^*$ is not an optimal solution of (FP). Then there exists an $\bar{x} \in s$ such that

$$\underset{y\in Y}{Sup}\frac{l_i(\bar{x},y)+(\bar{x}^T\ D\bar{x})^{\frac{1}{2}}}{m_i(\bar{x},y)-(\bar{x}^T\ E\bar{x})^{\frac{1}{2}}}<\underset{y\in Y}{Sup}\ \frac{l_i(x^*,y)+(x^{*T}\ Dx^*)^{\frac{1}{2}}}{m_i(x^*,y)-(x^{*^T}\ Ex^*)^{\frac{1}{2}}}$$

We note that

$$\underset{y\in Y}{Sup}\ =\frac{l_i(x^*,y)+(x^{*T}\ Dx^*)^{\frac{1}{2}}}{m_i(x^*,y)-(x^{*T}\ Ex^*)^{\frac{1}{2}}}\ \frac{l_i(x^*,\bar{y}_i)+(x^{*T}\ Dx^*)^{\frac{1}{2}}}{m_i(x^*,\bar{y}_i)-(x^{*T}\ Ex^*)^{\frac{1}{2}}}=k_0,$$

for $\bar{y}_i\in Y(x^*),\ i=1,2,.....s$ and

$$\frac{l_i(\bar{x},\bar{y}_i)+(\bar{x}^T\ D\bar{x})^{\frac{1}{2}}}{m_i(\bar{x},\bar{y}_i)-(\bar{x}^T\ E\bar{x})^{\frac{1}{2}}}\le\underset{y\in Y}{Sup}\ \frac{l_i(\bar{x},y)+(\bar{x}^T\ D\bar{x})^{\frac{1}{2}}}{m_i(\bar{x},y)-(\bar{x}^T\ E\bar{x})^{\frac{1}{2}}}$$

Thus, we have

$$\frac{l_i(\bar{x},\bar{y}_i)+(\bar{x}^T\ D\bar{x})^{\frac{1}{2}}}{m_i(\bar{x},\bar{y}_i)-(\bar{x}^T\ E\bar{x})^{\frac{1}{2}}}<k_0,\ \ for\ \ i=1,2,.....s$$

it follows that

$$l_i(\bar{x},\bar{y}_i)+(\bar{x}^T\ D\bar{x})^{\frac{1}{2}}-k_0\left(m_i(\bar{x},\bar{y}_i)-(\bar{x}^T\ E\bar{x})^{\frac{1}{2}}\right)<0,\ \ for\ i=1,2,.....s$$

(7)

From (1), (3), (5), (6) and (7), we obtain

$$\sum_{i=1}^{s}t_i^*\left\{l_i(\bar{x},\bar{y}_i)+\bar{x}^T\ Dw-k_0\left(m_i(\bar{x},\bar{y}_i)-\bar{x}^T\ EV\right)\right\}$$

$$\leq \sum_{i=1}^{s} t_i^* \left\{ l_i \left( \bar{x}, \bar{y}_i \right) + \left( \bar{x}^T D\bar{x} \right)^{\frac{1}{2}} - k_0 \left( m_i \left( \bar{x}, \bar{y}_i \right) - \left( \bar{x}^T E\bar{x} \right)^{\frac{1}{2}} \right) \right\}$$

$$< 0 = \sum_{i=1}^{s} t_i^* \left\{ l_i \left( x^*, \bar{y}_i \right) + \left( x^{*T} Dx^* \right)^{\frac{1}{2}} - k_0 \left( m_i \left( x^*, \bar{y}_i \right) - \left( x^{*T} Ex^* \right)^{\frac{1}{2}} \right) \right\}$$

$$= \sum_{i=1}^{s} t_i^* \left\{ l_i \left( x^*, \bar{y}_i \right) + x^{*T} Dw - k_0 \left( m_i \left( x^*, \bar{y}_i \right) - \left( x^{*T} EV \right) \right) \right\}$$

It follows that

$$\sum_{i=1}^{s} t_i^* \left\{ l_i \left( \bar{x}, \bar{y}_i \right) + \bar{x}^T Dw - k_0 \left( m_i \left( \bar{x}, \bar{y}_i \right) - \bar{x}^T EV \right) \right\}$$

$$< \sum_{i=1}^{s} t_i^* \left\{ l_i \left( x^*, \bar{y}_i \right) + x^{*T} Dw - k_0 \left( m_i \left( x^*, \bar{y}_i \right) - x^{*T} EV \right) \right\} \qquad (8)$$

As $\sum_{i=1}^{s} t_i^* \left( l_i \left( \cdot, \bar{y}_i \right) + (\cdot)^T Dw - k_0 m_i \left( \cdot, \bar{y}_i \right) - (\cdot)^T EV \right)$ is B-(p, r)-invex at $x^*$ on s with respect to $\eta$ and b, we have

$$\frac{1}{r} b(x, x^*) \left\{ e^r \left[ \sum_{i=1}^{s} t_i^* \left( l_i \left( x, \bar{y}_i \right) + x^T Dw - k_0 \left( m_i \left( x, \bar{y}_i \right) - x^T EV \right) \right) \right] \right.$$

$$\left. - \sum_{i=1}^{s} t_i^* \left( l_i \left( x^*, \bar{y}_i \right) + x^{*T} Dw - k_0 \left( m \left( x^*, \bar{y}_i \right) - x^{*T} EV \right) - 1 \right) \right\}$$

$$\geq \frac{1}{p} \left\{ \sum_{i=1}^{s} t_i^* \left( \nabla l_i \left( x^*, \bar{y}_i \right) \right) + Dw - k_0 \left( \nabla m_i \left( x^*, \bar{y}_i \right) - EV \right) \right\} \left\{ e^{p\eta(x, x^*)} - 1 \right\}$$

holds for all $x \in s$, and so for $x = \bar{x}$. Using (10.8) and $b(\bar{x}, x^*) > 0$ together with the inequality above, we get

$$\frac{1}{p}\left\{\sum_{i=1}^{s} t_i^*\left(\nabla l_i(x^*, \bar{y}_i)\right) + Dw - k_0\left(\nabla m_i(x^*, \bar{y}_i) - EV\right)\right\}\left\{e^{p\eta(\bar{x}, x^*)} - 1\right\} < 0$$

(9)

From the feasibility of $\bar{x}$ together with $\mu_h^* \geq 0,\ h \in H$, we have

$$\sum_{h=1}^{s} \mu_h^* g_h(\bar{x}) \leq 0 \qquad (10)$$

By $Bg-(p,r)$-invexity of $\sum_{h=1}^{s} \mu_h^* g_h(\cdot)$ at $x^*$ on s with respect to the same function $\eta$, and with respect to the function $b_g$, we have

$$\frac{1}{r} b_g(\bar{x}, x^*)\left\{e^{r\left[\sum_{h=1}^{p} \mu_h^* g_h(\bar{x}) - \sum_{h=1}^{p} \mu_h^* g_h(x^*)\right]} - 1\right\} \geq \frac{1}{p}\sum_{h=1}^{p} \nabla \mu_h^* g_h(x^*)\left\{e^{p\eta(\bar{x}, x^*)} - 1\right\}$$

Since $(x, x^*) \geq 0$ for all $x \in s$ then by (4) and (10), we obtain

$$\frac{1}{p}\sum_{h=1}^{p} \nabla \mu_h^* g_h(x^*)\left\{e^{p\eta(\bar{x}, x^*)} - 1\right\} \leq 0 \qquad (11)$$

By adding the inequalities (9) and (11) we have

$$\frac{1}{p}\left\{\sum_{i=1}^{s} t_i^*\left(\nabla l_i(x^*, \bar{y}_i)\right) + Dw - k_0\left(\nabla m_i(x^*, \bar{y}_i) - EV\right) + \sum_{h=1}^{p} \nabla \mu_h^* g_h(x^*)\right\}$$

$$\left\{e^{p\eta(\bar{x}, x^*)} - 1\right\} < 0,$$

Which contradicts (2). Hence the result.

## 4. Duality Result:

In this section, we consider the following dual to (Fp).

$$(FD) \quad \max_{(s,t,\bar{y})\in k(a)} \quad \sup_{(a,\mu,k,v,w)\in H_1(s,t,\bar{y})} k$$

where $H_1(s,t,\bar{y})$ denotes the set of all

$$(a,\mu,k,v,w)\in R^n\times R_+^p R_+\times R^n R^n$$

Satisfying

$$\sum_{i=1}^{s} t_i\left\{\nabla l_i(a,\bar{y}_i)+Dw-k\left(\nabla m_i(a,\bar{y}_i)-EV\right)+\nabla\sum_{h=1}^{p}\mu_h g_h(a)\right\}=0 \tag{12}$$

$$\sum_{i=1}^{s} t_i\left\{l_i(a,\bar{y}_i)+a^T Dw-k\left(m_i(a,\bar{y}_i)-a^T EV\right)\right\}\geq 0 \tag{13}$$

$$\sum_{h=1}^{p}\mu_h g_h(a)\geq 0 \tag{14}$$

$$(s,t,\bar{y})\in k(a) \tag{15}$$

$$w^T Dw\leq 1,\quad V^T EV\leq 1 \tag{16}$$

If, for a triplet $(s,t,\bar{y})\in k(a)$, the set $H_1(s,t,\bar{y})=\phi$, then we define the supremum over it to be $-\infty$. For convenience,

we let,

$$\Psi_1(\cdot)=\sum_{i=1}^{s} t_i \left(l_i(\cdot,\bar{y}_i)+(\cdot)^T Dw-k\left(m_i(\cdot,\bar{y}_i)-(\cdot)^T EV\right)\right)$$

Let $S_{FD}$ denote a set of all feasible solutions of problem (FD). Moreover, let $S_1$ denote

$$S_1=\left\{a\in R^n:\left(a,\mu,k,v,w,s,t,\bar{y}\right)\in S_{FD}\right\}$$

Now we derive the following weak, strong and strict converse duality theorems.

**Theorem 3 (Weak Duality):**

Let x be a feasible solution of (p) and $\left(a,\mu,k,v,w,s,t,\bar{y}\right)$ be a feasible of (FD). Let

(1) $\sum_{i=1}^{s} t_i^* \left(l_i(\cdot,\bar{y}_i)+(\cdot)^T Dw-k_1\left(m_i(\cdot,\bar{y}_i)-(\cdot)^T EV\right)\right)$ is B-(p, r)-invex at a on $SUS_1$ with respect to $\eta$ and b satisfying $b(x,a)>0$, $\sum_{h=1}^{p}\mu_h g_h(\cdot)$ is $B_g-(p,r)$-invex at a on $SUS_1$ with respect to the same function $\eta$ and with respect to the function $b_g$ not necessarily, equal to b.

Then

$$\sup_{y\in Y}\frac{l_i(x,y)+(x^T Dx)^{\frac{1}{2}}}{m_i(x,y)-(x^T Ex)^{\frac{1}{2}}}\geq k \qquad (17)$$

**Proof:** Suppose to the contrary that

$$\sup_{y\in Y}\frac{l_i(x,y)+(x^T Dx)^{\frac{1}{2}}}{m_i(x,y)-(x^T Ex)^{\frac{1}{2}}}<k$$

Then, we have

$$l_i(x, \bar{y}_i) + (x^T Dx)^{\frac{1}{2}} - k\left( m_i(x, \bar{y}_i) - (x^T Ex)^{\frac{1}{2}} \right) \leq 0, \text{ for all } \bar{y}_i \in Y.$$

It follows from (10.5) that

$$t_i \left\{ l_i(x, \bar{y}_i) + (x^T Dx)^{\frac{1}{2}} - k\left( m_i(x, \bar{y}_i) - (x^T Ex)^{\frac{1}{2}} \right) \right\} \leq 0 \qquad (18)$$

with at least one strict inequality, since

$$t = (t_1, t_2, \ldots\ldots, t_s) \neq 0$$

From (1), (13), (16) and (18), we have

$$\Psi_1(x) = \sum_{i=1}^{s} t_i \left\{ l_i(x, \bar{y}_i) + x^T Dw - k\left( m_i(x, \bar{y}_i) - x^T EV \right) \right\}$$

$$\leq \sum_{i=1}^{s} t_i \left\{ l_i(x, \bar{y}_i) + (x^T Dx)^{\frac{1}{2}} - k\left( m_i(x, \bar{y}_i) - (x^T Ex)^{\frac{1}{2}} \right) \right\}$$

$$< 0 \leq \sum_{i=1}^{s} t_i \left\{ l_i(a, \bar{y}_i) + a^T Dw - k\left( m_i(a, \bar{y}_i) - a^T EV \right) \right\}$$

$$= \Psi_1(a)$$

Hence

$$\Psi_1(x) < \Psi_1(a) \qquad (19)$$

Since $\sum_{i=1}^{s} t_i \left( l_i(\cdot, \bar{y}_i) + (\cdot)^T Dw - k \left( m_i(\cdot, \bar{y}_i) - (\cdot)^T EV \right) \right)$ is B-(p, r)-invex at a on $SUS_1$ with respect to $\eta$ and b, we have

$$\frac{1}{r} b(x,a) \left\{ e^r \left[ \sum_{i=1}^{s} t_i \; l_i(x, \bar{y}_i) + x^T Dw - k\left( m_i(x, \bar{y}_i) - x^T EV \right) - \sum_{i=1}^{s} t_i \left( l_i(a, \bar{y}_i) \right) \right. \right.$$

$$\left. \left. + a^T Dw - k\left( m_i(a, \bar{y}_i) - a^T EV \right) \right] - 1 \right\}$$

From (19) and b(x, a)>0 together with the inequality above,

We get

$$\frac{1}{p} \left[ \sum_{i=1}^{s} t_i \left\{ \nabla l_i(a, \bar{y}_i) + Dw - k\left( \nabla m_i(a, \bar{y}_i) - EV \right) \right\} \right] \left( e^{p\eta(x,a)} - 1 \right) < 0 \tag{20}$$

Using the feasibility of x-together with $\mu_h \geq 0, \quad h \in H,$ we obtain

$$\sum_{h=1}^{p} \mu_h g_h(x) \leq 0 \tag{21}$$

From hypothesis (ii) we have

$$\frac{1}{r} b_g(x,a) \left\{ e^r \left[ \sum_{h=1}^{p} \mu_h g_h(x) - \sum_{h=1}^{p} \mu_h g_h(a) \right] \right\}_{-1} \geq \frac{1}{p} \sum_{h=1}^{p} \nabla \mu_h g_h(a) \left\{ e^{p\eta(x,a)} - 1 \right\}$$

$b_g(x,a) \geq 0$ then by (10.14) and (10.21), we obtain

$$\frac{1}{p} \sum_{h=1}^{p} \nabla \mu_h g_h(a) \left\{ e^{p\eta(x,a)} - 1 \right\} \leq 0 \tag{22}$$

Thus, by (20) and (22), we obtain the inequality

$$\frac{1}{p}\left\{\sum_{i=1}^{s} t_i \left(\nabla l_i(a, \bar{y}_i) + Dw - k\left(\nabla m_i(a, \bar{y}_i) - EV\right)\right) + \sum_{h=1}^{p} \nabla \mu_h g_h(a)\right\} \quad \left\{e^{p\eta(x,a)} - 1\right\} < 0$$

which contradicts (12). Hence (17) holds.

**Theorem 4 (Strong Duality):**

Let $x^*$ be an optimal solution of (FP) and $\nabla g_h(x^*),\ h \in H(x^*)$ are linearly independent. Then there exist $(s, t^*, \bar{y}) \in k(x^*)$, and $(x^*, \bar{\mu}, \bar{k}, \bar{v}, \bar{w}) \in H_1(\bar{s}, \bar{t}, \bar{y}^*)$ such that $(x^*, \bar{\mu}, \bar{k}, \bar{v}, \bar{w}, \bar{s}, \bar{t}, \bar{y}^*)$ is a feasible solution of (FD) .Further the hypotheses of weak duality theorem are satisfied for all feasible solutions $(a, \mu, k, v, w, s, t, \bar{y})$ of (FD), then $(x^*, \bar{\mu}, \bar{k}, \bar{v}, \bar{w}, \bar{s}, \bar{t}, \bar{y}^*)$ is an optimal of (FD), and the two objectives have the same optimal values.

**Proof:** If $x^*$ be an optimal solution of (FP) and $\nabla g_h(x^*),\ h \in H(x^*)$ is linearly independent, then by Theorem 1, there exist $(s, t^*, \bar{y}) \in k(x^*)$ and $(x^*, \bar{\mu}, \bar{k}, \bar{v}, \bar{w}) \in H_1(\bar{s}, \bar{t}, \bar{y}^*)$ such that $(x^*, \bar{\mu}, \bar{k}, \bar{v}, \bar{w}, \bar{s}, \bar{t}, \bar{y}^*)$ is feasible for (FD) and problems (FP) and (FD) have the same objective values and

$$\bar{K} = \frac{l_i(x^*, \bar{y}^*) + (x^{*T} Dx^*)^{\frac{1}{2}}}{m_i(x^*, \bar{y}^*) - (x^{*T} Ex^*)^{\frac{1}{2}}}$$

The optimality of this feasible solution for (FD) thus follows from Theorem 3.

**Theorem 5 (Strict Converse Duality):**

Let x* and $\left(\bar{a}, \bar{\mu}, \bar{k}, \bar{v}, \bar{w}, \bar{s}, \bar{t}, \bar{y}^*\right)$ be the optimal solutions of (FP) and (FD), respectively, and $\nabla g_h(x^*),\ h \in H(x^*)$ is linearly independent. Suppose that $\sum_{i=1}^{s} t_i^* \left(l_i(\cdot, \bar{y}_i) + (\cdot)^T Dw - \bar{k}\left(m_i(\cdot, \bar{y}_i) - (\cdot)^T EV\right)\right)$ is strictly B-(p, r)-invex at a on $SUS_1$ with respect to $\eta$ and b satisfying $b(x, a) > 0$ for all $x \in s$. Furthermore, assume that $\sum_{h=1}^{p} \mu_h g_h(\cdot)$ is $B_g$-(p, r)-invex at a on $SUS_1$ with respect to the same function $\eta$ and with respect to the function $b_g$, but not necessarily, equal to the function b. Then $x^* = \bar{a}$, that is, $\bar{a}$ is an optimal point in (FP) and

$$\sup_{y \in Y} \frac{l_i(\bar{a}, \bar{y}^*) + (\bar{a}^T D\bar{a})^{\frac{1}{2}}}{m_i(\bar{a}, \bar{y}^*) - (\bar{a}^T E\bar{a})^{\frac{1}{2}}} = \bar{K}$$

**Proof:** We shall assume that $x^* \neq \bar{a}$, and reach a contradiction fom the strong duality theorm (theorm 4) it follws that that is, $\bar{a}$ is an optimal point in (FP) and

$$\sup_{y \in Y} \frac{l_i(x^*, \bar{y}^*) + (x^{*T} Dx^*)^{\frac{1}{2}}}{m_i(x^*, \bar{y}^*) - (x^{*T} Ex^*)^{\frac{1}{2}}} = \bar{K} \qquad (23)$$

By feasibility of $x^*$ together with $\mu_h \geq 0,\ h \in H$, we obtain

$$\sum_{h=1}^{p} \mu_h g_h(x^*) \leq 0 \qquad (24)$$

By assumption, $\sum_{h=1}^{p}\mu_h g_h(\cdot)$ is $B_g$-(p, r)-invex at a on $SUS_1$ with respect to $\eta$ and with respect to the $b_g$. Then, by Definition (12), there exists a function by such that $b_g(x,a)\geq 0$ for all $x\in s \;\; and \;\; a\in s_1$. Hence by (14) and (24).

$$\frac{1}{r}b_g(x^*,\bar{a})\;\left\{e^r\left[\sum_{h=1}^{p}\mu_h g_h(x^*)-\sum_{h=1}^{p}\mu_h g_h(\bar{a})\right]\right\}_{-1}\leq 0$$

Then, from Definition (10.2), we get

$$\frac{1}{p}\sum_{h=1}^{p}\nabla\mu_h g_h(\bar{a})\left\{e^{p\eta}(x^*,a)-1\right\}\leq 0 \qquad (25)$$

Therefore, by (10.25), we obtain the inequality

$$\frac{1}{p}\left\{\sum_{i=1}^{s}t_i\left(\nabla l_i(\bar{a},\bar{y}_i)+Dw-\bar{k}\left(\nabla m_i(\bar{a},\bar{y}_i)-EV\right)\right)\right\}\left\{e^{p\eta}(x^*,\bar{a})-1\right\}\geq 0$$

As $\sum_{i=1}^{s}t_i^*\left(l_i(\cdot,\bar{y}_i)+(\cdot)^T Dw-\bar{k}\left(m_i(\cdot,\bar{y}_i)-(\cdot)^T EV\right)\right)$ is strictly B-(p, r)-invex with respect to $\eta$ b at $\bar{a}$ on $SUS_1$. Then, by definition of strictly B-(p, r)-invexity and from above inequality, it follows that

$$\left\{\frac{1}{r}b(x^*,\bar{a})\times\sum_{i=1}^{s}t_i\left(l_i(x^*,\bar{y}_i)+x^{*T}Dw-\bar{k}\left(m_i(x^*,\bar{y}_i)-x^*EV\right)\right)\right.$$

$$\left.-\sum_{i=1}^{s}t_i\left(l(\bar{a},\bar{y}_i)+\bar{a}^T Dw-\bar{k}\left(m_i(\bar{a},\bar{y}_i)-\bar{a}^T EV\right)\right)-1\;\;>0\right\}$$

From the hypothesis $b(x^*,\bar{a})>0$, and the above inequality,

We get

$$\sum_{i=1}^{s} t_i \left( l_i (x^*, \bar{y}_i) + x^{*T} Dw - \bar{k} \left( m_i (x^*, \bar{y}_i) - x^{*T} EV \right) \right)$$

$$- \sum_{i=1}^{s} t_i \left( l_i (\bar{a}, \bar{y}_i) + \bar{a}^T Dw - \bar{k} \left( m_i (\bar{a}, \bar{y}_i) - \bar{a}^T EV \right) \right) > 0$$

Therefore, by (13),

$$\sum_{i=1}^{s} t_i \left( l_i (x^*, \bar{y}_i) + x^{*T} Dw - \bar{k} \left( m_i (x^*, \bar{y}_i) - x^{*T} EV \right) \right) > 0$$

Since $t_i \geq 0, \quad i = 1, 2, ..... s,$ therefore there exists $i^*$ such that

$$l_i (x^*, \bar{y}_i^*) + x^{*T} Dw - \bar{k} \left( m_i (x^*, \bar{y}_i^*) - x^{*T} EV \right) > 0$$

Hence, we obtain the following inequality

$$\frac{l_i (x^*, \bar{y}^*) + (x^{*T} Dx^*)^{\frac{1}{2}}}{m_i (x^*, \bar{y}^*) - (x^{*T} Ex^*)^{\frac{1}{2}}} > \bar{K},$$

which contradicts (23). Hence the result.

# Second Order Dual Minimax Fractional Programming Under Binvexity

**DR.G.VARALAKSHMI**
**In charge Dept.of Statistics, PRR & VS Government Coleege, Vidavaluru**

**Abstract:** In this paper, we derive some theorems and duality theorems on Second Order DualMinimax Fractional Programming under binvexity

**Keywords:** Binvex functions and second order Duality.

## . Introduction

In this Chapter, we consider the following minimax fractional programming problem.

(p) minimize $\Psi(x) = \underset{y \in Y}{\text{Sup}} \dfrac{f_i(x, y)}{g_i(x, y)}$

s.t $h(x) \le 0$ , $x \in R^n$

where Y is a compact subset of $R^l$, $f(\cdot,\cdot): R^n \times R^l \to R$, $g(\cdot,\cdot): R^n \times R^l \to R$ are twice continuously differentiable on $R^n \times R^l$ and $h(\cdot,\cdot): R^n \to R^m$ is twice continuously differentiable on $R^n$. It is assumed that for each (x, y) in $R^n \times R^l$, $f_i(x, y) \ge 0$ and $g_i(x, y) \ge 0$.

Since minimax fractional programming has wide applications, much attention has been paid optimality conditions and duality theorems for minimax fractional programming problems. For the case of convex differentiable minimax fractional programming, Yadav and Mukherjee [10] formulated two dual models for (p) and derived duality theorems. Chandra and Kumar [3] pointed out certain omissions in the dual formulation of Yadav and Mukherjee [9], they constructed two modified dual problems for minimiax fractional programming problem and proved duality results. Liu and Wu [5,6], and Yang and Hou [10] discussed optimality conditions and duality results for (p) involving generalized convexity assumptions.

Mangasarian [7] introduced the notation of second order duality for nonlinear programs by introducing an additional vector $p \in R^n$. He has indicated a possible computational advantage of the second order dual over the first order dual. Instead of imposing explicit condition on p, Mond [8] included p in a second order type convexity. Bector et al [2] discussed second order duality results for minimax programming problems under generalized B-Convexity. Later on, Liu [4] extended these results involving second order generalized B-Convexity. Recently, Husain et al [3] have formulated two types of second order dual models for minimax fractional programming problems, and derived weak, strong and strict coverse duality theorems under binvex assumptions.

In this paper, two types of second order duality in minimax fractional programming are formulated by introducing an additional vector r. The weak, strong and converse duality theorems are proved for these programes under binvexity assumptions. Our result generalizes these existing dual formulations which were discussed by the authors in but they not consider this in binvexity. Hence in this Paper an attempt to made to full this gap in the aim of research by developing some theorems and duality theorems in second order duality for minimax fractional programming.

## 2. Preliminaries

Let $S = \{x \in R^n : h(x) \le 0\}$ denote the set of all feasible solutions of (p). For each $(x, y) \in R^n \times R^l$, we define

$$J(x) = \{j \in M = \{1, 2, \} : h_j(x) \le 0\}$$

$$Y(x) = \left\{ y \in Y : \frac{f_i(x, y)}{g_i(x, y)} = \sup_{Z \in Y} \frac{f_i(x, z)}{g_i(x, z)} \right\},$$

and $k(x) = \{(s, t, \tilde{y}) \in N \times R_s^+ X R^{ls} : l \le s \le n+1, t = (t_1, t_2, ....., t_s) \in R_+^s,$

$$\sum_{t=1}^{s} t_i = 1, \tilde{y} = (\tilde{y}_1, \tilde{y}_2, ....., \tilde{y}_s);\ \tilde{y}_i \in Y(x), i = 1, 2, ..... s\}$$

let $f : R^n \to R$ be a twice differentiable function.

**Definition (1):**

Function f is said to be binvex at $\bar{x} \in R^n$, such that for all $x, p \in R^n$, we have

$$\frac{f_i(x)}{g_i(x)} - \frac{f_i(\bar{x})}{g_i(\bar{x})} + \frac{1}{2} p^T \nabla^2 \frac{f_i(\bar{x})}{g_i(\bar{x})} p \ge (x - \bar{x})^t \left[ \nabla f(\bar{x}) + \nabla^2 f(\bar{x}) p \right]$$

**Definition (2) :** Function f is said to be strictly binvex at $\bar{x} \in R^n$ such that for all $x, p \in R^n$, we have

$$\frac{f_i(x)}{g_i(x)} - \frac{f_i(\bar{x})}{g_i(\bar{x})} + \frac{1}{2} p^T \nabla^2 \frac{f_i(\bar{x})}{g_i(\bar{x})} p > (x - \bar{x})^t \left[ \nabla \frac{f_i(\bar{x})}{g_i(\bar{x})} + \nabla^2 \frac{f_i(\bar{x})}{g_i(\bar{x})} p \right]$$

The following theorem will be needed in the proofs of strong duality theorems.

**Theorem (1) (Necessary Conditions).** Let $x^*$ be a solution of $(p)$ and let $\nabla g_j(x^*),\ j \in J(x^*)$ be linearly independent. There exist $\left(s^*, t^*, \bar{y}^*\right) \in k(x^*),\ \lambda^* \in R_+$ and $\mu^* \in R_+^m$ such that

$$\nabla \sum_{i=1}^{s^*} t_i^* \left(f_i(x^*, \bar{y}_i^*)\right) - \lambda^* g_i(x^*, \bar{y}_i^*) + \nabla \sum_{j=1}^{m} \mu_j^* h_j(x^*) = 0$$

$$\left(f_i(x^*, \bar{y}_i^*)\right) - \lambda^* g_i(x^*, \bar{y}_i^*) = 0,\ i = 1, 2, \ldots\ldots, s^*$$

$$\sum_{j=1}^{m} \mu_j^* h_j(x^*) = 0,$$

$$t_i^* \geq 0,\ \sum_{i=1}^{s^*} t_i^* = 1,\ \ \bar{y}_i^* \in y(x^*),\ i = 1, 2, \ldots\ldots, s^*$$

### 3. First Duality Model

By utilizing the necessary optimality conditions of the previous section, we formulate the following second order dual to (p) as follows.

$$(MD) \qquad \max_{(s,t,\bar{y}) \in k(z)} \ \sup_{(z,\mu,\lambda,r,p) \in H_1(s,t,\bar{y})} \lambda$$

where $H_1(s, t, \bar{y})$ denotes the set of all $(z, \mu, \lambda, \gamma, p) \in R^n \times R_+^m \times R_+ \times R^n \times R^n$

Satisfying $\nabla \sum_{i=1}^{s} t_i \left(f_i(z, \bar{y}_i)\right) - \lambda gi(z, \bar{y}_i) + \nabla^2 \sum_{i=1}^{s} t_i \left(f_i(z, \bar{y}_i) - \lambda gi(z, \bar{y}_i)\right) p$

$$+ \nabla \sum_{j=1}^{m} \mu_j g_j(z) + \nabla^2 \sum_{j=1}^{m} \mu_j g_j(z) p = 0 \qquad (1)$$

$$\sum_{i=1}^{s} t_i \left( f_i (z, \bar{y}_i) \right) - \lambda g_i (z, \bar{y}_i) + \left( \nabla \sum_{i=1}^{s} t_i \left( f_i (z, \bar{y}_i) - \lambda g_i (z, \bar{y}_i) \right) r \right)$$

$$- \frac{1}{2} p^T \nabla^2 \sum_{i=1}^{s} t_i \left( f_i (z, \bar{y}_i) - \lambda g_i (z, \bar{y}_i) \right) p \geq 0 \qquad (2)$$

$$\sum_{j=1}^{m} \mu_j g_j (z) + \left( \nabla \sum_{j=1}^{m} \mu_j g_j (z) \right) r - \frac{1}{2} p^T \nabla^2 \sum_{j=1}^{m} \mu_j g_j (z) p \geq 0 \qquad (3)$$

$$\left( \nabla \sum_{i=1}^{s} t_i \left( f_i (z, \bar{y}_i) - \lambda g_i (z, \bar{y}_i) \right) \right) r + \left( \nabla \sum_{j=1}^{m} \mu_j g_j (z) \right) r \leq 0 \qquad (4)$$

if, for a triplet $(s, t, \bar{y}) \in k(z)$, the set $H_1 (s, t, \bar{y}) = \phi$, then we define the supremum over it to be $-\infty$.

**Theorem1 (Weak Duality):** Let x and $(z, \mu, \lambda, s, t, \bar{y}, r, p)$ be feasible solutions of (p) and (MD), respectively. Assume that

(i) $\sum_{i=1}^{s} t_i \left( f_i , \bar{y}_i \right) - \lambda g_i (\cdot , \bar{y}_i)$ is $\eta$-bonvex at z;

(ii) $\sum_{j=1}^{m} \mu_j g_j (\cdot)$ is $\eta$-bonvex at z.

Then $\sup_{y \in Y} \frac{f_i (x, y)}{g_i (x, y)} \geq \lambda$

**Proof:** by the feasibility of x for (p), $\mu \geq 0$ and (3), we get

$$\sum_{j=1}^{m} \mu_j g_j (x) \leq 0 \leq \sum_{j=1}^{m} \mu_j g_j (z) + \left( \nabla \sum_{j=1}^{m} \mu_j g_j (z) \right) r - \frac{1}{2} p^T \nabla^2 \sum_{j=1}^{m} \mu_j g_j (z) p$$

The above inequality together with hypothesis (ii) implies

$$\left(\nabla\sum_{j=1}^{m}\mu_j g_j(x)+\nabla^2\sum_{j=1}^{m}\mu_j g_j(z)\,p\right)(x-z)^t\le\left(\nabla\sum_{j=1}^{m}\mu_j g_j(z)\right)r$$

From (9.3.1), (9.3.4) and (9.3.5), we have

$$\left(\nabla\sum_{i=1}^{s}t_i\left(f_i(z,\bar{y}_i)-\lambda gi(z,\bar{y}_i)\right)\right)+\left(\nabla^2\sum_{i=1}^{s}t_i\left(f_i(z,\bar{y}_i)-\lambda gi(z,\bar{y}_i)\right)p\right)(x-z)^t\ge-\left(\nabla\sum_{j=1}^{m}\mu_j g_j(z)\right)r$$

$$\ge\left(\nabla\sum_{i=1}^{s}t_i\left(f_i(z,\bar{y}_i)-\lambda gi(z,\bar{y}_i)\right)\right)r$$

which in view of hypothesis (i) and (2) fields

$$\nabla\sum_{i=1}^{s}t_i\left(f_i(x,\bar{y}_i)\right)-\lambda gi(x,\bar{y}_i)\ge\sum_{i=1}^{s}t_i\left(f_i(z,\bar{y}_i)-\lambda gi(z,\bar{y}_i)\right)+$$

$$\left(\nabla\sum_{i=1}^{s}t_i\left(f_i(z,\bar{y}_i)-\lambda gi(z,\bar{y}_i)\right)r\right)$$

$$-\frac{1}{2}p^T\nabla^2\left(\sum_{i=1}^{s}t_i\left(f(z,\bar{y}_i)-\lambda h(z,\bar{y}_i)\right)\right)p\ge0$$

Therefore, there exists a certain $i_o$ such that

$$f_i(x,\bar{y}_{io})-\lambda gi(x,\bar{y}_{io})\ge0$$

Hence $\sup_{y\in Y}\dfrac{f_i(x,y)}{g_i(x,y)}\ge\dfrac{f_i(x,\bar{y}_{io})}{g_i(x,\bar{y}_{io})}\ge\lambda$

**Theorem 2 (Strong Duality)**

Assume that $x^*$ is an optimal solution of (p) and $\nabla g_i(x^*),\ j \in J(x^*)$ are linearly independent. Then there exist $(s^*, t^*, y^*) \in k(x^*)$ and $(x^*, \mu^*, \lambda^*, r^* = 0, p^* = 0) \in H_1(s^*, t^*, y^*)$ such that $\left(x^*, \mu^*, \lambda^*, s^*, t^*, \bar{y}^*, r^* = 0, p^* = 0\right)$ is a feasible solution of (MD) and the two objectives have the same values. If, in addition, the assumptions of weak duality hold for all feasible solutions $\left(x, \mu, \lambda, s, t, \bar{y}, r, p\right)$ of (MD), then $\left(x^*, \mu^*, \lambda^*, s^*, t^*, \bar{y}^*, r^* = 0, p^* = 0\right)$ is an optimal solution of (MD).

**Proof:** Since $x^*$ is an optimal solution of (p) and $\nabla g_i(x^*),\ j \in J(x^*)$ are linearly independent, then by Theorem (1), thee exist $(s^*, t^*, y^*) \in k(x^*)$ and $(x^*, \mu^*, \lambda^*, r^* = 0, p^* = 0) \in H_1(s^*, t^*, \bar{y}^*)$ such that

$(x^*, \mu^*, \lambda^*, s^*, t^*, \bar{y}^*, r^* = 0, p^* = 0)$ is a feasible solution of (MD) and the two objectives have the same values. Optimality of $(x^*, \mu^*, \lambda^*, s^*, t^*, \bar{y}^*, r^*, p^* = 0)$ for (MD), thus follows weak duality (Theorem 9.3.1).

**Theorem 3 (Strict Converse Duality)**

Let $x^*$ and $(z^*, \mu^*, \lambda^*, s^*, t^*, \bar{y}^*, r^*, p^*)$ be optimal solutions of (p) and (MD), respectively, suppose that

(i) $\nabla g_j(x^*),\ j \in J(x^*)$ are linearly independent,

(ii) $\sum_{i=1}^{s} t_i^* \left(f_i(\cdot, \bar{y}_i^*) - \lambda^* gi(\cdot, \bar{y}_i^*)\right)$ is strictly binvex at z*,

(iii) $\sum_{j=1}^{m} \mu_j^* g_j(\cdot)$ is binvex at z*. Then $z^* = x^*$.

**Proof:** Suppose to the contrary that $z^* \neq x^*$, and we will derive a contradiction. Since $x^*$ and $(z^*, \mu^*, \lambda^*, s^*, t^*, \bar{y}^*, r^*, p^*)$ be optimal solutions of (p) and (MD), respectively, and $\nabla g_j(x^*),\ j \in J(x^*)$ are linearly independent, therefore, by theorem (2), we have

$$\sup_{y^* \in Y} \frac{f_i(x^*, y^*)}{g_i(x^*, y^*)} = \lambda^* \qquad (6)$$

The feasibility of $x^*$ for (p), $\mu^* \geq 0$ and (3) imply

$$\sum_{j=1}^{m} \mu_j^* g_j(x^*) \leq 0 \leq \sum_{j=1}^{m} \mu_j^* g_j(z^*) + \left( \sum_{j=1}^{m} \mu_j^* g_j(z^*) \right) r^* -$$

$$-\frac{1}{2} p^{*T} \nabla^2 \sum_{j=1}^{m} \mu_j^* g_j(z^*)\, p^*,$$

Which along with hypothesis (iii) gives

$$\left( \nabla \sum_{i=1}^{m} \mu_j^* g_j(z^*) + \nabla^2 \sum_{j=1}^{m} \mu_j^* g_j(z^*) p \right)(x^* - z^*)^t \leq \left( \nabla \sum_{i=1}^{m} \mu_j^* g_j(z^*) \right)$$

Therefore, inequality (9.3.1) along with (9.3.7) yields

$$\nabla \sum_{i=1}^{s} t_i^* \left( f(z^*, \bar{y}_i^*) \right) - \lambda^* h(z^*, \bar{y}_i^*) + \left( \nabla^2 \sum_{i=1}^{s} t_i^* \left( f_i(z^*, \bar{y}_i^*) - \lambda g_i(z^*, \bar{y}_i^*) \right) p \right)(x^* - z^*)^t$$

$$\geq \left( \nabla \sum_{i=1}^{s} t_i^* \left( f_i(z^*, \bar{y}_i^*) - \lambda^* g_i(z^*, \bar{y}_i^*) \right) \right) r^*,$$

which by hypothesis (ii) and inequality (9. 3.2) gives

$$\sum_{i=1}^{s} t_i^* \left( f(x^*, \bar{y}_i^*) - \lambda^* h(x^*, \bar{y}_i^*) \right) > 0$$

For a certain $i_o$, this implies

$$\sup_{y^* \in Y} \frac{f_i(x^*, y^*)}{g_i(x^*, y^*)} \geq \frac{f_i(x^*, \bar{y}_{io}^*)}{g_i(x^*, \bar{y}_{io}^*)} > \lambda^*,$$

which is a contradiction to (6). Hence $z^* = x^*$.

**4. Second duality model**

In this section, we formulate the following second order dual to (p) as follows.

$$(GMD) \qquad \max_{(s,t,\bar{y}) \in k(z)} \quad \sup_{(z,\mu,\lambda,r,p) \in H_2(s,t,\bar{y})} \lambda$$

where $H_2(s, t, \bar{y})$ denotes the set of all $(z, \mu, \lambda, r, p) \in R^n \times R_+^m \times R_+ \times R^n \times R^n$

Satisfying

$$\nabla \sum_{i=1}^{s} t_i \left( f_i(z, \bar{y}_i) \right) - \lambda g_i(z, \bar{y}_i) + \nabla^2 \sum_{i=1}^{s} t_i \left( f_i(z, \bar{y}_i) - \lambda h(z, \bar{y}_i) \right) p$$

$$+ \nabla \sum_{j=1}^{m} \mu_j g_j(z) + \nabla^2 \sum_{j=1}^{m} \mu_j g_j(z) p = 0 \qquad (4.1)$$

$$\sum_{i=1}^{s} t_i f_i(z, \bar{y}_i) - \lambda g_i(z, \bar{y}_i) + \sum_{j \in J_0} \mu_j g_j(z) + \left( \nabla \sum_{i=1}^{s} t_i f_i(z, \bar{y}_i) - \lambda g_i(z, \bar{y}_i) + \sum_{j \in J_0} \mu_j g_j(z) \right) r$$

$$-\frac{1}{2} p^T \nabla^2 \sum_{i=1}^{s} t_i \left( f_i(z, \bar{y}_i) - \lambda g_i(z, \bar{y}_i) + \sum_{j \in J_0} \mu_j g_j(z) \right) p \geq 0 \qquad (4.2)$$

$$\sum_{j\in J_\alpha}\mu_j g_j(z)+\left(\sum_{j\in J_\alpha}\mu_j g_j(z)\right)r-\frac{1}{2}p^T\nabla^2\sum_{j\in J_\alpha}\mu_j g_j(z)p\geq 0,\quad \alpha=1,2,....r$$

(4.3)

$$\left(\nabla\sum_{j\in J_\alpha}t_i\left(f_i(z,\bar{y}_i)-\lambda g_i(z,\bar{y}_i)\right)+\left(\nabla\sum_{j=1}^{m}\mu_j g_j(z)\right)\right)r\leq 0 \qquad (4.4)$$

where $J_\alpha\subseteq M,\ \alpha=0,1,2,....,k$ with $\bigcup_{\alpha=0}^{k}J_\alpha=M$ and $J_\alpha\cap J_\beta=\phi,$ if $\alpha\neq\beta.$ If, for a triplet $(s,t,\bar{y})\in k(z),$ the set $H_1(s,t,\bar{y})=\phi,$ then we define the supremum over it to be $-\infty$.

**Theorem 4.1 (Weak Duality):** let x and $(z,\mu,\lambda,s,t,\bar{y},r,p)$ be feasible solutions of (p) and (GMD), respectively. Assume that

(i) $\sum_{i=1}^{s}t_i\left(f_i(\cdot,\bar{y}_i)-\lambda gi(\cdot,\bar{y}_i)\right)+\sum_{j\in J_0}\mu_i g_j(\cdot)$ is binvex at z;

(ii) $\sum_{j\in J_\alpha}\mu_i g_j(\cdot),\quad \alpha=1,2,.....r$ binvex at z.

Then $\sup_{y\in Y}\dfrac{f_i(x,y)}{g_i(x,y)}\geq\lambda$

**Proof:** By the feasibility of x for (p), $\mu\geq 0$ and (9.4.3), we get

$$\sum_{j\in J_\alpha}\mu_i g_j(x)\leq 0\leq\sum_{j\in J_\alpha}\mu_i g_j(z)+\left(\nabla\sum_{j\in J_\alpha}\mu_i g_j(z)\right)r-\frac{1}{2}p^T\nabla^2\sum_{j\in J_\alpha}\mu_i g_j(z)p,\ \alpha=1,2,....r$$

(4.5)

The above inequality (4.5) with hypothesis (ii) implies

$$\left(\nabla\sum_{j\in J_\alpha}\mu_j g_j(z)+\nabla^2\sum_{j\in J_\alpha}\mu_j g_j(z)p\right)(x-z)^t\le\left(\nabla\sum_{j\in J_\alpha}\mu_j g_j(z)\right)r,\ \alpha=1,2,....r$$

which together with (4.1), (4.4) yields

$$\nabla\sum_{i=1}^{s}t_i\left(f_i(z,\bar{y}_i)\right)-\lambda gi(z,\bar{y}_i)+\nabla^2\sum_{i=1}^{s}t_i\left(f_i(z,\bar{y}_i)-\lambda g_i(z,\bar{y}_i)\right)p$$

$$+\ \nabla\sum_{j\in J_0}\mu_j g_j(z)+\left(\nabla^2\sum_{j\in J_0}\mu_j g_j(z)p\right)(x-z)^t$$

$$\ge\nabla\sum_{i=1}^{s}t_i\left(f_i(z,\bar{y}_i)\right)-\lambda gi(z,\bar{y}_i)+\left(\sum_{j\in J_0}\mu_j g_i(z)p\right)r$$

In view of hypothesis (i) and the above inequality implies

$$\sum_{i=1}^{s}t_i\left(f_i(x,\bar{y}_i)\right)-\lambda gi(x,\bar{y}_i)+\sum_{j\in J_0}\mu_j g_i(x)$$

$$\ge\sum_{i=1}^{s}t_i\left(f_i(z,\bar{y}_i)\right)-\lambda g_i(z,\bar{y}_i)+\sum_{j\in J_0}\mu_j g_j(z)+\left(\nabla\sum_{i=1}^{s}t_i\left(f_i(z,\bar{y}_i)\right)-\lambda g_i(z,\bar{y}_i)+\sum_{j\in J_0}\mu_j g_j(z)\right)r$$

$$-\frac{1}{2}p^T\left(\nabla^2\sum_{i=1}^{s}t_i\left(f_i(z,\bar{y}_i)-\lambda g_i(z,\bar{y}_i)\right)+\sum_{j\in J_0}\mu_j g_j(z)\right)p$$

By $\mu\ge 0,\ g(x)\le 0$ and (4.2) it follows that

$$\sum_{i=1}^{s}t_i\left(f_i(x,\bar{y}_i)-\lambda g_i(x,\bar{y}_i)\right)\ge 0$$

Therefore, there exists a certain $i_o$ such that

$$f_i(x, \bar{y}_{io}) - \lambda g_i(x, \bar{y}_{io}) \geq 0$$

$$\sup_{y \in Y} \frac{f_i(x, y)}{g_i(x, y)} \geq \frac{f_i(x, \bar{y}_{io})}{g_i(x, \bar{y}_{io})} > \lambda$$

The proof of the following theorem is similar to that of Theorem (9.3.2) and hence, is omitted.

**Theorem 4.2 Strong Duality:** Assume that $x^*$ is an optimal solution of (p) and $\nabla g_j(x^*),\ j \in J(x^*)$ are linearly independent. Then there exist $(s^*, t^*, \bar{y}^*) \in k(x^*)$ and $(x^*, \mu^*, \lambda^*, r^* = 0, p^* = 0) \in H_1(s^*, t^*, \bar{y}^*)$ such that

$(x^*, \mu^*, \lambda^*, s^*, t^*, \bar{y}^*, r^* = 0, p^* = 0)$ is a feasible solution of (GMD) and the two objectives have the same values. If, in addition, the assumptions of weak duality hold for all feasible solutions $(x, \mu, \lambda, s, t, \bar{y}, r, p)$ of (GMD), then $(x^*, \mu^*, \lambda^*, s^*, t^*, \bar{y}^*, r^* = 0, p^* = 0)$ is an optimal solution of (GMD).

**Theorem 4.3 (Strict Converse Duality)**

Let $x^*$ and $(z^*, s^*, t^*, \bar{y}^*, r^*, p^*)$ be optimal solutions of (p) and (GMD), respectively, suppose that

(i) $\nabla g_j(x^*),\ j \in J(x^*)$ are linearly independent.

(ii) $\sum_{i=1}^{s} t_i^* \left( f_i(\cdot, \bar{y}_i^*) - \lambda^* g_i(\cdot, \bar{y}_i^*) \right) + \sum_{j \in J_0} \mu_j^* g_j(\cdot)$ is strictly binvex at $z^*$.

(iii) $\sum_{j \in J_\alpha} \mu_j^* g_j(\cdot),\quad \alpha = 1, 2, \ldots . k$ binvex at $z^*$.

Then $z^* = x^*$.

**Proof:** It can be proved similarly to Theorem (3.3.).
