# Dwindling Population of a Scincid Lizard *Mabuya Carinata* (SCHNEIDER, 1801) in Nellore District of Andhra Pradesh, South India

**R. Janardana Rao[1], Dr. I. S. Chakrapani[2], Dr. M. Rajasekhar[3]**

[1, 3]Department of Zoology, Sri Venkateswara University, Tirupati, Andhra Pradesh, India

[2]Department of Zoology, PRR & VS Govt. College, Vidavalur, Nellore district, Andhra Pradesh

**Abstract:** ***Mabuya carinata (Schneider, 1801) is the keeled grass skink, commonly observed in our surroundings. This scincid lizard is of least concern according to the Wild Life (Protection) Act, 1972. But it is alarming that population of this species is fast dwindling in different parts of the country. Mabuya is an efficient bio-indicator and plays an important role in food web of terrestrial ecosystems. The present study aims at assessment of population dynamics of this precious animal in Nellore district of Andhra Pradesh. Line transect and direct counting methods were adopted. Statistical analysis was done by using MS Office Excel 2007. The results show that there is drastic decline in the population of Mabuya from 2011 to 2015 at an alarming rate. Threats for the conservation of this animal are examined and remedial measure suggested.***

**Keywords:** *Mabuya*, Bio-indicator, Scinicds

## 1. Introduction

As on 4th November 2017, there are 6263 species of lizards inhabiting different habitats across the globe. Of these, 1634 species belong to the family Scincidae of infraorder Scincomorpha, belonging to order Squamata. The mabuyid skinks include only 201 species belonging to 26 genera [1]. These are highly diverse, worldwide in distribution, Though less in number (3619) of species described so far [1], ophidians received greater attention of wildlife biologists, conservationists, ecologists, and molecular biologists, lizards could not attract much of their attention, though they play an important role in ecosystem dynamics. PubMed database displays 38535 research articles related to reptiles, out of which 11511 can be accessed as abstract or full text article from a public network. 15285 articles are published on snakes, out of which 4444 can be accessed as abstract or full text. 10854 articles are related to lizards as a whole, 3530 can be accessed. While agamids are represented by 169 articles, only 65 can be accessed. 259 articles were published about skinks, only 145 can be accessed. The genus *Mabuya* is poorly represented in literature, only by 111 articles, while only 24 can be accessed [2].

| Sl. No | Subject of Research | Total number of papers published | Total number of papers which can be accessed from a public network |
|---|---|---|---|
| 1 | Reptiles (general) | 38535 | 11511 |
| 2 | Snakes | 15282 | 4444 |
| 3 | Lizards | 10854 | 3530 |
| 4 | Agamids | 169 | 65 |
| 5 | Skinks | 259 | 145 |
| 6 | Mabuya | 111 | 24 |

Skinks are highly diverse and known to be present worldwide. The diversity of mabuyine lizards was earlier attributed to only one genus *Mabuya*, but four new monophyletic genera which have well-defined geographical distribution are proposed [3]. These genera include the African and Madagascan species *Trachylepis*, the Asian species *Eutropis*, the Cape Verde island species Chioninia and the new world skink *Mabuya*. The systemic position of mabuyid skinks is debated [4,5,6].

The genus *Mabuya* is circumtropical in distribution. It consists of about 30 described species. The generic rearrangement of this genus assigning the members of *Mabuya* to Eutropis [7,8] has been much debated. Phylogenetic studies based on the sequences of nuclear and mitochondrial genes [9] confirm the monophyly of the tropical Asian Eutropis. An endemic Indian radiation of members of the genus *Mabuya* was revealed by the nuclear and mitochondrial trees. An initial dispersal of Eutropis around 5.5-17 million years ago, from South East Asia into India was also suggested by these studies. This was followed by two back dispersals from India. These events are thought to give rise to the extant members of the genus *Mabuya*, which include 8 species endemic to India [10].

Members of genus *Mabuya* from Africa and Asia are interesting for researchers of biogeography of Peninsular India. About 200 million years ago (mya), the Peninsular Indian plate was geologically part of the Gondwanaland. It is established that around 160 mya, the Peninsular India plate, together with Madagascar and Seychelles got separated from Africa. Subsequent events led to separation of Madagascar about 80mya, which later drifted across the Indian Ocean and finally collided with the Eurasian plate about 55-42 mya [11]. Then the Peninsular India plate merged with Eurasian plate, with the concurrent exchange of organisms between the two land masses [12]. With this possibility, Gondwanan fauna got scattered out of India [13]. Simultaneously, fauna of Asia and Africa entered the Indian land [14,15]. It is suggested that origin of *Mabuya* took place in the Asian mainland and it dispersed to other parts of the globe [16].

In the light of these facts, we started exploring the biogeography of the common Indian skink *Mabuya carinata*

(Schneider, 1801). An extensive survey was undertaken in Andhra Pradesh, South India.

## 2. Materials and Methods

SPS Nellore district is selected for this study, because of the fact that it hosts a variety of habitat- rupicolous, forest, grass land and marine. This is selected because species of *Mabuya* are known to exist in all these ecosystems. But we focussed on *Mabuya carinata* only.

Nellore District is the Southernmost Coastal District of Andhra Pradesh. Located between between 13-30' and 15-6' of the Northern latitude and 70-5' and 80-15' of the Eastern Longitudes, the district has occupied a crucial place in the economy of Andhra Pradesh state. It is bound on the north by Prakasam District, on the East by Bay of Bengal, on the South by Chittoor District and Tiruvallur District of Tamilanadu and on the West by Velikonda Hills which separate it from Kadapa District. The eastern half of the District which lice adjacent the coast is fairly fertile and the western half of the district has low elevation towards west with large track of low shrub jungles diversified with rocky, will stony plains. The district has a coastal line of 169 km (Image 1). The maximum temperature is 36 to 46 °C (97 to 115 °F) during summer and the minimum temperature is 23 to 25 °C (73 to 77 °F) during winter. The rainfall ranges from 700 to 1,000 mm (28 to 39 in) through South West and North East Monsoons. Nellore is subject both to droughts and to floods based on the seasons. It is also one of the hottest cities in India with at least 35 super hot days in a year.

Direct counting method was used to arrive at population count of *Mabuya carinata* in the areas surveyed. Conventional distance sampling method was adopted for this survey.

Opportunistic searches comprised of slow walking among the habitat suitable for existence of *Mabuya carinata*. These were carried out over a vast area.

Line transect method was used, where *Mabuya* population is presumed to be high. Transect lines were marked during day time with fishing line for every 5 metres, prior to each attempt. When required, survey was held at dusk, using power full head mounted 6 v spotlights and hand torches. Every potential habitat was searched for the presence of skinks and number of skinks observed was noted down. A noose was used to catch the gecko live. Gecko was released after taking morphometric details as given by Daniel *et.al* [17]. Population analysis was carried out by direct counting. Habitat analysis was done, as described by Kotwal [18]. Sympatric reptiles were identified using the key provided by Smith [19], and Boulinger[20]. No invasive method was used. No animal was either harmed or killed while doing morphometric analysis in the field and no sample was collected for any other purpose. Statistical analysis was done by using Microsoft Office Xcel 2007.

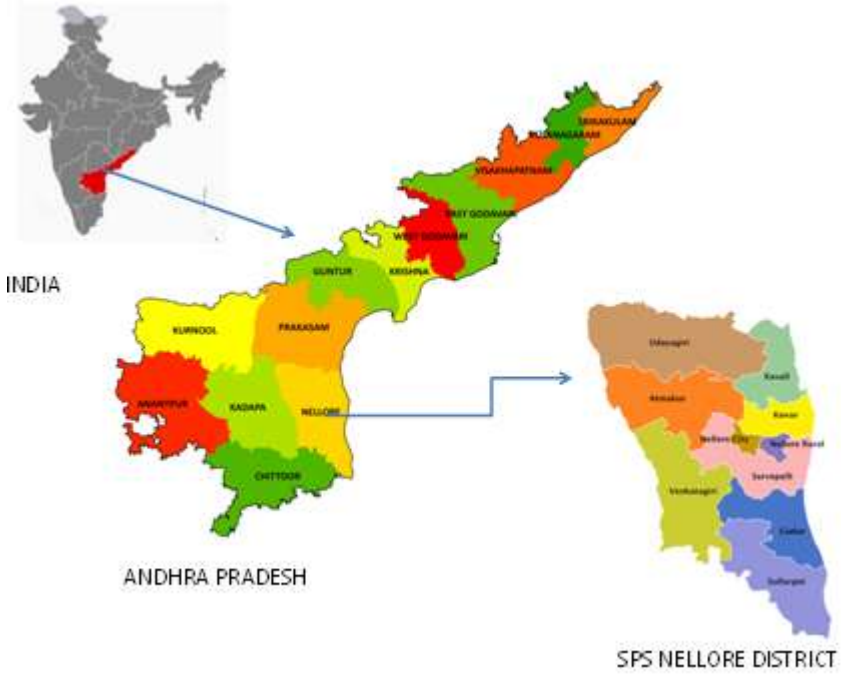

**Image 1:** Map of the Study area

## 3. Results and Discussion

**Animal Description and Habitat:**

**We describe the animal, as spotted in the Penusila Wildlife Sanctuary, Nellore.** *Mabuya* has an obtusely pointed snout, which is longer than the orbit (Images 2). Frontal is variable in length. *Mabuya* has well-developed frontoparitals and interparietal. As a characteristic feature, 5th or 6th supralabial is found to be subocular, and also equal in length to the preceeding labials. Of the four supraoculars observed, second supraocular is the largest and is in contact with the frontal. 5-7 supraciliaries are observed, the first being the largest. Temporal scales are small, almost identical to those upon the rest of the body.

Licensed Under Creative Commons Attribution CC BY

Dorsal scales are keeled, which are in 5 rows in many of the animals noticed. Occasionally 7 rows are found. Pre-anal scales and median subcaudal scales are small. Subconical tubercles are found on the ventral surface of palms and soles. Larger tubercles are present on the heels. *Mabuya carinata* can be identified in the field by scaly lower eyelid, numerous small scales on the underside of 4th toe, 30-34 scales round the body, legs reaching the elbow and absence of post-nasal. These observations are coinciding with those of earlier authors [19,20].

Typically, *Mabuya carinata* is found under litter, logs and abandoned places covered with scrub vegetation.

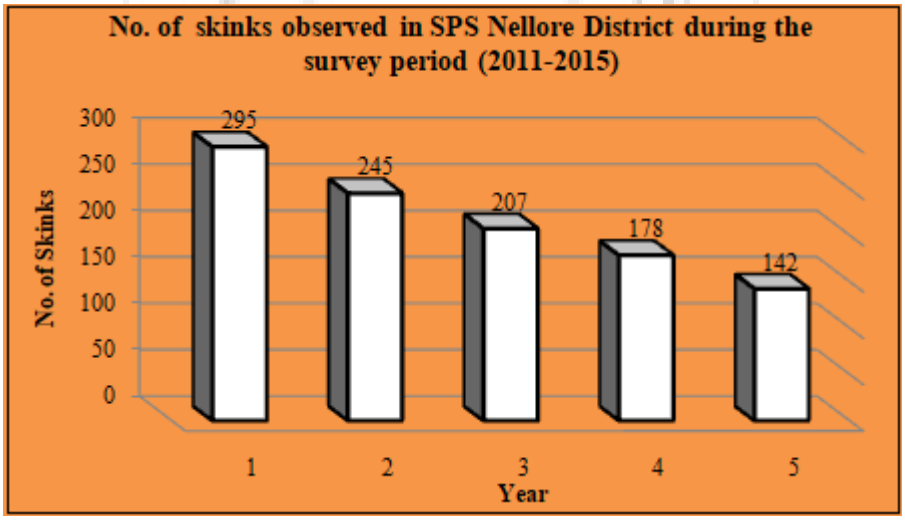

**Image 2:** Common Indian Skink in its natural habitat

**Population of *Mabuya* in SPS Nellore district during the study period**

| Sl. No | Year | No. of animals observed | % increase or decrease with reference to previous year |
|---|---|---|---|
| 01 | 2011 | 295 | -- |
| 02 | 2012 | 245 | -16.94 |
| 03 | 2013 | 207 | -15.51 |
| 04 | 2014 | 178 | -14.00 |
| 05 | 2015 | 142 | -20.93 |

In the year 2011, during the survey period, 295 skinks were observed in all the study locations. There was a reduction in skink population in the study locations by -16.94% during the next survey year. In the next survey year, i.e., 2013, skink population in the surveyed locations recorded a fall by 15.51%. During the next survey year also, there was a decline by 14.00%. During the survey year 2015, there was a negative growth of skink population in the surveyed locations by -20.93% . Altogether, there was a reduction in skink population by 51.86% from the year 2011 to the year 2015. As skinks are very much sensitive to environmental changes, if this decline is continued in the present scale, it is estimated that by 2020 skink population will become very much minimal, and they may face extinction.

Keeping in view the recent changes in the global warming profile and anthropogenic interference in herpetofaunal habitat, it is very much needed to safeguard this important genus in food chains.

## Abstract

*Oroxylum indicum* belongs to family: Bignoniaceae (Jacaranda family) commonly known as Broken bones tree is widely distributed throughout South East Asia and India. The endangered forest tree known as *Oroxylum indicum* is having many unexplored medicinal properties. To report different phytochemicals like sterols, saponins, glycosides, flavonoids, alkaloids, tannins, phenols and quinones various tests were performed. The results of these phytochemical testing of crude methanol and ethanol extracts from leaves of *Oroxylum indicum* showed the presence of many important compounds used in the cure of various human ailments. The preliminary phytochemical screening study revealed that the leaf of *Oroxylum indicum* has presence of Flavonoids, Saponins Alkaloids,Sterols, Tannins ,Phenolic Compounds, Fats and Oils,. Glycosides, lignins. Whereas Anthraquinones, Anthocyanides, Coumarins ,Proteins, Carbohydrate, Indoles, Reducing sugars and Aminoacids are found to be absent in both the extracts. The extracts from *O. indicum* leaves collected from different provinces in Penchalakona of Nellore district were prepared by decoction and maceration with methanol, ethanol and evaluated their antimicrobial effects on three clinically isolated bacteria, *Bacillus subtilis MTCC 441,Staphylococcus aureus MTCC 737,Pseudomonas aeruginosa MTCC 1035* and a fungal pathogen *Candida albicans MTCC 3018* using disc diffusion assay. Methanol and ethanol extracts from *O. indicum* leaves at the concentration of 1000 mg/mL exhibited maximum antibacterial activity against *Staphylococcus aureus* with an inhibition zone of 15.9 mm and 14.1mm respectively. But it has no inhibitory affect on *Bacillus subtilis, Pseudomonas aeruginosa and Candida albicans.* The methanol and ethanol extracts from the leaves of this plant scavenged DPPH(1, 1Diphenyl-2picrylhydrazyl) free radicals with 65% and 63% inhibition and nitric oxide free radicals are scavenged by 72% and 71% respectively. The present study revealed the antioxidant potential of leaves of *Oroxylum indicum*. 2,2diphelyl 1-picrylhydrazyl (DPPH), and Nitric oxide are used as free radicals and scavenging potential and reductive ability assay of methanol and ethanol extract of leaves were performed to evaluate the inhibition percentage. From the results, it is clearly understood that the extracts from *O. Indicum* leaves have antioxidant effect along with antimicrobial nature, on clinically isolated pathogenic bacteria and it could be used for medicinal and pharmaceutical purposes in the future.

# INTRODUCTION

Plants are the basis of many traditional medicines worldwide. Traditional medicines derived from plants are used by about 60% of the world's population. Though there are various approaches to control diseases because of their secondary complications, herbal formulations are preferred due to lesser side effects and low cost. The use of drugs and dietary supplements derived from green sources has been increased in recent years. Botanists, microbiologists, Ethno pharmacologists and chemists are searching the earth for phytochemicals and drugs which could be used for treatment of many stubborn infectious diseases in a green and natural way. While 30 to 50% of current pharmaceuticals are derived from plants, only few of them are used as antimicrobials. Traditional healers have long used plants to prevent or cure infectious conditions. Plants are rich in a wide variety of secondary metabolites, such as Terpenoids, Tannins, Alkaloids, Flavonoids, Saponins and Anthraquinones which have been found in vitro to have antimicrobial and anti oxidant properties. Leaves, stems and Roots of *Oroxylum indicum* are being used as an important drug component in the Indian Ayurvedic system for cure of various diseases and used as a tonic. ***Oroxylum indicum*** (Linn.), the plant used in this study is one of ten drugs named Dasamoola, is generally used in Ayurvedic system of medicine. Various studies indicated that sonapatha (common name of this plant in Ayurvedic medicine) possesses antioxidant, anticancer, hepato-protective, antimicrobial, analgesic and gastro-protective properties. Plants of *O.indicum* have been used as traditional medicine known to possess unique medicinal properties such as anti inflammatory, diuretic, anti-arthritic, antibacterial, anti-tussive and anti-fungal properties. The roots of *O.indicum* are known for anti-helminthic, anti-bronchitic, anti-luecodermatic, anti-rheumatic and anti-anorexic. The leaves and bark of stem are reported to possess flavonoids like baicalein, chrysin, oroxylin-A and scutellarin. The flavonoid baicalein is reported to have an anti-oxidant [1], hepato protective [2], anti-ulcer [3] and immuno-modularity activity [4]. This plant is used as an astringent, carminative, diuretic, stomachic, aphrodisiac and has high potential for stimulating digestion, curing fevers, coughs and preventing other respiratory disorders [5]. Bark of *O.indicum* is reported to be used to cure fevers, gastritis, liver disorders, as a purgative, for controlling hypertension, for treating headache [6] epilepsy, muscular sprain and in controlling hypertension [7] and general weakness [8] . The normal dose is reported 8 to 16 g of bark in the form of decoction, extract or powder [9,10]. The seeds are active in controlling chronic cough and gastralgia: 5 to 10 g daily in the form of a decoction or powder and also used as purgative. An alcoholic maceration of fresh bark is applied externally for lacquer allergic dermatitis. The fruits of *Oroxylum indicum* are acrid, sweet, stomachic, anthelmintic,

DOI: 10.21276/IJIPSR.2017.05.11.606

and good in treating diseases of the heart and the throat, piles, bronchitis, used as an expectorant, improves the appetite, useful in leucoderma [11-16]. The aqueous extract of leaves of *Oroxylum indicum*

has been reported to possess significant anti-inflammatory activity [17]. The roots are used in dropsy and the leaves are reputed as an emollient. Tender fruits are described as carminative and stomachic [18]. The root of this plant is also one of the important ingredients in most commonly used ayurvedic formulations like dantyadyarista, brahma rasayana, dasamula, amartarista, dhanawantara ghrita, narayana taila [19]. The anti cancer potential of different parts of the plant has already been reported [20,21]. Inspite of its extensive use in folk, ayurvedic, herbal and tribal medicine the phytochemical analysis of leaves of *O. indicum* was not studied. Hence the present investigation has been under taken this analysis to screen different types of phytochemicals in *O.indicum* along with evaluation of antimicrobial and anti oxidant properties. *Oroxylum indicum* (Bignoniaceae), a broken bone tree is a local ornamental tree often grown for its strange appearance. It is mostly found along the river banks or slopes of the hills. The following are some of the local names/synonyms with which the tree is called in its respective regions of India.

**Table 1: Synonyms**

| **Language** | **Local name/Synonyms** |
|---|---|
| Hindi | Bhut-vriksha, Dirghavrinta, Kutannat, Manduk, Patrorna, Putivriksha, Shallaka, Shuran, Son, Vatuk. |
| Manipuri | Shamba |
| Sanskrit | Aralu,Shyonaka |
| Assamese | Toguna |
| Oriya | Tatelo |
| Bengali | Sona |
| Konkani | Davamadak |
| Kannada | Tattuna |
| Telugu | Manduka-parnamu,Pampena,Suka-nasamu,Tundilamu |
| Marathi | Tayitu,Tetu |
| Tamil | Cori-konnai,Palai-y-utaicci,Puta-puspam(the flower) |
| Malayalam | Palaqapayyani,Vashrppathiri, Vellappathiri |

Except in the western drier area, the plant is distributed throughout India and South East Asia. *Oroxylum indicum* Vent. (Bignoniaceae), a rare endangered and threatened medicinal plant widely used traditionally for treating several disorders [22]. The root bark and stem bark possess antiallergic properties and are used in treating allergic disease, hoarseness, gastralgia, diarrhoea, dysentery,

DOI: 10.21276/IJIPSR.2017.05.11.606

urticaria, jaundice, asthma, sore throat, laryngitis, infantile, measles and erythema [22–23]. Antioxidants are now standing on the mainstay of the treatment and prevention of several diseases [23-24]. This has been used as a single drug or as a component of certain poly-herbal drug preparations in Indian system of medicine ie. Ayurveda. It is active ingredient of well known Ayurvedic formulations like Dashmularistha, Chyavanprash etc. [25]. Present research is directed towards finding naturally occurring antioxidants particularly of plant origin. The present study describes the phytochemicals present in *Oroxylum indicum* leaves and its antimicrobial and antioxidant properties.

**Botanical Description**

A small tree, 8-15 m tall, branched at top; bark light brown, soft with green juice and often with numerous corky lenticels. Leaves are 3-8 cm long, 2-3 pinnate with opposite pinnae, rachis very stout, cylindrical, leaflets 2-4 pairs, 7-13 cm long and 4-11 cm broad, ovate or elliptic, acuminate, glabrous, base rounded or sometimes cordate; petioles of the lateral leaflets 7-15 mm long. Flowers are numerous, in large erect racemes, 0.3-0.6 meter long or even more pedicels 6-31 mm long. Calyx 4 cm long, leathery, glabrous and oblong-campanulate. Corolla usually lurid-purple, reaching 10 cm long, fleshy lobes about 4 cm long with crisped margins. Stamens 5, slightly exerted beyond the corolla tube, one of them little shorter than the 4, filaments cottony at the base. Capsules 0.3-0.6 meter long and 5-9 cm broad, straight, tapering to both ends, flat, hardly 8 mm thick, acute, valves semi-woody. Seeds numerous, 6 cm long, winged all round except at the base( Kirtikar & Basu, 2001; Ayurvedic Pharmacopoeia of India) .The large leaf stalks wither and fall off the tree and collect near the base of the trunk, appearing to look like a pile of broken limb bones. The tree is a night-bloomer and flowers are adapted to natural pollination by bats. They form enormous seed pods that hang down from bare branches. Those long fruits curve downward and resemble the wings of a large bird or dangling sickles or swords in the night. The seeds are round with papery wings. Bark is off brown in colour. In India, the plants flower any time during August to February depending on climate. *O. indicum* is propagated naturally by seeds, which germinate in the beginning of the rainy season (June to September). Problems related with its natural propagation and indiscriminate exploitation for medicinal purpose has pushed *O. indicum* to the list of endangered plant species of India.

**Geographical Distribution*:*** *Oroxylum indicum* is native to the Indian subcontinent, in Indo-China, in the Himalayan foothills with a part extending to Bhutan and southern China and the Malaysia.

DOI: 10.21276/IJIPSR.2017.05.11.606

**Taxonomical Classification:** *Oroxylum indicum* belongs to the family Bignoniaceae. Its taxonomical classification reported in literature is as given below.

**Table 2: Taxonomical Classification**

| **Kingdom** | **Plantae** |
|---|---|
| Division | Magnoliophyta |
| Class | Magnoliopsida |
| Order | Lamiales |
| Family | Bignoniaceae |
| Genus | Oroxylum |
| Species | Indicum |

**Fig.1: *Oroxylum indicum***

## MATERIALS AND METHODS

Leaves of *Oroxylum indicum* were collected from Penchalakona forest of Nellore disrict A.P.,in July 2016. The plant was identified by Prof. Dr. S.K.M.Basha, Department of Botany, Vikramasimhapuri University, P.G Centre, Kavali district of AndhraPradesh, India. The plant material was purified with distilled water and was shade dried for one month. Leaf sample of the material was ground into fine powder and stored in air tight containers at room temperature. All the specimens at different leaf stages were documented in the form of herbarium sheets which have been deposited in the Herbarium, Department of Botany, Vikramasimhapuri University, P.G Centre, and Kavali,Andhrapradesh, India. The powdered material was then extracted using solvents methanol and ethanol in the ratio 1:10 using Soxhlet apparatus. (Khan *et al*., 1988). The solvent was evaporated under reduced pressure in rotatory evaporator to get methanol and ethanol extracts. Antibacterial and antifungal activities of the four plant extracts were investigated by the disc diffusion method [26] .The supernatants were collected, covered, labelled and used for the screening of various phytochemicals. After extracting all colouring material, the solvent was removed by evaporating in a water bath, which gave rise to a solid isolate of extract used for antimicrobial and antioxidant screening.

**Phytochemical Analysis**

The photochemical analysis of the leaves was carried out to determine the presence of following bioactive compounds using the standard qualitative procedures.

DOI: 10.21276/IJIPSR.2017.05.11.606

**Tests Performed for the Presence of Phytochemicals**

**A) Tests for Flavonoids**

1. **Shinoda test (Magnesium hydrochloride reduction test):** To the test solution few fragements of magnesium ribbon and concentrated hydrochloric acid were added drop wise and reddish to pink colour was resulted.
2. **Zinc Hydrochloride reduction test:** To test the sample solution for the flavonoids added a mixture of zinc dust and concentrated hydrochloric acid results in red colour.
3. **Lead acetate test:** When aqueous basic lead acetate was added to test sample produces reddish brown precipitate.
4. **Ferric chloride test:** To few ml of test samples taken separately, few drops of ferric chloride were added which resulted in the formation of blackish red precipitate.
5. **Alkaline reagent test:** When sodium hydroxide solution was added to the test samples formation of intense yellow colour, which turns to colour less on addition of few drops of dilute acid indicates the presence of flavonoids.

**B) Tests for Saponins**

**Foam test:** 5ml of extract was shaken vigorously to obtain a stable persistent froth. The froth was then mixed with three drops of olive oil and observed for the formation of an emulsion, which indicated the presence of saponins.

**C) Tests for Glycosides**

1. **Kellar Kiliani test:** 1ml of concentrated sulphuric acid was taken in a test tube then 5ml of extract and 2ml of glacial acetic acid with one drop of ferric chloride were added, formation of a blue colour.
2. **Raymond's test:** Test solution when treated with dinitrobenzene in hot methanolic alkali giving a violet colour.
3. **Molisch test:** When alpha naphthol and concentrated H2SO4 were added to test samples reddish violet ring at junction of two layers was resulted.
4. **Concentrated Sulphuric acid test:** Conc.H2SO4 was added to test sample which resulted in appearance of reddish colour.
5. **Legal's test:** The test samples when treated with pyridine and sodium nitroprusside solution blood red colour will be developed.
6. **Bromine water test:** When treated with bromine water test solution gives yellow precipitate.

DOI: 10.21276/IJIPSR.2017.05.11.606

**D) Tests for Alkaloids**

1. **Dragendorff's test:** To 1 ml of each of the sample solution taken in a test tube few drops of Dragendorff's reagent (potassium bismuth iodide solution) was added. A reddish brown precipitate was observed indicating the presence of alkaloids.
2. **Meyer's test:** To 1ml of each of the sample solution few drops of Meyer's reagent (potassium mercuric chloride solution) was added. A creamy white precipitate was formed indicating the presence of alkaloids.
3. **Wagner's test:** To few ml of each of the sample solution, Wagner's reagent (Iodine in potassium iodide) was added, which resulted in the formation of reddish brown precipitate indicating the presence of alkaloids.
4. **Hager's test:** To 1 ml of each of the sample few drops of Hager's reagent (Picric acid) was added. Yellow precipitate was formed reacting positively for alkaloids.
5. **Tannic acid test:** When few ml of 10% Tannic acid was added to 1ml of each sample, a buff colour precipitate was formed giving positive result for alkaloids.
6. **FeCl 3 test:** One drop of FeCl 3solution was added to each of the test sample, formation of yellow precipitate was resulted reacting positively for alkaloids.

**E) Tests for Sterols**

1. **Libermann-Buchard test:** When samples were treated with few drops of acetic anhydride, boiled and few drops of concentrated sulphuric acid from the sides of the test tube were added, shows a brown ring at the junction of two layers and the upper layer turns green which shows the presence of steroids.
2. **Salkowski test:** Few drops of concentrated sulphuric acid were added to the test samples in chloroform, a red colour appears at the lower layer indicates the presence of sterols

**F) Tests for Tannins and Phenolic Compounds**

1. **Ferric chloride test:** When few drops of ferric chloride were added to sample solution a blackish precipitate appears.
2. **Gelatin test:** When gelatine and water were added to test samples formation of white precipitate was resulted.
3. **Lead acetate:** Few ml of test samples were taken in different test tubes followed by the addition of aqueous basic lead acetate. It results in the formation of reddish brown bulky preceipitate.

DOI: 10.21276/IJIPSR.2017.05.11.606

4. **Alkaline reagent:** When sodium hydroxide solution was added to the sample solution results in the formation of yellow to red precipitate.
5. **Mitchell's test:** Tannins give a water soluble iron–tannin complex with iron and ammonium citrate or iron and sodium tartarate.
6. **Ellagic acid test:** When 5% glacial acetic acid and 5% sodium nitrite were added to test samples a muddy niger brown colour appears, which is a positive result for phenols.

**G) Tests for Fats and Oils**

1. **Stain test:** Press the small quantity of each extract between two filter papers, the stain on filter papers indicates the presence of the oils.
2. **Saponification test:** Added a few drops of 0.5N alcoholic potassium hydroxide to various extracts with a drop of phenolphthalein separately and heat on water bath for 1-2hours, formation of soap or partial neutralization of alkali indicates the presence of oils and fats.

**H) Tests for Lignins**

1. **Labat test:** When gallic acid is added to the test sample,it results in the formation of olive green colour.
2. **Furfuraldehyde test:** When furfuraldehyde is added to the test sample a red colour appears indicating the presence of lignin.

**I) Tests for Quinones**

**Alcoholic KOH test:** When alcoholic KOH was added to the test samples red to blue colour appears reacting positively for quinones.

**J) Terpenoids and steroids test**

1.50% $H_2SO_4$ is added along the sides of the test tube containing a mixture of methanolic HCl and acetic anhydride. If there is any change in color, from green to blue-green (sometimes via red or blue) indicates the presence of terpenoids and steroids.

**K) Anthroquinones test**

1. 5 g plant powder was shaken with 20 ml of benzene and filtered. To the filtrate 5 ml of 10% ammonium hydroxide solution was added and shaken well. Presence of pink red or violet color, in the ammonical phase indicates the presence of free anthroquinones (Fransworth, 1966).

**L) Anthocyanidin test**

To the plant extract was added equal volume of methanolic HCl. Appearance of red or purple color indicates the presence of anthocyanidins.

DOI: 10.21276/IJIPSR.2017.05.11.606

**M) Coumarin test**

To the methanolic extract, a few drops of alcoholic sodium hydroxide were added. Formation of yellow color indicated the presence of coumarins.

**N) Proteins test (Millions test)**

2 ml of methanolic extract was boiled with a few drops of Million's reagent (Millions reagent is a solution of mercuric nitrate in nitric acid) results in the formation of red color indicates the presence of proteins.

**O) Carbohydrate test (Molish test)**

To the methanolic extract, c-naphthol solution (1gm dissolved in 100 ml of ethanol w/v) was added. Then conc. $H_2SO_4$ is added gently along the walls of the inclined test tube. Appearance of a red to violet color at the interface is taken as a positive reaction.

**P) Indole test**

If a violet color was developed on adding Ehrlich reagent to the alcoholic extract, it is considered as a positive reaction for indoles.

**Q) Test for reducing sugars**

To the 5 ml of methanolic extract, 5 ml of Benedict's reagent was added in a boiling test tube. The test tubes were incubated in boiling on water bath for 15-30 minutes. The formation of an orange red precipitate indicated the presence of reducing sugars.

**R) Test for amino acids**

To the methanolic extract, was added few drops of Ninhydrin solution and boiled. The formation of violet colour indicates the presence of amino acids.

**Determination of Antibacterial Activity of *O. Indicum* Leaf Extracts Using Disc Diffusion Assay:**

Sensitivity tests were performed by disc diffusion with standard antibiotics, following Kirby-Bauer method. The assessment of antimicrobial activity was done based on measurements of the diameter of inhibition zones (NCCLS, 1998). The assays were performed against three clinically isolated pathogenic bacteria *Bacillus subtilis MTCC 441,Staphylococcus aureus MTCC 737,Pseudomonas aeruginosa MTCC 1035* and a fungal pathogen *Candida albicans MTCC 3018* . Each extract was dissolved in 95% ethanol or sterile water at different concentrations (250, 500 and 1000 mg/mL). Then each solution was impregnated on to a small disc of filter paper and placed on the top of agar containing 100 µL of bacterial solution at a concentration of 1.5ˆ108 CFU/mL per plate (adjusted by comparing to 0.5 McFarland). Similarly, each plate carried a blank disk by adding solvent control

DOI: 10.21276/IJIPSR.2017.05.11.606

alone in the centre, and antibiotic discs (6.0-mm diam) of (20 µg/ml, Streptomycin sulphate for bacteria) and Nystatin (20 µg/ml, for fungal) were also used as a positive control. All of the plates were incubated at 37°C for 18 hours for bacteria and at 28°C for 48 hours for fungi. The zones of growth inhibition around the discs were measured after 18 hours of in incubation at 37°C for bacteria and 48 hours for fungi at 28°C, respectively. The sensitivity of the microorganism species to the plant extracts was determined by measuring the sizes of inhibitory zones on the agar surface around the discs. All determinations were undertaken in triplicate and the average zone of inhibition was calculated with the standard deviation.

**Determination of In Vitro Antioxidant activity of *O.Indicum* Extracts Using DPPH Scavenging Method** [27]

**a) DPPH (1, 1-Diphenyl-2picrylhydrazyl) free radical scavenging activity**

- The ability of the sample to scavenge DPPH radicals were determined.
- 0.5 ml of aliquot of test at different concentrations (100 µg/ml and 200 µg/ml )in methanol was mixed with 0.5 ml of 100mM methanolic solution of DPPH.
- The mixture was incubated for 30 min in darkness and at ambient temperature.
- Absorbance was recorded at 517 nm.

**b) Nitric oxide radical scavenging activity**

1. The standard used here was Ascorbic acid. 100 µg/ml and 200 µg/ml solution of standard in methanol and ethanol were used for assay.
2. Sample solution was prepared by dissolving the sample in methanol and ethanol
3. 10 mg of each extract were dissolved in methanol and ethanol and solutions of 100 µg/ml and 200 µg/ml concentrations were prepared.
4. In this assay 0.5 ml of Sodium nitro prusside (5 mmol) in phosphate buffered saline pH 7.4, was mixed with different concentration of the sample and incubated at 25°C for 3 hrs.
5. A control without the test compound, but an equivalent amount of methanol and ethanol were taken. Control tube without the plant extract, but with equivalent amount of buffer was maintained in an identical manner.
6. Then 1.5 ml of Griess reagent (1% sulphanilamide, 2% phosphoric acid and 0.1% N-1-naphthyl ethylene diaminedihydrochloride) was added and incubated for 30 minutes.
7. The absorbance of the chromophore formed during diazotization of nitrite ions with suphanilic acid and its subsequent coupling with Napthyl ethyl enediamine was read at 546 nm. The experiment was repeated in triplicate.

DOI: 10.21276/IJIPSR.2017.05.11.606

8. Absorbance was measured at 546 nm and the percentage scavenging activity was measured.

$$\text{Percentage inhibition} = \frac{\text{Absorbance of Control} - \text{Absorbance of Test}}{\text{Absorbance of Control}} \times 100$$

The percentage of inhibition for each reaction was then calculated, and EC50 values (µg/mL) were calculated from the linear equation from the curve between the percentage of inhibition and the solution's concentration. Each experiment was conducted in triplicate.

The EC50 value of each extract was expressed as the mean˘SD. The assays were performed as previously described [28-29].

## RESULTS

The results of the phytochemical screening to test the presence of Flavonoids, Saponins Glycosides,Alkaloids,Sterols, Tannins ,Phenolic Compounds, Fats and Oils, Lignins and Quinones, Terpenoids, Anthraquinones, Anthocyanides, Coumarins ,Proteins, Carbohydrate, Indoles, Reducing sugars and Aminoacids in the extracts from various parts of *Oroxylum indicum* are shown in Table 3.The preliminary phytochemical screening study revealed that the leaf of *Oroxylum indicum* has presence of Flavonoids, Saponins Alkaloids,Sterols, Tannins ,Phenolic Compounds, Fats and Oils,. Glycosides and lignins. Whereas Anthraquinones, Anthocyanides, Coumarins ,Proteins, Carbohydrate, Indoles, Reducing sugars and Aminoacids are found to be absent in both the extracts.

The methanolic and ethanolic leaf extracts of the plant *Oroxylum indicum* has shown prominent antimicrobial activity on tested pathogens, whereas the Methanol extract of plant has shown maximum inhibition on *Staphylococcus aureus* MTCC 737*(15.9 mm inhibition zone).* Ethanol extract of plant has shown maximum inhibition on *Staphylococcus aureus* MTCC 737*(14.1 mm inhibition zone )* and both the extracts have no effect on *Bacillus subtilis MTCC 441, ,Pseudomonas aeruginosa MTCC 1035* and a fungal pathogen *Candida albicans MTCC 3018* . The anti microbial activity is shown in table.4. With reference to the anti oxidant activity DPPH (1, 1 Diphenyl-2picrylhydrazyl) free radicals are scavenged by methanolic extract by 65% and ethanolic leaf extract by 63%. Nitric oxide free radicals are scavenged by methanolic leaf extracts by 72% and ethanolic leaf extracts by 71%. The anti oxidant activity is shown in table 5&6.

## DISCUSSION

Background check reveals that the flavonoids (Rauha, 2000), sterols (Pereira et al., 2006) and phenolic compounds (Proestos, 2005) show antimicrobial activity against several pathogens (Eloff, 2004). Preliminary phytochemical analysis of *Oroxylum indicum* plant leaf extracts and its fractions shows the presence Flavonoids, Saponins Alkaloids, Sterols, Tannins, Phenolic Compounds, Fats and Oils,. Except Glycosides and lignins. Hence the antimicrobial activity exhibited by the Methanolic and ethanolic leaf extracts could be related with the concentrations of above said secondary metabolites present in these selected plant extracts. The results obtained here with antimicrobial activity support the folkloric claims regarding the plant and its medicinal values. This paper helps in formulating natural principles to combat drug resistance of certain bacteria. It is therefore, implied that isolation and proper characterization of the active constituents from the extracts of this plant species as possible antimicrobial and antioxidant agent. Secondary metabolites are chemicals produced by plants. Of these, Saponnins are known to possess hypocholesterolic, anti cancerous, anti mutagenic, anti fungal, zenotoxic anti cytotoxic, anti inflammatory, heamolytic, immune adjuvent, anti protozoal, spermicidal and clastogenic activities. Saponins have been used to control human heart diseases and can also control cholesterol levels. Tannins have insecticidal, mild diuretic, stomachic, antibacterial, antidote and

**DOI: 10.21276/IJIPSR.2017.05.11.606**

haemostatic properties. Alkaloids comprised the vast single class of secondary plant metabolites. Alkaloids have anti fungal, antitumor, anti-amoebic, anti plasmodial, anti-bacterial and anti-ulcer activities. Glycosides show antidiabetic, cardiac, molluscidal, antibacterial, anti-HIV,anti-leukaemia,laxative,analgesic,antipyretic,aphrodisiac and antistress activities. Phenols have anti-microbial, anti-oxidant, anti-viral, vasodilatory and anti-inflammatory effects. In the present study, the methanol and ethanol extracts from *Oroxylum indicum* leaves were tested for their in vitro antimicrobial and antioxidant activities. The extracts from *O. indicum* leaves promoted moderate to intermediate antimicrobial activities against clinically isolated bacteria *Staphylococcus aureus* MTCC 737. The ethanol and methanol extracts from the leaves of *O. indicum* showed high in vitro antioxidant effects. Phytochemical study of the extracts showed some phenolics and flavonoids including baicalein. This compound promotes a strong antioxidant effect, and could be used as preparations from *O. indicum* in the future. Quantitative analysis of the active compound in *O. indicum* leaf extracts should be further investigated in the future. Therefore this research gives insight into the medical potential of the plant based drugs, and for further development of these drugs.

# DROUGHT IN A P IMPACTS AND ADAPTIONS STRATEGIES WITH REFERENCE TO THE ALL MANDALS OF PRAKASAM DISTRICT BASED ON 2011 AGRICULTURAL YEAR

**DR.G.VARALAKSHMI***

***Lecturer, Incharge in Department of Statistics, D.K.Goverment Autonomous College For Women, Nellore, Andhra Pradesh, India.**

## 1. OBJECTIVE OF THE STUDY

The Department of Planning, with the technical help of CRIDA, has also developed, as part of preparing a drought management plan, a real-time decision support system to forecast, and warn the farmers about, the likely upcoming drought and suggest actions such as cropping patterns, to mitigate these impacts. Research institutions, such as ICRISAT and the Agricultural University, have been conducting extensive research on drought resistant crops, appropriate agricultural strategies in drought prone regions and the socio-economic impact of drought in select rural communities. Among these districts in this project I have taken Prakasam District.

In Prakasam District Agriculture operations in Kharif season depends largely on South-West monsoon rains only in Prakasam District. Most of the area cultivated in Kharif is Rain fed. During the present Kharif season (South-west monsoon), 277.8 mm rainfall received as against the normal rainfall of 388.3 mm. The deficit rainfall is -28.5%. Agriculture and its allied sectors are the main source of income of the people in the District. In the south-west monsoon, 20 average rainy days recorded as against 28 normal rainy days. The rainfall received is not wide spread and only scattered. Prolonged dry spells i.e., 21 to 58 days have been continued in the most of the Mandals. Out of 56 Mandals in the District, scanty rainfall was recorded in 4 Mandals, deficit rainfall recorded in 36 Mandals and normal rainfall recorded in 14 Mandals.

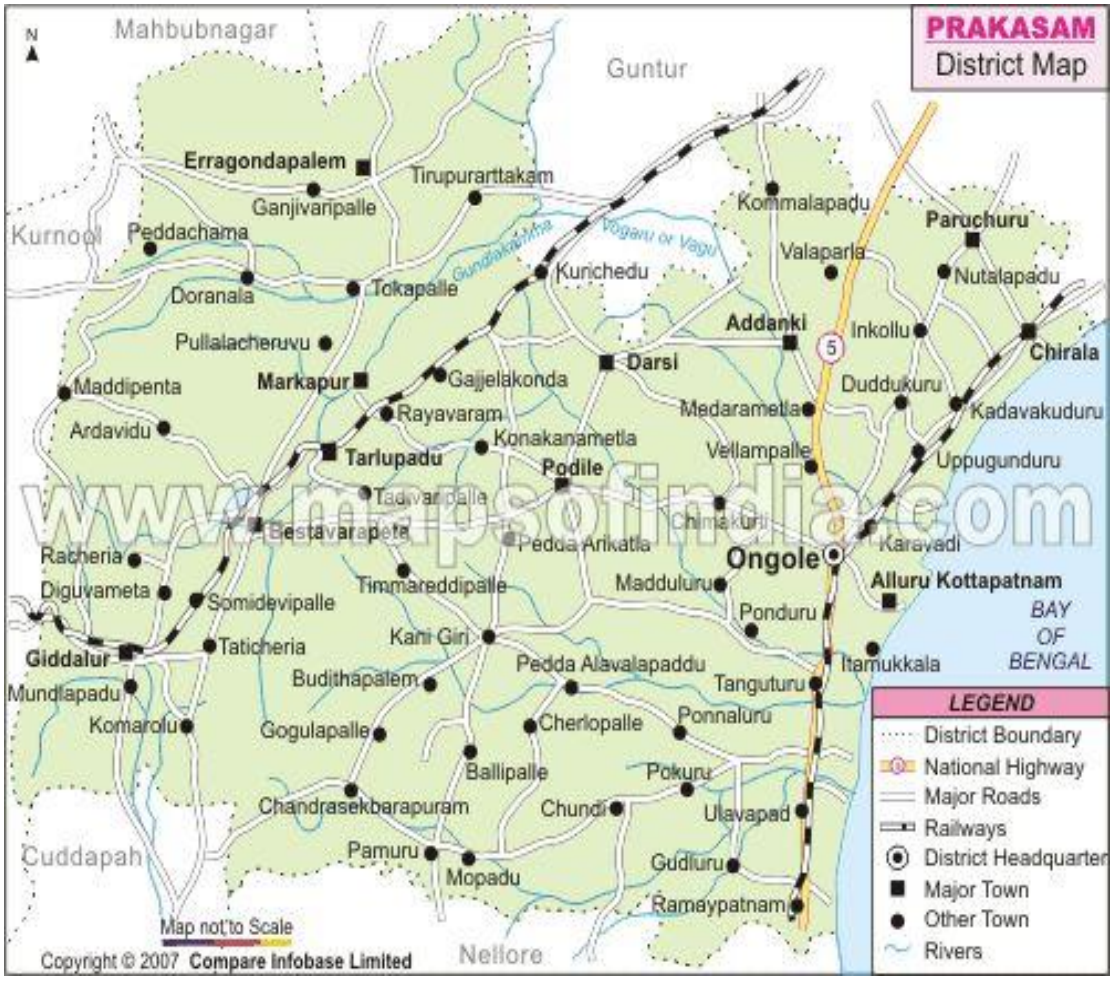
**GENERAL DESCRIPTION OF THE DISTRICT**

## 1.2 INTRODUCTION

Ongole district was formed in the year 1970 by the amalgamation of backward areas of erstwhile Guntur, Nellore and Kurnool districts with head quarters at Ongole. Ongole district was later re-named as Prakasam district in the honor of great freedom fighter, Sri. T. Prakasam pantulu.

**Administrative divisions and planning unit**

Prakasam district is divided into 56 mandals and 1041 gram panchayats. The area of a mandal ranges between 15000 and 25000 ha after excluding forest area and non-agricultural land and a gram panchayat, on an average, extends over 1000 ha.



The 56 mandals in the district are listed below:

| | | | | | |
|---|---|---|---|---|---|
| 1 | Ongole | 21 | Tallur | 41 | Komarole |
| 2 | Kothapatnam | 22 | Mundlamur | 42 | Kanigiri |
| 3 | Tangutur | 23 | Darsi | 43 | Pamur |
| 4 | Chimakurthy | 24 | Podili | 44 | Veligandla |
| 5 | S.N.Padu | 25 | K.K.Mitla | 45 | H.M.Padu |
| 6 | Chirala | 26 | Kurichedu | 46 | C.S.Puram |
| 7 | Vetapalem | 27 | Donakonda | 47 | P.C.Palli |
| 8 | Chinaganjam | 28 | Marripudi | 48 | Kandukur |
| 9 | N.G.Padu | 29 | Y.Palem | 49 | Ponnalur |
| 10 | Parchur | 30 | Dornala | 50 | V.V.Palem |
| 11 | Inkollu | 31 | Tripuranthakam | 51 | Gudlur |
| 12 | Karamchedu | 32 | Pullalacheruvu | 52 | L.Samudram |
| 13 | Yaddanapudi | 33 | Markapur | 53 | S.Konda |
| 14 | Martur | 34 | Tarlupadu | 54 | Ulavapadu |
| 15 | J.Pangulur | 35 | Peddaraveedu | 55 | Zarugumalli |
| 16 | Santhamagulur | 36 | Cumbum | 56 | Kondepi |
| 17 | Ballikurava | 37 | Ardhaveedu | | |
| 18 | Addanki | 38 | Giddalur | | |
| 19 | Korisapadu | 39 | Racherla | | |
| 20 | Maddipadu | 40 | B.Peta | | |

These 56 mandals are aggregated in to 12 ADA circles.Since the gram panchayat is too small a unit to be considered as a planning and monitoring unit, the next unit in hierarchy i.e. mandal has been considered as the

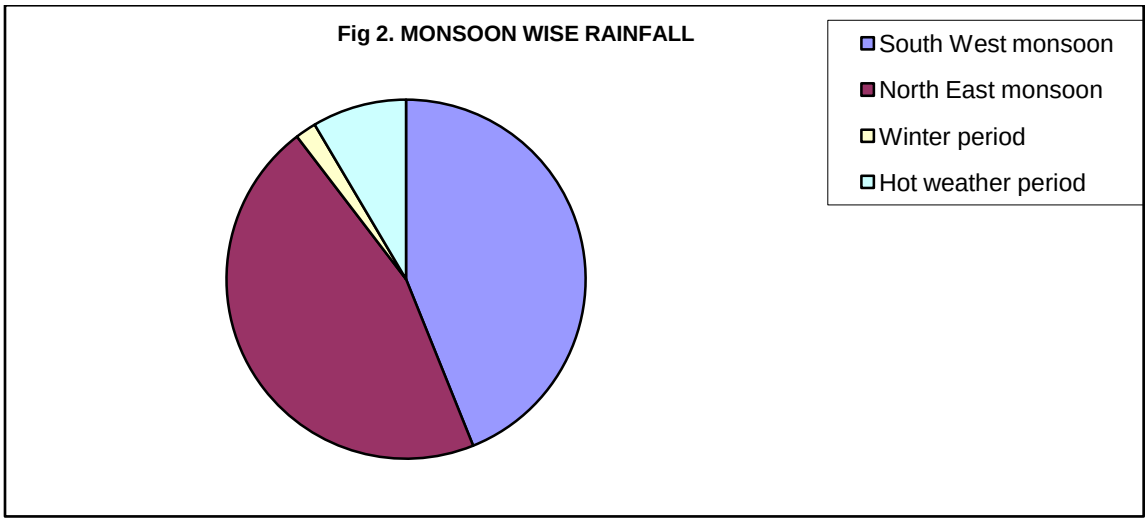
planning unit for various agricultural and allied activities. Therefore, in this report, constraints, strategies and schemes relevant to each mandal have been worked out and are aggregated at ADA circle level for reporting purpose. An ADA circle comprises of three to six mandals and is akin to a taluk in other states in terms of geographical coverage. The data are finally aggregated at the district level.

## 2. DISTRICT MAP

## 2.1GENERAL STATISTICS

There are 1093 revenue villages in Prakasam district and they are organized in to 1043 gram panchayats.. Ongole and chirala ADA circles have the highest population, while Purchur and Singaraya Konda ADA circles have the lowest population. The scheduled caste population is concentrated more in Ongole, Addanki and Darsi ADA circles. The scheduled tribe population is concentrated more in Yerragonda palem and Chirala ADA circles . In 2011 census, Prakasam district had population of 3,397,448 of which male and female were 1,714,764 and

1,682,684 respectively. In 2001 census, Prakasam had a population of 3,059,423 of which males were 1,552,332 and remaining 1,507,091 were females.. There was change of 11.05 percent in the population compared to population as per 2001. In the previous census of India 2001, Prakasam District recorded increase of 10.88 percent to its population compared to 1991.



## 2.2 DISTRICT AT A GLANCE

### 2.2.1 Location and geographical units

The district lies between $14.57^{0'}$ and $16.17^{0'}$ northern latitude and $78.43^{0'}$ and $80.25^{0'}$ eastern longitude. The district is bounded by Bay of Bengal in the east, Nellore and Kadapa districts in the south, Kurnool district in the west and Guntur and Mahabubnagar districts in the North. The district comprises of three revenue divisions with 56 mandals. It has 1092 revenue villages and is organized in to 12 agricultural sub-divisions. The district is having 102 km long coastline spanning over eleven mandals.

### Rainfall

The rainfall of the district is influenced by both the south-west and north-east monsoons. Total normal rainfall of the district is 871.5 mm. The contribution from south west monsoon (June - Sept) is 388.3 mm and from north east monsoon (Oct-Dec) is 393.0 mm. The remaining rainfall of 89.5 mm is received in winter season (17.0 mm) and in hot summer period (73.2 mm) .

Drought is a common phenomenon in the district due to scanty and uneven rainfall in the monsoon seasons (south west & north east monsoon)

**Dry Spells**

During South-west monsoon period, dry spells recorded in 45 Mandals. Out of which Severe Dry spell (43 Days and above) recorded in 1 Mandal, Moderate Dry Spells (29 to 42 Days) in 16 Mandals and Mild Dry spells (21 to 28 Days) in 30 Mandals recorded. Due to these dry spells the crops like Redgram, Cotton, Chillies, Paddy, Groundnut etc. will suffer badly and Horticulture Crops like Sweet Orange, Batavia, Acid Lime etc, are also affected.

**Crop Coverage**

An extent of 1,87,439 Ha. area sown as against the Normal area of 2,33,580 Ha. which comes to 80%. Most of the area covered under Rain fed crops only. At present rain fed crops are in withering condition.

The predominant crops viz., Red gram (Ha.38,353), Cotton (54,083), Chilies (Ha.21,257) were cultivated in Prakasam District, which accounts 61% of the total Normal Area. The remaining 39% area sown in different crops during Kharif.

The present stage of the Cotton crop is Vegetative to picking stage and condition of the crop is stunted growth. The present sown crops viz., Bajra, Green gram, Red gram, Chilies and Vegetables are in withering stage and stunted growth.

**Horticulture Crops**

Horticulture is one of the thrust areas in the overall development of the Prakasam District. The major horticulture crops grown in the District are Sweet Orange, Mango, Sapota, Cashew, Papaya, Chilies and Vegetables. Depletion of water tables and drying of bore wells leading to dry-up of Sweet Orange gardens in upland area of the district.

Due to shortage of rainfall, discharge of water from Bore wells reduced in upland Mandals. Area under Vegetables particularly Tomato in upland areas is reduced to below 50% as against the normal area. 50% of Chilies crop grows under rain fed area, and growth of Chilies also effects adversely. The yield is expected to reduce in Sweet Orange, Acid Lime, Chilies and Vegetables above 50%. The Sweet Orange and Acid Lime gardens in upland mandals of the district started drying due to drying of bore wells.

## 2.3 TOPOGRAPHY AND AGRO-CLIMATIC CHARACTERISTICS

### A) Rivers

Gundlakamma, Manneru, Musi and Paleru rivers flow through the district. The Gundlakamma river flows at an altitude of about 2,700 ft near Gundla Brahmeswaram of Nallamala forest. It enters the plains through the Cumbum gorge. It runs in north-east direction and touches Mundlamur, Addanki, Maddipadu and Ongole Mandals and falls into Bay of Bengal near Devarampadu of Ongole mandal. The important tributaries are Kandaleru, Chilamaleru and Dornapuvagu. The total length of the river is about 265 Km, out of which about 220 Km is in the district. The projects across this river are the Thippayapalem reservoir, Duvvaleru Project, Cumbum and Bhavanasi tanks.

The river Manneru in the Veligondas at Balupalli of C.S.Puram mandal flows through Nellore district and takes a turn at Pentrala of Lingasamudram mandal in this district. It flows a distance of 112 Km and falls into Bay of Bengal near Karedu of Ulavapadu mandal. The Dokkalavagu and Nerellavagu fall into this river. It feeds Mopadu reservoir, Rallapadu reservoir and V.R.Kota channel.

The river Musi flows near Dokkalasala in the Veligondas. It flows first in the eastern direction and then in southern direction through Markapur, Darsi, northern boarder of Podili, Kondepi, Tangutur and Kothapatnam mandals and falls into the Bay of Bengal near Madanur of Kothapatnam mandal. It is joined by Gajjaleru, Dondaleru and Atleru in its course and it feeds tanks in Podili and Konakanamitla mandals.

## 2.4 LAND USE PATTERN AND LAND HOLDINGS

The total geographical area of the district is 17.14 lakh ha.

### Agrarian structure

Marginal and small farm category farmer together account for 79 per cent of the total land holdings, but their combined share in the land was only 44 per cent. 56 per cent of the land is owned by 21 per cent of the farmers belonging to medium and large farm categories.

## 2.5 IRRIGATION AND GROUND WATER

The area irrigated in Prakasam district is about 2.15 lakh ha, which represent 32% of the cultivable area. The details of area under different irrigation sources in the district are presented in table

## IRRIGATION
## MAJOR (NSP), MEDIUM AND MINOR IRRIGATION)

Irrigation Circle, Ongole is having Major (NSP) Medium (5 Projects) and Minor Irrigation (368 M.I.Tanks + 589 PR Tanks = 957 Tanks) with an ayacut of 4,29,747 Acres, 40,992 Acres and 1,36,532 Acres respectively in Prakasam District.

**Major NSP**

| Jurisdiction | Covering Mandals | Villages | Ayacut in Acres |
|---|---|---|---|
| M.85/3 onwards & M.18/0 of ABC | 25 Nos. | 50 | 4,29,749 |

**Medium Irrigation - 5 Nos.**

## GROUND WATER LEVELS

The Ground water levels in the district depend up on the rainfall and Ground water exploitation. The water levels are being monitored through 56 Piezometer bore wells and 150 Observation open wells.

The monthly average water levels of the district from the month of October, 2010 to October, 2011 is

| Water levels | | | Remarks |
|---|---|---|---|
| October, 2010 in Mts | October, 2011 in Mts | Fluctuations in Mts | |
| 6.00 | 9.37 | -3.38 | Fall in water levels |

The maximum water level is 42.0 m at Pullalacheruvu (V) & (M) which falls in Non-command and up land area. The minimum water level is 0.80 M at Parchur (V) & (M) which falls in command and coastal plain.

The net fall of ground water levels in the upland mandals is 4 to 17 m. The maximum water level at Tarlupadu mandal is 36.14 m during the month of October, 2011 and the minimum water level at Tripuranthakam mandal is 5.11 m.

The depletion of Ground water levels in the district is attributed to -26% of deficit rainfall during the water year 2011-12.

If the same weather conditions continuous, there is chance for further depletion of Ground water levels and leads to acute shortage of ground water for both drinking and irrigation purpose.

As per the GEC -2007 estimation out of 62 minor basins in the district, 06 basins fall in Over exploited category, 02 basins falls in Critical category, 07 in Semi critical category and remaining 47 basins falls in safe category.

As per AP WALTA 121 villages in the district are declared as over exploited villages where further ground water exploitation for irrigation is banned until the ground water conditions improves.

## 2.6ASSESSMENT OF ELIGIBILITY OF MANDALS FOR DECLARATION UNDER DROUGHT:

56 mandals are existing in the district are divided into three categories depending upon the annual average rainfall usually received.

**Category –A**: Annual Normal rainfall below 750 mm
(deficiency 15% and above)

**Category –B**: Annual Normal rainfall from 750 to 1000 mm
(deficiency 20% & above)

**Category –C**: Annual Normal rainfall above 1000 mm
(deficiency 25% and above)

The following four parameters have been prescribed for assessing the eligibility of a Mandal for declaration under drought affected Mandals.

1. 1st Parameter : Deficiency in rainfall(compulsory parameter)
2. 2nd Parameter : Compression or reduction in cropped area of 50% and above under all principal crops
3. 3rd Parameter : Reduction in crop yields of 50% and above.
4. 4th Parameter : Dry spells its impact on crop damages

Of the above 4 Parameters, 3 Parameters including rainfall parameter must be justified for a Mandal to become eligible for declaration of drought. Based on the above parameters, the Mandals eligible and ineligible for proposing them as drought Mandals in all three categories (Rainfall categories) are furnished in the annexure for kind perusal.

## 3. METHODOLOGY

### 3.1 DISTRIBUTIONS

Three distributions are used in the fitting of the drought distribution. The first is exponential distribution that is known as a class of continuous probability distributions in probability theory and statistics with the following probability density function (pdf) and cumulative distribution function (cdf):

$$f(x) = \lambda e^{-\lambda x},\ x \geq 0,\ \lambda \geq 0 \qquad (1)$$

where $\lambda$ is the rate parameter of the distribution .$F(x)= 1- e^{-\lambda x}$ (2)

Next is gamma distribution that is known as a two-parameter family of continuous probability distributions in probability theory and statistics with the following probability density function (pdf) and cumulative distribution function (cdf):

$f(x)= \frac{e^{-x} x^{\lambda-1}}{\Gamma(\lambda)}$, $x \geq 0, \lambda > 0$. where $\Gamma(\lambda) = \int_0^{\infty} e^{-x} x^{\lambda-1}$ . (3)

The p.d.f. of gamma distribution with two parameters

$f(x)= \frac{a^{\lambda}}{\Gamma(\lambda)} e^{-ax} x^{\lambda-1}$, $x \geq 0, \lambda > 0$. (4)

Finally, weibull distribution that is known a continuous probability distribution in probability theory and statistics with the following probability density function (pdf) :

$$f(x;c,\alpha,\mu) = \frac{c}{\alpha}\left(\frac{x-\mu}{\alpha}\right)^{c-1} \exp\text{-}\left(\frac{x-\mu}{\alpha}\right)^{c-1} ;\ x>\mu, c>0. \qquad (5)$$

A drought threshold is an essential element in categorizing the drought events in drought analysis. Drought threshold is a constant demand where the droughts are defined as periods during which the discharge is below the threshold level. A threshold that applied commonly in monitoring rainfall and preparing drought alerts is at the seventieth percentile of the rainfall when the rainfall in a certain period is less than seventy percent of normal Precipitation.(Precipitation means the quantity of water falling to earth at a specific place with in specific period

of time)

In determining the threshold values, the data of rainfall amount are sorted in ascending order where the value at the seventy percent of the rainfall data is recognized as the seventieth percentile of the rainfall series, p70 which is then set as the threshold.

$$L = (PN)/100 \qquad (12)$$

where L is the number of measurements under the seventieth percentile, P=70 as the selected percentile and N is the total number of measurements in the data set. Therefore, the threshold is the $L^{th}$ value of amount of rainfall.

## 3.2 MAXIMUM LIKELIHOOD ESTIMATION

Maximum likelihood estimation (MLE) is a general and popular statistical method in fitting a statistical model to data and estimating the parameters of the corresponding model that maximize the probability or likelihood of the sample data.

Suppose $x$ is a continuous random variable with pdf $f(x;\theta_1,\theta_2,...,\theta_k)$ where $\theta_1,\theta_2,...,\theta_k$ are k unknown constant parameters which need to be estimated with an experiment conducted to obtain N independent observations, $x_1, x_2, ..., x_N$,

the estimation of parameters, $\hat{\theta}_1,\hat{\theta}_2,...,\hat{\theta}_k$ can be obtained by solving the differentiation of logarithmic likelihood function below:

$$\frac{d\sum_{i=1}^{N}\ln f(x_i;\theta_1,\theta_2,...,\theta_k)}{d\theta_j} = 0 \qquad (13)$$

where $j = 1,2,..., k$.

## 3.3 GOODNESS-OF-FIT TESTS

It is commonly applicable to verify the compatibility of a model and data by the statistical goodness-of-fit (GOF) tests. The GOF tests are applied in describing the fitness of a distribution to a set of observations. Measures of GOF typically summarize the discrepancy between observed values with the expected values under the specific

model selected.

The best fitted distribution will be determined based on the minimum error produced, which is measured by the techniques shown below:

(1) Akaike Information Criterion (AIC) is a method used for measuring the goodness-of-fit of an estimated statistical model that ranked based on the minimum error produced.

The formula of AIC is shown below:

$$AIC = 2k - 2\ln L \qquad (14)$$

where $k$ is the number of parameters in the statistical model, and $L$ is the maximized value of the likelihood function for the estimated model.

(2) Kolmogorov-Smirnov (KS) test is a form of minimum distance estimation that quantifies a distance between the empirical distribution function of the sample and the cumulative distribution function of the reference distribution.

The KS test statistic is defined as:

$$D = \max_{1 \le i \le N} \left( \left| F(x_i) - \frac{i-1}{N} \right|, \left| \frac{i}{N} - F(x_i) \right| \right)$$

where $x_i$ is the increasing ordered data, $F$ the theoretical distribution and $N$ is the number of sample size.

## 3.4. RESULTS AND DISCUSSION

### 3.4.1 Descriptive Statistics

The descriptive statistics computed are mean, variance, standard deviation, coefficient of variation, skewness, kurtosis and the maximum rainfall amount for each station. The summary of the descriptive statistics for each station is shown in Table 2.

**Table 2.** The descriptive statistics of the daily rainfall amount in prakasam

| Stations | Mean | Variance | Standard Deviation | Coefficient Variation | Skewness | Kurtosis | Maximum Amount |
|---|---|---|---|---|---|---|---|
| S01 | 7.0471 | 152.91 | 12.3660 | 1.7547 | 3.4581 | 21.560 | 137.5 |
| S02 | 5.8803 | 107.68 | 10.3770 | 1.7647 | 3.4151 | 25.040 | 152.0 |
| S03 | 6.1321 | 185.04 | 13.6030 | 2.2183 | 6.3572 | 73.591 | 234.8 |
| S04 | 6.5637 | 161.12 | 12.6930 | 1.9339 | 4.9975 | 45.891 | 188.0 |
| S05 | 6.8607 | 208.08 | 14.4250 | 2.1026 | 6.8322 | 85.481 | 261.0 |
| S06 | 5.6709 | 243.81 | 15.6140 | 2.7534 | 9.2645 | 157.100 | 398.0 |
| S07 | 5.5118 | 183.20 | 13.5350 | 2.4557 | 4.8424 | 38.444 | 189.5 |
| S08 | 5.4471 | 175.09 | 13.2320 | 2.4293 | 5.2733 | 50.828 | 227.0 |
| S09 | 7.1123 | 179.95 | 13.4140 | 1.8861 | 4.1730 | 32.092 | 172.0 |
| S10 | 4.5302 | 69.67 | 8.3469 | 1.8425 | 3.8164 | 24.391 | 87.8 |
| S11 | 7.0900 | 171.11 | 13.0810 | 1.8450 | 4.8445 | 43.850 | 183.7 |
| S12 | 5.4008 | 156.12 | 12.4950 | 2.3135 | 4.7372 | 40.403 | 196.0 |
| S13 | 5.5472 | 90.42 | 9.5091 | 1.7142 | 4.8446 | 64.779 | 204.7 |
| S14 | 6.8804 | 199.74 | 14.1330 | 2.0541 | 6.1923 | 80.647 | 298.0 |
| S15 | 6.0165 | 108.57 | 10.4200 | 1.7319 | 4.4725 | 45.706 | 193.3 |
| S16 | 5.9719 | 136.67 | 11.6910 | 1.9576 | 7.5171 | 143.760 | 311.0 |
| S17 | 5.4816 | 108.69 | 10.4250 | 1.9019 | 4.9849 | 55.252 | 205.3 |

From the summary, the mean or average of precipitation amount during the ten years period for all the stations lies between 4.50 mm per day and 7.20 mm per day with the highest mean value of 7.11 mm per day from S09 while the lowest mean of 4.53 mm per day from S10.

The variance for all the daily rain gauge stations is in the range of 69.60 $mm^2$ per $day^2$ to 243.90 $mm^2$ per $day^2$. The standard deviation for all the seventeen stations is ranged from 8.30 mm per day to 15.70 mm per day. S06 obtains the highest standard deviation with the value of 15.61 mm per day which indicates the large variation in the daily rainfall amount series while S10 receives the lowest standard deviation with the value of 8.35 mm per day which implies the small variation in the daily rainfall amount series. Furthermore, it is clear that the standard deviation for each station is always larger than the mean by referring to the fact that there are some effects caused by the extreme value to the large values in the raw data.

The coefficient of variations for the seventeen rain gauge stations will represent the irregularity of the daily precipitation between stations. However, the results of the coefficient of variation show that the values for each station are quite homogeneous where the range is between 1.70 and 2.80. S06 displays the highest value of coefficient of variation, which is 2.75 while S13 has the smallest value of coefficient of variation, which is 1.71.

The coefficient of skewness is used to verify the degree of asymmetric of a distribution around the mean. The values of skewness lie in between 3.40 and 9.30 where these positively results indicate that all the skewness are positively skewed for all stations. S06 receives the highest value of skewness with the value 9.26 which gives a clear indication that this station is very obviously skewed and the asymmetric tail is extending to the right while S02 with the smallest skewnes value of 3.42 indicates that the asymmetric tail is also extending to the right with less skewed.

The value of kurtosis can be used to determine the relative peakness or flatness of a distribution. The values of kurtosis are all positive in the range of 21.50 to 157.10. S06 obtains the highest value of kurtosis with the value 157.10 which implies the possibility of a leptokurtic distribution where the data set tend to have a distinct peak near to the mean with a heavy tail since the peak of distribution is too high around the mean. S01 receives the smallest value of kurtosis with the value 21.56 which indicates that the data set tend to have a flat peak near to the mean.

The maximum daily rainfall amount is ranged between 87.80 mm per day and 398.00 mm per day where S06 receives the highest maximum rainfall amount of 398.00 mm per day followed by S16 with the maximum rainfall amount of 311.00 mm per day. S10 on the other hand obtains the lowest maximum rainfall amount which is 87.80 mm per day.

### 3.4.2 Threshold

In finding the best fitted distribution to represent the drought events, it is essential to determine a threshold where the data fall below the corresponding threshold is categorized as drought and these data are used in the fitting of distribution. The threshold values for all the stations are shown in Table 3.

**Table 3.** The threshold values for each station

| Station | Threshold |
|---|---|
| S01 | 13.2 |
| S02 | 14.3 |
| S03 | 16.3 |
| S04 | 12.0 |
| S05 | 13.0 |
| S06 | 9.8 |
| S07 | 11.5 |
| S08 | 13.0 |
| S09 | 14.7 |
| S10 | 7.3 |
| S11 | 9.8 |
| S12 | 11.0 |
| S13 | 10.5 |
| S14 | 14.0 |
| S15 | 10.8 |
| S16 | 12.0 |
| S17 | 10.0 |

### 3.4.3 Goodness-of-Fit Tests

The best fitted distribution can be verified using Goodness-of-Fit (GOF) tests. In this study, three types of GOF tests were applied, namely Akaike Information Criterion (AIC), Kolmogorov-Smirnov (KS) test and Cramer-von-Mises (CVM). By referring to the definition of Goodness-of-Fit (GOF) tests, the best fitted distribution was selected based on the minimum error produced. The results of the GOF tests were shown in Table 4.

**Table 4.** The results of three GOF tests for daily rainfall amount in Prakasam.

| Station | AIC | | | KS | | |
|---|---|---|---|---|---|---|
| | EXP | GAM | WBL | EXP | GAM | WBL |
| S01 | 7960.2 | 7884.9 | 7859.2 | 0.07787 | 0.06198 | 0.05949 |
| S02 | 6895.3 | 6411.9 | 6353.4 | 0.19120 | 0.07673 | 0.07603 |
| S03 | 6477.0 | 6389.8 | 6355.3 | 0.09439 | 0.07187 | 0.06349 |
| S04 | 7655.7 | 7570.2 | 7550.1 | 0.07674 | 0.06658 | 0.06832 |
| S05 | 7548.7 | 7498.4 | 7471.9 | 0.07848 | 0.06515 | 0.06265 |
| S06 | 5733.3 | 5735.1 | 5734.9 | 0.11033 | 0.10661 | 0.10598 |
| S07 | 5419.0 | 5414.8 | 5416.1 | 0.07817 | 0.09110 | 0.08949 |
| S08 | 5590.2 | 5591.9 | 5592.2 | 0.10569 | 0.11010 | 0.10725 |
| S09 | 7684.6 | 7542.8 | 7511.3 | 0.25071 | 0.07525 | 0.06324 |
| S10 | 6491.4 | 6393.1 | 6362.7 | 0.09052 | 0.06713 | 0.06175 |
| S11 | 5849.8 | 5565.0 | 5501.9 | 0.16040 | 0.08455 | 0.06363 |
| S12 | 5629.6 | 5605.9 | 5612.3 | 0.11063 | 0.11242 | 0.10793 |
| S13 | 7421.7 | 7321.2 | 7292.6 | 0.08733 | 0.06568 | 0.06322 |
| S14 | 7435.5 | 7266.1 | 7244.3 | 0.09930 | 0.07411 | 0.07240 |
| S15 | 7711.2 | 7579.6 | 7523.6 | 0.11636 | 0.07236 | 0.06430 |
| S16 | 7276.2 | 7077.7 | 7030.3 | 0.12547 | 0.07248 | 0.06557 |
| S17 | 7055.0 | 6946.9 | 6918.2 | 0.09789 | 0.07122 | 0.06884 |

Table 4 shows the results of the three GOF tests for daily rainfall amount in Prakasam. The best fitted distribution is selected according to the minimum error produced.

From the results displayed above, many stations have resulted in weibull distribution to be the best fitted distribution to represent the drought event. Further, by using either the AIC, KS , it is found that weibull is still the distribution having the most minimum error .Therefore, weibull distribution is ranked first as the best fitted distribution in representing the drought events in Prakasam while gamma distribution is ranked second and exponential distribution is ranked last using all the results of GOF tests for each rain gauge station. Hence,

weibull distribution is the most appropriate distribution to represent the drought event in Prakasam.

## 3.5. CONCLUSIONS

The fitting of the most appropriate distribution to characterize the drought events starts with measuring the threshold value applied at the seventieth percentile. The data which fall below the threshold values is then used in the fitting distribution and weibull distribution has been found to be the best fitted distribution for the representation of the daily drought event in Prakasam District. However, gamma distribution is ranked second while exponential distribution is ranked last in the fitting of drought event in Prakasam District. Weibull is just like Gamma distribution is a two-parameters distribution. Clearly these two distributions outperform the exponential distribution that is a one-parameter distribution.

# ON MINIMAX MULTI OBJECTIVE FRACTIONAL OPTIMALITY CONDITIONS WITH CONVEXITY

**DR.G.VARALAKSHMI***

*Lecturer Incharge, Department of statistics, D.K.G.D.C(A) for women, Nellore

***ABSTRACT***

***Under different forms of convexity conditions, sufficient Kuhn] Tucker conditions and three dual models are presented for the minimax fractional programming.***

## 1. INTRODUCTION

The necessary and sufficient conditions for generalized minimax pro-gramming were first developed by Schmitendorf [16]. Convexity assumptions in the sufficient optimality of [16] and also employed the optimality conditions to construct several dual problems which involve pseudo convex and quasiconvex functions, and they also derived weak and strong duality theorems.

Recently, Hanson [7] introduced the concept of a differentiable invex function which is a generalization of the convex function, and he proved the Kuhn Tucker sufficient optimality theorem and the duality theorem for the nonlinear programming problem involving differentiable invex functions. In this paper, Some definitions and notations are given in section 2.In section 2, We also establish the sufficient conditions for the minimax multi objective fractional programming problem with pseudo convexity. When the sufficient conditions are utilized, one parametric dual problem and two parametric-free dual problems may be formulated and duality results are presented in section 3,4and5

## 2. NOTATIONS AND PRELIMINARY RESULTS

Throughout, this paper, let $R^n$ be the *n*-dimensional Euclidean space and $R_q^n$ be its non-negative orthant. We now consider the following minimax fractional problem

$$\text{(FP) Minimize } F(x) = \sup_{y \in Y} \frac{f_i(x,y)}{h_i(x,y)}$$

$$\text{subject to } g_j(x) \le 0$$

Where

(a) Y is a component subset of $R^m$,

(b) $f_i(.,.) : R^n \times R^m \to R$ is a differentiable function with $f_i(x,y) \ge 0$,

(c) $h_i(.,.): R^n \times R^m \to R$ is a differentiable function with $h_i(x,y) > 0$,

(d) $g_j(.): R^n \to R^p$ is a differentiable function.

We let

$$J = \{1,2,..,p\}$$

$$J(x) = \{ j \in J \mid g_j(x) = 0\}$$

$$Y(x) = \left\{ y \in Y \middle| \frac{f_i(x,y)}{h_i(x,y)} = \sup_{Z \in Y} \frac{f_i(x,y)}{h_i(x,y)} \right\}$$

$$K = \left\{ (s,t,\bar{y}) \in N \times R_+^s \times R^{ms} \middle| 1 \le s \le n+1, t = (t_1,\ldots,t_s) \in R_+^s \right.$$

with $\sum_{i=1}^{s} t_i = 1$ and $\bar{y} = (y_1,\ldots, y_s)$ with $y_i \in Y(x), i = 1,\ldots, s \left. \right\}$.

In [5], Chandra and Kumar derived the following necessary conditions for optimality of (P):

THEROM 2.1 (Necessary Conditions)[5]. Let $x^*$ be a (P)-optimal solution and $\nabla g_j(x^*)$, $j \in J(x^*)$ be linearly independent. Then there exist $(s^*, t^*, \bar{y}) \in K, v^* \in R,$ and $\mu^* \in R_+^p$ such that

$$\sum_{i=1}^{s^*} t_i^* \{\nabla f_i(x^*, y_i) - v^* \nabla h_i(x^*, y_i)\} + \nabla \sum_{j=1}^{p} \mu_j^* g_j(x^*) = 0, \qquad (2)$$

$$f_i(x^*, y_i) - v^* h_i(x^*, y_i) = 0, i = 1,\ldots, s, \qquad (3)$$

$$\sum_{j=1}^{p} \mu_j^* g_j(x^*) = 0, \qquad (4)$$

$$\mu^* \in R_+^p, t_i^* \geq 0, \sum_{i=1}^{s^*} t_i^* = 1, y_i \in Y(x^*), i = 1,..., s^*. \quad (5)$$

In order the relax the convexity assumption in Theorem 2.1, we impose the following generalized convexity introduced by Hanson [7]:

Definition 2. 1. Let $\phi: X \to R$ (where $X \subseteq R^n$) be a differential function

(a) The function $\phi$ is said to be convex at $x_0$ if there exists for all $x \in X$,

$$\phi(x) - \phi(x_0) \geq (x - x_0)^T \nabla \phi(x_0).$$

Further, $\phi$ is said to be strictly convex at $x_0$ if there exists for all $x \in X$, $x \neq x_0$,

$$\phi(x) - \phi(x_0) > (x - x_0)^T \nabla \phi(x_0).$$

(b) The function $\phi$ is said to be pseudo convex at $x_0$ if there exists for all $x \in X$,

$$(x - x_0)^T \nabla \phi(x_0) \geq 0 \Rightarrow \phi(x) \geq \phi(x_0)$$

or equivalently

$$\phi(x) < \phi(x_0) \Rightarrow (x - x_0)^T \nabla \phi(x_0) < 0.$$

Further, $\phi$ is said to be strictly pseudo convex at $x_0$ if there exists for all $x \in X$, $x \neq x_0$,

$$(x - x_0)^T \nabla \phi(x_0) \geq 0 \Rightarrow \phi(x) > \phi(x_0)$$

Or equivalently

$$\phi(x) \leq \phi(x_0) \Rightarrow (x - x_0)^T \nabla \phi(x_0) < 0.$$

(c) The function $\phi$ is said to be quasi convex at $x_0$ if there exists for all $x \in X$,

$$\phi(x) \leq \phi(x_0) \Rightarrow (x - x_0)^T \nabla \phi(x_0) \leq 0.$$

Theorem 2.2 (Sufficient conditions).

Assume that $(x^*, \mu^*, v^*, s^*, t^*, \bar{y})$ satisfy relations (2)-(5). If

$\sum_{i=1}^{s} t_i^* (f_i(., y_i) - v^* h_i(., y_i))$ is a pseudo-convex function at $x^*$, then $x^*$ is an optimal solution of (P).

Proof: Let $x$ be any feasible solution of (P). From (1) and (4), we have

$$\sum_{j=1}^{p} \mu_j^* g_j(x) \le 0 = \sum_{j=1}^{p} \mu_j^* g_j(x^*).$$

Using the quasi-convexity of $\sum_{j=1}^{p} \mu_j^* g_j(.) = 0$ at $x^*$, we have

$$(x - x^*)^T \nabla \sum_{j=1}^{p} \mu_j^* g_j(x^*) \le 0. \qquad (6)$$

Relation (2) along with (6) yields

$$(x - x^*)^T \nabla \sum_{i=1}^{s^*} t_i^* (f_i(x^*, y_i) - v^* h_i(x^*, y_i)) \ge 0. \qquad (7)$$

Along with the facts that $\sum_{i=1}^{s^*} t_i^* (f_i(., y_i) - v^* h_i(., y_i))$ is a pseudo-convex at $x^*$,

we get from (7) and (3)

$$0 = \sum_{i=1}^{s^*} t_i^* (f_i(x^*, y_i) - v^* h_i(x^*, y_i)) \le \sum_{i=1}^{s^*} t_i^* (f_i(x, y_i) - v^* h_i(x, y_i)) .$$

Therefore , there exists a certain $i_0$ ,such that

$$0 \le f_i(x, y_{i_0}) - v^* h_i(x, y_{i_0}) .$$

It follows that

$$\sup_{y\in Y}\frac{f_i(x,y)}{h_i(x,y)} \geq \frac{f_i(x,y_{i_0})}{h_i(x,y_{i_0})} \geq v^* = \sup_{y\in Y}\frac{f_i(x^*,y)}{h_i(x^*,y)}.$$

Thus the proof of theorem is complete.

Remark 2.1. In theorem 2.2, If $\sum_{i=1}^{s^*} t_i^* ( f_i(.\ , y_i) - v^* h_i(., y_i))$ is a quasi-convex function at $x^*$ and $\sum_{j=1}^{p} \mu_j^* g_j(.)$ is a strictly pseudo-convex function at $x^*$, then the Theorem 2.2 also holds.

## 3. DUALITY MODEL

Making the use of the optimality conditions of the preceding section, we introduce a dual (DI) to the minimax problem (P) as follows:

(DI) $\max_{(s,t,\bar{y})\in} \sup_{(z,\mu,v)\in H_1(s,t,\bar{y})} v$, where $H_1(s,t,\bar{y})$ denotes the set of all triplets $(z,\ \mu, v) \in R^n \times R_+^p \times R_+$ satisfying

$$\sum_{i=1}^{s} t_i \{\nabla f_i(z\ , y_i) - v\ \nabla h_i(z, y_i)\} + \nabla \sum_{j=1}^{p} \mu_j g_j(z) = 0, \tag{8}$$

$$\sum_{i=1}^{s} t_i\ (f_i(z\ , y_i) - v\ h_i(z, y_i)) \geq 0, \tag{9}$$

$$\sum_{j=1}^{p} \mu_j g_j(z) \geq 0, \tag{10}$$

$$(s,t,\bar{y}) \in K.$$

If for a triplet $(s,t,\bar{y}) \in K$ the set $H_1(s,t,\bar{y})$ is empty, then we define the supremum over it to be $-\infty$.

THEOREM 3.1 (Weak Duality). Let $x$ and $(z,\mu,v,s,t,\bar{y})$ be (P)-feasible and be (DI)-feasible, respectively, and assume that $\sum_{i=1}^{s} t_i\ (f_i(.\ , y_i) - v\ h_i(., y_i))$ is a pseudo-convex function at $z$, and $\sum_{j=1}^{p} \mu_j g_j(.)$ is a quasi-convex function at $z$. Then $\sup_{y\in Y}(f_i(x,y)/h_i(x,y)) \geq v$.

Proof: By both the feasibility of $x$ and (10), we have

$$\sum_{j=1}^{p}\mu_j g_j(x) \le 0 \le \sum_{j=1}^{p}\mu_j g_j(z).$$

Using the quasi-convex of $\sum_{j=1}^{p}\mu_j g_j(.)$ at $z$, we have

$$(x-z)^T \nabla \sum_{j=1}^{p}\mu_j g_j(z) \le 0. \qquad (11)$$

consequently, (8) and (11) yield

$$(x-z)^T \nabla \sum_{i=1}^{s} t_i (f_i(z\ ,y_i) - v\ h_i(z,y_i)) \ge 0. \qquad \textbf{(12)}$$

**On account of pseudo-convexity of** $\sum_{i=1}^{s} t_i (f_i(.,y_i) - v\ h_i(.,y_i))$ at $z$, we get from (12) and (9)

$$0 \le \sum_{i=1}^{s} t_i (f_i(z\ ,y_i) - v\ h_i(z,y_i)) \le \sum_{i=1}^{s} t_i (f_i(x,y_i) - v\ h_i(x,y_i)).$$

**Therefore, there exists a certain** $i_0$ **, such that**

$$0 \le f_i(x,y_{i_0}) - v\ h_i(x,y_{i_0}).$$

It follows that

$$\sup_{y\in Y}\frac{f_i(x,y)}{h_i(x,y)} \ge \frac{f_i(x,y_{i_0})}{h_i(x,y_{i_0})} \ge v.$$

**Thus, the proof of the theorem is complete.**

**Remark 3.1. In Theorem 3.1, if** $\sum_{i=1}^{s} t_i (f_i(.,y_i) - v\ h_i(.,y_i))$ **is a quasi-convex function at** $z$ and $\sum_{j=1}^{p}\mu_j g_j(.)$ is a strictly pseudo-convex function at $z$, then Theorem 3.1 also holds.

**THEOREM 3.2 (Strong Duality). Assume that** $x^*$ is a (P)-optimal solution and $\nabla g_i(x)$, $j \in J(x^*)$ **is linearly independent. If in addition the hypothesis of Theorem 3.1 holds for all (DI)-feasible points** $(z,\mu,v,s,t,\bar{y})$, **then the two problems (P) and (DI) have the same external values.**

**Proof: By theorem 2.1 there exists** $(s^*, t^*, \bar{y}) \in K, (x^*, \mu^*, v^*) \in H_1(s^*, t^*, \bar{y})$ **such that** $(x^*, \mu^*, v^*, s^*, t^*, \bar{y})$ is a (DI)-optimal solution.

Since $v^* = f_i(x^*, y_i)/h_i(x^*, y_i)$, optimality of this feasible solution for (DI) follows from Theorem 3.1.

**THEOREM 3.3 (Strict Converse Duality). Let** $\bar{x}$ **and** $(z, \mu, v, s, t, \bar{y})$ be optimal solutions of (P) and (DI), respectively, and assume that $\sum_{i=1}^{s} t_i (f_i(.,y_i) - v\ h_i(.,y_i))$**is a pseudo-convex function at** $z$ for all $(s,t,\bar{y}) \in K, (x,\mu,v) \in H_1(s,t,\bar{y}), \sum_{j=1}^{p} \mu_j g_j(.)$ **is a quasi-convex function at** $z$ and, $\nabla g_i(\bar{x}), j \in J(\bar{x})$ **is linearly independent. Then** $\bar{x} = z$**; that is,** $z$ is a (P)-optimal solution and $\sup_{y \in Y}(f_i(z,y)/h_i(z,y)) = v$.

Proof: We shall assume that $\bar{x} \neq z$ and reach a contradiction. From Theorem 3.2 we know that

$$\sup_{y \in Y} \frac{f_i(\bar{x}, y)}{h_i(\bar{x}, y)} = v. \qquad (13)$$

By both the feasibility of $\bar{x}$ and (10), we have

$$\sum_{j=1}^{p} \mu_j g_j(\bar{x}) \leq 0 \leq \sum_{j=1}^{p} \mu_j g_j(z).$$

Using the quasi-convex of $\sum_{j=1}^{p} \mu_j g_j(.)$,we get from the inequality above

$$(\bar{x} - z)^T \nabla \sum_{j=1}^{p} \mu_j g_j(z) \leq 0. \qquad \textbf{(14)}$$

**Consequently, (8) and (14) yield**

$$(\bar{x} - z)^T \nabla \sum_{i=1}^{s} t_i (f_i(z\ , y_i) - v\ h_i(z, y_i)) \geq 0. \qquad (15)$$

On account of **strict pseudo-convexity of** $\sum_{i=1}^{s} t_i (f_i(.,y_i) - v\ h_i(.,y_i))$**at** $z$, we get

From (15) and (9)

$$0 \le \sum_{i=1}^{s} t_i \, (f_i(z\ , y_i) - v\ h_i(z, y_i)) < \sum_{i=1}^{s} t_i \, (f_i(x, y_i) - v\ h_i(x, y_i)).$$

Therefore, there exists a certain $i_0$ **, such that**

$$0 < f_i(x, y_{i_0}) - v\ h_i(x, y_{i_0}).$$

It follows that

$$\sup_{y \in Y} \frac{f_i(x, y)}{h_i(x, y)} \ge \frac{f_i(x, y_{i_0})}{h_i(x, y_{i_0})} > v = \sup_{y \in Y} \frac{f_i(z, y)}{h_i(z, y)}.$$

Which contradicts (13), and the proof is complete.

## 4. DUALITY MODEL II

In order to discuss another dual model for (P), we first state another version of Theorem 2.1. This is done by replacing the parameter $v^*$ with $f_i(x^*, y_i)/h_i(x^*, y_i)$ and by rewriting the multiplier functions associated with the inequality constraints. The result of Theorem 2.1 can be stated as follows.

THEOEM 4.1.If $x^*$ is an optimal solution of the problem (P) and $\nabla g_i(x),\ j \in J(x^*)$ is linearly independent, then there exists $(s^*, t^*, \bar{y}) \in K$ and $\mu^* \in R_+^p$ such that

$$\sum_{i=1}^{s^*} t^*_i \{h(x^*, y_i)\nabla f_i(x^*, y_i) - f_i(x^*, y_i)\nabla h_i(x^*, y_i)\} + \nabla \sum_{j=1}^{p} \mu^*_j g_j(x^*) = 0,$$

$$\sum_{j=1}^{p} \mu^*_j g_j(x^*) = 0,$$

$$\mu^* \in R_+^p, t_i^* \ge 0, \sum_{i=1}^{s^*} t^*_i = 1, y_i \in Y(x^*), i = 1, ..., s^*.$$

Now we introduce a dual (DII) to the minimax problem (P)

(DII) $\max_{(s,t,\bar{y})\in K} \sup_{(z,\mu)\in H_2(s,t,\bar{y})} f(z)$, where $H_2(s,t,\bar{y})$ denotes the set of $(z,\mu)\in R^m \times R_+^p$ satisfying

$$\sum_{i=1}^{s} t_i \{h(z,y_i)\nabla f_i(z,y_i) - f_i(z,y_i)\nabla h_i(z,y_i)\} + \nabla \sum_{j=1}^{p} \mu_j g_j(z) = 0, \tag{16}$$

$$\sum_{j=1}^{p} \mu_j g_j(z) \geq 0, \tag{17}$$

$y_i \in Y(z), i = 1,..., s,$

and

$$F(z) = \sup_{y\in Y} \frac{f_i(z,y)}{h_i(z,y)}. \tag{18}$$

If the set $H_2(s,t,\bar{y})$ is empty, then we define the supremum over it to be $-\infty$. Throughout this section, we simply denote $\psi(.)$ as

$$\sum_{i=1}^{s} t_i \{h(z,y_i) f_i(i,y_i) - f_i(.,y_i) h_i(.,y_i)\}.$$

THEOEREM 4.2 (Weak Duality). Let x be (P)-feasible and $(z,\mu,v,s,t,\bar{y})$ be (DII)-feasible, respectively, and assume that $\psi_1(.)$ is a pseudo-convex function at $z$, and $\sum_{j=1}^{p} \mu_j g_j(.)$ is a quasi-convex function at $z$. Then $\sup_{y\in Y}(f_i(x,y_i)/h_i(x,y_i)) \geq F(z)$.

Proof: By both the feasibility of $x$ and (17), we have

$$\sum_{j=1}^{p} \mu_j g_j(x) \leq 0 \leq \sum_{j=1}^{p} \mu_j g_j(z).$$

Using the quasi-convexity $\sum_{j=1}^{p} \mu_j g_j(.)$ at $z$, we have

$$(x-z)^T \nabla \sum_{j=1}^{p} \mu_j g_j(z) \leq 0. \tag{19}$$

Consequently, (16) and (19) yield

$$(x-z)^T \nabla \psi_1(z) \geq 0. \tag{20}$$

On account of pseudo-convexity of $\psi_1(.)$ at $z$, we get from (20)

$$0 = \psi_1(z) \leq \psi_1(.x).$$

Therefore, there exists a certain $i_0$, such that

$$0 \leq h_i(z, y_{i_0}) f_i(x, y_i) - f_i(z, y_i) h_i(x, y_{i_0}).$$

It follows that

$$\sup_{y \in Y} \frac{f_i(x,y)}{h_i(x,y)} \geq \frac{f_i(x, y_{i_0})}{h_i(x, y_{i_0})} \geq \frac{f_i(z, y_{i_0})}{h_i(z, y_{i_0})}. \tag{21}$$

Since $y_{i_0} \in Y(z)$, we have

$$F(z) = \frac{f_i(z, y_{i_0})}{h_i(z, y_{i_0})}. \tag{22}$$

Thus the proof of the theorem is complete.

Remark 4.1. In theorem 4.2, if $\psi_1(.)$ is a quasi-convex function at $z$, and $\sum_{j=1}^{p} \mu_j g_j(.)$ is a strictly pseudo-convex function at $z$, then Theorem 4.1 also holds.

Similar to the proof of Theorems 3.2, 3.3, we can establish Theorems 4.3, 4.4. Therefore, we simply state them.

THEOREM 4.3 (Strong Duality). If $x^*$ is a (P)-optimal solution and $\nabla g_i(x), j \in J(x^*)$ is linearly independent, and if in addition the hypothesis of Theorem 4.2 holds for all (DII)-feasible points $(z, \mu, s, t, \bar{y})$, then the two problems (P) and (DII) have the same external values.

THEOREM 4. 4 (Strict Converse Duality). Let $\bar{x}$ and $(z, \mu, v, s, t, \bar{y})$ be optimal solutions of (P) and (DII)-feasible points $(z, \mu, v, s, t, \bar{y})$, $\psi_1(.)$ is strictly pseudo-convex at $z$, and $\sum_{j=1}^{p} \mu_j g_j(.)$ is quasi-convex at $z$. Then $\bar{x} = z$ : that is, $z$ is a (P)-optimal solution.

## 5. DUALITY MODEL III

Based on (2) and (3), we obtain

$$\nabla \sum_{i=1}^{s^*} t_i^* f_i(x^*, y_i) - \frac{f_i(x^*, y_i)}{h_i(x^*, y_i)} \nabla \sum_{i=1}^{s^*} t_i^* h_i(x^*, y_i) + \nabla \sum_{j=1}^{p} \mu_j^* g_j(x^*) = 0, \text{ for all } i = 1,..., s^*.$$

Multiplying the above equations respectively by $t_i^*(h_i(x^*, y_i)$, $i = 1,..., s^*$, and adding them up, we have

$$\sum_{i=1}^{s^*} t_i^* f_i(x^*, y_i) \nabla \left[ \sum_{i=1}^{s^*} t_i^* f_i(x^*, y_i) + \sum_{j=1}^{p} \mu_j^* g_j(x^*) \right] - \sum_{i=1}^{s^*} t_i^* f_i(x^*, y_i) \nabla \left[ \sum_{i=1}^{s^*} t_i^* h_i(x^*, y_i) \right] = 0.$$

The above equation, together with (4), implies

$$\nabla \left( \frac{\sum_{i=1}^{s^*} t_i^* f_i(x^*, y_i) + \sum_{j=1}^{p} \mu_j^* g_j(x^*)}{\sum_{i=1}^{s^*} t_i^* h_i(x^*, y_i)} \right)$$

$$= \left( \sum_{i=1}^{s^*} t_i^* h_i(x^*, y_i) \right)^{-2} \times \left( \left[ \sum_{i=1}^{s^*} t_i^* h_i(x^*, y_i) \right] \nabla \left[ \sum_{i=1}^{s^*} t_i^* f_i(x^*, y_i) + \sum_{j=1}^{p} \mu_j^* g_j(x^*) \right] - \left[ \sum_{i=1}^{s^*} t_i^* f_i(x^*, y_i) + \sum_{j=1}^{p} \mu_j^* g_j(x^*) \right] \nabla \left[ \sum_{i=1}^{s^*} t_i^* h_i(x^*, y_i) \right] \right)$$

$$= \left( \sum_{i=1}^{s^*} t_i^* h_i(x^*, y_i) \right)^{-2} \times \left( \left[ \sum_{i=1}^{s^*} t_i^* h_i(x^*, y_i) \right] \nabla \left[ \sum_{i=1}^{s^*} t_i^* f_i(x^*, y_i) + \sum_{j=1}^{p} \mu_j^* g_j(x^*) \right] \right.$$

$$\left. - \left[ \sum_{i=1}^{s^*} t_i^* f_i(x^*, y_i) \right] \nabla \left[ \sum_{i=1}^{s^*} t_i^* h_i(x^*, y_i) \right] \right)$$

$$= 0.$$

Consequently, the result of Theorem 2.1 can be stated as follows.

THEOREM 5.1. If $x^*$ is an optimal solution of the problem (P) and $\nabla g_i(x)$, $j \in J(x^*)$ is linearly independent, then there exist $(s^*, t^*, \bar{y}) \in K$ and $\mu^* \in R_+^p$ such that

$$\nabla\left(\frac{\sum_{i=1}^{s^*} t_i^* f_i(x^*, y_i) + \sum_{j=1}^{p} \mu_j^* g_j(x^*)}{\sum_{i=1}^{s^*} t_i^* h_i(x^*, y_i)}\right) = 0,$$

$$\sum_{j=1}^{p} \mu_j^* g_j(x^*) = 0,$$

$$\mu^* \in R_+^p, t_i^* \geq 0, \sum_{i=1}^{s^*} t_i^* = 1, y_i \in Y(x^*), i = 1, \ldots, s^*.$$

We shall continue our discussion of the parameter-free duality model for (P) in this section by showing that the following variant of (DIII) is aiso the dual problem for (P):

(DIII) $\max_{(s,t,\bar{y}) \in K} \sup_{(z,\mu) \in H_2(s,t,\bar{y})} \dfrac{\left(\sum_{i=1}^{s} t_i f_i(z, y_i) + \sum_{j=1}^{p} \mu_j g_j(z)\right)}{\left(\sum_{i=1}^{s} t_i^* h_i(z, y_i)\right)}$ where $H_3(s,t,\bar{y})$ denotes the set $(z,\mu) \in R^m \times R_+^p$ satisfying

$$\nabla\left(\frac{\sum_{i=1}^{s} t_i f_i(z, y_i) + \sum_{j=1}^{p} \mu_j g_j(z)}{\sum_{i=1}^{s} t_i^* h_i(z, y_i)}\right) = 0. \qquad (23)$$

If the set $H_3(s,t,\bar{y})$ is empty, then we define the supremum over it to be $-\infty$. Throughout this section, we simply denote $\psi_1(.)$ as

$$\sum_{i=1}^{s} t_i h_i(z, y_i)\left[\sum_{i=1}^{s} t_i f_i(., y_i) + \sum_{j=1}^{p} \mu_j g_j(.)\right] - \left[\sum_{i=1}^{s} t_i f_i(z, y_i) + \sum_{j=1}^{p} \mu_j g_j(z)\right]\sum_{i=1}^{s} t_i h_i(., y_i).$$

We shall state weak duality, strong, and strict converse duality theorems for (P)-(DIII).

THEOREM 5.2 (Weak Duality). Let $x$ be (P)-feasible and $(z,\mu,s,t,\bar{y})$ be (DIII)-feasible, and assume that $\psi_2(.)$ is a pseudo-convex function at $z$. Then

$$\sup_{y\in Y}\frac{f_i(x,y)}{h_i(x,y)}\geq\frac{\sum_{i=1}^{s}t_i f_i(z,y_i)+\sum_{j=1}^{p}\mu_j g_j(z)}{\sum_{i=1}^{s}t_i h_i(z,y_i)}.$$

Proof: From (23), we have

$$\nabla\psi_2(z)=0. \tag{24}$$

By means of contradiction, we suppose that

$$\sup_{y\in Y}\frac{f_i(x,y)}{h_i(x,y)}<\frac{\sum_{i=1}^{s}t_i f_i(z,y_i)+\sum_{j=1}^{p}\mu_j g_j(z)}{\sum_{i=1}^{s}t_i^* h_i(z,y_i)}.$$

Thus we have an inequality

$$f_i(x,y)\sum_{i=1}^{s}t_i h_i(z,y_i)<h_i(x,y)\left[\sum_{i=1}^{s}t_i f_i(z,y_i)+\sum_{j=1}^{p}\mu_j g_j(z)\right] \text{ For all } y\in Y.$$

Furthermore, this above inequality implies

$$\left[\sum_{i=1}^{s}t_i f_i(x,y_i)\right]\left[\sum_{i=1}^{s}t_i h_i(z,y_i)\right]<\left[\sum_{i=1}^{s}t_i h_i(x,y_i)\right]\left[\sum_{i=1}^{s}t_i f_i(z,y_i)+\sum_{j=1}^{p}\mu_j g_j(z)\right].$$

Hence, we have another inequality

$$\left[\sum_{i=1}^{s}t_i f_i(x,y_i)+\sum_{j=1}^{p}\mu_j g_j(x)\right]\left[\sum_{i=1}^{s}t_i h_i(z,y_i)\right]-\left[\sum_{i=1}^{s}t_i h_i(x,y_i)\right]\left[\sum_{i=1}^{s}t_i f_i(z,y_i)+\sum_{j=1}^{p}\mu_j g_j(z)\right]$$

$$<\sum_{j=1}^{p}\mu_j g_j(x)\sum_{i=1}^{s}t_i h_i(z,y_i).$$

Using the fact that $\sum_{i=1}^{s} t_i h_i(z, y_i) > 0, \sum_{j=1}^{p} \mu_j g_j(x) \le 0$, and the latest inequality, we have

$$\psi_2(x) < 0 = \psi_2(z).$$

Using the fact that $\psi_2(.)$ is a pseudo-convex function at $z$, we have

$$(x - z)^T \nabla \psi_2(z) < 0. \qquad (25)$$

But (24) and (25) are not compatible. Thus, the proof is complete.

Remark 5.1. If we add the constraint $\sum_{i=1}^{s} t_i f_i(z, y_i) + \sum_{j=1}^{p} \mu_j g_j(z) \ge 0$ to the dual problem (DIII), and if $f_i(., y_i), -h_i(., y_i), g_j(.)$ are convex functions, and $(x - z)^T = x - z$ we can reduce Theorem 5.2 to Theorem 3.2, of Chandra and Kumar [5].

As a consequence of Theorems 5.1 and 5.2, we obtain the following strong duality theorem:

THEOREM 5.3 (Strong Duality). If $x^*$ is a (P)-optimal solution and $\nabla g_i(x), j \in J(x^*)$ is linearly independent, and if in addition the hypothesis of Theorem 5.2 holds for all (DIII)-feasible points $(z, \mu, s, t, \bar{y})$, then the two problems (P) and (DIII) have the same extremal values.

THEOREM 5.4 (Strict Converse Duality). Let $\bar{x}$ and $(z, \mu, s, t, \bar{y})$ be optimal solutions of (P) and (DIII), respectively, and assume that $\psi_2(.)$ is a strictly pseudo-convex function at $x$ for all $(s, t, \bar{y}) \in K, (z, \mu) \in H_3(s, t, \bar{y})$, and $\nabla g_i(x), j \in J(x^*)$ is linearly independent. Then $\bar{x} = z$; that is, $z$ is a (P)-optimal solution.

Proof: We shall assume that $\bar{x} \ne z$; and reach a contradiction. From Theorem 5.3 we know that

$$\sup_{y \in Y} \frac{f_i(\bar{x}, y)}{h_i(\bar{x}, y)} = \frac{\sum_{i=1}^{s} t_i f_i(z, y_i) + \sum_{j=1}^{p} \mu_j g_j(z)}{\sum_{i=1}^{s} t_i h_i(z, y_i)}.$$

Hence we have

$$f_i(\bar{x},y)\sum_{i=1}^{s}t_i\,h_i(z,y_i)\le h_i(\bar{x},y)\left[\sum_{i=1}^{s}t_i\,f_i(z,y_i)+\sum_{j=1}^{p}\mu_j g_j(z)\right]\quad\text{For all } y\in Y.$$

Furthermore, this above inequality implies

$$\left[\sum_{i=1}^{s}t_i\,f_i(\bar{x},y_i)\right]\left[\sum_{i=1}^{s}t_i\,h_i(z,y_i)\right]\le\left[\sum_{i=1}^{s}t_ih_i(\bar{x},y_i)\right]\left[\sum_{i=1}^{s}t_i\,f_i(z,y_i)+\sum_{j=1}^{p}\mu_j g_j(z)\right].$$

Hence, we have another inequality

$$\left[\sum_{i=1}^{s}t_i\,f_i(\bar{x},y_i)+\sum_{j=1}^{p}\mu_j g_j(\bar{x})\right]\left[\sum_{i=1}^{s}t_i\,h_i(z,y_i)\right]-\left[\sum_{i=1}^{s}t_ih_i(\bar{x},y_i)\right]\left[\sum_{i=1}^{s}t_i\,f_i(z,y_i)+\sum_{j=1}^{p}\mu_j g_j(z)\right]$$

$$\le\sum_{j=1}^{p}\mu_j g_j(\bar{x})\sum_{i=1}^{s}t_i\,h_i(z,y_i).$$

Using the fact that $\sum_{i=1}^{s}t_i\,h_i(z,y_i)>0,\sum_{j=1}^{p}\mu_j g_j(\bar{x})\le 0,$ and the latest inequality, we get

$$\psi_2(\bar{x})\le 0=\psi_2(z).$$

With the strict pseudo-convexity of $\psi_2(.)$, we have $(x-z)^T\nabla\psi_2(z)<0.$ that is,

$$(\bar{x}-z)^T\left\{\sum_{i=1}^{s}t_i\,h_i(z,y_i)\nabla\left[\sum_{i=1}^{s}t_i\,f_i(z,y_i)+\sum_{j=1}^{p}\mu_j g_j(z)\right]-\left[\sum_{i=1}^{s}t_i\,f_i(z,y_i)+\sum_{j=1}^{p}\mu_j g_j(z)\right]\left[\nabla\sum_{i=1}^{s}t_i\,h_i(z,y_i)\right]\right\}<0.\quad(26)$$

But (23) and (26) are not compatible. This completes the proof.

## ABSTRACT

**Background:** Hepatitis is a health problem affecting millions of people worldwide and it is the major risk factor for liver cirrhosis. In India, many plants are used to treat hepatitis. But little is known about the effects of (-)-epicatechin a bioactive compound of *Phyllanthus niruri* (PN) in hepatitis rats. **Objective:** The present study was designed to explore the antioxidant property of (-)-epicatechin isolated from PN in D-Galactosamine (D-GalN) induced hepatitis rats. **Materials and Methods:** The rats are divided into five groups as per the experimental design. (-)-Epicatchin pretreatment was given to the hepatitis rats for 21 days and biochemical analysis was carried out. The hepatic antioxidant enzymes like superoxide dismutase (SOD), catalase (CAT), glutathione peroxidase (GPx), and glutathione reductase (GR), glutathione S-transferase (GST), reduced glutathione (GSH), and malondialdehyde (MDA) and serum markers aspartate aminotransferase (AST), alanine aminotransferase (ALT), alkaline phosphatase (ALP), albumin, and bilirubin are estimated. **Results:** All the antioxidant enzymes activities and albumin levels are depleted in hepatitic rats. Whereas GST, ALP, AST, ALT activities and MDA, and bilirubin levels are elevated in hepatitis rats, (-)-epicatechin pretreatment increased all the antioxidant enzymes and decreased the GST, ALP, AST, ALT, and MDA levels in hepatitis rats. However, histopatholoigic studies also proves that (-)-epicatechin pretreatment decreased the tissue damage in hepatitis condition. This is the first report on the antioxidant enzymes and hepatoprotective effect of (-)-epicatechin in hepatitis rats. **Conclusion:** From this study, we conclude that (-)-epicatechin treatment decreased the oxidative damage in hepatitis rats.

**Key words:** (-)-Epicatechin, hepatitis, antioxidants enzymes, liver markers

## SUMMARY

- The present study was carried out to know the impact of (-)-epicatechin on antioxidant enzymes activities in hepatitis rats.
- From this study, we found that the antioxidant enzymes SOD, CAT, GPx, GR, GSH depleted in hepatitis rats and increased with (-)-epicatechin in hepatitis rats. MDA levels increased in hepatitis rats and decreased with (-)-epicatechin in hepatitis rats.
- From this study, we concluded that (-)-epicatechin will be useful to treat hepatotoxicity in rats.

**Abbreviations used:** *Phyllanthus niruri* (PN), D-Galactosamine (D-GalN),superoxide dismutase (SOD), catalase (CAT), glutathione peroxidase (GPx), and glutathione reductase (GR), glutathione s transferase (GST), reduced glutathione (GSH) and malondialdehyde (MDA) aspartate aminotransferase (AST), alanine aminotransferase (ALT), alkaline phosphatase (ALP), World Health Organisation (WHO), Indian Institute of Science (IISc), Nicotinamide adenine dinucleotide phosphate (NADPH), thiobarbituric acid reactive substances (TBARS),

## INTRODUCTION

Hepatitis is a major public health problem worldwide, responsible for considerable morbidity and mortality from liver disease. According to World Health Organization (WHO) report, an estimated 600,000 persons die each year due to the acute or chronic consequences of hepatitis.[1] Types of hepatitis are A, B, C, D, E, F, and G. Developing countries like India is also struggling to manage the impact of hepatitis along with the growing burden of obesity, diabetes, hypertension, and coronary heart disease. Hence, hepatitis remains as clinical challenge and a problem of great importance today.

Hepatitis may be induced by virus, alcohol, lipid oxidation products, and various drugs.[2] D-Galactosamine (D-GalN) is a hepatotoxicant, causing liver injury, which is closely related to human viral hepatitis due to their similarities in morphologic and functional features of hepatitis. Liver damage induced by D-GalN generally reflects in disturbance of liver cell metabolism, which leads to characteristic changes in the serum enzyme activities. It has been reported that GalN induces damage in rat hepatocyte, which results in increased production of reactive oxygen species.

*Phyllanthus niruri* (PN) Linn has been used in Ayurvedic medicine for over 2000 years and has been used in wide number of traditional ailments such as jaundice, gonorrhea, frequent menstruation, diabetes and liver-related disorders.[3] In PN many phytochemical constituents like flavonoids, alkaloids, terpenoids, lignans, polyphenols, tannins, coumarins, and saponins are seen. The bioactive compounds of *Phyllanthus* are astragalin, catechin, (+),(-)-epicatechin, catechin-3-o-gallate, epicorilagin, quercetin, geraniin, phyllnirurin, cymene, estradiol, fraternusterol, gallocatechin, limonene, lupeol, niranthin, mirphyllin, phyllanthin, hypophyllanthin, and so on.

(-)-Epicatechin is a flavan-3-ol, a secondary plant constituent belonging to the group of flavonoids and found in berries, grapes, apples, red wine, tea, cocoa, and phyllanthus.[4] (-)-Epicatechin has antidiabetic, anticancer, antilipidemic, antineoplastic, cardio protective, anti-inflammatory, and antioxidant properties.[5,6]

The present investigation was designed to explore the antioxidant and hepatoprotective effect of (-)-epicatechin in D-GalN-induced hepatitis in rats. There were no reports available on the effect of (-)-epicatechin on antioxidant defense system enzymes in hepatitis in rats. To the best of our knowledge, this is the first reported data on the antioxidant activity and hepatoprotective effect of (-)-epicatechin during hepatitis condition.

## MATERIALS AND METHODS

### Chemicals

All chemicals used in the present study are obtained from Sigma (St. Louis, MO, USA), Fisher Scientific (Pittsburg, PA, USA), Merck (Mumbai, India), Ranbaxy (New Delhi, India), and Qualigens (Mumbai, India).

### Isolation of bioactive compound (-)-epicatechin

Fresh plants of PN were locally collected in the months of October and November 2014 from seven hills of Tirupati, Andhra Pradesh, India, identified, and authenticated by botany taxonomist, Dr. Madhava Chetty, Department of Botany, S.V. University. A voucher specimen No. 2151 was retained in the Department of Botany, S.V. University, Tirupati. The bioactive compound of PN i.e., (-)-epicatechin was extracted by different methods. PN was grinded and ethanol added. The mixture was filtered and dried by using a rotary evaporator. The mixture is then washed with hexane. All other experimental work was carried out by using thin layer chromatography (TLC) and high-performance liquid chromatography (HPLC) and isolated pure bioactive compound (-)-epicatechin.[7]

### Induction of hepatitis

The rats are given D-GalN to induce hepatitis. Hepatitis was confirmed by estimating AST, ALT, and ALP in serum. AST, ALT, and ALP activities increased in rats, our results are similar with those from hepatitis subjects.

### Animals and experimental design

This experiment was carried in male Wistar rats (3 months old, weighing 180 ± 200 g) obtained from Indian Institute of Science (IISC), Bangalore. The animals were kept under standard laboratory conditions (temperature (27 ± 2°C), natural light dark cycle (photoperiod of 12-h light and 12-h dark), and humidity of 55–60%. The rats were given standard pellets diet (Lipton Rat Feed Ltd., Pune) and water *ad libitum* throughout the experimental period. The study design was approved by the animal ethical committee (Resolution No. 10/08/a/CPCSCA/IAEC/SVU/09-10/ZOOL/KRS/Dt.25.09.2009). After 7 days of acclimatization, animals were divided into five groups of six rats each.

**Group I normal control (NC)**: These rats received saline for 21 days and served as normal control.

**Group II (-)-epicatechin compound control treatment (Et)**: These rats received pretreatment of bioactive compound of PN (epicatechin 50 mg/kg body weight) for 21 days.

**Group III hepatitis control (Ht)**: A single injection of D-GalN (800 mg/kg body weight) was given intraperitoneally for the induction of hepatitis 48 h before sacrifice.

**Group IV hepatitis + (-)-epicatechin – 50 mg/kg body weight) treatment (H+Et)**: Hepatitis rats received pretreatment of bioactive compound ((-)-epicatechin) orally for 21 days.

**Group V hepatitis + Silymarin treatment (H+St):** Hepatitis rats received pretreatment of standard drug Silymarin (100 mg/kg body weight) orally for 21 days.

After 21 days of treatment, all the rats were sacrificed. Blood samples were collected in sterile plastic tubes and serum was separated by centrifugation at 3000 rpm for 10 min at 4°C. Liver tissue was quickly removed, washed in ice cooled 0.9% NaCl, and immersed in liquid nitrogen and immediately stored at -80°C for further biochemical analysis. Liver tissue was also used for histopathologic studies.

### Isolation of mitochondria

The isolation of mitochondria was done by using the methods of Kaushal *et al.*[8] The liver was placed in beakers containing chilled (-4°C) isolation media, which contained 0.25 M sucrose, 10 mM Tris-HCl buffer, pH 7.4, 1 mM EDTA, and 250 µg BSA/mL. The tissues were minced and washed repeatedly with the isolation medium to remove adhering blood and 10% (w/v) homogenates were prepared using homogenizer. The nuclei and cell debris were sedimented by centrifugation at 650*g* for 10 min and discarded. The supernatant was subjected to a further centrifugation at 7500*g* for 10 min. The resulting mitochondrial pellet was washed by suspending gently in the isolation medium and by re-sedimenting at 7500*g* for 10 min. Finally, the mitochondrion was suspended in the isolation medium.

### Measurement of antioxidant enzymes

SOD activity in liver was measured by the method of Misra and Fridovich.[9] The absorbance was read at 340 nm for 4 min and the activity was expressed as the amount of enzyme that inhibits the oxidation of epinephrine by 50%, which is equal to one unit. Whereas CAT activity was determined in the liver as described by Aebi[10] using Triton X-100 by measuring the absorbance at 240 nm for 60 s on a UV-Spectrophotometer (Hitachi U-2800).

GPx activity was estimated by Flohe and Gunzler.[11] GR activity was measured by the method of Carlberg and Mannervik[12] by monitoring the oxidation of nicotinamide adenine dinucleotide phosphate (NADPH) at 340 nm for 3 min. However, the levels of reduced glutathione (GSH) in liver was measured as described by Akerboom and Sies.[13] GST activity was assayed by the method of Habig *et al.*[14] Protein content in liver was determined by the method of Bradford.[15]

## Determination of the thiobarbituric acid reactive substances

The extent of liver lipid peroxidation in term of thiobarbituric acid reactive substance (TBARS) formation was measured as described by Ohkawa *et al.*[16]

## Estimation of serum markers

AST, ALT, ALP, albumin, and bilirubin are estimated in serum by kit methods.

## Free radical scavenging activity of PN

The free radical scavenging activity, i.e., DPPH of PN was determined spectrophotometrically by the method of Brand-Williams *et al.*[17]

The $H_2O_2$ free radical scavenging activity of PN is estimated by the method of Ruch *et al.*[18]

The reducing power was determined according to the method of Oyaizu.[19]

## Histopathologic studies

The liver tissues were fixed for 48 h in 4% paraformaldehyde, dehydrated by passing them successively in different mixtures of ethyl alcohol–water, cleaned in xylene, and embedded in paraffin. Sections of liver (3μ thick) were prepared, stained with hematoxylin and eosin (H&E 10×), and mounted using neutral (DPX) mountant for microscopic observation.

## Statistical analysis

Results are expressed as means ± standard deviation (SD). Variance analysis was done with Duncan's multiple comparison tests on data using the SPSS (Version 15, SPSS Inc., Chicago, IL, USA) and MS Office, Excel software for the significance of the main effects (factors), and treatments along with their interactions. Statistical significance was set at *P* less than 0.05. The *P* values are presented with the obtained data.

# RESULTS

## Free radical scavenging activity of PN

The free radical scavenging activity of PN was assessed by using DPPH, hydrogen peroxide, and reducing powers shown in Figure 1 . Interestingly, DPPH, hydrogen peroxide, and reducing power activity of PN demonstrated remarkable free radical scavenging effects with significant activity when compared with standard antioxidants. DPPH, hydrogen peroxide, and reducing powers of PN were increased with increase in the concentration levels. This shows that PN possess free radical scavenging activity [Figure 1].

## Effect of (-)-epicatechin on the antioxidant enzymes, SOD, CAT, GPx, GR, GST, and GSH

Figure 2 depicts the activities of antioxidant enzymes. When compared with normal control, the activities of all the liver antioxidant enzymes (SOD, CAT, GPx, GR, and GSH) are significantly decreased in hepatitis rats. However, (-)-epicatechin pretreatment in hepatitis rats SOD, CAT, GPx, GR, and GSH activities are increased. GST activity was increased in hepatitis condition. However (-)-epicatechin supplementation reverted back the GST activity to near normal in hepatitis rats. Our results showed that (-)-epicatechin pretreatment brought back all the antioxidant enzymes near to normal in hepatitis rats. Silymarin drug also showed a considerable effect in reverting the effects of hepatitis treated rats for all the enzymes.

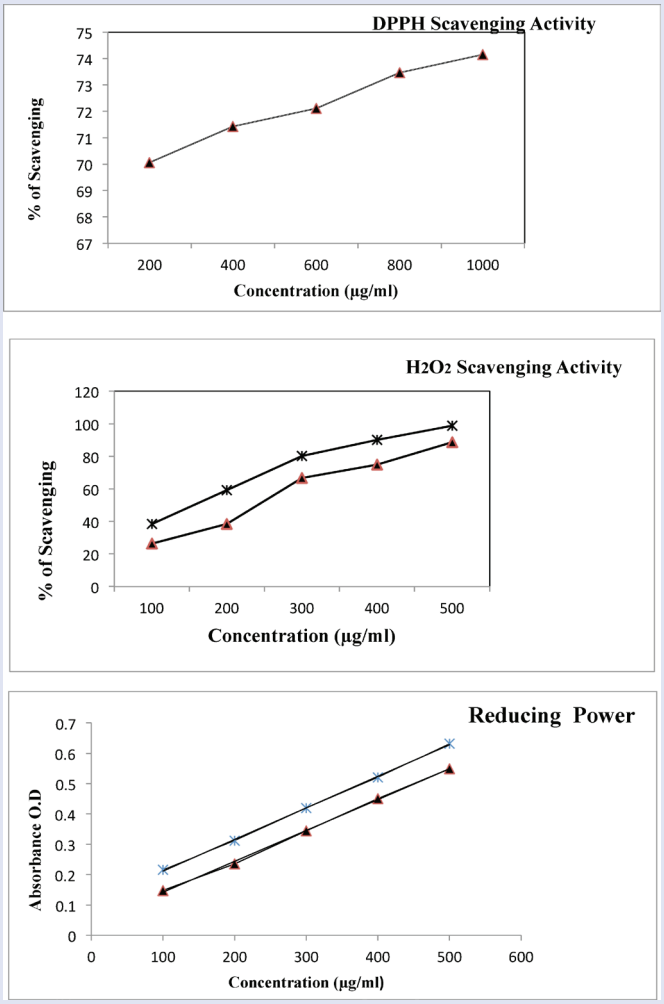

**Figure 1:** Free radical scavenging activity (DPPH, $H_2O_2$, reducing power) of PN and ascorbic acid as standards

## Impact of (-)-epicatechin on MDA levels

Oxidative tissue damage marker MDA levels significantly ($P < 0.05$) increased in D-GalN-induced hepatitis control rats than in normal control. However, (-)-epicatechin pretreatment progressively reduced ($P < 0.05$) oxidative tissue damage by decreasing the MDA levels compared with hepatitis control rats, which suggests that (-)-epicatechin could be able to retarded the hepatic tissue damage under D-GalN-induced hepatitis. Silymarin drug also showed the same effect in hepatitis rats [Figure 3].

## Effect of (-)-epicatechin on serum markers in hepatitis rats

Serum AST, ALT, ALP, bilirubin, and albumin are used as biochemical markers of hepatic tissue damage. Serum AST, ALT, ALP, and bilirubin levels significantly increased ($P < 0.05$) and albumin levels decreased in hepatitis rats over normal rats. However, pretreatment of (-)-epicatechin depleted AST, ALT, ALP activities, and bilirubin levels in hepatitis rats. But albumin levels elevated in hepatitis rats. (-)-Epicatechin supplementation prevented the hepatic tissue damage in hepatitis rats. Hence, all the serum markers levels are came back to near normal levels [Table 1].

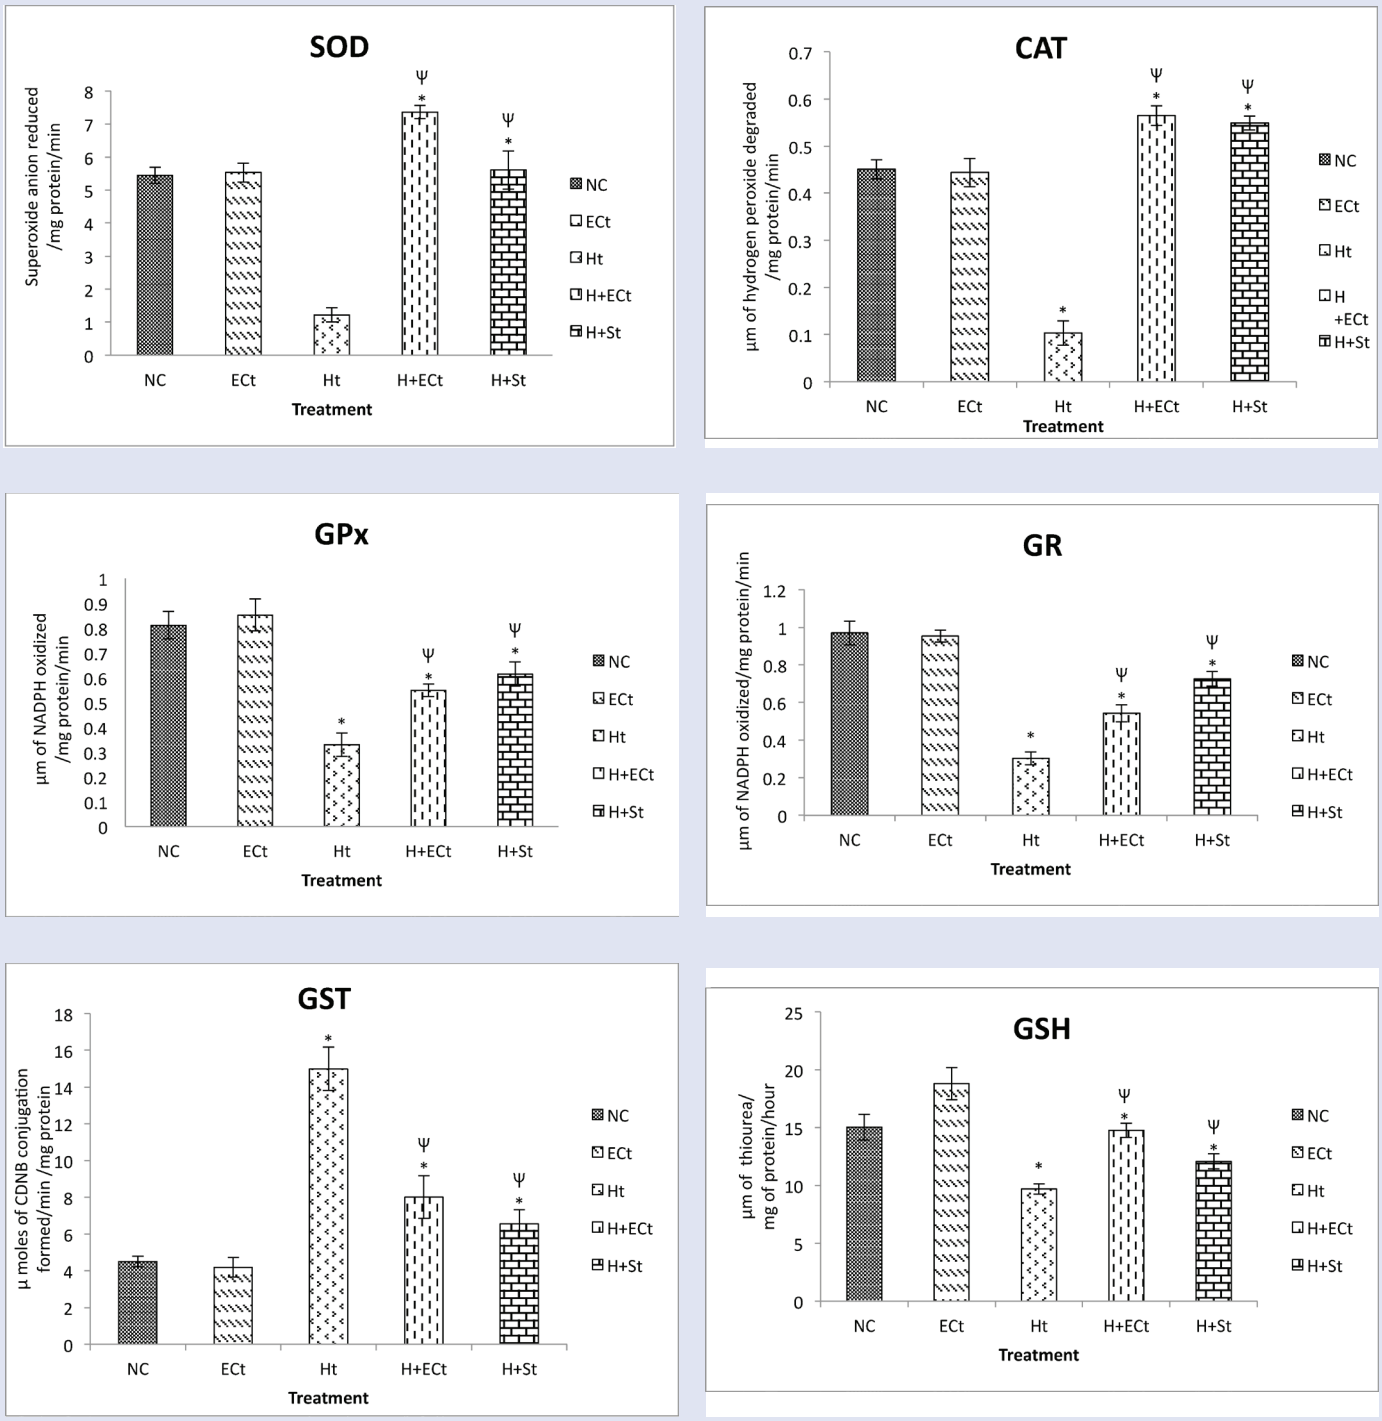

**Figure 2:** Effects of (-)-epicatechin and Silymarin on SOD, CAT, GR, GPx, GST activities, and GSH levels in the liver tissues of normal and hepatitis rats

## Effect of (-)-epicatechin on histopathologic changes of liver in D-GalN-induced hepatitis rats

In the present study, we observed degeneration of central vein, hepatocytes, and sinusoids in D-GalN-induced hepatitis control rats. Free radical production under hepatitis condition is more, hence in this condition, hepatic cell damage is seen. However, with (-)-epicatechin pretreatment, we observed regeneration of central vein, hepatocytes, and sinusoids in hepatitis rats. Which further confirms the hepatoprotective effect of the (-)-epicatechin. (-)-Epicatechin alone and Silymarin treatments did not show any change in the architecture of the liver as compared with normal control [Figure 4].

## DISCUSSION

Free radical production causes extensive damage to tissues and biomolecules leading to various disease conditions like diabetes, hepatitis, and cancer. Herbal treatment protects tissue damage against many diseases. Hence, an alternative solution to the problem is to consume natural antioxidants from food supplements and traditional medicines.

In the present study, we carried out the free radical scavenging activity of DPPH, $H_2O_2$, and reducing power of PN. These free radical scavenging assays have provide a good method to know the antioxidant activity. In this study, DPPH, $H_2O_2$, and reducing powers of PN showed good free radical scavenging activity [Figure 1].

Oxidative damage due to oxidative stress is the failure of the cell's defense against the deleterious effects of harmful agents. In our study, D-GalN decreased the activities of SOD and CAT enzymes in hepatitis rats. The inhibition of SOD activity in hepatitis rats may be attributed to inefficient scavenging of ROS, which might be implicated to oxidative inactivation of SOD.[20] CAT is a heme protein, which decomposes hydrogen peroxide and protects the tissues from highly reactive hydroxyl radicals. Our findings are supported by the previous studies, decline of SOD and CAT activity in D-GalN-induced hepatitis rats. However, pretreatment of (-)-epicatechin remarkably increased the SOD and CAT activity in D-GalN-induced hepatitis, it was indicated that (-)-epicatechin significantly prevents the superoxide anions and hydrogen peroxide radicals by SOD and CAT in D-GalN-intoxicated rats [Figure 2].

In our study, we observed the depleted activities of GR and GPx in hepatitis rats. D-GalN decreased the GPx and GR activities due to the free radicals, which led to interaction with these proteins and modulation of their action. GPx reduced the $H_2O_2$ to water in the presence of GSH and GR reduce the oxidized glutathione into reduced glutathione, which is essential for defense against free radicals. However, pretreatment of PN bioactive compound (-)-epicatechin substantially enhanced the GPx and GR activity either may be synthesis of GSH levels or may be decreased the free radicals by their antioxidant activity. Our results show the strong evidence of hepatoprotective effect of (-)-epicatechin that significantly reduces hepatic tissue damage in hepatitis rats [Figure 2].

GST plays a vital role in the detoxification of electrophiles produced by ROS via catalyzing the conjugation of electrophiles with GSH. In the current study, we reported that GST activity was increased in hepatitis rats. GST can remove free radicals, and their levels can reflect the antioxidant capacity of the tissue. Excessive oxidation in cells that causes reduction in GSH/GSSG may also affect other cellular events, hence GST activity was increased.[21] However, (-)-epicatechin pretreatment decreased GST activity in hepatitis rats. (-)-Epicatechin supplementation may decrease the production of toxic free radicals in hepatitis rats, so GST activity may decrease [Figure 2].

Glutathione is an important protein thiol that protects the cells against cytotoxic agents such as reactive oxygen species. GSH profoundly appeared in liver tissue, thus the liver has highly sophisticated protection from free radicals. However, in our study, GSH levels significantly decreased under D-GalN intoxication, indicating that GSH is highly vulnerable to toxic free radical mediated tissue damage. These results are in accordance with those of the earlier investigations that noticed that the tissue antioxidant status was being operated at diminished level in D-GalN-induced hepatitis, which may be due to either increased degradation or decreased synthesis of glutathione.[22] PN bioactive compound (-)-epicatechin increased the GSH levels in D-GalN-induced hepatitis rats. Pretreatment of (-)-epicatechin significantly defense the free radicals induced by D-GalN due to its free radical scavenging activities which reflected either decreased the utilization of GSH or may be enhance the synthesis the GSH by increasing the activity of GR.

Oxidative stress has been reported as one of the major causes of GalN-induced liver damage.[23] Excessive production of free radicals resulting from oxidative stress can damage lipids.[24] Increased lipid peroxidation in the organism is attenuated by the enzymatic antioxidant system and small molecule antioxidants. In the current experiment, we observed higher levels of MDA in hepatitis rats than normal control rats. The current data are in agreement with previously reported data.[25,26] However, D-GalN intoxication promotes to increase the free radical production in liver tissue, which can lead to tissue damage. These higher levels may due to the decreased activities of antioxidant enzymes in hepatitis rats. (-)-Epicatechin supplementation decreased the MDA levels in hepatitis rats. (-)-Epicatechin pretreatment may decrease the production of free radicals in hepatitis rats, this may cause downregulation of MDA levels. Thus, (-)-epicatechin had shown a potent chain breaking agent, which may prevent reaction between free radical and cell membranes interactions and protect the liver tissue under D-GalN intoxication.

AST, ALT, and ALP are the most common liver marker enzymes. AST is present in both the cytoplasm and mitochondria of hepatocytes, whereas ALT is present only in the cytoplasm. ALP is an enzyme that transports metabolites across cell membranes. ALT, AST, and ALP are also aminotransferases that could act as liver biomarkers. Many reports reported that under disease conditions, serum marker levels increases due to tissue damage and oxidative stress.[27] In hepatitis condition, AST, ALT, and ALP activities increased in serum.[27] In our results, similar consequences are observed, AST, ALT, and ALP activities elevated in serum due to D-GalN intoxication. (-)-Epicatechin pretreatment significantly reduces the elevated serum AST, ALT, and ALP activities in hepatitis rats. It was suggested that (-)-epicatechin possesses

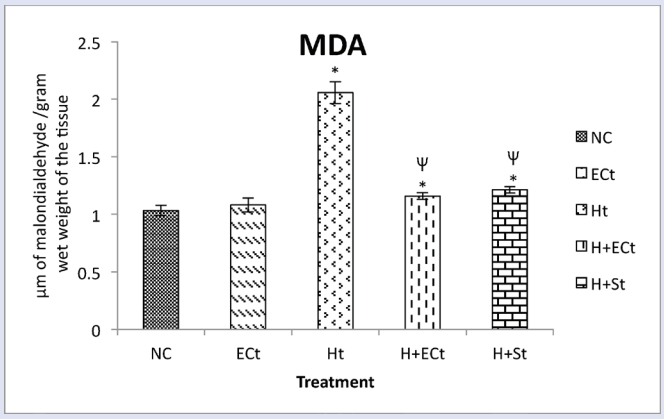

**Figure 3:** Effects of (-)-epicatechin and Silymarin on MDA levels in the liver tissues of normal and hepatitis rats. Data are expressed as means ± SD ($n$ = 6). *The values are significant compared with the following: control (*$P$ < 0.001) and hepatitic (*$P$ < 0.01) (Dunnett's multiple comparison test)

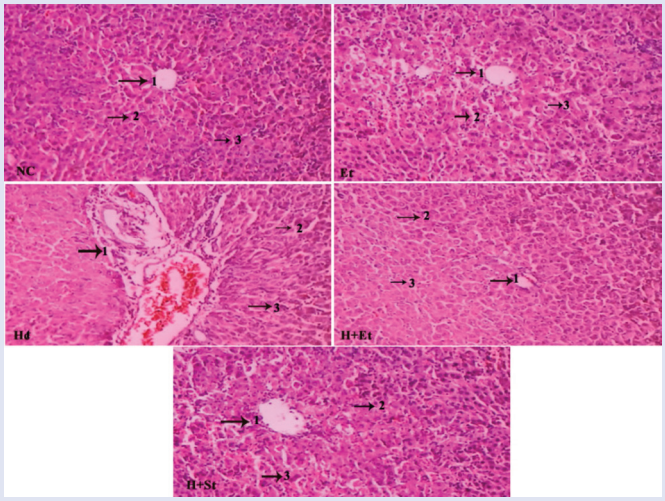

**Figure 4:** Effect of (-)-epicatechin on liver tissue during hepatitis condition

**Table 1:** Effect of (-)-Epicatechin on Serum markers in hepatitis rats

| Groups | AST (IU/L) | ALT (IU/L) | ALP (IU/L) | AL (G/dL) | BL (mg/dL) |
|---|---|---|---|---|---|
| Group I (NC) | 42.213 (±4.921) | 41.843 (±1.620) | 151 (±9.826) | 3.1 (±0.492) | 1.0 (±0.2) |
| Group II (Et) | 47.175 (±3.428) | 45.535 (±3.050) | 112 (±11.124) | 2.9 (±0.21) | 0.5 (±0.106) |
| Group III (Ht) | 206.442* (±7.642) | 131.642* (±11.398) | 302* (±12.368) | 1.2* (±0.0.82) | 2.7* (±0.046) |
| Group IV (H+Et) | 72.267* (±2.165) | 67.348* (±6.252) | 180* (±10.604) | 2.7* (±0.092) | 0.9* (±0.049) |
| Group V (H+St) | 66.731* (±4.614) | 51.189* (±3.092) | 151* (±8.814) | 2.2* (±0.142) | 0.8* (±0.063) |

All the values are means ± SD of six individual observations. * Significant at $p < 0.001$ with respect to normal control.

hepatoprotective activity in hepatitis rats [Table 1]. (-)-Epicatechin has a great potential against hepatitis condition. So (-)-epicatechin can be used as a health promoter for developing novel functional food ingredients and pharmaceutical preparations.[28]

In the current investigation, we reported an upregulation of bilirubin and a downregulation of albumin in the serum of hepatitis rats. During hepatitis condition, liver functions abnormally, hence all the hepatic markers are altered, which results in increased levels of bilirubin, accompanied by decreased levels of albumin.[29] Our results are in accordance with the previous studies showing that elevated levels of bilirubin and depleted levels of albumin in D-GalN-induced hepatitis.[30] However, (-)-epicatechin supplementation significantly declined the bilirubin and increased the albumin in hepatitis rats when compared with hepatitis control rats. (-)-Epicatechin pretreatment may suppressed the D-GalN toxicity in hepatic tissue by reducing the free radicals generation, which is reflected in the modulation of hepatic function as a result. We observed a decline in bilirubin and increased levels of albumin in hepatitis rats [Table 1].

Histopathologic studies of hepatitis liver showed disruption of sinusoids, degeneration of central vein, and hepatocytes, proving that free radicals production causes hepatic damage under hepatitis condition. When hepatitis rats pretreated with (-)-epicatechin, sinusoids, central vein and hepatocytes have regenerated. (-)-Epicatechin minimizes the production of free radicals in hepatitis-treated rats and protects the liver tissue from hepatitis-induced oxidative damage [Figure 4].

## CONCLUSION

This is the first report on hepatoprotective and antioxidant effect of (-)-epicatechin in hepatitis rats. From this study, we conclude that (-)-epicatechin bioactive compound isolated from PN modulated the antioxidant enzymes in hepatitis rats and also decreased the oxidative damage. Hence, (-)-epicatechin can be used as hepatoprotective and antioxidant agent against hepatitis. But more pharmacologic research work is required to find out the exact mechanism of (-)-epicatechin for its hepatoprotective activity in hepatitis condition.

## ABSTRACT

**Background:** The study of free radicals and their reactions is implicated in the pathogenesis of various human diseases. Therefore, antioxidants treatment plays a pivotal role in preventing the free radical-induced diseases. **Objective:** The objectives of this study were to examine the protective role of 6-gingerol from free transition metal ion-induced alterations by *in vitro* and Newcastle disease virus (NDV) in chicken eggs by *in ovo*. **Materials and Methods:** In this study, lipid peroxidation, DNA sugar oxidation, chelation of ferrous ions, DNA fragmentation, Cytochrome c-oxidation, ferric ion reducing activities and DPPH, superoxide and hydroxyl radicals scavenging activity by ESR studies were examined with 6-gingerol by *in vitro*. Furthermore, antiviral activity was screened with 6-gingerol by *in ovo*. **Results:** *In vitro* results showed that 254 µM/ml of 6-gingerol firmly inhibited erythrocyte membrane lipid peroxidation by 85.28% and DNA sugar oxidation by 91.26% when compared with butylated hydroxyanisole 74.42% (554 µM/ml) and 78.30% (824 µM/ml), respectively. Whereas, chelating activity of 6-gingerol was 80.2% which nearly similar to the EDTA activity (50 µg/ml) shown 83.93%. In addition, 6-gingerol (254µM/ml) scavenged the superoxide, hydroxyl, DPPH radicals by 84.96%, 90.45%, and 94.63% respectively and the same was strongly supported with ESR studies. Further, 254 µM/ml of 6-gingerol inhibited the DNA fragmentation, Cytochrome c-oxidation and reducing the ferric ion by in vitro and antiviral activity shown on NDV at 100 µg/ml. **Conclusion:** This study could enlighten that the 6-gingerol has a good metal sequester property and it could prevent the free radicals by *in vitro* and NDV growth in chicken eggs by *in ovo*.

**Key words:** 6-Gingerol, antioxidants, cytochrome c, DNA fragmentation, lipid peroxidation

## SUMMARY

- 6-gingerol prevents free transition metal ion induced alterations
- 6-gingerol protects the DNA from metal ions induced free radicals
- 6-gingerol inhibits the NDV growth in chicken eggs.

**Abbreviations used:** NDV: Newcastle Disease Virus; ESR: Electron Spin resonance; SOD: Super oxide Dismutase; HA: *Hemagglutination*.

## INTRODUCTION

The study of free radicals and their reactions has been led to increase the interest in the pathogenesis of human diseases. However, free transition metal ions induced free radicals interact the biomolecules and caused the oxidative damage. Thus, they play a major role in the contribution of oxidative stress-related diseases.[1] However, all aerobic animals have antioxidant defense system to counteract the harmful effects induced by free radicals.[2] Sometimes, these protective mechanisms are disrupted by various pathological conditions due to an increase of oxidative stress.[3]

Newcastle disease virus (NDV) causes Newcastle disease in all domestic and wild avian species. Its effect the egg production, hemorrhagic intestinal lesions, nervous disorders and respiratory distress.[4] Consequently, its effect on economic status of food production sectors in all around the world because of high mortality and morbidity was associated with disease.[5] Moreover, viral infections are accompanied with profound changes in cell/tissue metabolism, which lead to generate the reactive oxygen species. In this scenario, antioxidant supplementations were needed to overcome the oxidative stress. Although a number of synthetic

antioxidants accomplish to be promising, their toxicity and side effects were restricted on their extensive prescription.

The phenolic compounds of plants have gained much attention due to their free radical scavenging and antioxidant activities with potential beneficial implications in human and animals health.[6] When they consumed with food, antioxidants minimize rancidity, retard the formation of toxic oxidation products, maintain nutritional quality, and increase shelf life.[7] Many medicinal plants have shown good antimicrobial activity. Several epidemiological studies have also been reported that the consumption of natural antioxidants reduced the risk of a number of chronic diseases.[8,9]

Ginger (*Zingiber officinale*) belongs to *Zingiberaceae* family. Since over 2000 years, ginger rhizome has been used worldwide as a spice and flavoring agent. Ginger has a long history of medicinal use for various diseases including dementia, fever, infectious diseases,[10] arthritis,[11] and diabetes.[12] Ginger rhizome contains biological active constituents including gingerol. Gingerols are found in greater abundance in fresh ginger.[13] Gingerol exhibit anti-inflammatory, antihyperglycemic, and anticancer activity.[14] To the best of our knowledge, there is no report related to ginger volatile compound 6-gingerol effect on free transition metal ion-induced free radical-mediated alterations and antiviral activity against NDV by *in vitro* and *in ovo* conditions. Therefore, we investigated the transition metal ion-induced free radical-mediated alterations and antiviral activity against NDV by 6-gingerol.

## MATERIALS AND METHODS

### Chemicals

6-Gingerol was purchased from TCI chemicals, China. 5,5'-dimethyl-l-pyrroline-N-oxide (DMPO), xanthine oxidase, cytochrome c, superoxide dismutase (SOD), and calf thymus DNA were purchased from Sigma-Aldrich, USA; remaining all chemicals were analytical grade and purchased from Sigma and HiMedia.

### *In vitro* studies

#### *Erythrocyte membrane lipid peroxidation*

Lipid peroxidation was induced in erythrocyte ghost by adopting the method of Dodge *et al.*[15] Lipid peroxidation was measured by the assessment of thiobarbituric acid reactive substances using Dahle *et al.*'s[16] method. Briefly, 6-gingerol was added at various concentrations ranging from 10 to 100 μg/ml to the reaction mixture. Butylated hydroxyanisole (BHA) was used as a positive control. The absorbance was measured calorimetrically at 535 nm. The percent inhibition of lipid peroxidation was calculated by comparing the absorbance of the test samples with negative control.

#### *Fenton reactant-induced DNA sugar damage*

Oxidative DNA sugar damage was measured by the following Sultan *et al.*'s[17] method. Briefly, 6-gingerol at various concentrations ranging from 10 to 100 μg/ml was added to the reaction mixture and absorbance was read at 535 nm using a Shimadzu ultraviolet (UV)-1800 Spectrophotometer (Tokyo, Japan). BHA was used as a positive control. The percent inhibition of DNA oxidation was measured by comparing the absorbance of the test sample with a negative control.

#### *Hydroxyl radical-mediated DNA damage*

DNA damage was measured on agarose gel by deoxyribose assay.[18] Briefly, 100 μg of calf thymus DNA was added to the 100 μl of reaction mixture and 10 μl of loading buffer was run on 1% agarose with ethidium bromide. The electrophoresis was conducted and DNA was visualized under a UV transilluminator (Bio-Rad, Sydney, Australia). BHA (50 and 100 μg/ml) was used as positive control.

#### *Cytochrome c reduction*

The cytochrome c-reducing capacity of 6-gingerol was measured using the method of Suter and Richter.[19] Briefly, 6-gingerol was added (10–100 μg) to the oxidative cytochrome c and absorbance was assessed at 550 nm using a Shimadzu UV-1800 Spectrophotometer. BHA was used as positive control.

#### *Test for ferric ion-reducing capacity ($Fe^{3+}$ to $Fe^{2+}$)*

The ferric ion-reducing capacity of 6-gingerol was assessed using the method followed by Wang *et al.*[20] Briefly, 6-gingerol was added at various concentrations ranging from 10 to 100 μg to the reaction mixture. The absorbance was recorded at 700 nm using Shimadzu UV-1800 spectrophotometer. Absorbance increases with an increase in ferric ion-reducing capacity.

#### *Test for ferrous ion-chelating activity*

Ferrous ion-chelating activity of 6-gingerol was assessed by the method proposed by Suter and Richter.[19] 6-gingerol at various concentrations ranging from 10 to 100 μg was added to the reaction mixture. The absorbance was measured at 700 nm using Shimadzu UV-1800 Spectrophotometer. Ethylenediaminetetraacetic acid (EDTA) (10–100 μg) was used as positive control. The percent of ferrous ion-chelating activity was measured by comparing the absorbance of the test samples with that of the negative control.

#### *Superoxide-scavenging activity*

Superoxide radical ($O^{-2}$)-scavenging activity was measured using the method followed by Lee *et al.*[21] Briefly, 6-gingerol was added at various concentrations ranging from 10 to 100 μg to the reaction mixture. The absorbance was measured calorimetrically at 560 nm. SOD (10–100 μg/3 ml) was served as positive control. The percent superoxide-scavenging activity was determined accordingly by comparing the absorbance of test samples with the negative control.

#### *Hydroxyl radical-scavenging activity*

Hydroxyl radical-scavenging activity was measured by deoxyribose assay.[18] Briefly, 6-gingerol was added at various concentrations ranging from 10 to 100 μg to the reaction mixture and absorbance was measured at 532 nm. BHA was used as positive control. The percent inhibition of hydroxyl radical-scavenging activity of 6-gingerol was evaluated by comparing with negative control.

#### *1,1-Diphenyl-2-picrylhydrazyl radical-scavenging activity*

1,1-Diphenyl-2-picrylhydrazyl (DPPH) radical-scavenging activity was evaluated by the method of Shimada *et al.*[22] Briefly, 6-gingerol was added to the reaction mixture at various concentrations ranging from 10 to 100 μg/ml. The absorbance was read at 517 nm in a Shimadzu UV-1800 Spectrophotometer. BHA at 400 μM was used as positive control. The percent DPPH radical-scavenging activity of 6-gingerol was calculated by decrease in absorbance at 517 nm in comparison with the negative control.

### Free radical-scavenging activity of 6-gingerol by electron spin resonance

Free radical-scavenging activity of 6-gingerol was determined by electron spin resonance (ESR) spectrophotometer. In this study, JES-FA200 model of X-band ESR (Japan) was used.

#### *Hydroxyl radical scavenging assay*

ESR studies were carried out by the method of Morales *et al.*[23] Briefly, 10 μl of 6-gingerol at various concentrations (10–100 μg/ml) was added to the reaction mixture. Ascorbic acid was used as a reference antioxidant. The ESR spectrum was recorded for every 60 s after the addition of $H_2O_2$.

### *Superoxide anion radical scavenging assay*

ESR studies were carried out using Morals *et al*.'s[23] method. Briefly, 10 µl of 6-gingerol at various concentrations (10–100 µg/ml) was added to the reaction mixture. SOD was used as a reference antioxidant. The ESR spectrum was recorded for every 120 s after the addition of xanthine oxidase at ambient temperature.

## Antiviral activity by *in ovo*

### *Virus*

Komarov mesogenic stain of NDV was obtained from Sri Venkateswara Veterinary University, Tirupati, Andhra Pradesh, India. In our study, 1024 hemagglutination (HA) units of NDV stock was prepared and it was preserved at −40°C until use. Embryonic infective dose ($EID_{50}$) was evaluated by the method of Reed and Muench[24] and it was found $10^{9.7}$ units/ml in chick embryos.

### *Embryonated chicken eggs*

Embryonated chicken eggs were obtained from the Poultry Department, Sri Venkateswara Veterinary University, Tirupati, Andhra Pradesh, India.

### *Inoculation of eggs*

After 9–12 days incubation of embryonated eggs, they were used for NDV infection and this was followed by the treatment with 6-gingerol. Eggs were mainly divided into six groups in which 2nd, 4th, 5th, and 6th groups were again divided each into three subgroups ($n$ = 5) based on the inoculation of 6-gingerol concentrations, 25, 50, and 100 µg/ml, respectively. They were perforated and immediately inoculated by the NDV and 6-gingerol as follows: Group-1 eggs were inoculated with 0.1 ml of phosphate buffered saline, Group-2 eggs were inoculated with 6-gingerol, and Group-3 eggs were treated with virus stock (1024 HA units), Group-4, i.e., pretreated group, where eggs were infected with 0.1 ml of stock virus after 1 h inoculation of 0.1 ml 6-gingerol, Group-5, i.e., posttreatment group, where eggs were treated with 6-gingerol after 1 h inoculation of virus, and Group-6 simultaneously treated group where eggs were treated with 0.1 ml of viral stock along with 6-gingerol. Embryo survival rate was observed daily for 5 days. Allantoic fluid was collected from all the groups for HA test to determine the viral titer in the eggs.

### *Hemagglutination test*

HA test was carried out according to OIE manual (1996) standard diagnostic test. HA test was performed and the observations were recorded. All tests were repeated in triplicates.

## Statistical analysis

Data were represented as mean ± standard deviation by Microsoft corporation , Redmond, Washington, United States GraphPad Software, San Diego, California, USA.

# RESULTS AND DISCUSSION

Some of the ginger nonvolatile pungent compounds (gingerols, shogaols, and zingerone) have antioxidant, anti-inflammatory, and gastroprotective activity,[25,26] and anticancer activity might be due to it's free radical scavenging activity.[26] The phenolic bioactive compounds could reduce the viral growth may due to their antioxidant activity.[27,28] However, the redox active metals play a major role in the generation of free radicals.[29] In stress condition, excess of superoxide release the iron from iron-containing molecules which generate the highly reactive hydroxyl radicals and make the changes in cell membrane, DNA, and other cellular molecules and which induce the diseases.[30] Therefore, in this study, we investigated the effect of 6-gingerol on free transition metal ion-induced free radical-mediated alterations by *in vitro* and antiviral activity on NDV by *in ovo*.

## Inhibition of ghost lipid peroxidation by 6-gingerol

Lipid peroxidation is a complex process occurring in cells and it induces the alterations in the membrane and generates potentially toxic products which are covalently interacting with proteins and DNA[31] bases and damaged. The inhibitory effect of 6-gingerol against ferrous sulfate and ascorbic acid induced ghost lipid peroxidation as shown in Figure 1a. 6-gingerol inhibits the lipid peroxidation at high level about 85.28% at low concentration (75 µg/ml) while BHA showed 73.42% at 100 µg/ml. The levels of lipid peroxidation products may use as biomarkers for the measurement of oxidative stress. Our *in vitro* results suggested that 75 µg/ml concentration of 6-gingerol significantly broke down the chain reaction of lipid peroxidation maybe by donating proton or electrons to the free radicals or chelation of ferrous ions in the Fenton reaction which prevents the generation of free radicals.

## Inhibitory effect of 6-gingerol on Fenton reactant-induced DNA sugar damage

The results shown in Figure 1b exhibit a positive relationship between the concentration of 6-gingerol and inhibition of oxidative DNA sugar damage. The maximum inhibition of DNA sugar damage by 91.26% at 75 µg/ml of 6-gingerol was observed when compared with BHA, which showed 78.30% at 125 µg/ml. Our results suggested that 6-gingerol may have the ability to combat against free radical-mediated degradation of DNA sugar moiety by their antioxidant and metal sequester property.[32,33]

## Protective effect of 6-gingerol on hydroxyl radical-mediated DNA damage

Increased production of reactive oxygen species concerned to increase the oxidative stress by deterioration of antioxidant mechanism which can lead to proliferate the DNA damage and it has been linked to various pathological disorders.[34] In the present study, calf thymus DNA was subjected to the Fenton reactants for 30 min; as shown in Figure 2a, high mobility of DNA (lane-2) was observed on agarose gel when compared with untreated DNA (lane-1) due to extensive DNA fragmentation by hydroxyl radical oxidation. Inhibition of DNA fragmentation of 6-gingerol was observed at various concentrations ranging from 25 to 100 µg/ml. The maximum inhibition of DNA fragmentation was observed at 75 µg/ml (lane 7) which was higher than the known synthetic antioxidant BHA (100 µg/ml) (lane 4). This effectiveness of the 6-gingerol to prevent oxidative DNA damage was concomitant to its hydroxyl radical-scavenging activity. This suggests that 6-gingerol might have the ability to combat free radical-mediated oxidative damage.

## 6-Gingerol cytochrome c reduction

In this study, cytochrome c has been used as a model protein. It is an electron transporter in the respiratory chain. 6-gingerol significantly reduced the oxidized cytochrome c in a concentration-dependent manner (25–100 µg/ml). The maximum cytochrome c-reducing capacity of 6-gigenrol was observed at 75 µg/ml which is higher than the known synthetic antioxidant BHA (100 µg/ml) [Figure 2b]. The earlier studies were shown similar results with the ethyl alcohol and water (1:1) extract of curry leaves which contain reducing compounds that reduce ferric-cytochrome c to ferro-cytochrome c.[35] Reduction of cytochrome c by 6-gingerol might also implemented to maintain the cytochrome c redox state which is an important to regulate the apoptosis.

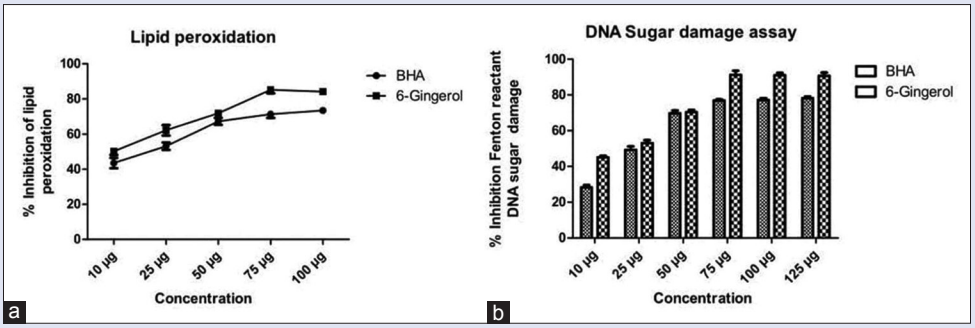

**Figure 1:** (a) Inhibition of rat red blood cell membrane lipid peroxidation by various concentration of 6-gingerol. (b) Inhibition of DNA sugar damage at various concentrations of 6-gingerol compared with butylated hydroxyanisole. The negative control was without any antioxidant or extract. Results are shown as mean ± standard deviation (*n* = 3)

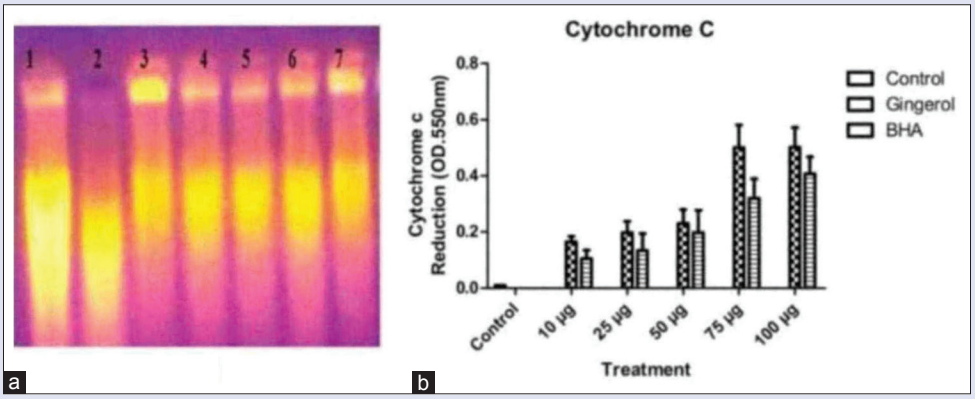

**Figure 2:** (a) Inhibition of hydroxyl radicals-mediated DNA degradation by 6-gingerol. Lane 1: calf thymus DNA untreated; lane 2: Calf thymus DNA + Fenton reactants lanes 3–7 show the results for calf thymus DNA + Fenton reactants solution + butylated hydroxyanisole (50 µg and 100 µg), 6-gingerol at 25, 50, and 75 µg, respectively. Butylated hydroxyanisole is a standard antioxidant. (b) Cytochrome c reduction capacity of 6-gingerol. The positive control was ascorbic acid. Results are shown as mean ± standard deviation (*n* = 3)

## 6-Gingerol ferric ion-reducing capacity

It was mainly depended on the substances those have dropping the electrons or hydrogen atoms for reducing the $Fe^{+3}$/ferricyanide into ferrous form and consequently terminate radical chain reaction. The previous studies have been reported that the extract of spices and herbs showed ferric ion-reducing activity.[35,36] In the present study, as shown in Figure 3a, the maximum reducing capacity of 6-gingerol (1.77 ± 0.10) was observed at lower concentration (75 µg/ml) when compared with BHA at 125 µg/ml concentration (0.912 ± 0.02). The reducing capacity of 6-gingerol might be due to their hydrogen-donating ability.

## 6-Gingerol ferrous ion-chelating activity

Iron is an essential mineral for normal physiology; when it is excess, it facilitates the formation of free radicals via Fenton reaction. The substances those were chelate the iron and removal of free iron from circulation could have valuable antioxidant capability. This can be a promising approach to prevent oxidative stress-induced diseases. Iron pro-oxidant property was last when it is chelated. Hence, we examined the chelation of $Fe^{+2}$ by 6-gingerol in a competitive way with potassium ferricyanide. Interestingly, as shown in Figure 3b, maximum (80.2%) $Fe^{+2}$ binding capability of 6-gingerol was found at 75 µg/ml as evidenced by the low absorption at 700 nm and its chelating effect is comparable with EDTA (50 µg/ml) which showed a chelating effect of 83.93%.

## 6-Gingerol superoxide radical-scavenging activity

The aerobic animals have able to suppressed superoxide anions by their antioxidant defense system when they are produced in certain limits. However, in excess, they cause cell damage.[21] In the present *in vitro* study, superoxide anions were generated via nitroblue tetrazolium (NBT) assay system. The results in Figure 4a showed superoxide anion-scavenging activity of 6-gingerol at various concentrations ranging from 10 to 100 µg/ml. The maximum superoxide anion-scavenging activity of 6-gingerol (84.96%) was observed at 75 µg/ml while it was 78.27% at 100 µg/ml of BHA. SOD was used as a positive control that showed 87.23% at 25 µg/ml concentration. The active inhibition of the NBT reduction by 6-gingerol suggests that 6-gingerol is a potential scavenger of superoxide anion. The previous studies have also been supported to our results; the ginger significantly scavenges the superoxide anions and acts as a dietary antioxidant *in vivo*.[37]

## 6-Gingerol hydroxyl radical-scavenging activity

Hydroxyl radicals are highly reactive substances and are easily to initiate the cell damage *in vivo* when compared with other reduced forms of dioxygen.[38] However, from our results [Figure 4b], 6-gingerol shown maximum hydroxyl radical-scavenging activity by 90.45% at 75 µg/ml which was higher than a well-known synthetic antioxidant BHA (77.25%) at 100 µg/ml. This implies that 6-gingerol may able to reduce the $Fe^{+3}$–EDTA reactions which was initiated the OH radicals using $H_2O_2$.

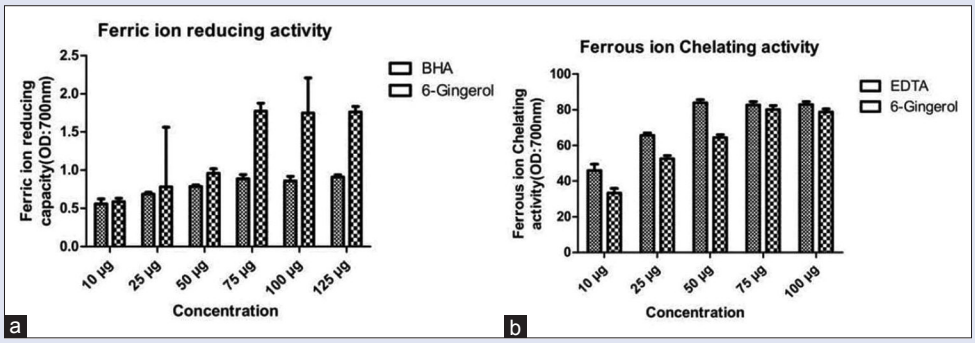

**Figure 3:** (a) Dose-dependent ferric ion-reducing capacity of 6-gingerol. Results are shown as mean ± standard deviation ($n$ = 3). The positive control was butylated hydroxyanisole. (b) Dose-dependent ferrous iron-chelating activity of 6-gingerol. The negative control was without any antioxidant or extract. Results are shown as mean ± standard deviation ($n$ = 3). Positive control was ethylenediaminetetraacetic acid

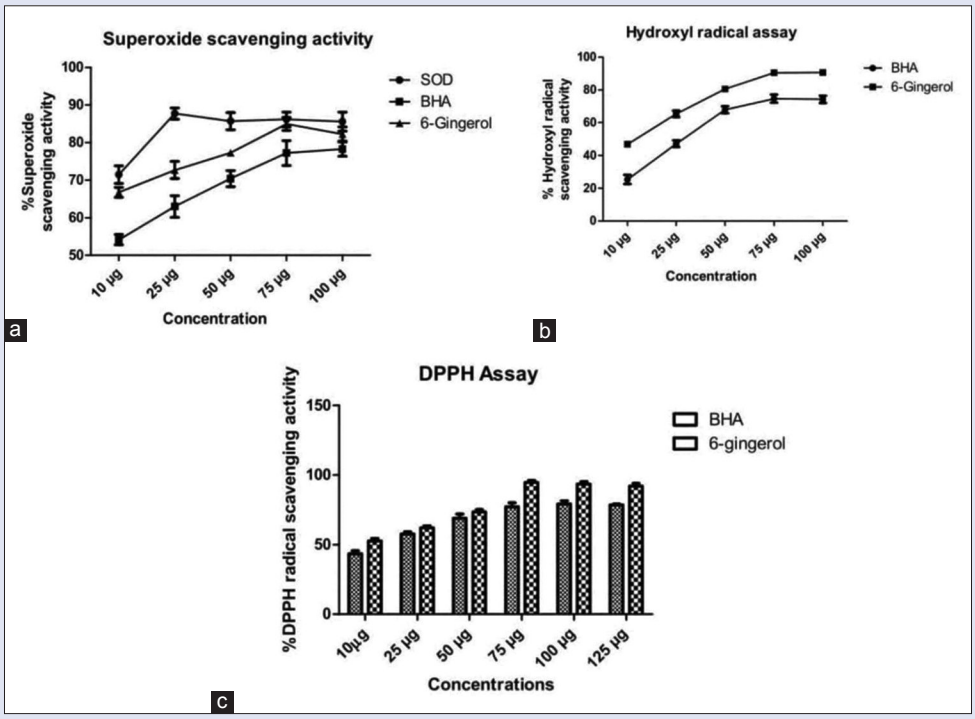

**Figure 4:** (a) The superoxide-scavenging activity of 6-gingerol. The negative control was without any antioxidant or extract. Positive control superoxide dismutase. (b) Hydroxyl radical-scavenging activity of various concentration of 6-gingerol in comparison with butylated hydroxyanisole. The negative control was without any antioxidant or extract. (c) Inhibition of 1,1-diphenyl-2-picrylhydrazyl radicals at various concentrations of 6-gingerol in comparison with butylated hydroxyanisole. Results are shown as mean ± standard deviation ($n$ = 3)

The earlier studies have demonstrated that phenolic compounds showed high antioxidant activity by donating electrons to the free radicals and suppress their activity.[35]

## 6-Gingerol 1,1-Diphenyl-2-picrylhydrazyl radical-scavenging activity

DPPH analysis is one of the tests used to prove the ability of 6-gingerol to act as donor of hydrogen atoms or electrons. The obtained results shown in Figure 4c explain 6-gingerol exhibited a significant effect on inhibition of DPPH radicals in dose-dependent manner. The maximum activity of 6-gingerol (94.66%) was observed at 75 µg/ml and it was higher than the known synthetic antioxidant BHA (79.19%) at 100 µg/ml. The results indicated that 6-gingerol is a powerful free radical scavenger compared with known antioxidant. The hydrogen-donating abilities of the phenolic compounds of the ginger are thought to be responsible for the inhibition of DPPH-free radical.[39]

## 6-Gingerol hydroxyl radical-scavenging activity by electron spin resonance

The ESR spectrum of DMPO-OH adducts showed a typical 1:2:2:1 quarted line. The ESR signal is proportional to the concentration of spin adducts in the solutions. The ESR signal significantly diminished with increase of 6-gingerol concentrations and it was higher at 75 µg/ml concentration [Figure 5a-g] when compared with other concentrations. Consequently, this activity was similar to the reference antioxidant ascorbic acid (75 µg/ml). This activity shown by gingerol may be due to (a) suppression of hydroxyl radicals formation by 6-gingerol in the Fenton reaction, (b) donation of proton or electron to radical spin

**Table 1:** Antiviral activity of 6-gingerol at various concentration

| Treatment Mode | 6-Gingerol dose in µg/ml | No. of eggs | Mortality | | | | HA Test | | % of mortality | Mean Ab Titre |
|---|---|---|---|---|---|---|---|---|---|---|
| | | | 24 h | 48 h | 72 h | 96 h | +ve | -ve | | |
| Normal control (0.1 ml saline) | - | 5 | 0/5 | 0/5 | 0/5 | 0/5 | 0 | 5 | 0 | ≤1/2 |
| 6-Gingerol Control | 25 | 5 | 0/5 | 0/5 | 0/5 | 0/5 | 0 | 5 | 0 | ≤1/2 |
| | 50 | 5 | 0/5 | 0/5 | 0/5 | 0/5 | 0 | 5 | 0 | ≤1/2 |
| | 100 | 5 | 0/5 | 0/5 | 0/5 | 0/5 | 0 | 5 | 0 | ≤1/2 |
| Virus control (0.1 ml of 1024 HA units) | - | 5 | 2/5 | 3/5 | - | - | 5 | 0 | 100 | 1/1024 |
| Pre treatment | 25 | 5 | 0/5 | 2/5 | 2/5 | 0/5 | 4 | 1 | 80 | 1/256 |
| | 50 | 5 | 0/5 | 1/5 | 1/5 | 0/5 | 2 | 3 | 40 | 1/32 |
| | 100 | 5 | 0/5 | 1/5 | 0/5 | 0/5 | 1 | 4 | 20 | 1/8 |
| Post treatment | 25 | 5 | 2/5 | 1/5 | 2/5 | 0/5 | 5 | 0 | 100 | 1/512 |
| | 50 | 5 | 2/5 | 1/5 | 1/5 | 0/5 | 4 | 1 | 80 | 1/128 |
| | 100 | 5 | 1/5 | 1/5 | 0/5 | 0/5 | 2 | 3 | 40 | 1/32 |
| Simultaneously | 25 | 5 | 2/5 | 0/5 | 1/5 | 1/5 | 4 | 1 | 80 | 1/128 |
| | 50 | 5 | 1/5 | 1/5 | 1/5 | 0/5 | 3 | 2 | 60 | 1/64 |
| | 100 | 5 | 1/5 | 1/5 | 0/5 | 0/5 | 2 | 3 | 40 | 1/32 |

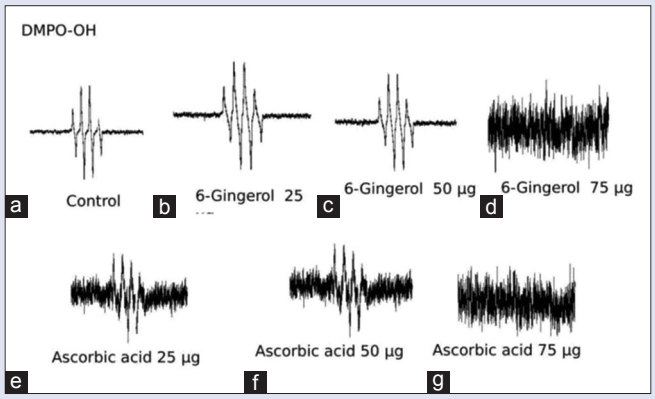

**Figure 5:** Quenching effect of various concentrations of 6-gingerol using 5,5′-dimethyl-l-pyrroline-N-oxide to trap the OH radical. Examples of electron paramagnetic resonance spectra signal ranging from 326–346 mT: (a) Control; (b-g) Effects of concentrations ranging from 10 to 75 µg/ml. The positive control was ascorbic acid

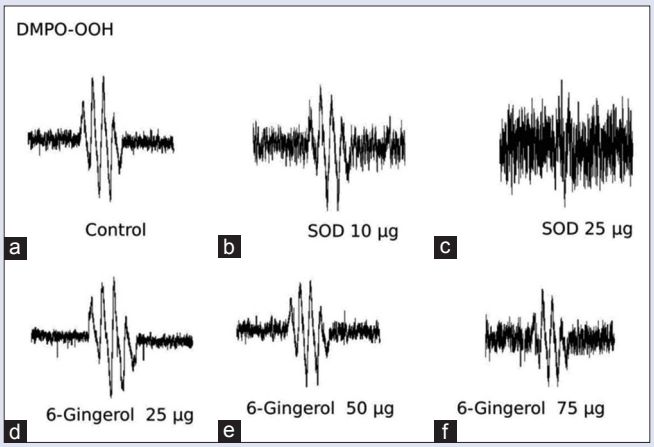

**Figure 6:** Quenching effect of various concentrations of 6-gingerol using 5,5′-dimethyl-l-pyrroline-N-oxide to trap the O2 radical. Examples of electron paramagnetic resonance spectra signal ranging from 326 to 346 mT: (a) = control; (b-f) Effects of concentrations ranging from 10 to 75 µg/ml. The positive control was superoxide dismutase

adduct, and (c) competition between 6-gingerol and the spin trap agent for the hydroxyl radical.[40,41]

## Superoxide anion radical-scavenging activity of 6-gingerol by electron spin resonance

The results obtained are as shown in Figure 6a-f, the intensity of the signals virtually abolished with increasing of 6-gingerol concentrations from 10 to 100 µg/ml, and it was higher at 75 µg/ml of 6-gingerol concentration when compared with other concentrations. However, this activity was similar with the antioxidant enzyme SOD at 25 µg/ml concentration.

In this study, ESR signals of DMPO-OOH were gradually decreased when increased the concentration of 6-gingerol, it may be due to (a) the fact that 6-gingerol inhibits the xanthine oxidase activity and (b) transformation of superoxide anion to oxygen.[42,43]

## Inhibition of Newcastle disease virus growth in chicken eggs by 6-gingerol

NDV has a single-stranded negative probing filamentous RNA.[44] At present, there is no specific treatment for NDV, and it was only controlled by the vaccination. Recently, there has been a growing interest in plants as natural sources for the treatment of viral diseases as therapeutics.

The results from our *in ovo* study, as shown in Table 1, showed that normal control and 6-gingerol alone treated embryonic eggs were not shown any agglutination in HA test and mortality whereas untreated NDV-infected eggs have shown agglutination in HA test (1/1024 virus titer) and all infected eggs died within 48 h. Six-gingerol pretreated viral infected eggs shown 80%, 40%, and 20% mortality rate at concentrations of 25, 50, and 100 µg/ml of 6-gingerol, respectively, whereas in HA test, their viral titer values 1/256, 1/32, and 1/8, respectively. Six gingerol posttreated group eggs showed 100%, 80% and 40% mortality rate at various concentrations of 25, 50, and 100 µg/ml 6-gingerol and their viral titer values were 1/512, 1/128, and 1/32, respectively. Virus and 6-gingerol (1:1 v/v) simultaneously treated group showed 80%, 60%, and 40% mortality rate at various concentrations of 25, 50, and 100 µg/ml of 6-gingerol and their titer values were 1/128, 1/64, and 1/32, respectively.

Several studies made a comparative evaluation of the antioxidant and the antiviral activities of plant extracts and naturals substances. The higher amount of phenolic compounds particularly flavonoids and tannins are known to possess good antiviral activities.[27,28] In our *in ovo* study, 6-gingerol pretreatment significantly exerts antiviral activity in a dose-dependent manner which indicates that 6-gingerol inhibited the viral growth. Post and simultaneously 6-gingerol treated NDV-infected

eggs have shown low titer value in HA test and mortality when compared with NDV control. This could be suggested that 6-gingerol has ability to prevent the NDV growth at some extent. The antiviral effect of 6-gingerol on NDV might be due to killing the virus and/or interfering with viral multiplication[45] or may it exhibit protease inhibition, and hence interferes with cleavage of hemagglutinin neuraminidase and fusion protein, which are important to glycoproteins for NDV attachment and multiplication or virucidal effect.[46,47]

## CONCLUSION

Our research results clearly demonstrated that 6-gingerol has shown a good metal sequesters property by recuperation of free transition metal ion-induced free radical alterations by *in vitro* and it also inhibits the NDV growth in embryonic chicken eggs by *in vivo*. Thus, this study provides a basis for developing a valuable food additive to protect from the free radical-induced alterations and NDV in chickens

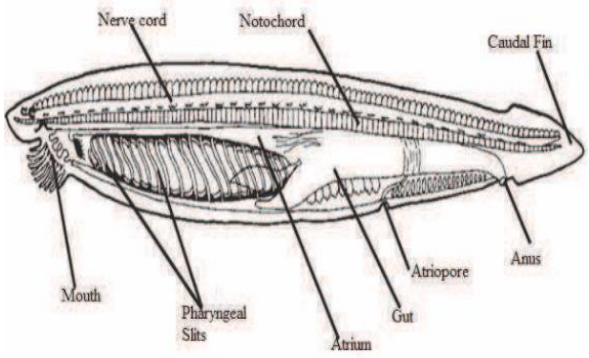
# MODULE-I

## INTRODUCTION

Animal kingdom is basically divided into two sub kingdoms:

(a) Nonchordata- including animals without notochord.



(b) Chordata- This comprising animal having notochord or chorda dorsalis. While the Chordata has a notochord at some stage during the life, it is not known to exist in the Nonchordata.

- The Chordata is the animal phylum with which everyone is most intimately familiar, since it includes humans and other vertebrates However, not all chordates are vertebrates.

- All chordates have the following features at some stage in their life (in the case of humans and many other vertebrates, these features may only be present in the embryos).

- Pharyngeal slits – a series of openings that connect the inside of the throat to the outside of the

"neck". These are often, but not always, used as gills.

- Dorsal tubular nerve cord – A bundle of nerve fibers which runs down the "back". It connects the brain with the lateral muscles and other organs.

Pharyngeal slits dorsal nerve cord & Notochord

- Notochord – cartilaginous rod running underneath, and supporting, the nerve cord.

- Post-anal tail – an extension of the body posts the anal opening.

## ORIGIN OF CHORDATES

It is believed that chordates originated from invertebrates. However, it is difficult to determine from which invertebrate group of the chordate developed.

It is almost constant that chordate ancestors were soft bodied animals. Hence, they were not preserved as fossil.

Many theories have been put forward to explain the evolution of chordates, few of them are as follows:

### (a) COELENTERATE THEORY:

According to this theory chordates developed from coelenterates.

It is belived that radial symmetry coelenteron, cnidoblasts etc, disappeared and advanced characters developed to give rise the chordates.

This theory infers that chordate might have acquired higher characters independently. This theory is not acceptable.

**(b) ANNELID THEORY:** This theory suggests that the chordates have evolved from an annelid stock, like many chordates the annelids show bilateral symmetry, metasmerism, head, lateral coelome complete digestive tract, closed circulatory system, haemoglobin, etc.

2.1. *Scoliodon*: Morphology, structure of Heart, Brain and sense organs.

2.2. Migration in fishes and types of scales - Dipnoi fishes

*2.3 Characters and Classification of Amphibia upto orders*

*2.4. Rana* : Morphology, respiratory system, structure of heart, Brain and reproductive systems only.

# MODULE-II

**External Features of Dogfish (Scoliodon):**

**Shape, Size and Colour:**

Dogfish (Scoliodon) has a long, laterally compressed spindle-shaped body tapering at both ends. The fully grown specimen measures from 30 to 60 cm in length. The colour of the body is dark grey above and pale white beneath, while the portions of the caudal fin are more or less dark. Body surface is rough due to backwardly directed spines of placoid scales embedded in the dermis.

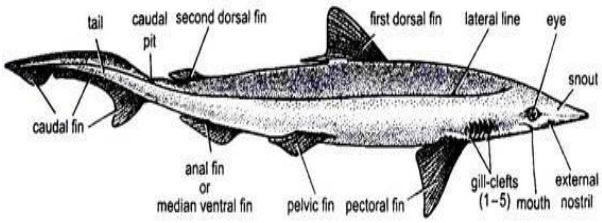

Fig. 14.1. *Scoliodon*. External features.

**Division of Body:**

The body is divisible into head, trunk and tail, though there are no distinct boundaries between these regions.

**(i) Head:**

The head is strongly compressed dorso-ventrally and is produced in front into a wedge-shaped snout or rostrum.

**(ii) Trunk:**

The trunk is almost elliptical in transverse section. Its thickest part lying in front of the middle of the body. The trunk gradually tapers behind into the tail.

**(iii) Tail:**

The tail is laterally compressed and is bent upwards at a small angle and fringed with a caudal fin. Such a tail is known as heterocercal tail.

**Fins:**

Dogfish (Scoliodon) is provided with two sets of fins which are flattened expansions of the skin supported by cartilaginous rods and horny fin rays- these are unpaired or median fins and paired lateral fins.

**(i) Median Fins:**

The median fins are two dorsal fins, a ventral or anal fin and a caudal fin. The first dorsal fin is large and triangular in shape and is situated a little in front of the middle of the body. It has a basal lobe. The second dorsal fin is also triangular in outline but is very small and is situated midway between the first dorsal and the tip of the tail. The caudal fin extends along the dorsal and ventral

3.3. Identification of Poisonous snakes

# MODULE-III

**REPTILIA: CHARACTERS AND CLASSIFICATION**

Reptiles are cold-blooded vertebrates, breath by lungs and having the body covered by scales or scutes.

General characters:

- They are inhabitants of terrestrial and aquatic (both marine and freshwaters) environments.
- Their skin is dry, cornified and usually covered by **epidermal** scales or scutes. There are a few integumentary scent glands secreting pheromones during breeding seasons.
- Single external nasal opening is present on the snout. Ear drums are slightly depressed.
- Two pairs of pentadactyle limbs are present. The limbs end in clawed digits.
- The cloacal opening is either transverse or longitudinal.
- A post-anal tail is present.
- The heart is composed of two auricles and a partially divided ventricle. There are right and left systemic arches.
- The kidney is metanephric type.
- Mullerian duct persists as oviduct in female and Wolffian duct is retained as vas deference in male. Males possess copulatory organs.
- Twelve pairs of cranial nerves are present.
- Vomero-nasal organ (Organ of Jacobson) is well-developed.
- Single occipital condyle in the skull is present for the attachment with atlas.
- Mandible consists usually six pieces of bones.
- Vertebrae are procoelous. Sternum is greatly developed with ribs.
- Cleidoic eggs are large. The calcareous shell serves for protection against desiccation and external injury. The shell is porous for gaseous exchange.
- Fertilisation is internal.
- Embryos are provided with extra-embryonic membranes, like amnion, chorion and allantois.

4.1. General characters of Aves and Classification of Mammals- comparison of Prototheria, Metatheria and Eutheria
4.2. Pigeon (*Columbia livia*) : Exoskeleton, respiratory system, structure of heart,
4.3. Migration in birds and its significance, Flight adaptation in birds
4.4. Dentition in Mammals,

# MODULE-IV

# GENERAL CHARACTERS OF AVES

## Introduction:

Class Aves includes birds, bipedal vertebrates. Birds are unique in having feathers as their exoskeleton. Aves originated from therapod dinosaurs in Jurassic period and modernized in the cretaceous period. **T.H.Huxley** called birds "G**lorified reptiles"**. **J.Z. Young** described them as the "**Masters of air**" . Ornithology is the study of birds.

## General characters of Aves

- Birds are cosmopolitan and found in all continents, seas and most islands.
- Their wide occurrence is due to their power of flight, which enables them to reach places unreachable to other animals.
- Most of them can fly and a few have lost the power of flight.

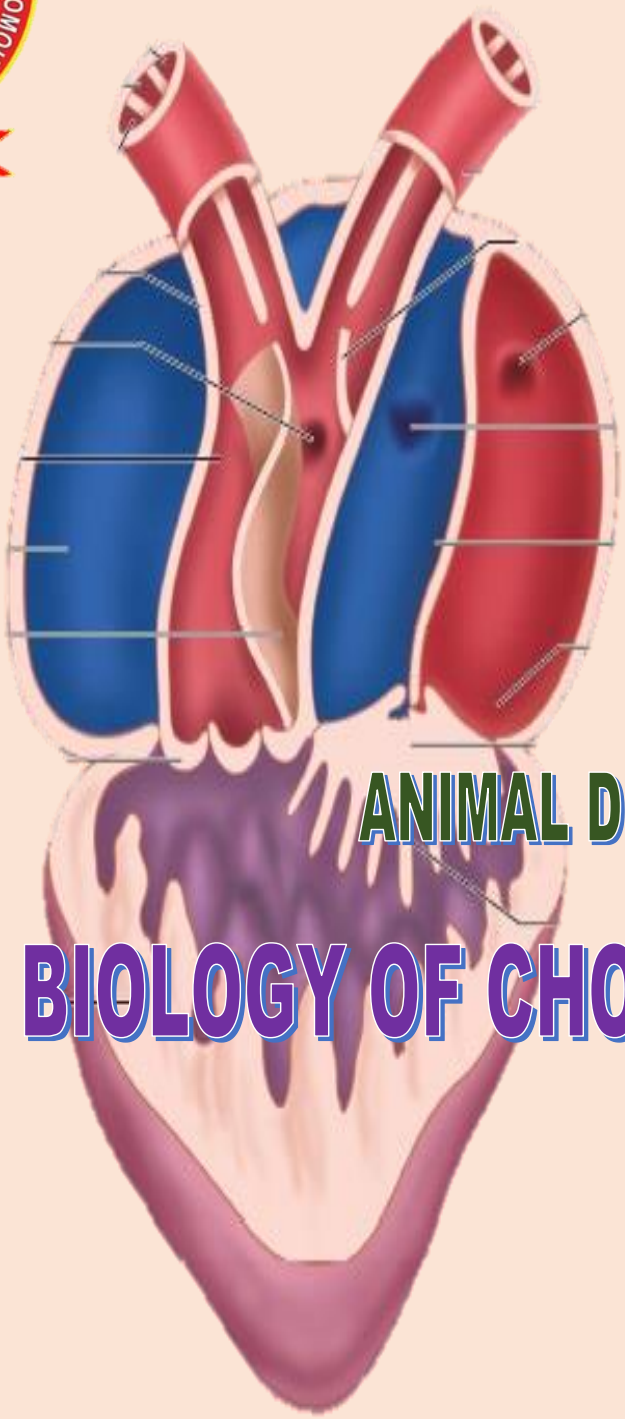
## Body temperature:

- They are **homeothermic** (**warm blooded**) and the body temperature provides high metabolic rate for quick energy supply.
- Birds are **endothermic**, and expend a lot of energy to keep warm.

## Body form and appendages:

- The body is boat shaped and streamlined.
- It is divisible into **head, neck, trunk** and **tail.**
- The forelimbs are modified into wings for flight which are supported by powerful flight muscles attached to the sternum.
- Each fore limb has 1 to 3 digits and each hind limb has 1 to 4 digits.
- The hind limbs are used for perching, walking, hopping, wading, swimming etc.
- Skin is dry and thin except for uropygial or oil gland on the tail.
- Body is covered by epidermal horny skeleton of feathers which conserve body heat, help in flight and provide colouration to the birds.

## Endoskeleton:



- The endoskeleton is bony, but delicate and light.
- Skull is **monocondylic**, i.e., with single occipital condyle.
- Sternum is usually large and with a median keel for the attachment of flight muscles.
- Bones are pneumatic, i.e., contain air cavities to reduce weight.

## Digestive system:

- Mouth has a wide gap and jaws are covered with horny sheaths to form strong beaks.
- Beaks are adapted to various modes of feeding: seed-crushing, fruit-scooping, fish-tearing, nectar-sipping, wood-chiselling, grain-pickling etc.
- Teeth are absent and food is swallowed un masticated.
- The **crop** stores and softens food.
- Alimentary canal often has additional chambers; **crop and gizzard.**
- Gizzard is muscular to crush and churn the softened food.
- Some birds keep stone in the gizzard to effectively crush seeds and grains. Alimentary canal leads to the cloaca.
- The cloaca is divided into three linear compartments: i.e., anterior **coprodaeum** middle **urodaeum**

**Abstract**: Charles Dickens, the greatest English novelist of the Victorian Era, attempts to draw the attention of his readers with the theme of poverty, one of the central problems in some of his novels. Mulk Raj Anand, an eminent Indian writer in English, is notable for his depiction of the lives of the poorer castes in traditional Indian society in his novels. The present article aims at making a comparative study of the poor and oppressed people in the novel *Oliver Twist* by Charles Dickens, and *Untouchability by* Mulk Raj Anand. The problem of poverty was very serious in English society of the late 19th century, and so Charles Dickens chose this theme as one of the central themes of some of his novels including *Oliver Twist* (1839). This novel represents the Victorian English society where the poverty is next to enormous wealth. Mulk Raj Anand's debut novel *Untouchability* exposes the oppression, injustice, exploitation to the whole community of the outcastes in India. This novel covers the span of a decade from 1930 to 1940 when poverty, slavery and the inhuman exploitation of the masses were at the peak. Both the writers in their novels focus on the poor, suffering and wretchedness of the poor. The outcastes are exploited by almost all on the economic level too. To both the writers, exploitation of man is immoral and impermissible, particularly the poor and the illiterate. Both of them depict the lifestyle of the poor and the upper class.

## I. INTRODUCTION

Dickens was not only the first great urban novelist in England, but also one of the most important social commentators who used fiction effectively to criticize economic, social, and moral abuses in the Victorian era. Dickens showed compassion and empathy towards the vulnerable and disadvantaged segments of English society, and contributed to several important social reforms.

Dickens believed in the ethical and political potential of literature, and the novel in particular, and he treated his fiction as a springboard for debates about moral and social reform. In his novels of social analysis Dickens became an outspoken critic of unjust economic and social conditions.

Dickens was not the first novelist to draw attention of the reading public to the deprivation of the lower classes in England, but he was much more successful than his predecessors in exposing the ills of the industrial society including class division, poverty, bad sanitation, privilege and meritocracy and the experience of the metropolis. In common with many nineteenth-century authors, Dickens used the novel as a repository of social conscience

Mulk Raj Anand a socially committed novelist has produced a good deal of literature. He has written more than a dozen novels and about seventy short stories. He focused his attention on the sufferings, misery and wretches of the poor as a result of the exploitation of of the downtrodden classes of the Indian society. His themes mainly deals with the poverty, society hunger and exploitation.charless dickens is one of the greatest novelist in the English literatures. He wrote about the real world. He wrote about the poor people and social injustice

The theme of poverty remains on the central problems that Charles dickens focuses and attempts to draw attention to his readers. The problem of poverty becomes a serious social and economic burden of English society of the late 19th century. The two writes are compared here as their themes were more related with the poor and oppressed people and social exploitation. Mulk Raj Anand was also called as Indian Charles dickens.

Oliver Twist (1837-39), which represents a radical change in Dickens's themes, is his first novel to carry a social commentary similar to that contained in the subsequent Condition-of-England novels Dickens explores many social themes in Oliver Twist, but three are predominant: the abuses of the new Poor Law System the evils of the criminal world in London and the victimisation of children. The critique of the Poor Law of 1834 and the administration of the workhouse is presented in the opening chapters of Oliver Twist. Dickens gives the most uncompromising critique of the Victorian workhouse, which was run according to a regime of prolonged hunger, physical punishment, humiliation and hypocrisy Oliver fell on his knees, and clasping his hands

together, prayed that they would order him back to the dark room—that they would starve him—beat him—kill him if they pleased—rather than send him away with that dreadful man [1]

In Oliver Twist Dickens presents a portrait of the macabre childhood of a considerable number of Victorian orphans. The orphans are underfed, and for a meal they are given a single scoop of gruel. Oliver, one of the oppressed children, dares to ask for more gruel and is severely punished.

The evening arrived; the boys took their places. The master, in his cook's uniform, stationed himself at the copper; his pauper assistants ranged themselves behind him; the gruel was served out; and a long grace was said over the short commons. The gruel disappeared; the boys whispered each other, and winked at Oliver; while his next neighbours nudged him. Child as he was, he was desperate with hunger, and reckless with misery. He rose from the table; and advancing to the master, basin and spoon in hand, said: somewhat alarmed at his own temerity: 'Please, sir, I want some more.' [2]

This scene, which has become "the most familiar incident in any English novel" strongly appealed to the Victorian conscience. Dickens challenged the Victorian idea of charity for the so-called "deserving poor". He showed persuasively that the workhouse was a failed attempt to solve the problem of poverty and unwanted children.

Anand's novel Untouchable expresses his great advocacy of the marginalized and defenceless against their age long humiliation, persecution and oppression. Anand himself observes Great author is to highlight the cause of the dumb and the deserted, the lowly and the lost of an adverse society. The author also flings a harsh irony on the snobbery and hypocrisy, ostentation and fabrication of the aristocratic people who, sometimes One of the prime concerns of a stoop low to achieve the end. A writer, the prince of the pen, is the true voice of the million mass particularly of the untouchable and the vulnerable victimized by undeserved tyranny and injustice from the time immemorial. And this is what prompted Mulk Raj Anand to present the deplorable description of the destitute

In this article there were a lot of similarities in the works of Charles dickens oliver twist and Mulk Raj Anand untouchable .First if we go for the work of Charles dickens. Charles Dickens in this novel Oliver Twist depict English society of Victorian age which is full of contrasts where the poverty is next to snornious wealth, and where spiritual richness is often overshadowed by the material desperate social portions of the characters of novels.dickens pores a question whether poverty is really a sinn or something really bad that make people fall lower and lower in the social ladder or probably it is just a poor material portion of individuals.

In the novel untouchable by Mulk raj anand covers the san from 1930 to 1940 when poverty slavers and the inhuman exploilation of the masses were at the peak .In this Novel untouchable by Mulk raj anand the characters in this novels belongs to downtreden society.There was a poverty and slavery in this Novel,the authorisation of high class society on low class society, hunger and poverty is potrayed in this Novels.So, in there two novel both the writers used the themes of poverty, hunger, social status and human exclopitation .

Charles dickens depicts the opprersive nature of the 19$^{th}$ century society and subjection of the poor and poverty.while Mulk raj anand depicted the poor and oppressive nature of 21$^{st}$ century society and its subjection of the poor and poverty. Both the novels oliver twist and untouchable well illustrate the situation and condition of the lower class Juxtapore against the lavish liver of middle classes and the aristocracy.In oliver twist oliver is the protagonist, he is an orphan. Oliver twist and his companions suffered the tortures of slow staruation for many days.the powerful pathor and visual imagery which dicken user in deserileing Oliver is a martuful creation to intensify the gravity of circumstances in which Oliver finds himself. The staruation of the poor at athe work houses was also a reflection of the hunger encountered by the paupers outside the poor work houses.

In untouchable Bakha is the protagonist. Anand is the first Indian novelist to have depicted in the novel from the stigma of this eveil which isolates a man from his own society. The character in his novels belongs to the down trodelen society. The characters are normal, simple, credible human being unaware of their social conditions.Bhaka shouts for foods and begs for food.The woman comes out and throws a chapatti for him, he suffered with hunger all the day. M.K Naïk writes "Untouchable is a scathing incident of Hindu society and irony is the weapon of this indictment"[3]

There were many situations in oliver twist where oliver was insulted many times, from his birth, when oliver goes to the workhouse, he is introduced to ten fat gentleman and one who was particularly fat with very round red face. The fat gentle men are juxtaposed against the children at the poor houses who were starved as evidenced by the scene in which the older children forced oliver to ask for more food. In the novel it is stated that the immater were fed on the small quantities of oatmeal, three meals of thin gravel a day and half a roll on Sundays. The same way untouchable by Mulk raj anand also depicts the related circumstances, Bakha a sweeper boy and a latrine clean starts his day welcomed by the abuses of his latrines with a brush and bucket.After cleaning roads and toilets in house, he goes to an alley nearby to beg for food. When bakha returns home, he tells his father They think we are mere dirt because we clean their dirt" [4]

He starts shouting or food but nobody responds tired of the hectic schedule he sleeps on the wooden platform in front of a house.The woman comes out of the house on the call of a sadhu.She shouts at Bakha for polluting her house.She asks him to clean the drain to get a piece of bread. Mean while a woman from neighbouring house gives him a chapatti .Mulk raj anand in his article "The source of potest in my Novels" say I wished to create the folk, the lumpens and the suppressed, oppressed, repressed, those who have seldom appeared in our literature"[5]

In oliver twist the poor were actually oppressed and those who were not living in the work house were forced to work and they could no longer be provided with any aid.In Victorian age the authorities believed that the paupers were lazy and idle, yet hey failed to understand that they were poor because of lack of employment and if they did final any work at all, it was always low paying petty work like sweeping and repairing roads.Even though the poor laws were snacted to arrist the poor, they did nothing to change their plight or improve their situation.The poor were furthered exploited by physical and emotional abuses. and takes him to his home lifting on his hand. The thankless mother of the child shouts at him for defiling her house. For the work he did they throw the bread of slice on him as they do to animals so they workhard, they were ill treated due to their poverty, hunger and low_ class. Oh! You eater of masters what have you done ?....Give me my child ...you have defiled the houses besides wounding my son"[6] In case of Mulk raj untouchable in period from 1930 to 1960's in India the poor end lower cartes were treated very badly, there were some invidents that happend in a day to Bakha. He receives a slap from the high cart Brahmin for defiling him by his touch makes him aware of his true identity. An other incident he faces at another moment of humiliation at the steps of the temple that increases the rage of his soul. Once when he saved the child from accident

In untouchable the themes of exploitation are best expressed through the character of sohini Bakha's sister. She not only excmplifier caste expoitation but also six exploitation.Gulabo a washer woman, a caste superior to other cartes exploits sohini, she being of the low carte among he outcartes would naturally be looked down upon by Gulabo. She becomes the victim of sexual exploitation due to here carte and poverty.

Dickens successfully portrays the child exploitation in Oliver twist . He potrays it as the abuse of them in 19$^{th}$ century Britian. Most of there children are orphans and also members of the low class, therefore they were economically desparate and they were forced to endure by means of survivial even if it meant accepting maltreatment. In oliver twist olivers feels alone, he dislikes being alone and having no body to care for him, where as in untouchable Bakha also feels alone though he has a father lakhe who is not piety enough towards his son and daughter and always abuses him with his bad words.

Dickens showed compassion and empathy towards the vulnerable and disadvantaged segments of English society, and contributed to several important social reforms. Dickens's deep social commitment and awareness of social ills are derived from his traumatic childhood experiences when his father was imprisoned in the Marshallese Debtors' Prison under the Insolvent Debtors Act of 1813, and he at the age of twelve worked in a shoe-blacking factory In his adult life Dickens developed a strong social conscience, **an** ability to empathise with the victims of social and economic injustices

Mulk Raj also have the child hood experiences which he portrayed in untouchable Bakha's character is modelled after one of Anand's childhood friends, who was humiliated by his own mother for being a sweeper boy but whom Anand adored as a hero. Anand could never forget that sweeper boy and the insult and humiliation that he received by Anand's family. He gave voice to his views against the exploitation of a sweeper-boy through the character of Bakha in his very first novel *Untouchable*.

Dickens explores many social themes in Oliver Twist, but three are predominant: the abuses of the new Poor Law system, the evils of the criminal world in London and the victimisation of children... Dickens gives the most uncompromising critique of the Victorian workhouse, which was run according to a regime of prolonged hunger, physical punishment, humiliation and hypocrisy. Mulk Raj also explores social themes in untouchable he focused his attention on the sufferings, misery and wretchedness of the poor as a result of the exploitation of the downtrodden class of the Indian society. Religious hypocrisy, feudal system, East-West encounter, the place of woman in the society, superstitions, poverty, hunger and exploitation are his common themes.

In Untouchable Bakha suffers without any fault of his own. The slap he receives from the high caste Brahmin for defiling him by his touch makes him aware of his true identity. Soon after this he faces another moment of humiliation at the steps of the temple that increases the rage in his soul. But the molestation of his sister by the priest turns him violent to which he reacts aggressively. But his hereditary serfdom acts as a handicap to his spontaneous rebellion. In both the cases oliver in oliver twist and bakha in untouchability become rebellious towards the attitude of their superiors. He is simultaneously an exploited person and a rebel. He is scapegoat of the rigid caste system. Injustice inflicted upon him makes him rebellious. Excessive buses and insult makes him think about retaliation. At such moments he feels like a tiger at a bay. Saros Cowasjee in her book *So Many Freedoms* rightly says, But he is a tiger in a cage, securely imprisoned by the conventions his superiors have built up to protect themselves against the fury of those whom they exploit. [7]

## II. CONCLUSION

In the comparative study of both the novels oliver twist by Charles dickens and untouchable by Mulk Raj Anand there were a lot of similarities related to the poverty and oppression .Though the countries were different, traditions were different, culture changes but the poverty remains the same. Both the protagonists Oliver Twist and Bakha suffered throughout the novel because of poverty and oprresion. There were many similarities in writings of both the authors.

# "A Study of Human Heart": Little Dorrit by Charles Dickens

Abstract

The present paper aims at describing about the novel Little Dorrit by Charles Dickens. This is about how a girl of tender age in a family come across many problems and how she overcome all those hurdles in her life and how she saves her family which includes her father who was imprisoned for a long period for his debts and her brother and sister. By the end of the article we find her life ended happily and how she was blessed with a happy life, who helped her to solve her problems and ended her tragic life. The role played by her throughout novel to overcome her problems.

Key words: Charles Dickens, Little Dorrit, problems, solve, overcome.

## Introduction

Charles Dickens is remembered today as one of the greatest and most popular writers of the novel ever to have lived. Dickens captured the spirit of his age in both a profound and entertaining way. He wrote wit and humour, but he also wrote about the everyday tragedies of life he saw around him. Dickens was the greatest of English 19th century novelists but also captured the spirit of the times in which he lived. His own life and the age in which he lived were tightly intertwined, more so than with most writers.

Dickens believed in the ethical and political potential of literature, and the novel in particular, and he treated his fiction as a springboard for debates about moral and social reform. In his novels of social analysis Dickens became an outspoken critic of unjust economic and social conditions. Dickens was not the first novelist to draw attention of the reading public to the deprivation of the lower classes in England, but he was much more successful than his predecessors in exposing the ills of the industrial society including class division, poverty, bad sanitation, privilege and meritocracy and the experience of the metropolis. In common with many nineteenth-century authors, Dickens used the novel as a repository of social conscience.

Marshal sea prison is a place which stood within high walls in the London borough of Southwark. These walls encircled squalid houses which contained all manner of people all of whom shared a common fate for one reason each had the disgrace of being in debt. Rather than being granted the liberty to earn money to repay their creditors, they languished in prison. Mr.Dorrit was one such man. His complex business affairs had failed, and for the past 22 years he and his children had lived in one house within the prison. For all the 22 years of her life, the Marshal Sea was the only home little Dorrit known.

In Marshal sea prison Mr.Dorrit saw his wife die in prison, and there his children had grown up .The passing years had made this shably, soft mannered debtor respectful figure among other prisoners, gradually earning him the title of “Father of Marshal sea “In this grand capacity Mr.Dorrit would welcome new prisoners with pomp and gravity and receive money it became traditional to pay him upon departure.

“It became a not unusual circumstance for letters to be put under his door at night, enclosing half a crown, two half –crowns, now and then at long intervals even a half –

a-sovereign, for the Father of marshalsea, and with the compliments of collegian taking leave (LD.P.80)"

Arthur settled and earned a lot of money in business and decided to return back to London where his mother stayed. In past 20 years he had been working in china with his father. He returned back and felt there was no change and development in London. He found his family in its familiar gloom and darkness. The house brought him back all painful memories. His parents believed that suffering in life would gain them forgiveness for their sins when they die. Arthur is 40 years old .he feels he became old and decided to spend rest of his life in London with his mother. But his mother was not happy for his return from china. She is confined to wheel chair. Arthur handed his mother an old fashioned watch in a heavy case. He said it was his father's last wish to present this before he died. The watch has the letters DNF inside it. He asked his mother the meaning of it. She felt very anger and bitterness. She can neither forget nor forgive. At that movement Arthur noticed a girl for first time, a girl sitting in the shadows was employed in some needle work. She was working with his mother. The girl was very calm, she never ate the food given to her but she take to home. She worked for 12 hours; his mother has a good concern for her.

As the days passed Arthur grew increasingly curious about the girl who worked so quietly for his mother for 12 hours a day. The truth about little dorrit he came to know was that with love and devotion she worked hard to support her family. She had learned needle work from a milliner in the marshal sea prison, so she could earn money for her father.

She has secured work as a dancer for her sister Fanny and had found numerous jobs for her slovenly brother Tip. They all relied on her .They all took her for granted. Little Dorrit might have been little in body but not in spirit. This is the life to which Little Dorit returned as she fitted through the prison gaiter watched by Arthur clennam .One day he made up a story for the gate keeper, handed over a little money and was shown to Mr.Dorrit room. Little dorrit was alarmed when she opened the door to her employers son, but his eyes treated her to trust him. She introduced him to her father as a friend. Arthur invited little dorrit to walk with him outside the prison.

"Thus they emerged upon the iron bridge, which was as quite after the roaring streets, as though it had been open country. The wind blew roughly, the wet squalls came rattling past them, skimming the pools on the road and pavement, and raining them down into river. (LD.P.114)

Mean while she explained everything about her family and about her father.Arthur agreed that a man cannot be blamed simply for being poor. Arthur said that many good people are there who have fallen on misfortune through no fault of their own. Arthur expressed his wish to be a friend of Dorrit. He also asked her to tell the names of creditors so that he may try to persuade them to cancel defects Little Dorrit said thought for a movement .She said there was somebody called Barnacle .He works in circumlocution office.

Arthur mind was full of questions that night about little Dorrit, he questioned himself, why he was trying to help her. What reason could his mother have to treat Little Dorrit with unequal kindness He thought that Mr.Dorrit debts had something to do with the Arthurs business He also thought Dorrit confinement in prison and his mothers self imprisonment in her room both be part of a deal she had struck with heaven. The Circumlocution office was the main office of the British government, specialising in meetings, committees, complaining forms. It never made any decisions nor took any positive actions. It insisted to squash original ideas and dam pick independence and inventiveness. The works of thousands good people with projects that might benefit the people of Briton were lost under piles of papers in circumlocution office.

The Barnacles were a large, very important family they held all the most powerful positions in the circumlocution office just as Barnacles cling to a ship of state. If the ship sank with them clinging to it, that was the ships problem, not theirs. After 5 days of queuing and filling in forms at the circumlocution office, Arthur finally had the houner of meeting at Barnacles but the junior to Barnacles said he had not got appointment .Arthur felt very disappointed .He said to fill a another form ,send to another department ,for sign from there to other department.

Barnacle junior said about this, Arthur suggested it was not the way to do business, but the junior said, if you want you can, otherwise stop filling them. Arthur sat with his head in his hands outside the circumlocution office, wandering what to do. Next to him a soft weary voice observed, Arthur turned and saw a person who was very smartly dressed, gray haired man at his side. His name was Daniel Doyce. Arthur introduced himself about how 12 years ago; he invented something and thought he could make useful to their country. He said that he had been wasting his time and money in circumlocution office, trying to advance his invention he was the inventer, public offender and outlaw.

Arthur also introduced about himself ,he said about his work hope" bleeding heart yard", he said it was an appropriate named for a place where peoples hopes had been crunched .Hence then Introduced his friend Mr.Pancks who was a rent collector, he introduced him to Arthur. Pancks said he has a great in rest tracking family histories. Pancks explained, he said he can find all orts of things forgotten wills, Estates that Avnet been claimed. Arthur briefly explained his business at the circumlocution office. He explained everything of Mr.Dorrit. Then Pancks promised that he will find out information.

Arthur gladly accepted Doyce offer of a job taking care of his company finances. They became very close friends. Arthur felt very happy over bleeding heart yard and spending his time with Little Dorrit. Once Little Dorrit came to his office and said that her mother's servant Mr.Flinwinch in the shadows by the prison gate, and also another man with strange black spiny. By the time Pancks got in and introduced himself to Little Dorrit and asked to give her palm and said about her future. Arthur work in Bleeding heart yard brought him into contact with a gentleman called Mr.Meagles and his beautiful daughter Pet Meagles. Arthur remains of himself that he was 40 years old, Far too old to fall in love.

It was a very good thing for Arthur that he had resolved not to fall in love, for otherwise he would have grown to hate the handsome wealthy Mr.Gowam who would have been his rival in Pets love. against the will of her father Pet Meagles loved Mr.Gowdam, and agreed to marry him when Arthur heard of their Intended marriage .He went along for a walk by the river, carrying a bunch of roses he had intended to give to Pet as the roses were go into the river, the roses floated away on the river .Arthur went to marshal sea several times to see Little Dorrit.

"He put the roses in his breast and they walked on for a little while, slowly and silently, under the umbrageous trees. Then he asked her, in a voice of cheerful kindness, was there anything else that she would say to him as her friend and her father's friend, many years older than herself (LD.P.398)"

But whenever he called she was too busy to see him. Once they meet each other left the confines of the prison and walked side by side. Dear Little Dorrit soothed Arthur. He asked her why she was avoiding him, did she have a secret love with anyone, and Dorrit said not at all and said she was busy.

"They were very near the end of their walk, and they now came out of the gateway to finish it. Nothing would serve Maggie but they must stop at the grocer's window, short of their destination, for her to show her learning (LD.P.122)"

By the time Arthur and Dorrit returned to Marshal Sea Mr.Pancks was waiting at the gate. He was carrying a huge file full of papers. He said to Dorrit, as good fortune Arthur feeling a Fluttered of anticipation, took Pancks to his side and spoke hurriedly. Arthur made Dorrit to sit on a stone bench and held her hands in his face and said that his father can be a free man, he had inherited great wealth. Little Dorrit felt a dizzying sensation, as thought she was been physically lifted from the scholar around her.

All the three went to Mr.Dorrit in his old gray room wearing old gray gown and black cap. Dorrit informed his father about their fortune. She said the wall was gone, and you are prosperous. Arthur explained everything about the inheritance, Mr.Dorrit demanded to see Pancks and he was happy to pay him some money. His priority was to incur that his family should be worthy of noble and dignified family name of Dorrit. All wore new clothes, they all claimed into their carriage but they not found Little Dorrit. They saw Arthur carry Dorrit in his hands, and said to them that they forgot her, when she went to change her dress she fainted away.

The Dorrit family escape from the prison was a grand occasion people cheered from the yeard as the great gate opened. Anybody with sufficient wealth to be accepted by society knew of Mr.Merdle he was immensely rich and it was rumoured that every business he ever touched turned to gold, whether it be banking or building Mr.Merdle did everything that society accepted of him. Mr.Merdle was a reserved man and his wife was dissatisfied. It was to society that Mr.Dorrit and his family were now introduced .Mr.Dorrit had instructed his three children never to mention the Marshalsea. They must abandon all their previous habits of humility and present themselves as anybody's equals. They has a son Edmund Sparker who started at fanny in admiration from the movement he saw her. Mrs.merdle was keen to encourage this relationship with such a fine family. Within weeks arrangements had been made for Mrs.Merdle and her son to join the Dorrit family on a grand tour of the Alps and Italy.

A few weeks later Arthur received a letter from Dorrit and come to know about her sister marriage and about her. Arthur feels as he missed Little Dorrit terribly. Daniel Doyce had finally decided to his invitation to Russia, when he was meeting with great success. He

had left Arthur in a charge of the business in Bleeding Heart Yard. Doyce feels he had perfect confidence in Arthurs ability .He suggested him not to make risky investment. Arthur shared his partner's opinion. He says he had seen men lost all their money by making unsafe investments. Arthur said his mother about the Dorrits family change of fortune, then his mother felt happy and said to herself that she did nothing harm to her and felt relived.

Pancks suggested Arthur to invest Doyce money in Merdles and it would be as safe as house. He believed and investment in merdles so Doyce's property would double. Mr.Dorrit felt to accompany Fanny and Edmund back to London for their wedding. During the long journey back to Italy Mr.Dorrit felt ill and tied. He experienced a strange yearning for his former life in Marshalsea, yearning which made his heart ache .After they have arrived in Italy, Little Dorrit noticed the change in her father. He looked shrunken and old, ate little and asleep often.

A few days later some friends held a dinner to welcome the traveller back from London. In the dinner some of other guest insulted him as Ladies and gentleman, welcome to Marshal Sea both the father and daughter were pale and felt ashamed. As he wasted away next few days. Finally his spirit broke free of all earthly Concerns, Little Dorrit wept bitterly or her father death. Week later Arthur came to know about two news and shock, His head in his hand. One is that he got letter from Little Dorrit about her father death, and other his very bad news about Mr.Merdle had slit his wrist with penknife and was the news in morning news paper.

Arthur had gone against Doyce advice and invested Doyce money in Mr.Merdle business; he wept with regret and felt he had ruined his father. Arthur however was not so fortunate taking solely responsibility for Doyce new debts, he allowed himself to lead into the Marshal sea. He was placed and looked into Mr.Dorrits old room. He felt lonely and sighed for Little Dorrit days passed and Arthurs health and spirit sank under the weight that bore down on him .He was sure that he would die there, because it was so difficult to breathe .He slipped slowly into a fever a week later when he opened his life, there was a vases full of roses and in the corner, he found Little Dorrit knitting in the corner of the room, he was shocked to see her there. Her father hasn't invested everything in Merdle, she was poor again but she was not ruined, and was happier than before.

"I have nothing in the world. I am as poor as when I lived here. When papa came over to England, he confided everything he had to the same hands, and it is all swept away O, my dearest and best, are you quite sure you will not share my fortune with me now? (LD.P.976)"

Mrs.Clennem collected a legal document from her desk and moves out of her house and went to Dorrit and said she must explain herself to her and said she done a great wrong to her. She said by a complex maze of business intrigue and wills, little Dorrit was left with money and said she had kept it from her. She said that she had to restore it before she dies and asked Dorrit to forgive. She took the legal document from her bag and handed over to Dorrit, she read and forgave her.

By the time Dorrit reaches the prison Mr.Doyce was in Arthur room and they were in discussion about debts and Doyce excused Arthur and said Arthur you will have a new and prosperous career .Little Dorrit threw the document into the flames and never revealed to Arthur about the will. Arthur was released and both went too directly from Marshal Sea to the church where together they took their first step towards a modest useful and happy life.

"They all gave place when the singing was done and little Dorrit and her husband walked out of the church alone. They paused for a moment on the steps of the Portico, looking at the fresh perspective of the street in the autumn morning suns bright rays, and then went down (LD.P.986)"

From that day onwards they felt forever blessed as they followed life path together sunshine and shade, and lived very happily.

Title of the Paper: **PORTRAYAL OF CHILDHOOD AND SUFFERING IN CHARLES DICKENS' *DAVID COPPERFIELD*** / Authors: **Mrs. A. Vara Lakshmi Devi*, Dr. V. Sri Rama Murthy** and Dr. V.B. Chitra*****
Pages: **72-78** / Date of Publication: **25/06/2017**

So, far she published two articles now this paper is third article. She has ten years of experience in engineering college. She is interested in British Literature.

**Dr. V. Sri Rama Murthy **** is the Head of the Department of English at PRR & VS Government College, Vidavalur. He has been in teaching both in India and abroad for 19 years. He has been guiding Ph. D. Research Scholars of Vikrama Simhapuri University, Kakutur, Nellore and JNT University, Anantapuram. He has delivered several Guest Lectures, attended national & international workshops and seminars. He has also organized seminars and workshops. He has published several articles in both national and international journals.

**Dr. V.B. Chitra***** is the Head of the Department of English at JNTU (A) University, Anantapuramu. She is an Associate Professor at present. She has been guiding number of students at JNTU (A). She has delivered several Guest Lectures, attended national & international workshops and seminars. She has organized seminars and workshops. She has published several articles in both national and international journals.

***Abstract:***

*The present paper aims at studying the suffering of children and their living conditions in Victorian era. It is well known by the great development of the industrial revolution which had officially begun in 1950.It marks the most fundamental transformation of human life in the history of life. It created profound changes in the society; the worst was child labor a phenomenon that culminated in that period. The growing of population made a world of children, who lived in the work houses and were expected to work at the age of six or seven. Apart from this dickens also portrays the brutal treatment of children at the work houses. The present selected paper for research is David Copperfield which is Charles dickens Master piece and autobiographical novel which shows the social background of English society at that time. It is a novel that recounts poverty is bad. It is poverty that leaves David isolated and without a future as a child laborer in London. The research paper shows how a ten years David faced his hurdles in his childhood and how he suffered to have his own living as an orphan boy and how he get out of this sufferings and how his fate ended with his new happy life.*

*Key words: Copper Field, suffering, childhood and poverty.*

**Introduction:**

Charles Dickens was one of the great literary geniuses of all time and one of the most popular. He was nicknamed as the "Inimitable" and it can be argued that in all of English literature his creativity is revealed only by Shakespeare .He was enormously complex man. The present paper aims at presenting an Orphan boy's childhood and suffering in one of his masterpiece novel *David Copper Field* which is considered as his autobiographical novel also. In Most of his novels he mainly focuses on the poor and oppressed lives of children.

**Childhood and Suffering of David Copperfield:**

David Copperfield was born at Blunder stone a village in Suffolk. He was born with a Caul or membrane that covers the head of infant

that means he would be fortune in life. As a boy David experienced the loss of his parent, he knows in early years that his father died six months before he was born, when his mother Clara was six months pregnant .His father has a sister Betsey Trotwood, who never agreed to the marriage of her brother to Clara. They were separated to this reason. His aunt Betsey came to see Clara after his brother's death, she believed that the new born child was a girl, and she has to become the God mother to that child. Miss Betsey came to know that the child in Clara's lap was a boy; she rushed out of the house, never to enter the door again.

> "She went like a discontented fairy; or like one of those supernatural beings, whom it was popularly supposed I was entitled to see; and never came back any more."(Dickens, 24)

David at last reaches to the safe hands of his aunt after all his sufferings from then onwards he leads a happy life. With the gradual passage of time as an Orphan boy David spends his happy days with his mother and his nurse Peggotty. All the three become accustomed to a new happy life. David's happiness ends when one day Clara entered the house with Mr. Murdstone, a gentleman with beautiful black hair and Whiskers though the gentleman patted David with affection yet the boy didn't like him or his deep voice.

Clara and Murdstone decided to get married, David was sent away with Peggotty to her brother's house in Yarmouth, as David was too young to be told about the decision. Two weeks passed away Peggotty and David came back to home after a long journey. David found his mother married to Murdstone, he came to live with Clara along with his sister Jane Murdstone. From then everything changed. Mr. Murdstone treated David very harshly and in order to escape from the unhappiness of his life David lays his only pleasure in reading books that his father left them to him. It became clear that reading books can be seen as the only shelter for David to escape from the cruel treatment of Mr. Murdstone.

These books became his best friends in isolation. On one occasion David failed in successful completion of some lessons while David's mother was teaching him. David witnessed a cane in the hand of Mr. Murdstone, thus he was interrupted and feels afraid and forgets what his mother taught him. In the mean time Mr. Murdstone ordered him to walk up to his room, suddenly David surprised by the behavior of Mr. Murdstone of beating him.

> *"He had my head in a vice, but I twined him somehow, and stopped him for a*

> *moment, entreating him not to beat me. It was only for a moment that I stopped him, for he cut me heavily an instant afterwards, and in the same instant I caught the hand with which he held me in my mouth, between my teeth, and bit it through. It sets my teeth on edge to think of it" (Robert E. lougy, 414)*

David cried and pleased him to don't beat him and told him that he can't learn with their attendance. Moreover David tried to stop him and in order to defend himself he bites Mr. Murdstone in his hand. As a reaction to this Mr. Murdstone beats David again harshly as if he beat him to death, as a result of his misbehavior with his step father David was imprisoned for five days, David sees no one but only Miss. Murdstone who brings to him bread, meat and milk. David suffers a lot from the length of these five days. Thus he resembles them with years instead of days that had gone from his life. "Shall I never forget those lessons?" His biting of Murdstone's hand "Sets my teeth on edge to think of it" and the subsequent hours of punishment with the accompanying "Oppression of remembrance" are the memories that the narrator will "never forget" (Rosemary Mundhenk, 332)

David explains the long hours especially at night that makes him uncertain and doubt of knowing the time whether it is morning or not. As a consequence of this punishment of imprisoned and in the evening of the five day, Peggotty informs David that he will be send to school in London as it was decided by Mr. Murdstone. When Peggotty informs David about the decision of Mr. Murdstone of sending him abroad, he feels sad and began to blame himself and ask question to himself as what he had done to have been sent to hardest school.

Of course they hate him. It became clear from the beginning; they harshly, steadily and sullenly over looked at him. Mr. Murdstone had a desire to throw him away abroad to get rid of him. The changed circumstances cast a devasting effect on Clara's health and she soon realized the ghastliness of her decision to marry Mr. Murdstone. However by the time, it had been too late and the two devils had entered her peaceful life to bring loads of miseries.

School is a place from which people acquire knowledge, encounter with each other and learns a lot of information .But peoples sometimes struggle to get their success with the cruel treatment of head master and teachers as it is occurred

in a vast number of dickens novels in his several works. Dickens tackled the subject of children at schools especially in his novel *David Copperfield*.

David was sent away to a brooding school in London, a miserable school under the oversight of Mr. Creakle, who has a harsh treatment with the boys of the school .He, was sent much before the start of the term. Mr. Murdstone designed a plan to get rid of David as a result of his misbehavior with him. David was surprised as he was received everywhere with the name of Murdstone instead of Copperfield. The school was enclosed with a high brick wall and looked very strong and dull.

The first thing Mr. Murdstone done to David as a punishment for him is that he sent him to the school in holiday, when there is no one in the school. It became clear that Mr. Murdstone send David to Salem house school in a holiday as a retribution for David's behavior with Murdstone. The second bad thing that Mr. Murdstone done to David is that he told Mr. Creakle to treat David cruelly that emerged from his first meeting with him, when Mr. Creakle meet David for the first meeting with him. When Mr. Creakle meets David for the first time, he told him that he knows his step father Mr. Murdstone. David spends three months in Salem house unhappy and suffering but his worst thing that makes David suffer a lot during this time. "To make the matter worse, he was forced to wear a placard that bore the words "Take care of him, he bites". (Terry O'Brien, 9)

David suffers psychologically more than physically from the sign that he was obliged to wear, David became a game to other boys in school, and they enjoyed his placard too much. Tom traddles was the first boy to return from holiday befriended David. The only person who supports David during this time was Steer forth, who takes care of him in Salem house.

The time came for boys to visit their homes. David reached home and spends happily two days with his mother, Peggotty and his little brother. The next day Mr. Murdstone along with his sister Jane came home, everything changed again. David was restricted to spend time with Peggotty. The day came David have to leave home and go to school. His mother Clara bid him bye with the little brother in his hand. That was the last time he saw his mother and brother.

> *"I looked out, and she stood at the garden-gate alone, holding her baby up in the arms for me to see. It was cold still weather; and*

*not a hair of her head, or a fold of her dress, was stirred, as she looked intently at me, holding up her child."(Dickens, 133)*

One day when in school he was called by Mr. Creaks .He was informed that his mother was seriously ill after his arrival and was dead now. His grief not stopped by the news. He immediately reached home and attended the funeral of his mother. Peggotty was very affectionate with David and explained how his mother died. After his mother's death poor David felt very loanly. Miss. Peggotty was dismissed from the works. Mr. Barkins and Peggotty got married in a private ceremony at a church which was attended by Copperfield.

After the death of his mother David was removed from school and Mr. Murdstone sends him to work at the "Blacking Factory "thrown away in a very little age of ten. David was surprised by this action; he didn't think that Mr. Murdstone could do something like that by sending him to work. While sending to blacking factory Mr. Murdstone said some terms to David that he will earn enough for himself to provide for his eating, drinking and pocket money. He also said his lodges will be arranged by Murdstone. The next day he was sent to London with Mr. Quinion to begin the world on his own account. The duty assigned to David in the blacking house is to keep labels on the empty bottles, washing the bottles or corks to be fitted.

*"When the empty bottles ran short, there were labels to be pasted on full ones, or corks to be fitted to them, or seals to be put upon the corks ,or finished bottles to be packed in casks."(Terry O'Brien, 34)*

Mr. Quinion introduced Mr. Micaber to David, who was an agent and took orders on commission. Micawber was introduced to David on the subject of his lodgings and to stay with him. The salary for David at blacking house was 6 shillings a week. David was taken to Mr. Micawber family for his lodgings. Theirs is a funny family and were affectionate with David. Mr. Micawber was sent to jail due to his debts and was again released soon. But Micawber family decided to go to Polymath and left London. David decided he wouldn't stay in London without Micawber and resolved to run away to his aunt Miss. Betsy Trotwood on the suggestion of Micawber.

*"I had resolved to run away –To go, by some means or other, down into the country, to the relation I had in the world, and tell my story to my aunt, Miss Betsey". (Dickens, 187)*

David has faced many struggles on his way to reach his aunt Miss. Trotwood. His money was stolen on his way along

Available in on line at www.issnjournals.com

Title of the Paper: **PORTRAYAL OF CHILDHOOD AND SUFFERING IN CHARLES DICKENS' *DAVID COPPERFIELD*** / Authors: **Mrs. A. Vara Lakshmi Devi*, Dr. V. Sri Rama Murthy** and Dr. V.B. Chitra*****
Pages: **72-78** / Date of Publication: **25/06/2017**

with his bag, he sold his clothes and earns some money, but it was not sufficient to reach his aunt.

At last he reached his aunt in Dover. By the time he reached there he was thirsty, hunger and tied. His aunt never liked boys and not accepted him to enter his house, but David explained everything about him and his relationship with her and about his step father Mr. Murdstone and his sufferings. She was convinced and took him by her love and affection and offered him food. Miss. Trotwood sent a letter to Mr. Murdstone about David's arrival to her house. Both Mr. Murdstone and Jane came to his aunt house.

> *"Thus I began a new life, in a new name, and with everything new about me. Now that the state of doubt was over, I felt for many days, like one in a dream." (Dickens, 225)*

But David refused to go along with them. David's aunt adopted David and kept along with her. Miss Trotwood renamed David name as Trotwood Copperfield. His aunt decided to send him to Canterbury for his further studies. By this David's suffering ended and lived very happily with his God Mother.

**Conclusion:**

David by the end reaches his God mother house Miss Trotwood; she takes the complete responsibility of the boy. Though David has faced many problems at a very small age, all his struggles come to an ends and after he reaches his Aunt house. From then onwards David leads a very peaceful and happy life with his one and only relative Miss Trotwood. David within a short period forgets his past bad memories and sufferings and lives a wonderful life with his Aunt.

# The Role of Blended Learning in Teaching English at Under Graduate Level

**Dr. V. Sri Rama Murthy,**
Lecturer in English, Govt. Degree College, Naidupet, A.P, India

**Abstract**
In order to be successful in their teaching, teachers always look for different ways to increase the quality of their teaching. These days the use of computers and new technologies play pivotal role in teaching a foreign language, particularly English. In this situation computer-based distance learning courses that are supported by e-learning have emerged. E-learning is also exploited in the 'blended learning'. The term 'blended learning' is defined as 'a combination of online learning and face-to-face learning'. This has been defined in different ways by different people. Blended Learning instruction is a new teaching and learning approach that is being promoted at many higher educational institutions and universities at under graduate level, involving an integration of learning technologies and face-to-face teaching. It emerges as one of the most widespread teaching modalities used nowadays in the educational field, mainly by Universities and Higher Education Institutions mainly at under graduate level. Based on the concept of blended learning, it can be assumed that the introduction of this form in teaching and learning process can improve the efficiency of the educational process in a changing standard of modern education. So it is hoped that the blended learning approach is likely to emerge as the predominant instructional model in the future particularly at under graduate level.

**Key words:** teaching, computers, blended learning, e-learning

 ©copy right ORAY PUBLICATIONS

In order to be successful in the process of their teaching, teachers always look for different ways to increase the quality of their teaching. These days the use of computers and new technologies play pivotal role in teaching a foreign language, particularly English. In this connection, Brown says 'Teachers of English have a mission to help everyone in the world to communicate with each other and solve global problems. Of course, this is so because of the global status of English' (Brown, 1991). In this situation, computer-based distance learning courses have emerged. 'One of the supports of the distance learning is e-learning. Sometimes e-learning is also exploited in the so-called 'blended learning'.

The term blended learning originated in 'the business world in connection with corporate training' (Sharma and Barrett, 2007), then 'was employed in higher education' (MacDonald, 2006), and lastly it appeared in language teaching and learning. The research on blended learning reveals that this type of learning is used to increase the quality of learning. As opined by Dziuban, et al, 'Many researchers believed that blended learning is an essential learning process to enhance the efficiency and quality of learning because the blended learning supports all the benefits of pedagogical approaches that combine effectiveness and socialization opportunities of the classroom with the technological enhance active learning possibilities of the online environment' (Dziuban, Hartman, & Moskal, 2004, P.2).

The term 'blended learning', in general, is defined as 'a combination of online learning and face-to-face learning'. However, this has been defined in different ways by different people. Blended learning has been described as 'a pedagogical approach that combines effectiveness and socialization opportunities of the classroom with the technologically enhanced active learning possibilities of the online environment' (Dziuban, Hartman, & Moskal, 2004). Graham considers 'blended learning as an approach, and defines it as a learning approach that combines different delivery methods and styles of learning. The blend could be between any forms of instructional technology (e.g., Videotape, Web-based learning, CD-ROM, etc.)' (Graham, 2006). Rooney said, 'Appearance of the information technologies in teaching foreign languages led to appearance of a relatively new method, called blended learning. The term is most commonly defined as a combination of online and face-to-face instruction' (Rooney, 2003). Lieser & Taff define as, "Technology has been used inside and outside of the classroom for teaching and learning in many ways. Blended learning is a formalized model that provides individualized learning for students using a combination of face-to-face and technology-based learning in a planned, systematic way" (Lieser & Taff, 2013). Harvey elaborates, "The amount of technology used and time for students to spend with the technology depends on the implementation of the blended learning model. Blended learning is a flexible approach that combines face-to-face teaching/learning with remote (usually internet-based) learning" (Harvey, 2004–9). Bliuc et al. regards blended learning as the set of "learning activities that

 ©copy right ORAY PUBLICATIONS

involves a systematic combination of face-to-face interactions and technologically-mediated interactions between students, teachers, and learning resources" (Bliuc et al, 2007, P. 234). Based on the definition by C. Graham "three components of blended learning can be singled out:

- face-to-face learning that represents a traditional format when instructors and students meet during classes;
- self-study learning that assumes different types of activities, such as search on the Internet, webquests, etc, performed by students unassisted;
- online collaborative learning – an online cooperative work of students and instructors in forms of webinars, wikis, Skype conferences, etc." (Graham, 2005).

The role of blended learning in teaching English at under graduate level is useful, and blended learning facilitates the students acquire language with utmost interest. According to Thorne 'blended learning is the most logical and natural evolution of our learning and it suggests an elegant solution to the challenges of tailoring learning and development to the needs of learners. Thus, blended learning represents an opportunity to integrate the innovative and technological advances offered by online learning with the interaction and participation offered in the best of traditional learning. Blended Learning emerges as one of the most widespread teaching modalities used nowadays in the educational field, mainly by Universities and Higher Education Institutions' (Thorne, 2003). Blended Learning instruction is a new teaching and learning approach that is being promoted at many higher educational institutions and universities at under graduate level, involving an integration of learning technologies and face-to-face teaching, and it can not only hone the English language proficiency of learners, but also allow them to have more access to the language of native speakers.

Previous studies investigating the effectiveness of the blended learning approach have reported that 'it meets the educational needs of students such as enhancing flexibility and convenience, allowing the attainment of higher achievement and attitude levels, and improving language learning skills as well as developing critical thinking skills (Lee & Chong, 2007). Another aspect of blended learning is whether it deepens learning engagement and increases motivation in learning. Sucaromana finds that 'students who are taught in a blended learning environment have higher levels of intrinsic motivation, a better attitude toward the learning subject, and even better satisfaction with the learning climate than a face-to-face only environment. However, studies have reported on students' apprehension, anxiety and confusion when interacting with online materials' (Sucaromana, 2013). This type of experience is very common when students have no sufficient exposure to technological innovations in the classrooms. Moreover, ambiguous instructions and guidelines may cause students to become lost and disengaged, and so innovations involving technology should be integrated appropriately and effectively within

 ©copy right ORAY PUBLICATIONS

classrooms in order to improve and maximize the learning outcomes of the students. This study posits that the incorporation of self-access online reinforcement exercises would have positive pedagogical impact on them.

The role of teacher in implementing this blended learning approach is prominent. With reference to English Language Teaching using blended approach, Sharma suggests 'for blended learning to be effective the two component parts should be integrated with the technology complementing and not replacing the efforts of the teacher' (Sharma, 2007). According to Lewis, "technology is nothing without a teacher and a plan" (Lewis , 2009, P. 9).

Language learning is such a complex process that it is impossible to offer a single solution to all our problems, and to arrive at the perfect approach or technique for language learning in Indian context. Perhaps the best method is the one which works, and this varies from context to context. Any method which creates conditions for learning to take place is good. It should enable the learner to acquire the strategies of learning rather than merely equipping him with knowledge. What is important for the teacher, therefore, is to find out what approach and what method will enable him to realize a particular objective under a set of particular circumstances. Since it is felt that blended learning at under graduate level is useful, it is preferable that teachers and educationalists can make it an integral part in their curriculum. Focus should be drawn to learning center instruction. Blended learning offers approaches to solving one of the main tasks of modern traditional education, i.e. the implementation and development of each student's potential abilities. Based on the concept of blended learning, it can be assumed that the introduction of this form of training to teaching practice can improve the efficiency of the educational process in a changing paradigm of modern education. The blended learning approach is likely to emerge as the predominant instructional model in the future.

# Phytochemical Analysis and Antibacterial Activities of *Boswellia Ovalifoliolata*

**M. John Paul[1], Dr. SKM. Basha[2]**

[1] Research Scholar, Research and Development Centre, Bharatiar University, Coimbatore, Tamilnadu, India

[2]Department of Botany, Vikrama Simhapuri University, Kavali, Nellore Dt, Andhra Pradesh, India

**Abstract:** ***Different parts of Boswellia Ovalifoliolata were collected from different localities of Udayagiri hills of Velugonda hill range, Eastern Ghats, Nellore Dt, Andhra Pradesh, India. The methanolic extracts of various parts of the plants were qualitatively screened for phytochemicals using standard procedures which revealed the presence of various important bioactive chemical entities. Antibacterial activity of the methanolic extracts of stem bark and gum were evaluated against Bacillus subtilis, Staphylococcus aureus, and Gram negative bacteria Proteus vulgaris, Pseudmonas aeruginosa. The methanolic extracts of these plant parts have exhibited significant broad spectrum antibacterial activities.***

**Keywords:** Phytochemicals, Antibacterial, Ethnobotanical

## 1. Introduction

The treasure of traditional medicine, the plant kingdom has components of therapeutic values. More than 80 percent of the global population depends on the traditional medicine for improvement health, resistance and maintenance of good health. These Phytochemicals extracted from various parts of the plants act as natural antimicrobial agents. The metabolites extracted from the plants have curative properties and they can be used to treat outrageous infections and chronic diseases. One of the emerging global threats is multidrug resistance in pathogens. Hence the need of the hour is to search for novel antimicrobial agents. An abundant research work is going on to investigate the antimicrobial activity of various plant parts. A large number of antimicrobial chemical components of medicinal plants were identified and now they are under usage for treating offensive microbial infections and chronic diseases.

The Gum and stem bark of *Boswellia Ovalifoliolata* a member of Burseraceae have several therapeutic values. Oleo gum resin is used against ulcers, dysentery, joint pains and inflammations. Gum is used externally to cure arthritis (Y,N) (Nagaraju, 1992 ; Vedavathy, 1992). Gum with the fresh leaf juice is given in ulcers in mouth and throat (Vedavathy, 1992). Shade dried gum is powdered and dissolved in water. The extract obtained is mixed with curd and given orally to cure amoebic dysentery (Nagaraju, 1992). Gum powder of the plant is mixed with white precipitate of pounded stem of *Tinospora cordifolia* and honey , given orally in small quantity (10 ml),two times a day to cure hydrocele (I) (Vedavathy *et al.,* 1997a,b). Gum powder of *Boswellia ovalifoliolata* and *Boswellia serrata* and the fruit powder of *pedalium murex* are made into a paste. This is applied externally on the affected part of the testicles to cure hydrocoel . The treatment is continued for a fort-night (Y,Ye,I).

Stem bark and resin are shade dried and made into powder. About one tea spoonfuls of the mixture is given daily with sour milk on empty stomach for a month to cure stomach ulcers (Y,I).

## 2. Materials and Methods

The collected plant materials were cleaned, shade dried, powdered coarsely in a blender and then stored in air-tight containers for future use. The methanolic extracts of various parts of the plants were qualitatively screened for phytochemicals using standard procedures.

Fluorescence analysis was carried out following Chase and Pratt (1949) and Kokoski *et al.* (1958). The selected powdered drugs were studies both in visible light and Ultra-Violet light for their fluorescence characters.

The Pharmacognostical study includes morphology of the plant, macro and microscopical studies of the drug. Plant materials like gum and stem bark were collected for the studies. Following the techniques of Johansen (1940), Wallis (1967) and Trease and Evans (1985) the parts of the plants used as drug (stem bark, gum ) were fixed in 70% alcohol for 24 hours. Free hand sections taken were stained with safranin and light green and the permanent slides were prepared. Histochemical tests were carried out by treating the sections with solutions of phloroglucinol, chloral hydrate and hydrochloric acid as per Trease and Evans (1985). Maceration was carried out for the study of various cells and tissues. The small pieces of the materials were macerated with nitric acid and potassium chloride as per Trease and Evans (1985). The measurements of tissues (Quantitive microscopy) were carried out using ocular and stage micrometers (Erma-Japan) following Wallis (1967).Line drawing were drawn by using a Camera Lucida (mirror type). Photographs of the plants and the crude drug were taken by using a Minolta camera.

## 3. Experimental Studies

**Alkaloids test:** The methanolic extract was evaporated to dryness and the residue obtained was digested with 1% Hydrochloric acid. The resulting acidic solution was divided into two parts. To one part was added Mayer's reagent and to the second part dragendorff's reagent. Appearance of precipitate or turbidity indicates the presence of alkaloids.

Licensed Under Creative Commons Attribution CC BY

**Preparation of reagents**

**a) Mayer's reagent:** 1.3 g of Mercuric chloride and 5g of Potassium iodide were dissolved separately in 60 ml and 10 ml of double distilled water and both the solutions were mixed and diluted to 100 ml.

**b) Dragendorff's reagent:** 8g of the Bismath nitrate was dissolved in 20 ml of conc. nitric acid and 27.2g of Potassium iodide in 50 ml of double distilled water. Both the solutions were allowed to stand till $KIO_3$ crystallized out. Supernatant was decanted and final volume was adjusted to 100 ml.

**c) Flavonoids:** The plant extract was tested for flavonoids by shinoda's reaction. To a few ml of Methanolic extract, conc. Hydrochloric acid, Magnesium powder and a few fragments of Mg metal was added. The presence of flavonoids was identified by the development of pink or magneta or red coloured flame.

**d) Terpenoids (Liebermann-Burchard's test):** The Liebermann-Burchard's reaction was carried out by adding 0.5 ml of $H_2SO_4$ along the side of the test tube containing a mixture of Methanolic HCl and Acetic anhydrate (0.5 ml each). Formation of colour from green to bluish-green (sometimes via red or blue) indicate the presence of terpenoids.

**e) Steroids (Salkaowski reagent):** Development of wine red colour on adding con. $H_2SO_4$ and $CHCl_3$ to the Methanolic extract indicate the positive test for steroidal compounds.

**f) Lignins:** The plant extract was tested for the presence of lignins by adding conc. HCl and 2% Forfuraldehyde. Development of red colour indicates the presence of lignans.

**g) Indoles:** The development of voilet colour in the methanolic extract on adding Ehrilich reagent is considered as a positive reaction test.

**h) Carbohydrates (Molisch test):** To the methanolic extract, α-napthol solution (1.0g dissolved in 100 ml of each ethanol w/v) was added. Then Conc. $H_2SO_4$ was added gentlyalong the walls of the inclined test tube. Formation of a red to voilet colour indicate the presence of carbohydrates.

**i) Test for reducing sugars:** 2ml to 5ml of Benedict's reagent, 5ml of the test solution was added. The tubes were incubated in boiling water on water bath for 10-30 minutes. The development of an orange red precipitate indicate the presence of reducing sugars.

**j) Protiens (Million's test):** Million's reagent (solution of Mercuric nitrate in nitric acid) was added to 20 ml of boiling Methanolic extract. Formation of white precipitate that gradually turns red upon heating was observed for the presence of proteins.

**k) Phenolic compounds:** To the test solution 1-4 drops of 1% Ferric chloride was added. Appearance of intense colour in the extract was observed for the presence of phenolic compounds.

**l) Anthocyanidins:** The formation of red or purple colour with the plant extract, on adding equal volume of Methanolic HCl was taken as a positive reaction for anthocyanidins.

**m) Anthraquinones:** 20ml of benzene was added to 5g of plant powder and filtered. To the filtrate 5ml of 10% Ammonium hydroxide solution was added and shaken well. The formation of pink, red or violet colour in the ammonical phase indicate the presence of anthraquinones (Wall *et al.,* 1954 anf Frans Woath, 1966).

**n) Saponin test:** The plant extract was evaporated to dryness. Tap water was added and shaken vigorously in a graduated cylinder for 15 minutes. Formation of a persistent foam was taken as a positive reaction test.

**o) Tannins:** The Methanolic extract was concentrated and the residue was dissolved in water and tested with 1% Gelatin solution and 1% Gelatin salt solution (1g gelatin dissolved in 10g NaCl w/w) to separate volumes. The appearance of white precipitate indicate the presence of tannins.

## 4. Screening for Selective Secondary Constituents

### A. Phenolic compounds:

**a) Extractive procedure:**

The phenolic constituents were extracted by following the method given by Bate Smith (1954) and Ibrahim and Towers (1960). About 25g of healthy plant material was macerated with 100ml of 2N Hydrochloric acid.(HCL). The homogenate was digested on a boiling water bath for about half-an-hour. The contents were cooled and filtered through Whatman No.1 filter paper. The filtrate was extracted repeatedly with peroxide free diethyl ether. All the extracts were pooled and concentrated to 100ml and was treated three times with 25ml of 5% anhydrous sodium carbonate solution. The pooled carbonate solution was adjusted to pH 2.0 with Conc. Hydrochloric acid.

The acidified fraction at pH 2.0 was extracted with equal volumes (25ml) of fresh diethyl ether thrice. The combined other extracts were washed with distilled water repeatedly till all traces of hydrochloric acid was removed. The ether soluble water was removed by freezing the extract. The ether was evaporated to dryness on water bath at $98^0$C and the resulting phenolic compound residue was dissolved in 1ml of 95% ethanol. This was stored at low temperature in dark container for ready use.

**b) Identification**

About 2g of fresh weight equivalent to the final alcoholic extract was spotted on 23x29cm whatmann No.1

Licensed Under Creative Commons Attribution CC BY

Chromatographic filter paper with the help of micro pipette. The origin of the spot area was dried immediately with the help of hair-drier. Two dimensional ascending Chromatographic technique was adapted with benzene-acetic acid-water (60:70:30 v/v/v, upper layer) in the direction and sodium formate-formic acid-water (10:1:200 w/v/v) in the second direction. The Chromatographic chambers were saturated with the above solvent systems one day before the development of the Chromatograms at 22 to $24^0$c. The sheets after development were removed from the chambers and dried at room temperature. The dried sheets were observed under Ultra violet light and flourescent regions were marked. The papers while exposing to Ammonia vapours were also observed under UV light and new flourescent spots were marked.

The seperated phenolic compounds on the Chromatograms were identified by comparision of $R_f$ values and individual spot colours of Chromogenic sprays. The final confirmation was made with authentic samples by co-chromatography.

**c) Chromogenic spray reagents:**

**i) Diazotized sulphanilic acid reagent:**
25ml of freshly prepared 5% sodium nitrate was slowly added to 5ml of sulphanilic acid solution (900mg of sulphanilic acid was dissolved in 9ml of Conc. HCl and the solution was diluted to 100ml with $H_2O$) at $0^0$c. To intensify the colours of the developed spots, 20% Sodium Carbonate solution was sprayed to the wet sheets (sprayed at $0^0$c immediately after spraying the above solution).

**ii) Diazotized *p*-Nitraniline reagent:**
10ml of *p*-nitraniline reagent (1.5g of *p*-nitraniline was added to 45 ml of Conc. HCl and was made up to 950ml with distilled water) was mixed with 0.2ml of 5% Sodium nitrate and 10ml of 10% Sodium carbonate solution.

**Solvents:**

1. Benzene**:**Acetic acid **:** Water → 60:70:30
2. Sodium Formate**:** Formic acid**:**Water → 10 :1 :200

**B. Flavonoids Compounds**

**a) Extractive procedure**

The flavonoid compounds were extracted according to the method given by Markham (1982). About 5g of powdered plant material was extracted in two steps. First 18ml of Methanol and 2 ml of water (9:1) were added, shaken well and kept for one day at room temperature. The supernatant solution of the extract was taken and transferred to another test tube. Secondly Methanol and water of 5ml each (1:1) was added to the remaining residue, stirred well and the mixture left for 24 hours. The two extracts were combined, mixed well and filtered through cotton wool. Later the filtrate was evaporated to about 1/3 the original volume till most of the methanol was removed. The resultant aqueous extract was extracted with chloroform repeatedly for 3 times. The solvent extracted aqueous chloroform layer was evaporated to dryness under vaccum in a rotary evaporator. The dried residue was saturated with 1 ml of 95% alcohol and stored in a dark place at low temperature.

**b) Identification**

The extracts containing flavonoids were separated in suitable quantities on Whatmann No.1 Chromatographic filter paper(23x29 cm) adopting the ascending technique using the solvent system Iso-propyl alcohol **:** Ammonia (25%) **:** Water(8:1:1:v/v/v) and n-butanol:acetic acid: water(4:1:5v/v/v) (top layer was used).The dried Chromatograms were examined under UV lamp and the fluorescent spots were marked. The papers while exposed to Ammonia Vapours were also observed under UV lamp and the new fluorescent regions were marked. The flavonoid compounds were identified by comparing the $R_f$ values and colours with those of the authentic samples on the Chromatograms. Co-Chromatographic studies were conducted with authentic markers to confirm the identification.

**C) Chromogenic spray reagents**

**Diazotized sulphanilic acid reagent (Markham, 1982) :**0.3% solution of sulphanilic acid in 8% HCl (25ml) was mixed with 5% Sodium nitrite solution(1.5ml) just before use. The Chromatographic sheets were sprayed with this mixture and with a 20% solution of anhydrous Sodium carbonate.

**1% Alcoholic ferric chloride:**1 g of Ferric chloride was dissolved in alcohol and made up to 100ml.

**1% Alcoholic Aluminium chloride:**1g of Aluminium chloride was dissolved in alcohol and made up to 100ml, just before spraying of the chromatographic sheets

**Table:** Flavonoids:

**Solvents:**

1. Iso-propyl alcohol**:**Ammonia(25%) **:**Water → 8:1:1 & n-butanol**:**Acetic acid**:**Water → 4:1:5

**C. Amino acids**

**a) Extractive procedure**

Amino acids were extracted following the method of Das Chowdary *et al.,* (1967). About 5g of plant material was cut into small pieces and plunged immediately into a round bottomed flask containing 20ml of 80% Ethanol. It was reflexed for 30 minutes over a boiling water bath. The boiled material was ground in mortar using additional volumes of 10ml ethanol 80% (v) and centrifuged at 2000 rpm. The supernatant was collected and the Ethanol removed in vaccum. The aqueous extract was passed through Dowex 50W-X8 ($H^+$ from 20-50 mesh) column (1x10cm). the amino acids were eluted from the column with 50ml of 2N Ammonium hydroxide. The elute was evaporated to dryness and the residue was saturated with 95% Ethanol(1ml).

**b) Identification**

The extracts containing amino acids were seperated on Whatmann No.1 Chromatographic filter paper(23x28 cm) employing two-dimensional ascending technique using the solvent system:

1) Sec. butanol **:** Formic acid **:** Water(75:13:12v/v/v)-1st direction.
2) Buffer saturated phenol (1:2v/v)-2nd direction(6.3 g of Sodium citrate and 3.7g of Potassium dihydrogen phosphate were dissolved in 100ml of distilled water. To this 200ml of distilled phenol was added)

The amino acids were identified based on comparision of $R_f$ values, colours and with those of authentic samples by co-chromatographic studies.

**D. Anthocyanidins:**

**a) Extractive procedure:**The anthocyanidin constituents were extracted according to the method described by Harborne (1973). About 5g of plant material was immersed in 20ml of 2N HCl in a boiling test tube and heated for 30-40 minutes at6 $100^0$c. The extract was cooled and filtered. The filtrate was washed twice with 20 ml of ethyl acetate to remove flavones. The remaining aqueous extract was further heated at $80^0$c for 3 minutes to remove the last traces of ethyl acetate. The pigment was re-extracted again with a small volume of Iso-amyl alcohol. The Ethyl acetate extract was evaporated to dryness on a boiling water bath. The anthocyanid in the residue was diluted with 1ml of 1% Methanolic HCl and preserved at low temperature in dark for future use.

**b) Identification:**

The extracts containing anthocyanidins was separated on 23 x 29 cm Whatmann No.1 Chromatographic filter paper. Unidimensional Chromatographic ascending technique was employed with Conc. Hydrochloric acid, Formic acid, Water (2**:**5**:**3 v/w/v) and n-butanol**:** Acetic acid **:** water(4:1:5). The Chromatograms developed from the said solvent systems were taken out from the glass chambers and dried at room temperature. The fluorescent regions of dried papers were marked under UV light. The $R_f$ values and colours of the spots were determined by comparing with those of the authentic markers on the Chromatograms.

**Table 4a:**

| **Compound** | Stem Bark | Gum |
|---|---|---|

2) n-butanol **:** Acetic Acid **:** Water → 4**:**1**:**5

**Thin layer Chromatography (TLC):**

**E. Lipids:**

**a) Extractive procedure:**

Lipids were extracted following the method adopted by Hoppe and Heitefuss (1974). A solvent mixture consisting of 30ml Chloroform, 60ml of Methanol and 20 ml Water(1**:**2**:**0.8 v/v/v) was taken and allowed to boil. About 5g of plant material was homogenized in the above solvent mixture. The contents were filtered and taken separately. The residual mixture was treated with 70ml Methanol and

Licensed Under Creative Commons Attribution CC BY

the filtrate taken. The residue was again washed with 100ml Chloroform. All the above filtrate mixtures were taken in a separating funnel and 90ml of water added. The mixture now contains Chloroform**:** Methanol**:** Water in the ratio of 2**:**2**:**1.8 respectively and the mixture were allowed to settle. The lower lipid layer containing chloroform was separated and transferred into a breaker. The upper water layer was treated with 50ml of Chloroform successively for three times. All the extracted Chloroform layers were evaporated to dryness in a vacuum by rotary evaporation maintained at $40^0$C. The residue was treated with 2ml of Benzene to remove the traces of chlorophyll if present. Now the final lipid residue was dissolved in 2 ml of Chloroform and stored at low temperature in dark until use.

**b) Identification**

Thin layer plates were prepared by spreading a slurry of silicagel-G (50g in 100ml distilled water) to 105 mm thickness over thin glass plates. The glass plates were air dried and stored at room temperature. Before using, the plates were heated at $110^0$c for 30 minutes in a hot air oven for activation. Using micropipette, one gram equivalent of lipid extract was taken and potted on TLC plates. The spotted areas were allowed for immediate dryness with the help of a drier. The dried plates were run in uni dimensional ascending Chromatography by using TLC glass chambers. The chambers were saturated with developing solvents one day before the plates were developed.

**Solvent systems:**

1) Chloroform**:** Methanol**:** Acetic acid**:** Water (170**:**25**:**25**:**3 v/v/v/v)
2) Acetone**:** Benzene**:** Water(91**:**30**:**8 v/v/v).

The plates were placed in airtight tanks. The developed plates were removed and dried at room temperature and exposed to Iodine vapours to visualize all the lipid compounds.

The TLC plates were sprayed with 25% Sulphuric acid reagent with the help of an automizer for the clear detection of various lipid layers. The lipids were identified by comparision of $R_f$ values, color and with those of authentic samples by Co-Chromatographic studies.

**c) Chromogenic spray reagent:**

The TLC plates were sprayed with 25% Sulphuric acid and heated to $230^0$c for 15 minutes, and the colour observed. Glycolipids gave red brown while phospholipids gave bright, red and other lipids gave pale brown colour spots on white background

**Table 5a:** Lipids

## 5. Determination of ash values

The object of ashing crude drugs is to remove all traces of organic matter which may otherwise interfere in an analytical determination. The inorganic salts naturally occurring in drug or adhering to it or deliberately added to as a form of adulteration are removed by gradual incineration of the drug. Thus the residue remaining after incineration of the powdered drug is known as ash content. The ash values are a criterion to judge the identity or purity and quality of the crude drug.

**a) Determination of total ash:**

Total ash usually consists of Phosphates, Silicates and Carbonates of Potassium, Calcium and Magnesium. About 2 gm of the air dried powdered drug was accurately weighed and taken in a tared silica crucible, which was previously ignited and weighed. The powdered drug was spread as a fine even layer at the bottom of the crucible. The crucible containing the drug was gradually incinerated in a muffle furnace by increasing the temperature. It was heat dull red hot until free from carbon or converted into ash. Later the crucible was allowed to cool and kept in desiccators. The residue was weighed the percentage of total ash calculated with reference to the air dried sample. The residue was weighed the percentage of total ash calculated with reference to the air dried sample. The procedure was repeated till constant result was obtained.

**b) Determination of acid insoluble ash:**

Acid insoluble ash is a part of total ash insoluble in dilute Hydrochloric acid. The acid insoluble ash content is determined and recommended for certain drugs may be coated with dirt and sand. The total ash obtained as described above was treated with 25ml of 10% Hydrochloric acid and boiled for 5 minutes. The insoluble matter was filtered and collected on ashless filter paper (Whatman No.42) and the paper washed with hot water. The insoluble ash was ignited and weighed in a tared silica crucible. The acid insoluble ash of the drug was repeated to get constant results.

**c) Determination of water soluble ash:**

The total ash obtained from the above process was boiled with 25 ml of distilled water for 5 minutes. The insoluble ash was filtered through ash less filter paper (Whatman

Licensed Under Creative Commons Attribution CC BY

No.42). The residue was once again washed with water and ignited up to temperature not exceeding 450°c and converted into ash. The difference between the weight of total ash and insoluble matter represent the weight of water soluble ash. The percentage of water soluble ash was calculated with reference to the air dried drug.

**B. Determination of extractive values:**

Extractive values indicate the nature of the constituents present in a crude drug. Based on the diversity in chemical nature and properties of the contents of the drug, various solvents were used for the determination of extractives. The solvents used for extraction dissolve appreciable quantity of substances desired. The methods used to find out the extractive values were as follows.

**a) Determination of alcohol soluble extract:**

Alcohol is an ideal solvent frequently employed to determine various chemical contents like Tannins, Resins etc. Generally, Ethyl alcohol is used for determination of alcohol-soluble extractive. Dilute Alcohol a may also be used in some cases, depending upon solubility of constituents in a crude drug. In the present work, the author used 100 ml of 90% Alcohol for determining crude drug was macerated with 100 ml of 90% Alcohol in a stoppered flask for 24 hours. It was shaken frequently every 6 hours and allowed to stand to 18 hours. Then the extract was filtered rapidly through filter paper, taking precaution against loss of alcohol, about 25 ml of the filtrate was evaporated to dryness in a tared flat bottomed shallow dish, transferred to the oven and dried at 105°C and weighed. The percentage of alcohol soluble extract was calculated with reference to the air dried drug.

**Table:** Ash value of various parts *Boswellia ovalifoliolata*

| S.No. | Part(s) | Total Ash (%) | Acid insoluble ash (%) | Water insoluble ash (%) |
|---|---|---|---|---|
| 1 | Stem bark | 13.5 | 2.50 | 2.00 |
| | Gum | 6.00 | 1.60 | 1.50 |

**Table:** Extractive value of the various parts *Boswellia Ovalifoliolata*

|---|---|---|---|---|---|
| 1 | Stem bark | 17.6 | 22.4 | 4.8 | 3.4 |
| | Gum | 10.5 | 9.2 | 1.5 | 1.3 |

## 6. Fluorescence Studies

**Introduction:**

When physical and extractive value methods are inapplicable, especially powdered drugs, the fluorescence studies method will be useful to identify the drug. The study of fluorescence of powdered drugs as a means of identification appears to possess distinct possibilities of practical application (Chaudhuri Rai 1969). The ultra-violet light (200-400mu) is very active where several crude drugs show characteristic useful for their evaluation. Goodwin (1953) presented an excellent survey of fluorescent compounds in plants and the application of fluorimetry to their assay.

Fluorescence analysis was carried out following Chase and Pratt (1949) and Kokoski *et al.* (1958). The selected powdered drugs were studies both in Visible light and Ultra-Violet light for their fluorescence characters.

About one gram of the dried plant powder was extracted with 10 ml of the absolute alcohol. The tube containing Alcoholic extract of plant powder was placed at a distance of 14 cm from the source of Ultra-Violet tube and fluorescence observed. 2 ml of Alcoholic extract was treated with following reagents with the help of 1 ml pipette with 10 divisions.

Reagent I - Saturated Aqueous solution of $AgNO_3$
Reagent II - 0.1N Aqueous solution of NaOH
Reagent III - 5% Aqueous solution of HgCl2
The following tests were applied for fluorescence study

**Test 1**

a) Add 1 drop of Reagent I to 2ml of Alcoholic extract. It was shaken and fluorescence was observed.
b) 3 drops of Reagent II were added to the above (i.e.,a) and fluorescence observed immediately.

**Test 2**

a) Add 2 drops of Reagent II to 2 ml of Alcoholic extract, shaken and the colour of fluorescence was observed.
b) One drop of reagent III was added to the above containing extract (i.e.,a) shaken and noted the colour of fluorescence.
c) One more drop of Reagent III was added to the above (i.e.,a) shaken and noted the colour of fluorescence.
d) To the above (i.e.,c) 2 more drops of Reagent III were added, shaken and observed colour of fluorescence.

Dry powder also studies with the specified reagents. To the dry powder, a few drops of the following reagents were added separately and fluorescence observed immediately under Ultra-Violet tube light.

1) Powder as such 2) In NaOH in methanol 3) In NaOH in water 4) In HCl 5) 50% $HNO_3$ 6) 50% $H_2SO_4$. P

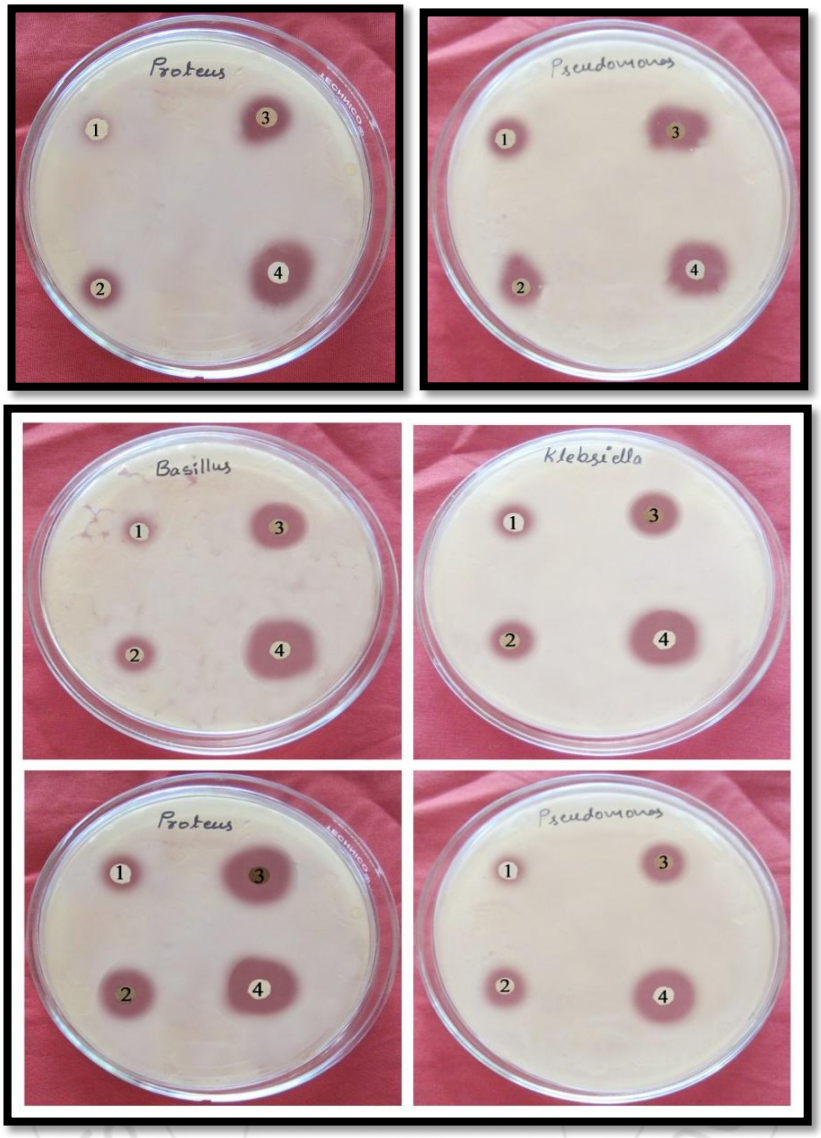
| Section | Pinch of Phloroglucinol +dil.Hcl + Alcohol | Lignin | Magenta colour (Fibres) | + |

**Antibacterial Activity**

The plant's secondary products may exert their action by resembling endogenous metabolites, ligands, hormones, signal transduction molecules or neurotransmitters and thus have beneficial medicinal effects on humans due to similarities in their potential target sites. The presence of antimicrobial substances in the higher plants provide a source of inspiration for novel drug compounds as plants derived medicines have made significant contribution towards human health. The antimicrobial compounds from plants may inhibit microbial growth by different mechanism than those presently used antimicrobials and may have a significant clinical value in treatment of resistant microbial strains. Therefore, random screening of plants for active chemicals is as important as the screening of ethnobotanically targeted species (Principle, 1989)**.**



**Bacterial Cultures:**
The bacterial cultures were procured from the Department of Microbiology, Sri Venkateswara Institute of medical Sciences (SVIMS), Tirupati, Andhra Pradesh. Pathogenic Gram positive bacteria such as *Bacillus subtilis*, *Staphylococcus aureus*, and Gram negative bacteria *Proteus vulgaris*, *Pseudmonas aeruginosa*, were maintained on nutrient agar slants at $4^0$C until further used for experimental studies**.**

## 7. Results

Present investigation, anti bacterial activity of four selected medicinal plant, on pathogenic bacterial strains, all exhibited significant antibacterial activity. Methanol stem extract of *Boswellia ovalifoliolata* at the concentration 60 mg/ml showed potent antibacterial activity. *P. vulgaris* (18mm) was more susceptible, followed by *P. aeruginosa* (16mm), *K. Pneumonia* (15mm) and *B. subtilis* (14mm).

# ETHNOBOTANICAL STUDY OF DURGAMKONDA OF VELIGONDA HILL RANGE, EASTERN GHATS, ANDHRA PRADESH

K. V. Rami Reddy[1], M. John Paul[2] and Dr. SKM. Basha[3]

**Abstract - Durgamkonda of Veligonda Hill Range, Eastern Ghats, Andhra Pradesh is floristically rich area where plants of various categories are growing spontaneously in their natural habitat. Durgamkonda is known for wide variety of Medicinal Plants that have been in existence identified and utilized since hundreds of years by local tribes. The present study aims at documentation of Medicinal Plants used by tribes for various purposes. Durgamkonda is the most important part of veligonda situated near Udayagiri forest of Nellore District.**
**Key words: Durgamkonda – Ethnobotany - Medicinal Plants —MPCA– Tribes.**

## I. INTRODUCTION

The area of Durgamkonda reserve forests covers aroung 5029.60 hectors of land. There is significant number of rare species of endemic flora and fauna, most of the area is under the conservation region. Udayagiri was also known as Kondyapalem in ancient times. It lies at the foot of Udayagiri hill which is about 938 meters above the sea level. The hill fort is supposed to have been built by Langula Gajapathi, a Hindu King.

Udayagiri is a mandal in Nellore district of Andhra Pradesh. Udayagiri hill (Sanjeevini hill) is situated on the southern part of Udayagiri town. It is the southernmost part of the Eastern Ghats. It comprised of dry deciduous forests and located at $14.8667^0$N, $79.3167^0$E. It has an average elevation of 3261 ft above the sea level. Durgampalli, Duragampalli road, Loddivagu (Loddi river), Salvapet, Kona canal, Kona,Tapaka, Chinna masjid (Small Mosque) Pedda masjid(Big Mosque) and fort are the main places of the hill. Herbarium species were deposited at Department of Botany, Vikrama Simhapuri University P. G Centre, Kavali.

## II. STUDY AREA

Durgamkonda of Udayagiri Durgam is a sacred Groove and off shoots of Eastern ghats is an abode for rich Bio-diversity.Total number of plants in our study from udayagiri hills is 295 species of 290 genera and 83 families with genus-species ratio is 4.5:3.7:1 .The presence of 295 species concludes that udayagiri forests as one of the phyto-diversity rich spot of Nellore district. Dicotyledons are represented by 260 species belonging to 270 genera of 35 families. Monocotyledons include 30 speies belonging to 20 genera of 11 families.

The ratio of dicotylidons to monocotylidons is 10:1.For species and 10.3:1 for genus Based on habit flora comprises 121 species (37%) under trees followed by 76 species shrubs (20%) and 107 species herbs (31%) and 37species of climbers (11%).37% of flora comprises trees ,33% of flora comprises herbs 21% of flora comprises shrubs and 11% of flora comprises climbers.

*Hardwickia binata and Pterocarpus santalinus* occur here and there over the veligondas. Anogeissus latifolia occurs in patches in the slopes of yerra konda. The principal ranges of hills bearing forests of the veligondas, the

[1] *Department of Botany, Rayalaseema University, Kurnool, Andhra Pradesh, India*
[2] *Research and Development Centre, Bharatiar University, Coimbatore, Tamilnadu, India*
[3] *Department of Botany, Vikrama Simhapuri University, Kavali, Nellore Dt, Andhra Pradesh, India*

yerrakonda and the Udayagiri duragam hills. The veligonda range, the yerrakonda ( yerra means Red) are called so because these hills contain a number of *Hardwickia binata* (yepi) trees. The young red leaves of these trees give a distinctive colour to their general aspect in summer.

*Hardwickia binata* is one of the dominant components in forests especially near foot hills and low elevation up to 300 m but due to over exploitation and slow regeneration it became threatened species in Veligonda hill range

Much stress is given to collect data on use of these plants by tribals namely yanadis ,tribal medicine.The ethno-medical data was prepared from house-wives who knew/practice of herbal medicine, village physicians, tribals, Yanadi, Yerukula and Nakkala.

34. Tangedu - *Cassia auriculata*

**MINOR FOREST PRODUCTS OF DURGAMKONDA OF UDAYAGIRI HILLS OF VELIGONDA HILL RANGE**

*Buchanania lanzan* (Sarapappu) seed: - The species occurs scattered in all the ranges but the seeds are collected only in Udayagiri Range.

*Strychnos nux-vomica* (Musti) seed:- The species occur scattered in all the ranges. The ripe fruits are collected from December to April .The proper time to start the collection is when the bats begin to eat the fruits.

*Sapindus emarginatus* (Kunkudu) Fruits:- Fruits ripe in April and the collection is made in May. Fruits used as substitute of soap.

*Tamarindus indica* (Chinta) Fruits:- Trees occur in scattered manner in all the ranges. The fruits ripe in February-March. Pods & leaves are used for culinary purpose.

*Murraya Koenigii* (Karivepaku) Leaves:- The leaves are collected and dispatched to consumption centers in Udayagiri division as well as to Madras. Leaves are used to flavor curries etc.

*Anogeissus latifolia* (Chirumanu)wood: The only species which occur in fair profusion. Wood is used as Timber.

*Cassia fistula* (Rela) Bark:- The species occur diffusely in hilly tracts of Udayagiri hill range. Stem bark and fruit pulp are used as laxative.

*Cassia auriculata* (Tangedu) Bark:- The species occur diffusely in plain areas of Udayagiri range. Powdered root bark is taken internally for cooling effect.

*Terminalia chebula* (Karaka)Fruits:- The species is found in fair abundance in interior ranges of Udayagiri hills. Fruits of myrobalan are of medicinally important. Wood is a valuble timber.

*Diospyros melanoxylon* (Beedi aaku)Leaves:- These occurs diffusely in all the Udayagiri hill ranges. Leaves are used in the preparation of Beedis.

*Accacia leucophloea* (Tella thumma) Bark :- Bark is used for tanning and in alcohol distillation. Gum is indigenous medicine.

*Viscum auriculatum* (Badanika) Stem:- Paste of plant applied to wounds.

*Terminalia bellerica* (Thandra) Fruits :- Fruit is used as astringent and a remedy for cough. Wood used as timber.

*Menecylon umbellatum* (Alli)Leaves :- Yellow dye from the leaves used for dyeing clothes and mats.

*Trichosanthes cucumerina* (Adavi potla)Roots :- Roots used to cure bronchitis. Leaves used in bilious disorders.

*Mytragyna parvifolia* (Batta Ganapa) Stem :- Wood used for furniture.

*Terenna asiatica* (Korivi) Leaves :- Leaves used in Skin deceases and swellings.

*Wrightia tinctoria (*Reppala) Bark :- Decoction of bark and leaves are taken for stomach disorders.

*Hemidesmus indicus* (Sugandhapala) Roots :- Roots used for cooling effect and blood purification.

*Strychnos potarorum* (Chilla) Seeds :- Seeds are used to clear turbid water and in eye diseases.

*Lucas aspera* (Tummi) Leaves:- Leaf juice used in treating jaundice and scorpion sting.

*Plumbago zeylanica* (Chitramulam) Root:- Roots used as appetizer and in skin diseases.

*Salvadora persica* (Varagogu) Leaves :- Twigs used as tooth cleaners, decoction of leaves in asthma and cough.

*Gmelina asiatica* (Gummadi) Fruits :- Ripe fruits used in removing dandruff.

*Chionanthes zeylanica* (Punagani) Roots :- Root bark used to control white discharge in ladies.

*Boswellia serrata* (Adavi sambrani):-Stem – stomach ulcers, diabetes. Leaf - mouth and throat ulcers. Gum – dysentery, inflammations, joint pains, arthritis, amoebic, dysentery, hydrocele, diabetes.

*Aegle marmelos* (L) (Maredu):-Whole plant – Venereal diseases, digestive and abdominal disorders, eye diseases, stupor, pyrexia, dropsy, vomiting, piles, intermittent fever. Leaf – Diabetes, fruit astringent, digestive stomachic, dysentery cooling agent.

*Gymnema sylvestre* (Retz) (Podapatri):-Root – Hydrocele, polyuria, poisoning. Leaf- Diabetes, diuretic, fruit stomachic, alexitaric, bronchitis, cardiac diseases.

*Gmelina arborea* (Roxb) (Gummadi teku):- Root – Cardiac diseases, dysuria, aphrodisiac, expectorant, demulcent. Leaf –Diabetes. Fruit-Diabetes.

*Gloriosa superba* (L) (Adavi Nabhi):- Tuber – Tonic, stomachic, anthelmintic, abortifacient, gonorrhea, ulcers, neuralgic pains, skin troubles, gout, rheumatism, piles, skin diseases, leprosy, wounds, snake bite and scorpion string. Leaf juice–Lice killer.

*Hardwickia binata Roxb* :- Bark yields resinuous gum and fibre leaf used as green manure

*Asparagus racemosus* Wild (Pilliteegalu):- Tuber – Herbal tonic, diuretic, galactogogue, urinary diseases, gynaecological disorders, diseases of nervous system, hyperacidity, gastritis, menorrhagia, eye diseases. Root, leaf – diabetes, cough, diarrhea, pain, skin diseases, nervous and rheumatic complaints.

*Andrographis paniculata* (Brum.f) (Nelavemu):- Whole plant – Febrifuge, astringent, anodyne, tonic, diabetes. Leaf – anthelmintic, malarial fever, skin diseases, general debility, discontinuation of menstrual cycle.
*Tinospora cordifolia* (Wild) (Kappa teega):- Root – Snake bite. Stem – Fissures in the sole, snake bite.
*Cassia senna* L (Senna):- Leaf and Fruit – Laxative, purgative, constipation, febrifuge, gout, worm infestation, skin diseases, abdominal and blood disorders.
*Piper longum* L (Pippallu):- Leaf and Fruit – Counter irritation, diabetes, analgesic, expectorant, inflammations, carminative, insomnia tonic, cough, cold, bronchitis, stimulant, lever disorders, fever, indigestion.
*Santalum album* L (Srigandhamu):- Heart wood and wood – Diabetes, oil- verenal diseases, refrigerant, expectorant, herpis worm infestation, dysuria.
*Strychnos colubrina* L. (Teega Mushti):- Wood – Fever. Root – Rheumatism, Anthelmintic, cutaneous disorders. Fruit – Mania.
*Strychnos potatorum* L.f (Chillaginja Chettu):- Seed – Tonic, diabetes, diarrhea, gonorrhea, cardiac diseases, abdominal diseases, stomachic, water purifier.

**\ENDEMISM:**
A good number of plants seemed to be endemic to these parts of Eastern Ghats. But specific mention may be made of *Pterocarus santalinus.* It is an interesting species in that it is more prevalent in this area than in the adjoining districts viz. Kurnool and Chittoor. It has edaphic preference at higher elevations *Shorea tumbaggaia* is rare but occurs in this forests only, found associated with Red sanders at high elevation. *Croton scabiosus* is another associate of Red sanders. A few more endemics like *Decalepis hamiltoni, Glossocardia, Sympagis petiolares, Hugonia mystax, Terminalia pallid,* also occur in this forest.
**Rare plants:** Owing to intensive studies in the area a good number of species have been discovered first time or recorded after a lapse of at least seventy years. Some of them by their occurrence here show continuity or extended distribution in the Udayagiri Hills. *Desmodium pryonii, Hibiscus purpureus, Rhynchosia rufesens, Rhynchosia rothii, Rhynchosia densiflora, Asyneuma fulgens.*

From the foregoing information it is clear that the area harbours a good number endemics and rare plants. It seems to be due to a combination of factors of edaphic, climatic as well as genetic structure in total. Thus these parts of Eastern Ghats forming at ecological islands support specific gene pool niche. Any disturbance due to biotic interference leading to degradation of forests, the prevailing semi arid climate and thermal regime, give scope for thrival of exotics resulting in the unusual change in natural ecosystems

The field work carried out at intervals has facilitated the researcher to record the data in various surveys. The survey resulted in collection of more than 225 medicinal plants used for different ailments along with the ethno medicinal data from 30 informants.
The following are the vulnerable plants in Udayagiri hill range

1. *Sterculia villosa*
2. *Aegle marmelos*
3. *Gymnema sylvestre*
4. *Oroxylum indicum*
5. *Gloriosa superba*
6. *Shorea tumbuggaia*
7. *Rubia cordifolia*
8. *Eubhorbia fusiformis*
9. *Stemona tuberosa*
10. *Hildergardia populifolia*
11. *Phyllanthus indofischeri*

**IV.CONCLUSION**
Ethnobotanical study of a particular region depicts its ecological, hydrological. Topographical, historical identification. Documentation of all indentified species of Durgamkonda of Udayagiri forest in the present study would serve as a reference for the students and teachers of Botany and others interested to get knowledge. This study also helps in the addition of new species to district flora. For the proper utilizing of forest resources, meticulous and estimated strategy need to be evolved without causing deterioration to the flora. There are efforts to develop infrastructure like Roads, electricity etc... To make this as one of the best tourist spot in the State. It can be developed as Andhra Ooty, if funds allotted. The climatic condition is semi arid with mixed type of vegetation consists of semi evergreen dry deciduous scrub forest. Hence it is suitable Medicinal plant conservative area.

***Abstract*** **-The Nagarjunasagar Srisailam Wildlife Sanctuary (also known as Rajiv Gandhi ….) occurs on the Nallamala Ranges (78°30'— 79°28'E; 15°53'—16°43'N) in Andhra Pradesh at elevations varying from 100 to 917 m. The area consists mostly (80%) of the area is gently rolling to steeply hilly (incl. a ref. in support).. These ranges include many plateaus of which Amrabad, Srisailam, Peddacheruvu, Sivapuram, Nekkanti are noteworthy.**

**The present paper refers to 214 species belonging to 175 genera, 91 families. Out of 91 families, 85 are of angiosperms, five are of Pteridophytes and one is a gymnosperm. The medicinal ferns of Pteridophytes are *Adiantum caudatum, Actinopteris radiate, Christella dentate, Hemionitis arifolia,* and *Lygodium flexosum. Cycas beddomei* is the only one gymnosperm. There are 60 (27.02%) herbs, 41 shrubs (18.46%) 77 trees(34.68%), and 33(14.86%) climbers. 34.68% of medicinal plants constitute trees.**

***Key Words:– Eastern Ghats, Deities – Tribes.***

## I. INTRODUCTION:

The Nagarjunasagar Srisailam Wildlife Sanctuary (also known as Rajiv Gandhi ….) occurs on the Nallamala Ranges (78°30'— 79°28'E; 15°53'—16°43'N) in Andhra Pradesh at elevations varying from 100 to 917 m. The Elevation varies from 100 m (330 ft) to 917 m (3,009 ft) above mean sea level.

Nargarjunasagar Srisailam Wildlife Sanctuary was declared as a sanctuary in 1978 and made a part of 'Protect Tiger'in 1983. In 1992, the reserve was renamed as Rajiv Gandhi Wildlife Sanctuary. Apart from tigers, the reserve is home for Over 150 bird species also occur here. Srisailam and Nagarjunasagar dams serve as water sources.

The perennial water sources are generally located in the valleys and the plateaus suffer from acute scarcity of water during summers. The Krishna River cuts its basin almost 200 m deep over a distance of 130 km through the reserve. The mean temperatures are 16°C in June (name the months) winter (December) and 43°C in summer (May) (name the months).

## II. STUDY AREA

Nargarjunasagar Srisailam Wildlife Sanctuary was declared as a sanctuary in 1978 and made a part of 'Protect Tiger'in 1983. In 1992, the reserve was renamed as Rajiv Gandhi Wildlife Sanctuary.

The main types of forest biomes in the reserve are : southern tropical dry deciduos forest *Hardwickia* forest and Deccan thorn scrub forests with much Euphorbia scrub. Important plant species here are : *Anogeissuslatifolia* ( axlewood ) , Cleisthanthus collinus (odcha) , *Terminalia* spp., *Pterocarpus marsupium* , *Hardwickia binata* (anjan tree), *Boswellia serrata* (Indian frankincense or Salai ) , *Tectona grandis* ( teak ), *Mundulea sericea* and *Albizia* spp. (silk plants). (Champion H.G., Seth.S.K.1968).

## III. MATERIALS AND METHODS

Field trips were undertaken during the four seasons-viz,Summer,Monsoon,Autumn and Winter in2014–2016. Details such as vegetative, flowering and fruiting stages of the plant species were observed.. The plant specimens were collected and determined using Gamble (1967) and Hooker (1897). During the field work, the specimens collected for the preparation of herbarium were processed following Jain and Rao (1977).

## IV. RESULTS

Table:1 list of species of Nagarjuna sagar srisailam wild life sanctuary

| S.No | Botanical Name | Vernacular name | Family | Habit | Medicinal Uses |
|---|---|---|---|---|---|
| 1 | Abuliton indicum (L.)Sweet.Hort.Brit. | Duvvenakaya/ Tutturubenda | Malvaceae | Shrub | Haematuria |
| 2 | Acacia leucophloea (Roxb.) Willd. | Tella tumma | Mimosaceae | Tree | Diuretic |
| 3 | Accacia nilotica (L.) Willd. | Nallatumma | Mimosaceae | Tree | Cough;Diarrhoea |
| 4 | Achyranthes aspera L. | Uttareni | Amaranthaceae | Herb | Piles;Dieretic |
| 5 | Actinopteris radiata (Koenig ex Sw.) | Mayuri shika | Actinopteridaceae | Herb | Skin diseases |
| 6 | Adiantum caudatum L. | Raja hamsa | Adiantaceae | Herb | Diabetes |
| 7 | Adiantum lunulatum Burm.f. | Chitrapadu | Adiantaceae | Herb | Ulcers;Dysentery |
| 8 | Aegle marmelos (L.) | Maredu / Bilva | Rutaceae | Shrub | Dysentery |
| 9 | Aerva lantana (L.) | Pindikura | Amaranthaceae | Herb | Urinary diseases |
| 10 | Ageratum conyzoides L. | Goat weed | Asteraceae | Herb | Nervine tonic |
| 11 | Alangium salvifollium (L.f.) | Udaga / Ankolamu | Alangiaceae | Tree | Dog bite |
| 12 | Albizia amara (Roxb.) | Cheekireni | Mimosaceae | Tree | Inflamation |
| 13 | Albizia odoratissima (L.f.) Benth. | Chinduga | Mimosaceae | Tree | Leprosy |
| 14 | Alstonia scholaris L. | Edakulapala | Apocynaceae | Climber | Abdominal pains;Dysentery |
| 15 | Andrographis paniculata (Burm.f.) Wall. | Nelavemu | Acanthaceae | Herb | Fever |
| 16 | Androghapis nallamlayana Ellis. | Kachugadda | Acanthaceae | Herb | Leucorrhoea |
| 17 | Anisomelea malabarica (L.) | Moga-Bira | Lamiaceae | Shrub | Diarrohoea;Eczema |
| 18 | Annona reticulata L. | Ramaphalam | Annonaceae | Tree | Astringent |
| 19 | Anogeissus latifolia (Roxb.ex Dc.) | Chirimanu / Elamas | Combretaceae | Tree | Bitter tonic;Astring |
| 20 | Argemeone mexicana L. | Kusuma / Brahmadandi | Pepepaveraceae | Herb | Syphillis |
| 21 | Aristolochia braceteolata Lam. | Gadidagadapa | Aristolochiaceae | Herb | Skin diseases; Diabetes |
| 22 | Aristolochia indica L. | Easwari | Aristolochiaceae | Herb | Snake bite |
| 23 | Arisaema tortuosum Schott | Rollavagu | Araceae | Herb | Kill worms in Cattle |
| 24 | Asperagus gonclados Baker | Pilliteegalu | Liliaceae | Herb | Galactagogue;Diabetes |
| 25 | Atalantia monophylla (L.) | Munukudu | Rutaceae | Shrub | Fever; Antiseptic |
| 26 | Azadirachta indica A.Juss. In Mem.Mus.Natl. | Vepa | Meliaceae | Tree | Skin diseases |
| 27 | Azima tetracantha Lam. | Tella uppili | Salvadoraceae | Shrub | Leprosy; Eczema |
| 28 | Bacopa monnieri (L.) Pennel | Brahmi | Scrophulriaceae | Herb | Memory booster |
| 29 | Baliospermum montanum (Willd.) | Konda audamu | Euphorbiaceae | Shrub | Stomach Pain;Laxative |
| 30 | Bamboosa arundinaceae(RETz.)Roxb. | Bongu Veduru | Bambusiaceae | Bush | Leprosy;Wounds |
| 31 | Bauhinia racemosa Lam.t | Are fibres | Caesalpinaceae | Tree | Malaria fever |
| 32 | Bauhinia vahlii Wight&Arn | Camel'sfoot climber | Caesalpiniaceae | Perennial creeper | Aphrodisiac;Dysentery |
| 33 | Blumea mollis (D.Don)Merr | Kukka pogaku | Asteraceae | Herb | Dropsy; Throat Infection |
| 34 | Boerhavia diffusa L. | Attamamidi | Nyctaginaceae | Herb | Urinary disorders |
| 35 | Boswelia serrata Roxb. | Sambrani | Burseraceae | Tree | Arthritis |
| 36 | Buchanania lanzam Spreng. | Morli | Anacardiaceae | Tree | Leucorrhoea |
| 37 | Buchanania oxilaris(Desr)Ramam. | Sara | Anacardiaceae | Tree | Boils; Cardio tonic; Wounds |
| 38 | Caesearia elliptica (Roxb.) | Chilakaduddi | Flacourtiaceae | Tree | Diabetes;Diuretic |
| 39 | Canscora diffusa (Vahl) R.Br | Shankhupuhi | Gentianaceae | Herb | Piles; Skin diseases |
| 40 | Capparis sepiaria L. | Nalla uppili | Capparaceae | Shrub | Febrifuge |
| 41 | Cardiospermum halicacabum L.Sp. | Buddakakara | Sapindaceae | Climber | Nervous disorders;Rhematism |
| 42 | Careya arborea Roxb. | Budda darimi | Barringtoniaceae | Tree | Eye diseases; Skin sores |
| 43 | Carmona retusa (Vahl) | Nomuchettu / Barranki | Boraginaceae | Shrub | Snake bite; Sterility |
| 44 | Canthium dicocum Teij.&Binn. | Nalla balusu | Rubiaceae | Tree | Fever;Diarrhoea |
| 45 | Cassia absus L.Sp. | Chanupala vittulu | Caesalpinaceae | Herb | Constipation; Cough |
| 46 | Cassia auriculata L. | Tangedu | Caesalpiniaceae | Shrub | Diabetes |
| 47 | Cassia fistula L.Sp. | Rela | Caesalpinaceae | Tree | Diabetes |
| 48 | Cassia italica (Mill.)Spreng. | Nelatangedu | Caesalpinaceae | Herb | Bone fracture |
| 49 | Cassia montana Meyne ex.Roth. | Pyditangedu | Caesalpinaceae | Shrub | Body Pains |
| 50 | Cassia occidentalis L.Sp. | Kasintha | Caesalpinaceae | Shrub | Laxative |
| 51 | Cassine glauca Kuntze | Neridi | Celastraceae | Tree | Eczema;Antidote |
| 52 | Cassytha filiformis L. | Sitamma savaralu | Lauraceae | Climber | Hair tonic; Dysentery |

## VI DISCUSSION

Nagarjunasagar Srisailam Wildlife Sanctuary in the Eastern Ghats is a rich biodiversity landscape of Deccan. The total number of medicinal plant species collected in this study from Nagarjunasagar Srisailam Wildlife Sanctuary is 214 species of 175 genera belonging to 91 families. Among these 18 Critically Endangered Plants (CE); 23 Endangered Plants (EN); 19 Near Threatened Plants (NT) ; 2 rare Plants are recorded.

## VII CONCLUSION

This report will be useful for researchers in the field of Ethanobotany, Ethanomedicine, Taxonomy, and Pharmacology for further studies. The tribals and local people who reside near and around the Sanctuary still depend on the plants to cure various ailments .This study also aims to create awareness among the non-tribal main stream society so as to realise the value of the sustainable biodiversity of wild life sanctuary. Numerous anthropogenic activities like developmental projects, eco-tourism, modernization, urbanization, overexploitation, over grazing are the major threats for the wild life sanctuary. This recognizes the need to conserve its biological resources. Wild life sanctuaries depict cultural, traditional, sociological, biological, economical values and are the chief method of in-situ conservation of biodiversity. Conservation of biological resources and of the indigenous traditional knowledge is essential for sustainable development and managing natural resources the world over.The history of indigenous knowledge as an old as the human race. This knowledge has always been very important for the people who generate it.It is a matter of survival for them. Two Rare medicinal plants *Andrographis nallmalayana*,and *Gyrocarpus americanus* Jacq.were found in the study area

## ACKNOWLEDGMENT

The authors are thankful to all the local people who shared their knowledge on ‘medicinally useful plants’ throughout. In and around the villages of the wild life sanctuary. .

**Abstract:** ***The human culture directly or indirectly was influenced by plants from the time immemorial. The progress of human civilization was accompanied by the use of plants and nature throughout the ages. Plants are fundamental to almost all life on earth providing protection and sustenance to other organisms. Plants which are nature's precious gift to mankind have health improving properties. Nature has served as a rich repository of medicinal plants for thousands of years and an improve number of modern drugs have been isolated from natural sources notably of plant origin. Herbal medicine, based on their traditional uses in the form of powders, liquids or mixtures, has been the basis of treatment for various ailments in India since ancient times. There are numerous references for the use of plants as therapeutic agents both in the works of Indian medicine and other works of antiquity. Plants have played a major role as the basic source for the establishment and enhancing the economy of developing countries like India. To elevate the medicinal properties, root tubers of Pimpinella tirupatiensis were collected from different localities of tirumal hills, Eastern Ghats, Andhra Pradesh, India. The methanolic extracts of root tubers were qualitatively screened for phytochemicals by using standard procedures which revealed the presence of various important bioactive chemical entities. Antibacterial activity of the methanolic extracts of root tubers were evaluated against Bacillus subtilis, Klebsiella pneumoniae and Proteus vulgaris, Pseudomonas aeruginosa. The methanolic extracts of root tubers have exhibited significant broad spectrum antibacterial activities.***

**Keywords:** Herbal medicine, Therapeutic agents, Phytochemicals, Root tubers

## 1. Plant Material Collection

During the exploration of ethno-medico-botanical survey, the root tubers of *Pimpinella tirupatiensis* were collected from different localities of Tirumal hills, Eastern Ghats, Andhra Pradesh, India. The root tubers were thoroughly washed with water and sufficient quantity of samples collected and chopped off into small fragments and shade dried. The dried samples were ground to make coarse powder (each 1 kg) and stored in polythene containers at room temperature. These samples were used for the detection of various secondary metabolites. Phytochemical screening was done following standard procedure adopted by Harborne (1973) and Gibbs (1974).

**Table 1-a:** Preliminary Phytochemical screening of *Pimpinella tirupatiensis* (Root tubers - Methanolic Extract)

## 2. Screening for selective secondary constituents:

### A. Phenolic compounds

**a) Extractive procedure**

The phenolic constituents were extracted by following the method given by Bate Smith (1954) and Ibrahim and Towers (1960). About 25g of healthy plant material was macerated with 100ml of 2N Hydrochloric acid.(HCL). The homogenate was digested on a boiling water bath for about half-an-hour. The contents were cooled and filtered through Whatman No.1 filter paper. The filtrate was extracted repeatedly with peroxide free diethyl ether. All the extracts were pooled and concentrated to 100ml and was treated three times with 25ml of 5% anhydrous sodium carbonate solution. The pooled carbonate solution was adjusted to pH 2.0 with Conc. Hydrochloric acid.

The acidified fraction at pH 2.0 was extracted with equal volumes (25ml) of fresh diethyl ether thrice. The combined other extracts were washed with distilled water repeatedly till all traces of hydrochloric acid was removed. The ether soluble water was removed by freezing the extract. The ether was evaporated to dryness on water bath at $98^0$C and the resulting phenolic compound residue was dissolved in 1ml of 95% ethanol. This was stored at low temperature in dark container for ready use.

**b) Identification**

About 2g of fresh weight equivalent to the final alcoholic extract was spotted on 23 x 29 cm whatmann No.1 Chromatographic filter paper with the help of micro pipette. The origin of the spot area was dried immediately with the help of hair-drier. Two dimensional ascending Chromatographic technique was adapted with benzene-acetic acid-water (60:70:30 v/v/v, upper layer) in the direction and sodium formate-formic acid-water (10:1:200 w/v/v) in the second direction. The Chromatographic chambers were saturated with the above solvent systems one day before the development of the Chromatograms at 22 to $24^0$c. The sheets after development were removed from the chambers and dried at room temperature. The dried sheets were observed under Ultra violet light and fluorescent regions were marked. The papers while exposing to Ammonia vapours were also observed under UV light and new fluorescent spots were marked.

The separated phenolic compounds on the Chromatograms were identified by comparison of $R_f$ values and individual spot colours of Chromogenic sprays. The final confirmation was made with authentic samples by co-chromatography.

**B. Flavonoids Compounds**

**a) Extractive procedure**

The flavonoid compounds were extracted according to the method given by Markham (1982). About 5g of powdered plant material was extracted in two steps. First 18ml of Methanol and 2 ml of water (9:1) were added, shaken well and kept for one day at room temperature. The supernatant solution of the extract was taken and transferred to another test tube. Secondly Methanol and water of 5ml each (1:1) was added to the remaining residue, stirred well and the mixture left for 24 hours. The two extracts were combined, mixed well and filtered through cotton wool. Later the filtrate was evaporated to about 1/3 the original volume till

Licensed Under Creative Commons Attribution CC BY

most of the methanol was removed. The resultant aqueous extract was extracted with chloroform repeatedly for 3 times. The solvent extracted aqueous chloroform layer was evaporated to dryness under vaccum in a rotary evaporator. The dried residue was saturated with 1 ml of 95% alcohol and stored in a dark place at low temperature.

**b) Identification**

The extracts containing flavonoids were separated in suitable quantities on Whatmann No.1 Chromatographic filter paper(23x29 cm) adopting the ascending technique using the solvent system Iso-propyl alcohol **:** Ammonia (25%) **:** Water(8:1:1:v/v/v) and n-butanol:acetic acid: water(4:1:5v/v/v) (top layer was used).The dried Chromatograms were examined under UV lamp and the fluorescent spots were marked. The papers while exposed to Ammonia Vapours were also observed under UV lamp and the new fluorescent regions were marked. The flavonoid compounds were identified by comparing the $R_f$ values and colours with those of the authentic samples on the Chromatograms. Co-Chromatographic studies were conducted with authentic markers to confirm the identification.

**C. Chromogenic spray reagents**

**Diazotized sulphanilic acid reagent (Markham, 1982) :**0.3% solution of sulphanilic acid in 8% HCl (25ml) was mixed with 5% Sodium nitrite solution(1.5ml) just before use. The Chromatographic sheets were sprayed with this mixture and with a 20% solution of anhydrous Sodium carbonate.

**1% Alcoholic ferric chloride:**1 g of Ferric chloride was dissolved in alcohol and made up to 100ml.

**1% Alcoholic Aluminium chloride:**1g of Aluminium chloride was dissolved in alcohol and made up to 100ml, just before spraying of the chromatographic sheets.

**Solvents:** 1. Iso-propyl alcohol **:** Ammonia(25%) **:** Water (8:1:1)
2. n-butanol**:** Acetic acid **:** Water(4:1:5)

**C. Amino acids**

**a) Extractive procedure**

Amino acids were extracted following the method of Das Chowdary *et al.*, (1967). About 5g of plant material was cut into small pieces and plunged immediately into a round bottomed flask containing 20ml of 80% Ethanol. It was refluxed for 30 minutes over a boiling water bath. The boiled material was ground in mortar using additional volumes of 10ml ethanol 80% (v) and centrifuged at 2000 rpm. The supernatant was collected and the Ethanol removed in vaccum. The aqueous extract was passed through Dowex 50W-X8 ($H^+$ from 20-50 mesh) column (1x10cm). the amino acids were eluted from the column with 50ml of 2N Ammonium hydroxide. The elute was evaporated to dryness and the residue was saturated with 95% Ethanol (1ml).

**b) Identification**

The extracts containing amino acids were seperated on Whatmann No.1 Chromatographic filter paper(23x28 cm) employing two-dimensional ascending technique using the solvent system:

1) Sec. butanol**:** Formic acid **:** Water(75:13:12v/v/v)-1$^{st}$ direction.

2) Buffer saturated phenol (1:2v/v)-2$^{nd}$ direction(6.3 g of Sodium citrate and 3.7g of Potassium dihydrogen phosphate were dissolved in 100ml of distilled water. To this 200ml of distilled phenol was added)

The amino acids were identified based on comparision of $R_f$ values, colours and with those of authentic samples by co-chromatographic studies.

**C) Chromogenic spray reagents**

**Ninhydrin:** It was prepared by dissolving 200 mg of Ninhydrin in 98ml of n-butanol with 2ml of glacial acetic acid.

**D. Anthocyanidins**

**a) Extractive procedure**

The anthocyanidin constituents were extracted according to the method described by Harborne (1973).

About 5g of plant material was immersed in 20ml of 2N HCl in a boiling test tube and heated for 30-40 minutes at6 $100^0$c. The extract was cooled and filtered. The filtrate was washed twice with 20 ml of ethyl acetate to remove flavones. The remaining aqueous extract was further heated at $80^0$c for 3 minutes to remove the last traces of ethyl acetate. The pigment was re-extracted again with a small volume of Iso-amyl alcohol. The Ethyl acetate extract was evaporated to dryness on a boiling water bath. The anthocyanidin in the residue was diluted with 1ml of 1% Methanolic HCl and preserved at low temperature in dark for future use.

**b) Identification**

The extracts containing anthocyanidins was separated on 23 x 29 cm Whatmann No.1 Chromatographic filter paper. Uni-dimensional Chromatographic ascending technique was employed with Conc. Hydrochloric acid, Formic acid, Water (2**:**5**:**3 v/w/v) and n-butanol **:** Acetic acid **:** water (4:1:5). The Chromatograms developed from the said solvent systems were taken out from the glass chambers and dried at room temperature. The fluorescent regions of dried papers were marked under UV light. The $R_f$ values and colours of the spots were determined by comparing with those of the authentic markers on the Chromatograms.

2. n-butanol **:** Acetic acid **:** Water(4**:**1**:**5).

**E. Lipids**

**a) Extractive procedure**

Lipids were extracted following the method adopted by Hoppe and Heitefuss (1974). A solvent mixture consisting of 30ml Chloroform, 60ml of Methanol and 20 ml Water(1**:**2**:**0.8 v/v/v) was taken and allowed to boil. About 5g of plant material was homogenized in the above solvent mixture. The contents were filtered and taken separately. The residual mixture was treated with 70ml Methanol and the filtrate taken. The residue was again washed with 100ml Chloroform. All the above filtrate mixtures were taken in a separating funnel and 90ml of water added. The mixture now contains Chloroform**:** Methanol**:** Water in the ratio of 2**:**2**:**1.8 respectively and the mixture were allowed to settle. The lower lipid layer containing chloroform was separated and transferred into a breaker. The upper water layer was treated with 50ml of Chloroform successively for three times. All the extracted Chloroform layers were evaporated to dryness in a vacuum by rotary evaporation maintained at $40^0$C. The residue was treated with 2ml of Benzene to remove the traces of chlorophyll if present. Now the final lipid residue was dissolved in 2 ml of Chloroform and stored at low temperature in dark until use.

**b) Identification**

Thin layer plates were prepared by spreading a slurry of silicagel-G (50g in 100ml distilled water) to 105 mm thickness over thin glass plates. The glass plates were air dried and stored at room temperature. Before using, the plates were heated at $110^0$c for 30 minutes in a hot air oven for activation.

Using micropipette, one gram equivalent of lipid extract was taken and potted on TLC plates. The spotted areas were allowed for immediate dryness with the help of a drier. The

Licensed Under Creative Commons Attribution CC BY

dried plates were run in uni dimensional ascending Chromatography by using TLC glass chambers. The chambers were saturated with developing solvents one day before the plates were developed.

**Solvent systems**

1) Chloroform**:** Methanol**:** Acetic acid**:** Water (170**:**25**:**25**:**3 v/v/v/v)
2) Acetone**:** Benzene**:** Water(91**:**30**:**8 v/v/v).

The plates were placed in airtight tanks. The developed plates were removed and dried at room temperature and exposed to Iodine vapours to visualize all the lipid compounds.

The TLC plates were sprayed with 25% Sulphuric acid reagent with the help of an automizer for the clear detection of various lipid layers. The lipids were identified by comparision of $R_f$ values, color and with those of authentic samples by Co-Chromatographic studies.

**c) Chromogenic spray reagent**

The TLC plates were sprayed with 25% Sulphuric acid and heated to $230^0$c for 15 minutes, and the colour observed. Glycolipids gave red brown while phospholipids gave bright, red and other lipids gave pale brown colour spots on white background.

Solvent : $CHCl_3$ : MeOH : HOAc : $H_2O$ (170:25:25.3).

**Physicochemical studies**

For several years, the crude drugs were identified by comparison only with the standard descriptions available. But recently, due to advancement in the field of Pharmacognosy, various techniques are followed to the standardization of crude drugs. Among such techniques, ash and extractive values are considered very important in promoting the quality and in establishing the Pharmacopeial standards of the drug.

Substandard quality of many drugs is due to either faulty collection or incorrect storage. When the constituents of a drug cannot be readily estimated by any other means, ash and extractive values are very useful especially for their evaluation. To prove its acceptability as a drug, studies of ash and extractive values are basically required in determining the quality and purity of selected crude drug.

**Materials and Methods**

The physical constants like ash and extractive values were determined by standard methods (Anonymous, 1985 and Kokate, 1991).

## 3. Experimental Studies

**A. Determination of ash values**

The object of ashing crude drugs is to remove all traces of organic matter which may otherwise interfere in an analytical determination. The inorganic salts naturally occurring in drug or adhering to it or deliberately added to as a form of adulteration are removed by gradual incineration of the drug. Thus the residue remaining after incineration of the powdered drug is known as ash content. The ash values are a criterion to judge the identity or purity and quality of the crude drug.

**a) Determination of total ash**

Total ash usually consists of Phosphates, Silicates and Carbonates of Potassium, Calcium and Magnesium. About 2 gm of the air dried powdered drug was accurately weighed and taken in a tared silica crucible, which was previously ignited and weighed. The powdered drug was spread as a fine even layer at the bottom of the crucible. The crucible containing the drug was gradually incinerated in a muffle furnace by increasing the temperature. It was heat dull red hot until free from carbon or converted into ash. Later the crucible was allowed to cool and kept in desiccators. The residue was weighed the percentage of total ash calculated with reference to the air dried sample. The residue was weighed the percentage of total ash calculated with reference to the air dried sample. The procedure was repeated till constant result was obtained.

**b) Determination of acid insoluble ash**

Acid insoluble ash is a part of total ash insoluble in dilute Hydrochloric acid. The acid insoluble ash content is determined and recommended for certain drugs may be coated with dirt and sand. The total ash obtained as described above was treated with 25ml of 10% Hydrochloric acid and boiled for 5 minutes. The insoluble matter was filtered and collected on ashless filter paper (Whatman No.42) and the paper washed with hot water. The insoluble ash was ignited and weighed in a tared silica crucible. The acid insoluble ash of the drug was repeated to get constant results.

**c) Determination of water soluble ash**

The total ash obtained from the above process was boiled with 25 ml of distilled water for 5 minutes. The insoluble ash was filtered through ash less filter paper (Whatman No.42). The residue was once again washed with water and ignited up to temperature not exceeding $450^o$c and converted into ash. The difference between the weight of total ash and

Licensed Under Creative Commons Attribution CC BY

insoluble matter represent the weight of water soluble ash. The percentage of water soluble ash was calculated with reference to the air dried drug.

**B. Determination of extractive values**

Extractive values indicate the nature of the constituents present in a crude drug. Based on the diversity in chemical nature and properties of the contents of the drug, various solvents were used for the determination of extractives. The solvents used for extraction dissolve appreciable quantity of substances desired. The methods used to find out the extractive values were as follows.

**a) Determination of alcohol soluble extract**

Alcohol is an ideal solvent frequently employed to determine various chemical contents like Tannins, Resins etc. Generally, Ethyl alcohol is used for determination of alcohol-soluble extractive. Dilute Alcohol a may also be used in some cases, depending upon solubility of constituents in a crude drug. In the present work, the author used 100 ml of 90% Alcohol for determining crude drug was macerated with 100 ml of 90% Alcohol in a stoppered flask for 24 hours. It was shaken frequently every 6 hours and allowed to stand to 18 hours. Then the extract was filtered rapidly through filter paper, taking precaution against loss of alcohol, about 25 ml of the filtrate was evaporated to dryness in a tared flat bottomed shallow dish, transferred to the oven and dried at 105$^{o}$C and weighed. The percentage of alcohol soluble extract was calculated with reference to the air dried drug.

**Table 6:** Ash value of Root tubers

| S.No. | Plant species | Part(s) | Total ash (%) | Acid insoluble ash (%) | Water insoluble ash (%) |
|---|---|---|---|---|---|
| 1. | ***Pimpinella tirupatiensis*** | Tuber | 9.50 | 3.00 | 1.75 |

**Table 7:** Extractive value of the root tubers

| S.No. | Species | Part(s) | 90% alcohol soluble extract (% w/w) | Water soluble extract(%w/w) | Chloroform soluble extract(%w/w) | Pet.Ether soluble extract(%w/w) |
|---|---|---|---|---|---|---|
| 1 | *Pimpinella tirupatiensis* | Tuber | 17.92 | 12 | 2.4 | 0.9 |

**Antibacterial Activity**

The presence of antimicrobial substances in the higher plants provide a source of inspiration for novel drug compounds as plants derived medicines have made significant contribution towards human health. The antimicrobial compounds from plants may inhibit microbial growth by different mechanism than those presently used antimicrobials and may have a significant clinical value in treatment of resistant microbial strains. Therefore, random screening of plants for active chemicals is as important as the screening of ethnobotanically targeted species (Principle, 1989).

**Materials and Methods**

**Collection of medicinal plants**: Selected medicinal plant, *Pimpinella tirupatiensis* has been used in the present study and it was collected from Tirumala hills, Eastern Ghats, Andhra Pradesh, India.

**Bacterial Cultures:** The bacterial cultures were procured from the Department of Microbiology, Sri Venkateswara Institute of medical Sciences (SVIMS), Tirupati, Andhra Pradesh, India. Pathogenic Gram positive bacteria such as *Bacillus subtilis*, *Klebsiella pneumoniae*, and Gram negative bacteria *Proteus vulgaris*, *Pseudomonas aeruginosa* were maintained on nutrient agar slants at 4$^{0}$C until further used for experimental studies.

**Preparation of the medium**

**Nutrient Agar media (P.H 7.0)**

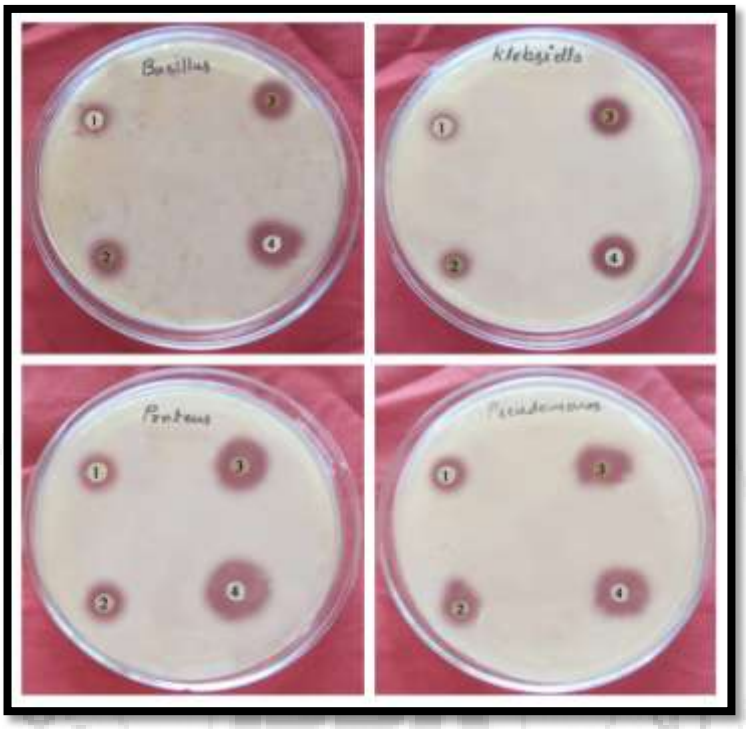
For the preparation of 1 lt of Nutrient Agar media ingredients like 1.5 g of beef extract, 1.5 g of yeast extract, 5 g of peptic digest of animal tissue and 5 g of sodium chloride were weighed and added in 500 ml of distilled water and heated with agitation to dissolve the constituents. Finally, the volumes were made upto 1 lt. Before the addition of agar (15 g) the pH of the medium was adjusted to 7.0 by adding few drops of 0.1 N NaOH or HCl using digital pH meter ( Elico Pvt. Ltd., Hyderabad). These were then sterilized by autoclaving at 15 lbs pressure at 120$^{0}$ C for 15 min; cooled to 40$^{0}$ C and approximately 20 ml of medium was poured to each 90mm sterilized petridish.

**Preparation of inoculum:**

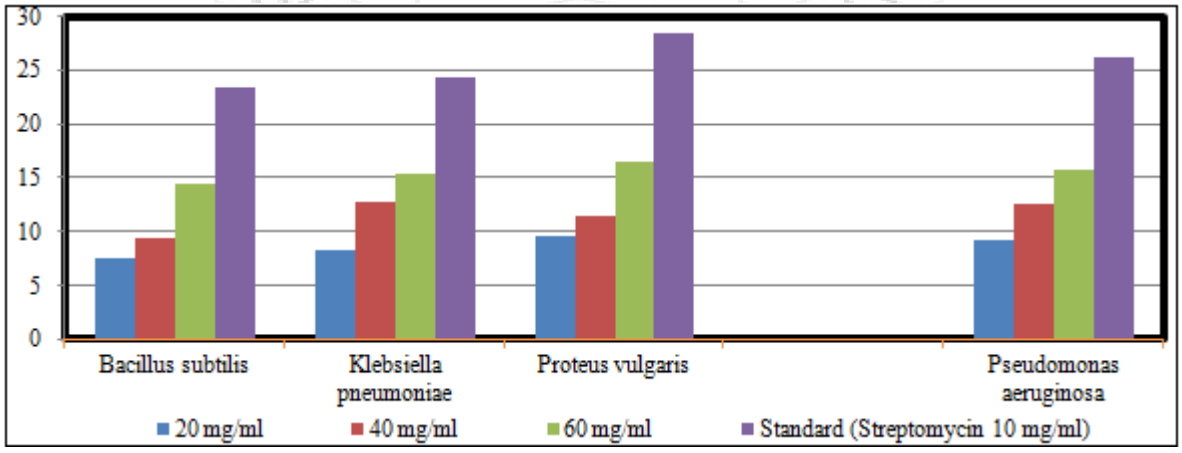
**Bacteria:** 18 hrs old bacterial broth cultures were used as inoculae after adjusting its population to 10$^{6}$ CFU/ ml (Colony Forming Units) using 0.9% (w/v) sterile saline by the method described by Forbes *et al*.,(1990).

**Preparation of plant extract:** The methanolic extracts of the four selected medicinal plants were prepared by dissolving 10gm of fine powder of each medicinal plants separately in 100 ml of methanol solvent. The contents were kept in orbitary shaker for 48 h. Then the extract was filtered and it is dried in hot air oven at 40$^{0}$ C. Then the extract was stored under refrigeration at 4$^{0}$ C for further studies.

**Preparation of sterile disc:** Whatman's No.3 filter paper was punched into 5 mm disc form and they sterilized, each sterile disc was incorporated individually with 20 – 60 mg/ml of extracts using micropipette. Precautions were taken to prevent the flow of the solvent extract from the discs to the outer surface. The condensed extracts were applied in small quantities on discs and they were allowed to dry in air. Then they were stored at 4$^{0}$ C.



**Assay of antimicrobial activity using Disc diffusion method:** The antimicrobial activity was performed by employing the disc diffusion method adopted by Bauer *et al.*, (1966) and Cruickshank (1968). The 20 ml of sterilized Muller Hinton Agar was poured into sterile petriplates, after solidification, 100 µl of fresh culture of human pathogens were swabbed on the respective plates. Sterile discs of Whatman No. 1 filter paper of about 6 mm were prepared.



Licensed Under Creative Commons Attribution CC BY

The discs were kept over the agar plates using sterile forceps at various concentrations (20, 40, and 60 mg/ml). Streptomycin 10mg/ml containing disc used as standard control. The plates were incubated for 24 h at $37^0$ C and the diameter of the inhibition zones was recorded. The assessment of antimicrobial activity was based on measurement of inhibition zones formed around discs. A zone of inhibition around the disc indicates that the compounds, which diffused into the agar from the disc, inhibited the growth of the organism.

**Antibacterial activity of *Pimpinella tirupatiensis*:**

| *S. No* | *Name of the microorganism* | *20 mg/ml* | *40 mg/ml* | *60 mg/ml* | *Standard (Streptomycin 10 mg/ml)* |
|---|---|---|---|---|---|

## 4. Results

Present investigation, antibacterial activity of *Pimpinella tirupatiensis* on pathogenic bacterial strains, the plant exhibited significant antibacterial activity. Methanol root extract of *Pimpinella tirupatiensis* at the concentration 60 mg/ml, *P.vulgaris* (16.5mm) was more susceptible, followed by *P. aeruginosa* (15.8mm), *K.pneumonia* (15.3mm), and *B.subtilis* (14mm).

**Abstract:** ***Indian medicine is known as the richest, the first and the foremost among other branches of medical knowledge that is available elsewhere on the globe. Much of the information was amply recorded by experienced individuals of this art. The earliest written record of the preparation and use of medicine from plants is in the Rig-Veda, Atharvanaveda documented more details on medicinal herbs and their varied utility. Throughout the history of man, plant drugs have played a vital role in healing and curing illness. Many indigenous methods were in use for centuries to treat various ailments. To elevate the medicinal properties, Different parts of Terminalia pallida were collected from different localities of Veligonda hill range, Eastern Ghats, Nellore Dt, Andhra Pradesh, India. The methanolic extracts of various parts of the plants were qualitatively screened for phytochemicals by using standard procedures which revealed the presence of various important bioactive chemical entities. Antibacterial activity of the methanolic extracts of stem bark and fruit were evaluated against Bacillus subtilis, Klebsiella pneumoniae and Proteus vulgaris, Pseudomonas aeruginosa. The methanolic extracts of these plant parts have exhibited significant broad spectrum antibacterial activities.***

**Keywords:** Stem bark, Antibacterial, Bioactive

## 1. General Introduction

Organic analytical study is one of the important and rapidly extending areas of plant drugs useful in pharmacognostical studies. The study helps in standardizing and differentiating the drugs and to provide adequate data for laying down pharmacopoeial standards. The Phytochemical evaluation of the selected crude drugs involves 1) organic analysis for active principles and 2) chromatography of different extracts.

**Preliminary Phytochemical studies**

## 2. Introduction

Phytochemical constituents are the basic source for the establishment of several pharmaceutical industries. The constituents present in a drug or plant play a significant role of crude drug. It is a qualitative chemical evaluation which indicates spectrum of chemical constituents present in a plant drug. Thus the Phytochemical screening is very important in identifying new sources of therapeutically and industrially important compounds like alkaloids, flavonoids, phenolic compounds, saponins, steroids, tannins, terpenoids etc. In pharmacognostical study, detection of these active principles are of great importance since many plant based drugs like aconite, atropine, brucine, caffeine, codeine, colchicines, digitoxin, digoxin, ephedrine, morphine, papaverine, pilcorpine, physostigmine, protopine, quinine, reserpine, scopolamine, strychnine, vinblastine, vincristine and taxol are widely used now-a-days in medicine for production of various pharmaceutical drugs. n general the organic compounds in plants can be categorised into three groups viz., primary metabolites, secondary metabolites and semantides. The primary metabolites (carbohydrates, proteins, lipids, cellulose and chlorophyll) are the basic constituents of the plant. They occur universally in the plant and play a vital role in the function of cell.

The compounds that are responsible for therapeutic effect are usually the secondary metabolites. These are selective and accumulate in the various parts of the plant cells. They synthesize either for a particular plant or may be translocated from other areas of active synthesis in the plant. Semantides are the information carrying molecules. DNA is primary, RNA is secondary and proteins are tertiary semantides.

**Plant Material Collection**

During the exploration of ethno-medico-botanical survey, the stem bark and fruits of *Terminalia pallida* were collected from different localities of Veligonda hill range, Eastern Ghats, Nellore Dt, Andhra Pradesh, India. These plant parts (Stem bark and fruit) were thoroughly washed with water and sufficient quantity of samples collected and chopped off into small fragments and shade dried. The dried samples were ground to make coarse powder (each 1 kg) and stored in polythene containers at room temperature. These samples were used for the detection of various secondary metabolites. Phytochemical screening was done following standard procedure adopted by Harborne (1973) and Gibbs (1974).

## 3. Experimental Studies

**Alkaloids test:** The methanolic extract was evaporated to dryness and the residue obtained was digested with 1% Hydrochloric acid. The resulting acidic solution was divided into two parts. To one part was added Mayer's reagent and to the second part dragendorff's reagent. Appearance of precipitate or turbidity indicates the presence of alkaloids.

**Preparation of reagents**

1) **Mayer's reagent:** 1.3 g of Mercuric chloride and 5g of Potassium iodide were dissolved separately in 60 ml and 10 ml of double distilled water and both the solutions were mixed and diluted to 100 ml.
2) **Dragendorff's reagent:** 8g of the Bismuth nitrate was dissolved in 20 ml of conc. nitric acid and 27.2g of Potassium iodide in 50 ml of double distilled water. Both the solutions were allowed to stand till $KIO_3$ crystallized out. Supernatant was decanted and final volume was adjusted to 100 ml.
3) **Flavonoids:** The plant extract was tested for flavonoids by shinoda's reaction. To a few ml of Methanolic extract, conc. Hydrochloric acid, Magnesium powder and a few fragments of Mg metal was added. The presence of flavonoids was identified by the development of pink or magenta or red coloured flame.
4) **Terpenoids (Liebermann - Burchard's test):** The Liebermann-Burchard's reaction was carried out by adding 0.5 ml of $H_2SO_4$ along the side of the test tube containing a mixture of Methanolic HCl and Acetic anhydrate (0.5 ml each). Formation of colour from green to bluish-green (sometimes via red or blue) indicate the presence of terpenoids.
5) **Steroids (Salkaowski reagent):** Development of wine red colour on adding con. $H_2SO_4$ and $CHCl_3$ to the Methanolic extract indicate the positive test for steroidal compounds.
6) **Lignans:** The plant extract was tested for the presence of lignins by adding conc. HCl and 2% Forfuraldehyde. Development of red colour indicates the presence of lignans.
7) **Indoles:** The development of voilet colour in the methanolic extract on adding Ehrilich reagent is considered as a positive reaction test.
8) **Carbohydrates (Molisch test):** To the methanolic extract, α-napthol solution (1.0g dissolved in 100 ml of each ethanol w/v) was added. Then Conc. $H_2SO_4$ was added gentlyalong the walls of the inclined test tube. Formation of a red to voilet colour indicate the presence of carbohydrates.
9) **Test for reducing sugars:** To 5ml of Benedict's reagent, 5ml of the test solution was added. The tubes were incubated in boiling water on water bath for 10-30 minutes. The development of an orange red precipitate indicates the presence of reducing sugars.
10) **Protiens (Million's test):** Million's reagent (solution of Mercuric nitrate in nitric acid) was added to 20 ml of boiling Methanolic extract. Formation of white precipitate that gradually turns red upon heating was observed for the presence of proteins.
11) **Phenolic compounds:** To the test solution 1-4 drops of 1% Ferric chloride was added. Appearance of intense colour in the extract was observed for the presence of phenolic compounds.
12) **Anthocyanidins:** The formation of red or purple colour with the plant extract, on adding equal volume of Methanolic HCl was taken as a positive reaction for anthocyanidins.
13) **Anthraquinones:** 20ml of benzene was added to 5g of plant powder and filtered. To the filtrate 5ml of 10% Ammonium hydroxide solution was added and shaken well. The formation of pink, red or violet colour in the ammonical phase indicates the presence of anthraquinones (Wall *et αl.,* 1954 anf Frans Woath, 1966).
14) **Saponin test:** The plant extract was evaporated to dryness. Tap water was added and shaken vigorously in a graduated cylinder for 15 minutes. Formation of a persistent foam was taken as a positive reaction test.
15) **Tannins:** The Methanolic extract was concentrated and the residue was dissolved in water and tested with 1% Gelatin solution and 1% Gelatin salt solution (1g gelatin dissolved in 10g NaCl w/w) to separate volumes. The appearance of white precipitate indicates the presence of tannins.

## 4. Screening for Selective Secondary Constituents

**A. Phenolic compounds**

**a) Extractive procedure**

The phenolic constituents were extracted by following the method given by Bate Smith (1954) and Ibrahim and Towers (1960). About 25g of healthy plant material was macerated with 100ml of 2N Hydrochloric acid.(HCL). The homogenate was digested on a boiling water bath for about half-an-hour. The contents were cooled and filtered through Whatman No.1 filter paper. The filtrate was extracted repeatedly with peroxide free diethyl ether. All the extracts were pooled and concentrated to 100ml and was treated three times with 25ml of 5% anhydrous sodium carbonate solution. The pooled carbonate solution was adjusted to pH 2.0 with Conc. Hydrochloric acid.

The acidified fraction at pH 2.0 was extracted with equal volumes (25ml) of fresh diethyl ether thrice. The combined

Licensed Under Creative Commons Attribution CC BY

other extracts were washed with distilled water repeatedly till all traces of hydrochloric acid was removed. The ether soluble water was removed by freezing the extract. The ether was evaporated to dryness on water bath at $98^0$C and the resulting phenolic compound residue was dissolved in 1ml of 95% ethanol. This was stored at low temperature in dark container for ready use.

**b) Identification**

About 2g of fresh weight equivalent to the final alcoholic extract was spotted on 23 x 29 cm whatmann No.1 Chromatographic filter paper with the help of micro pipette. The origin of the spot area was dried immediately with the help of hair-drier. Two dimensional ascending Chromatographic technique was adapted with benzene-acetic acid-water (60:70:30 v/v/v, upper layer) in the direction and sodium formate-formic acid-water (10:1:200 w/v/v) in the second direction. The Chromatographic chambers were saturated with the above solvent systems one day before the development of the Chromatograms at 22 to $24^0$c. The sheets after development were removed from the chambers and dried at room temperature. The dried sheets were observed under Ultra violet light and fluorescent regions were marked. The papers while exposing to Ammonia vapours were also observed under UV light and new fluorescent spots were marked.

The separated phenolic compounds on the Chromatograms were identified by comparison of $R_f$ values and individual spot colours of Chromogenic sprays. The final confirmation was made with authentic samples by co-chromatography.

**c) Chromogenic spray reagents**

**i) Diazotized sulphanilic acid reagent**

25ml of freshly prepared 5% sodium nitrate was slowly added to 5ml of sulphanilic acid solution (900mg of sulphanilic acid was dissolved in 9ml of Conc. HCl and the solution was diluted to 100ml with $H_2O$) at $0^0$c. To intensify the colours of the developed spots, 20% Sodium Carbonate solution was sprayed to the wet sheets (sprayed at $0^0$c immediately after spraying the above solution).

**ii) Diazotized *p*-Nitraniline reagent**

10ml of *p*-nitraniline reagent (1.5g of *p*-nitraniline was added to 45 ml of Conc. HCl and was made up to 950ml with distilled water) was mixed with 0.2ml of 5% Sodium nitrate and 10ml of 10% Sodium carbonate solution.

**Solvents:** 1. Benzene **:** Acetic acid **:** Water(60:70:30);
2. Sodium formate **:** Formic acid **:** Water(10 :1 :200)

**B. Flavonoids Compounds**

**a) Extractive procedure**

The flavonoid compounds were extracted according to the method given by Markham (1982). About 5g of powdered plant material was extracted in two steps. First 18ml of Methanol and 2 ml of water (9:1) were added, shaken well and kept for one day at room temperature. The supernatant solution of the extract was taken and transferred to another test tube. Secondly Methanol and water of 5ml each (1:1) was added to the remaining residue, stirred well and the mixture left for 24 hours. The two extracts were combined, mixed well and filtered through cotton wool. Later the filtrate was evaporated to about 1/3 the original volume till most of the methanol was removed. The resultant aqueous extract was extracted with chloroform repeatedly for 3 times. The solvent extracted aqueous chloroform layer was evaporated to dryness under vaccum in a rotary evaporator. The dried residue was saturated with 1 ml of 95% alcohol and stored in a dark place at low temperature.

**b) Identification**

The extracts containing flavonoids were separated in suitable quantities on Whatmann No.1 Chromatographic filter paper(23x29 cm) adopting the ascending technique using the solvent system Iso-propyl alcohol **:** Ammonia (25%) **:** Water(8:1:1:v/v/v) and n-butanol:acetic acid: water(4:1:5v/v/v) (top layer was used).The dried Chromatograms were examined under UV lamp and the fluorescent spots were marked. The papers while exposed to Ammonia Vapours were also observed under UV lamp and the new fluorescent regions were marked. The flavonoid compounds were identified by comparing the $R_f$ values and colours with those of the authentic samples on the Chromatograms. Co-Chromatographic studies were conducted with authentic markers to confirm the identification.

**C. Chromogenic spray reagents**

**Diazotized sulphanilic acid reagent (Markham, 1982) :**0.3% solution of sulphanilic acid in 8% HCl (25ml) was mixed with 5% Sodium nitrite solution(1.5ml) just before use. The Chromatographic sheets were sprayed with this mixture and with a 20% solution of anhydrous Sodium carbonate.

**1% Alcoholic ferric chloride:**1 g of Ferric chloride was dissolved in alcohol and made up to 100ml.
**1% Alcoholic Aluminium chloride:**1g of Aluminium chloride was dissolved in alcohol and made up to 100ml, just before spraying of the chromatographic sheets.

**Solvents:** 1. Iso-propyl alcohol **:** Ammonia(25%) **:** Water (8:1:1)
2. n-butanol**:** Acetic acid **:** Water(4:1:5)

**D. Amino acids**

**a) Extractive procedure**

Amino acids were extracted following the method of Das Chowdary *et al.*, (1967). About 5g of plant material was cut into small pieces and plunged immediately into a round bottomed flask containing 20ml of 80% Ethanol. It was reflexed for 30 minutes over a boiling water bath. The boiled material was ground in mortar using additional volumes of 10ml ethanol 80% (v) and centrifuged at 2000 rpm. The supernatant was collected and the Ethanol removed in vaccum. The aqueous extract was passed through Dowex 50W-X8 ($H^+$ from 20-50 mesh) column (1x10cm). the amino acids were eluted from the column with 50ml of 2N Ammonium hydroxide. The elute was evaporated to dryness and the residue was saturated with 95% Ethanol (1ml).

**b) Identification**

The extracts containing amino acids were seperated on Whatmann No.1 Chromatographic filter paper(23x28 cm)

Licensed Under Creative Commons Attribution CC BY

employing two-dimensional ascending technique using the solvent system:

1) Sec. butanol : Formic acid : Water(75:13:12v/v/v)-1st direction.

2) Buffer saturated phenol (1:2v/v)-2nd direction(6.3 g of Sodium citrate and 3.7g of Potassium dihydrogen phosphate were dissolved in 100ml of distilled water. To this 200ml of distilled phenol was added)

The amino acids were identified based on comparision of $R_f$ values, colours and with those of authentic samples by co-chromatographic studies.

**C) Chromogenic spray reagents**

**Ninhydrin:**It was prepared by dissolving 200 mg of Ninhydrin in 98ml of n-butanol with 2ml of glacial acetic acid.

**Solvents:** 1. Sec. butanol : Formic acid :Water(75:13:12)
2. Buffer: Phenol(1:2)

**E. Anthocyanidins**

**a) Extractive procedure**

The anthocyanidin constituents were extracted according to the method described by Harborne (1973).

About 5g of plant material was immersed in 20ml of 2N HCl in a boiling test tube and heated for 30-40 minutes at6 $100^0$c. The extract was cooled and filtered. The filtrate was washed twice with 20 ml of ethyl acetate to remove flavones. The remaining aqueous extract was further heated at $80^0$c for 3 minutes to remove the last traces of ethyl acetate. The pigment was re-extracted again with a small volume of Iso-amyl alcohol. The Ethyl acetate extract was evaporated to dryness on a boiling water bath. The anthocyanidin in the residue was diluted with 1ml of 1% Methanolic HCl and preserved at low temperature in dark for future use.

**b) Identification**

The extracts containing anthocyanidins was separated on 23 x 29 cm Whatmann No.1 Chromatographic filter paper. Uni-dimensional Chromatographic ascending technique was employed with Conc. Hydrochloric acid, Formic acid, Water (2:5:3 v/w/v) and n-butanol : Acetic acid : water (4:1:5). The Chromatograms developed from the said solvent systems were taken out from the glass chambers and dried at room temperature. The fluorescent regions of dried papers were marked under UV light. The $R_f$ values and colours of the spots were determined by comparing with those of the authentic markers on the Chromatograms.

**F. Lipids**

**a) Extractive procedure**

Lipids were extracted following the method adopted by Hoppe and Heitefuss (1974).

A solvent mixture consisting of 30ml Chloroform, 60ml of Methanol and 20 ml Water(1:2:0.8 v/v/v) was taken and allowed to boil. About 5g of plant material was homogenized in the above solvent mixture. The contents were filtered and taken separately. The residual mixture was treated with 70ml Methanol and the filtrate taken. The residue was again washed with 100ml Chloroform. All the above filtrate mixtures were taken in a separating funnel and 90ml of water added. The mixture now contains Chloroform**:** Methanol**:** Water in the ratio of 2**:**2**:**1.8 respectively and the mixture were allowed to settle. The lower lipid layer containing chloroform was separated and transferred into a breaker. The upper water layer was treated with 50ml of Chloroform successively for three times. All the extracted Chloroform layers were evaporated to dryness in a vacuum by rotary evaporation maintained at $40^0$C. The residue was treated with 2ml of Benzene to remove the traces of chlorophyll if present. Now the final lipid residue was dissolved in 2 ml of Chloroform and stored at low temperature in dark until use.

**b) Identification**

Thin layer plates were prepared by spreading a slurry of silicagel-G (50g in 100ml distilled water) to 105 mm thickness over thin glass plates. The glass plates were air dried and stored at room temperature. Before using, the plates were heated at $110^0$c for 30 minutes in a hot air oven for activation.

Using micropipette, one gram equivalent of lipid extract was taken and potted on TLC plates. The spotted areas were allowed for immediate dryness with the help of a drier. The dried plates were run in uni dimensional ascending Chromatography by using TLC glass chambers. The chambers were saturated with developing solvents one day before the plates were developed.

**Solvent systems**

1) Chloroform: Methanol: Acetic acid: Water (170:25:25:3 v/v/v/v)
2) Acetone: Benzene: Water(91:30:8 v/v/v).

The plates were placed in airtight tanks. The developed plates were removed and dried at room temperature and exposed to Iodine vapours to visualize all the lipid compounds.

The TLC plates were sprayed with 25% Sulphuric acid reagent with the help of an automizer for the clear detection of various lipid layers. The lipids were identified by comparision of $R_f$ values, color and with those of authentic samples by Co-Chromatographic studies.

**c) Chromogenic spray reagent**

The TLC plates were sprayed with 25% Sulphuric acid and heated to $230^0$c for 15 minutes, and the colour observed. Glycolipids gave red brown while phospholipids gave bright, red and other lipids gave pale brown colour spots on white background.

**Physicochemical studies:**

For several years, the crude drugs were identified by comparison only with the standard descriptions available. But recently, due to advancement in the field of Pharmacognosy, various techniques are followed to the standardization of crude drugs. Among such techniques, ash and extractive values are considered very important in promoting the quality and in establishing the Pharmacopeial standards of the drug.

Substandard quality of many drugs is due to either faulty collection or incorrect storage. When the constituents of a drug cannot be readily estimated by any other means, ash and extractive values are very useful especially for their evaluation. To prove its acceptability as a drug, studies of ash and extractive values are basically required in determining the quality and purity of selected crude drug.

## 5. Materials and Methods

The physical constants like ash and extractive values were determined by standard methods (Anonymous, 1985 and Kokate, 1991).

## 6. Experimental Studies

**A. Determination of ash values**

The object of ashing crude drugs is to remove all traces of organic matter which may otherwise interfere in an analytical determination. The inorganic salts naturally occurring in drug or adhering to it or deliberately added to as

Licensed Under Creative Commons Attribution CC BY

a form of adulteration are removed by gradual incineration of the drug. Thus the residue remaining after incineration of the powdered drug is known as ash content. The ash values are a criterion to judge the identity or purity and quality of the crude drug.

**a) Determination of total ash**

Total ash usually consists of Phosphates, Silicates and Carbonates of Potassium, Calcium and Magnesium. About 2 gm of the air dried powdered drug was accurately weighed and taken in a tared silica crucible, which was previously ignited and weighed. The powdered drug was spread as a fine even layer at the bottom of the crucible. The crucible containing the drug was gradually incinerated in a muffle furnace by increasing the temperature. It was heat dull red hot until free from carbon or converted into ash. Later the crucible was allowed to cool and kept in desiccators. The residue was weighed the percentage of total ash calculated with reference to the air dried sample. The residue was weighed the percentage of total ash calculated with reference to the air dried sample. The procedure was repeated till constant result was obtained.

**b) Determination of acid insoluble ash**

Acid insoluble ash is a part of total ash insoluble in dilute Hydrochloric acid. The acid insoluble ash content is determined and recommended for certain drugs may be coated with dirt and sand. The total ash obtained as described above was treated with 25ml of 10% Hydrochloric acid and boiled for 5 minutes. The insoluble matter was filtered and collected on ashless filter paper (Whatman No.42) and the paper washed with hot water. The insoluble ash was ignited and weighed in a tared silica crucible. The acid insoluble ash of the drug was repeated to get constant results.

**c) Determination of water soluble ash**

The total ash obtained from the above process was boiled with 25 ml of distilled water for 5 minutes. The insoluble ash was filtered through ash less filter paper (Whatman No.42). The residue was once again washed with water and ignited up to temperature not exceeding 450$^{o}$c and converted into ash. The difference between the weight of total ash and insoluble matter represent the weight of water soluble ash. The percentage of water soluble ash was calculated with reference to the air dried drug.

**B. Determination of extractive values**

Extractive values indicate the nature of the constituents present in a crude drug. Based on the diversity in chemical nature and properties of the contents of the drug, various solvents were used for the determination of extractives. The solvents used for extraction dissolve appreciable quantity of substances desired. The methods used to find out the extractive values were as follows.

**a) Determination of alcohol soluble extract**

Alcohol is an ideal solvent frequently employed to determine various chemical contents like Tannins, Resins etc. Generally, Ethyl alcohol is used for determination of alcohol-soluble extractive. Dilute Alcohol a may also be used in some cases, depending upon solubility of constituents in a crude drug. In the present work, the author used 100 ml of 90% Alcohol for determining crude drug was macerated with 100 ml of 90% Alcohol in a stoppered flask for 24 hours. It was shaken frequently every 6 hours and allowed to stand to 18 hours. Then the extract was filtered rapidly through filter paper, taking precaution against loss of alcohol, about 25 ml of the filtrate was evaporated to dryness in a tared flat bottomed shallow dish, transferred to the oven and dried at 105$^{o}$C and weighed. The percentage of alcohol soluble extract was calculated with reference to the air dried drug.

**Table 6:** Ash value of various parts of *Terminalia pallida*

| S.No. | Plant species | Plant Parts | Total ash (%) | Acid insoluble ash (%) | Water insoluble ash (%) |

| 1. | ***Terminalia pallida*** | Stem bark | 8.65 | 0.15 | 0.4 |
| | | Fruit | 4.00 | 0.35 | 2.4 |

**Table 7:** Extractive value of the stem bark and fruit of *Terminalia pallida*

| S.No. | Species | Plant Parts | 90% alcohol soluble extract (% w/w) | Water soluble extract (%w/w) | Chloroform soluble extract (%w/w) | Pet.Ether soluble extract (%w/w) |
|---|---|---|---|---|---|---|
| 1 | ***Terminalia pallida*** | Stem bark | 28.8 | 32 | 1.2 | 1.6 |
| | | Fruit | 18 | 4.8 | 0.4 | 0.8 |

**Antibacterial Activity**

The presence of antimicrobial substances in the higher plants provide a source of inspiration for novel drug compounds as plants derived medicines have made significant contribution towards human health. The antimicrobial compounds from plants may inhibit microbial growth by different mechanism than those presently used antimicrobials and may have a significant clinical value in treatment of resistant microbial strains. Therefore, random screening of plants for active chemicals is as important as the screening of ethnobotanically targeted species (Principle, 1989).

## 7. Materials and Methods

**Collection of medicinal plants**: Selected medicinal plant, *Terminalia pallida*, has been used in the present study and it was collected from Veligonda hill range, Eastern Ghats, Nellore Dt, Andhra Pradesh, India.

**Bacterial Cultures:** The bacterial cultures were procured from the Department of Microbiology, Sri Venkateswara Institute of medical Sciences (SVIMS), Tirupati. Pathogenic Gram positive bacteria such as *Bacillus subtilis*, *Klebsiella pneumoniae*, and Gram negative bacteria *Proteus vulgaris*, *Pseudomonas aeruginosa*, were maintained on nutrient agar slants at 4$^{0}$C until further used for experimental studies**.**

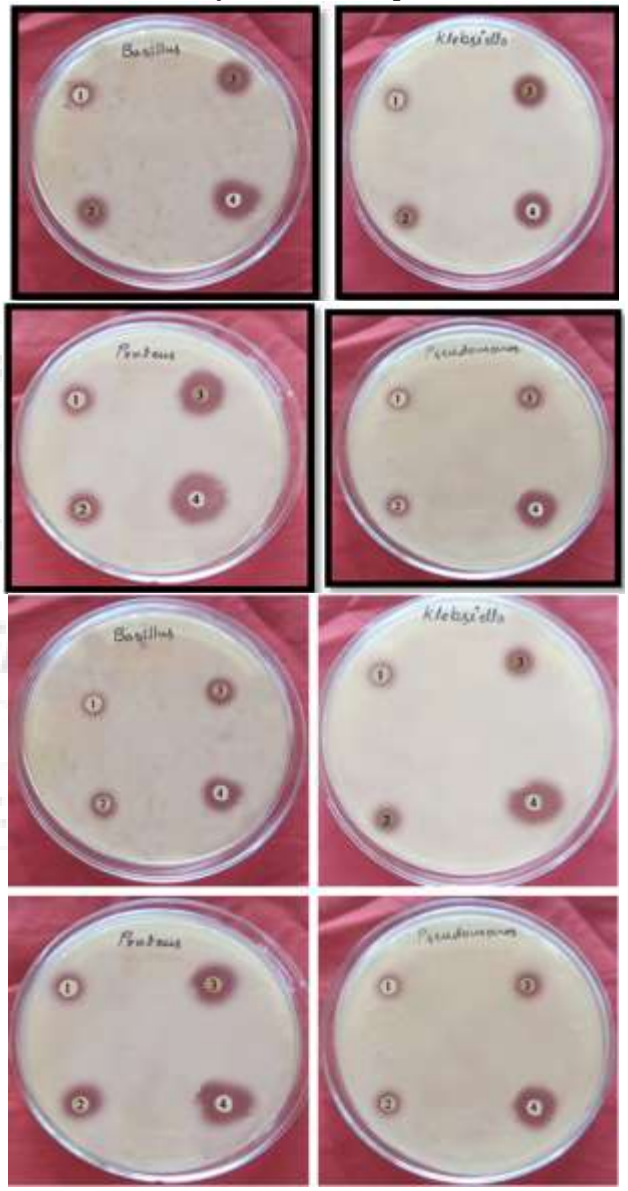
Licensed Under Creative Commons Attribution CC BY

**Preparation of the medium**

**Nutrient Agar media (P.H 7.0)**
For the preparation of 1 lt of Nutrient Agar media ingredients like 1.5 g of beef extract, 1.5 g of yeast extract, 5 g of peptic digest of animal tissue and 5 g of sodium chloride were weighed and added in 500 ml of distilled water and heated with agitation to dissolve the constituents. Finally, the volumes were made upto 1 lt. Before the addition of agar (15 g) the pH of the medium was adjusted to 7.0 by adding few drops of 0.1 N NaOH or HCl using digital pH meter ( Elico Pvt. Ltd., Hyderabad). These were then sterilized by autoclaving at 15 lbs pressure at $120^0$ C for 15 min; cooled to $40^0$ C and approximately 20 ml of medium was poured to each 90mm sterilized petridish.

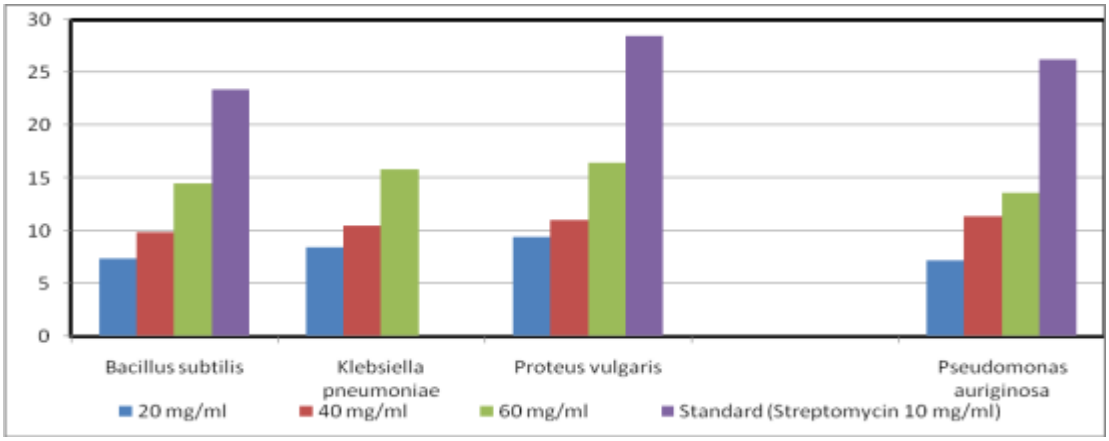
**Preparation of inoculum:**
**Bacteria:** 18 hrs old bacterial broth cultures were used as inoculae after adjusting its population to $10^6$ CFU/ ml (Colony Forming Units) using 0.9% (w/v) sterile saline by the method described by Forbes *et al*.,(1990).

**Preparation of plant extract:** The methanolic extracts of the four selected medicinal plants were prepared by dissolving 10gm of fine powder of each medicinal plants separately in 100 ml of methanol solvent. The contents were kept in orbitary shaker for 48 h. Then the extract was filtered and it is dried in hot air oven at $40^0$ C. Then the extract was stored under refrigeration at $4^0$ C for further studies**.**



**Preparation of sterile disc:** Whatman's No.3 filter paper was punched into 5 mm disc form and they sterilized, each sterile disc was incorporated individually with 20 – 60 mg/ml of extracts using micropipette. Precautions were taken to prevent the flow of the solvent extract from the discs to the outer surface. The condensed extracts were applied in small quantities on discs and they were allowed to dry in air. Then they were stored at $4^0$ C.

**Assay of antimicrobial activity using Disc diffusion method :**The antimicrobial activity was performed by employing the disc diffusion method adopted by Bauer *et al.,* (1966) and Cruickshank (1968). The 20 ml of sterilized Muller Hinton Agar was poured into sterile petriplates, after solidification, 100 µl of fresh culture of human pathogens were swabbed on the respective plates. Sterile discs of Whatman No. 1 filter paper of about 6 mm were prepared. The discs were kept over the agar plates using sterile forceps at various concentrations (20, 40, and 60 mg/ml). Streptomycin 10mg/ml containing disc used as standard control. The plates were incubated for 24 h at $37^0$ C and the diameter of the inhibition zones was recorded. The assessment of antimicrobial activity was based on measurement of inhibition zones formed around discs. A zone of inhibition around the disc indicates that the compounds, which diffused into the agar from the disc, inhibited the growth of the organism.



## 8. Results

Present investigation, antibacterial activity of *Terminalia pallida* on pathogenic bacterial strains, the plant exhibited significant antibacterial activity. For the Methanol extract of *Terminalia pallida* at the concentration 60 mg/ml *P. vulgaris* (16.5mm) was more susceptible, followed by *K. pneumonia* (15.8mm), *B.subtilis* (15.4mm) and *P. aeruginosa* (13mm).

**Antibacterial activity of *Terminalia pallida*:**

***Abstract:*** **- Medicinal plants have been used for centuries as remedies for human diseases because they contain components of therapeutic value. The two selected medicinal plants exhibited significant antibacterial activity on pathogenic bacterial strains. Methanol stem extract of *Boswellia ovalifoliolata* and *Syzigium alternifolium* showed potent antibacterial activity on *P. auriginosa* and *B. subtilis*.**

***Keywords: Boswellia ovalifoliolata, Syzigium alternifolium, Pseudomonas auriginosa, Bacillus subtilis*.**

## I. INTRODUCTION

Recently, the acceptance of traditional medicine as an alternative form of health care and the development of microbial resistance to the available antibiotics has led authors to investigate the antimicrobial activity of medicinal plants (Maoz and Neeman 1998; Hammer *et al.* 1999). During the last ten years the pace of development of new antimicrobial drugs has slowed down while the prevalence of resistance has increased astronomically (Hugo and Russell, 1984). In addition to this problem, antibiotics are sometimes associated with adverse effects on the host, including hypersensitivity, immunosuppression and allergic reactions (Ahmad *et al*, 1998). This situation forced scientists to search for new antimicrobial substances. Given the alarming incidence of antibiotic resistance in bacteria of medical importance (Monroe and Polk, 2000), there is a constant need for new and effective therapeutic agents (Bhavnani and Ballow, 2000). Therefore, there is a need to develop alternative antimicrobial drugs for the treatment of infectious diseases from medicinal plants (Cordell, 2000).

Literature reports and ethnobotanical records suggest that plants are sleeping giants of pharmaceutical industry (Hostettmann and Hamburger, 1991).They may provide natural source of antimicrobial drugs that will provide novel compounds that may be employed in controlling some infection globally. According to World Health Organization medicinal plants would be the best source to obtain a variety of drugs. About 80% of individuals from developed countries use traditional medicine, which has compounds derived from medicinal plants.

The use of plant extracts and phytochemicals, both with known antimicrobial properties, can be of great significance in therapeutic treatments. In the last few years, a number of studies have been conducted in different countries to prove such efficiency (Ikram and Inamul, 1984). The beneficial medicinal effects of plant materials typically result from the combinations of secondary products present in the plant. In plants, these compounds are mostly secondary metabolites such as alkaloids, steroids, tannins, and phenol compounds, which are synthesized and deposited in specific parts or in all parts of the plant. These compounds are more complex and specific and are found in certain taxa such as family, genus and species, but heterogeneity of secondary compounds is found in wild species (Balandrin *et al*, 1985). The medicinal actions of plants are unique to a particular plant species or group, consistent with the concept that the combination of secondary products in a particular plant is taxonomically distinct (Wink, 1999).

The plant's secondary products may exert their action by resembling endogenous metabolites, hormones, signal transduction molecules or neurotransmitters and thus have beneficial medicinal effects on humans due to similarities in their potential target sites. The presence of antimicrobial substances in the higher plants provide a source of inspiration for novel drug compounds as plants derived medicines have made significant contribution towards human health. The antimicrobial compounds from plants may inhibit microbial growth by different mechanism than those presently used antimicrobials and may have a significant clinical value in treatment of resistant microbial strains. Therefore, random screening of plants for active chemicals is as important as the screening of ethnobotanically targeted species (Principle, 1989).

## II MATERIALS AND METHODS

Collection of medicinal plants: Selected medicinal plants, *Boswellia ovalifoliolata and Syzigium alternifolium*, have been used in the present study and they were collected from Veligonda hills, Nellore district, Andhra Pradesh, India.

Bacterial Cultures: The bacterial cultures were procured from the Department of Microbiology, Sri Venkateswara Institute of medical Sciences (SVIMS), Tirupati.Pathogenic Gram positive bacteria such as *Bacillus subtilis*, and Gram negative bacteria *Pseudmonas aeruginosa*, were maintained on nutrient agar slants at $4^0$C until further used for experimental studies.

*Bacillus subtilis* : Bacillus subtilis was a gram positive, rod shaped, endospore forming catalase-positive bacterium commonly found in soil ( Madigan and Mortinnko, 2005). *Bacillus subtilis contaminate* food and causes food poisoning ( Ryan and Ray, 2004). It causes conjunctivitis followed by irridocheroiditis (Green wood *et al.*, 1997).

*Pseudomonas auriginosa* : *Pseudomonas auriginosa* is a gram negative rod shaped, non-encapsulated, aerobic ansd non-spore forming bacterium with unipolar motility occuring as an oppurtunistic pathogen of plants and human, which typically infects the pulmonary tract, burns, wounds and causes blood infections .The most common cause of burn infections was *P.auriginosa* and post- operative infection in radical keratotomy surgery patients.

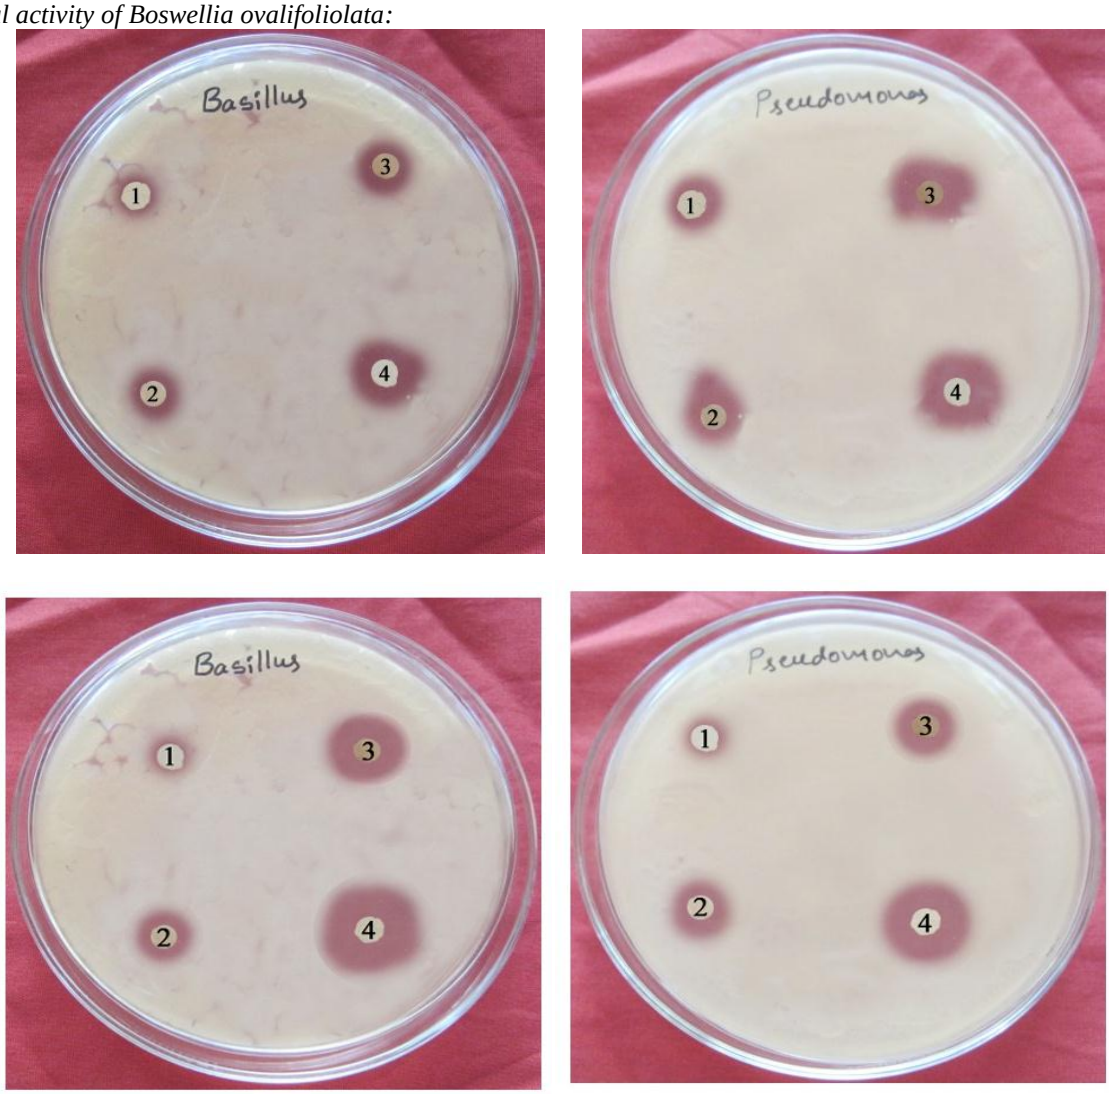
1. PREPARATION OF THE MEDIUM:

*Nutrient Agar media (pH 7. 0)*

For the preparation of 1 litre of Nutrient Agar media ingredients like 1.5 g of beef extract, 1.5 g of yeast extract, 5 g of peptic digest of animal tissue and 5 g of sodium chloride were weighed and added in 500 ml of distilled water and heated with agitation to dissolve the constituents. Finally, the volumes were made up to 1 liter. Before the addition of agar (15 g) the pH of the medium was adjusted to 7.0 by adding few drops of 0.1 N NaOH or HCl using digital pH meter (Elico Pvt. Ltd., Hyderabad). These were then sterilized by autoclaving at 15 lbs pressure at 1200 C for 15 min; cooled to 400 C and approximately 20 ml of medium was poured to each 90mm sterilized petridish.

2. *Preparation of inoculum:*
Bacteria: 18 hrs old bacterial broth cultures were used as inocula after adjusting its population to $10^6$ CFU/ ml (Colony Formong Units) using 0.9% (w/v) sterile saline by the method described by Forbes *et al*.,(1990).

3. *Preparation of plant extract:* The methanolic extracts of the four selected medicinal plants were prepared by dissolving 10gm of fine powder of each medicinal plant separately in 100 ml of methanol solvent. The contents were kept in arbitrary shaker for 48 h. Then the extract was filtered and it is dried in hot air oven at $40^0$ C. Then the extract was stored under refrigeration at $4^0$ C for further studies.



4. *Preparation of sterile disc:* Whatman's No.3 filter paper was punched into 5 mm disc form and they sterilized, each sterile disc was incorporated individually with 20 – 60 mg/ml of extracts using micropipette. Precautions were taken to prevent the flow of the solvent extract from the discs to the outer surface. The condensed extracts were applied in small quantities on discs and they were allowed to dry in air. Then they were stored at $4^0$ C.

5. *Assay of antimicrobial activity using Disc diffusion method:* The antimicrobial activity was performed by employing the disc diffusion method adopted by Bauer *et al.*, (1966) and Cruickshank (1968). The 20 ml of sterilized Muller Hinton Agar was poured into sterile Petri-plates, after solidification, 100 µl of fresh culture of human pathogens were swabbed on the respective plates. Sterile discs of Whatman No. 1 filter paper of about 6 mm were prepared. The discs were kept over the agar plates using sterile forceps at various concentrations (20, 40, and 60 mg/ml). Streptomycin 10mg/ml containing disc used as standard control. The plates were incubated for 24 h at $37^0$ C and the diameter of the inhibition zones was recorded. The assessment of antimicrobial activity was based on measurement of inhibition zones formed around discs. A zone of inhibition around the disc indicates that the compounds, which diffused into the agar from the disc, inhibited the growth of the organism.

| 1 | *Bacillus subtilis* | 7.21 ± 0.39mm | 10.42 ± 0.56 mm | 13.54 ± 0.49mm | 23.45 ± 0.65mm |
| 4 | *Pseudomonas auriginosa* | 7.5 ± 0.28mm | 10.7 ± 0.88mm | 15.5± 0.57mm | 26.25 ± 0.36 mm |

## RESULTS

Present investigation, anti bacterial activity of two selected medicinal plants, on pathogenic bacterial strains, all exhibited significant antibacterial activity. Methanol stem extract of *Boswellia ovalifoliolata* at the concentration 60 mg/ml showed potent antibacterial activity. *Pseudomonas auriginosa* (16mm) was more susceptible followed by *B. subtilis* (14mm). Methanol stem extract of *Syzigium alternifolium* at the concentration 60 mg/ml, *Pseudomonas auriginosa* (15.2mm) was more susceptible, followed by *B. subtilis* (13.5mm).

## III CONCLUSION

Among the two selected medicinal plants Methanol stem extract of *Boswellia ovalifoliolata* showed potent antibacterial activity, followed by *Syzigium alternifolium. Boswellia ovalifoliolata*, showed highest antibacterial activity and *Syzigium alternifolium* showed moderate antibacterial activity against the selected bacterial strains.

***Abstract:*** ***The proposed spectrophotometric methods are rapid, sensitive and reproducible for the analysis of cefdinir(A), and cefepime(B) in pharmaceutical dosage forms with short analysis time. The authors developed reagent for the estimation of cefdinir and cefepime, third and fourth generation cephalosporins respectively using catechol ( or p amino aceto phenone-AAP ) and sodium meta periodate at a λmax of 460 nm. The Beers law range, molar absorptivity and Sandell sensitivity will be 50-250 µg/mL,4.5X10$^3$ and 0.03 for cefdinir respectively. In case of cefepime the Beers law range, molar absorptivity and Sandell sensitivity will be 20-250µg/mL,6.05x10$^3$ and 0.02 respectively.***

***Keywords- Catechol , p-Amino aceto phenone and Sodium meta per iodate,cefdinir,cefepime***

## I. INTRODUCTION

*A. Cefdinir*

is chemically known as 8-[2-(2-amino-1,3-thiazol-4- yl)-1-hydroxy-2- nitroso-ethenyl] amino- 4-ethenyl-7-oxo- 2-thia-6- azabicyclo [4.2.0]oct-4-ene-5-carboxylic acid, a semi-synthetic, broad- spectrum antibiotic in the third generation of the cephalosporin class. It is used to control for common bacterial infections of the ear, sinus, throat, and skin. Therapeutic uses of cefdinir include otitis media, soft tissue infections, and respiratory tract infections, including sinusitis, strep throat, community-acquired pneumonia and acute exacerbations of bronchitis.

*B. Cefepime*

is chemically known as (6R,7R,Z)-7-(2-(2-aminothiozyl-4-yl)-2-(methoxyimino)acetamido)-3-((1-ethylpyrrolidinium1-yl)methyl)-8-oxo-5-thia-1-aza-bicyclo(4,2,0) oct-2-ene-2- carboxylate (Fig-1.2.1) is a fourth generation cephalosporin used to control both gram positive and gram negative bacteria. Cefepime is usually reserved to treat severe nosocomialpneumonia, infections caused by multi-resistant microorganisms (e.g. pseudomonas aeruginosa) and empirical treatment of febril eneutropenia. Cefepime has good activity against important pathogens including pseudomonas aeruginosa, Staphylococcus aureus, and multiple drug resistant Streptococcus pneumoniae. It acts against enterobacteriaceae, whereas other cephalosporins are degraded by many plasmid- and chromosome-mediated beta-lactamases.
Side effects of cefepime are mild pain, redness, or swelling at the injection site.

## II. EXPERIMENTAL

*A. Preparation of Solutions*

Catechol : 0.1% solution was prepared by dissolving 0.1 g of catechol sample (A.R .grade SDFCL Mumbai) in 100 mL of distilled water.

Sodium meta per iodate, $NaIO_4$ : 2.1392 g of NaIO4 (AR grade Hi Media laboratories Mumbai-66) was dissolved in distilled water and the total volume was brought to 1 Lt (0.01M) in a standard volumetric flask.

Standard solution of cefdinir and cefepime (in dosage form): Drug (RTIST – DT for Cefdinir or Novapime for cefepime – Lupin laboratories, Mumbai) solution was prepared by dissolving 100 mg of drug sample in 100mL of distilled water. Working solutions of drug sample (100mg / mL) were prepared by diluting aliquots of the stock solutions with distilled water.

*B. Instrumentation*

Spectral measurements and absorbance readings were made on Elico SL 177 double beam Spectrophotometer. pH measurements

©IJRASET: All Rights are Reserved

Volume 5 Issue VI, June 2017
ISSN: 2321-9653
International Journal for Research in Applied Science & Engineering Technology (IJRASET)

were carried out using Elico pH meter model LI 615.

*C. Establishment of Optimum Conditions*

The optimum conditions were established in each case basing on the development of maximum color and its stability and results are presented inTable – I. Among the various oxidizing agents tried, IO4- is the best one, followed by $H_2O_2$. The other oxidizing agents such as $IO_3^-$, Fe(III), $MnO_4^-$, $Ocl^-$ $Fe(CN)_6^{3-}$, were found not suitable. The efficiency of the oxidizing agent depends upon its relative reactive tendency towards reactants, (drug, catechol) products (indo-dyes) and also on the behavior of its reduced form. The formation of colored species of same λmax in the case of cefdinir (cefepime) with each pair of reagents, (Catechol – $IO_4^-$ and AAP-$IO_4^-$) suggests that the indo dye formed with both compounds is the same.

Table-I Experimental Conditions

| S.No | Drug | $P^H$ | Catechol | $NaIO_4$ | Maximum Colour development | Stability | λmax |
|---|---|---|---|---|---|---|---|
| 1 | Cefdinir | 4±0.4 | 1 mL | 1mL | 5 min. | 120 min. | 460 nm |
| 2 | Cefepime | 4±0.4 | 1 mL | 1mL | 5 min. | 180 min. | 460 nm |

*D. Assay Procedure*

1) *For Cefdinir (or Cefepime) using Catechol- $IO_4^-$*: 15 mL of buffer solution, 0.4 –5mL of aliquots of cefdinir (Cefepime) solution,1mLof $IO_4^-$, 1mLof catechol(or AAP)were successively placed in a 25 ml volumetric flask, so as to make total volume of 25 mL.The absorbance of colored species was measured at 460 nm between 5—70 min. against corresponding reagent blank prepared in a similar manner. The amount of cefdinir (or cefepime ) was read from calibration curve prepared with the standard solution under identical conditions.

*E. Optical Characteristics*

1) *Adherence to Beer's law.*: In order to test whether the cefdinir-catechol-$IO_4^-$(or AAP- $IO_4^-$ ) or cefepime- catechol-$IO_4^-$ (or AAP- $IO_4^-$) systems adhere to Beer's law, the absorbance at λmax of a set of solutions (25mL) containing varying amounts of cefdinir (cefepime),15 mL of buffer solutions, specified concentrations of catechol, (or AAP) and oxidizing agent (Table-II) were measured against blank on spectrophotometer. The linearity of the plot between absorbance and the concentration range specified in Table-II shows that the color system obeys Beer's law, Fig's 1.1 and 1.2. Beer's limits, molar absorptivity, optimum photometric range and Sandal's sensitivity values of the method in the case of cefdinir were calculated and results are incorporated in Table-II

Table-II Optical Characteristics

| Reagent | Beers Law Range µg/mL | Molar Absorptivity Lt/mol/cm | Sandell's sensitivity µg/cm2/0.001 absorbance units | Optimum photometric range µg/25 ml |
|---|---|---|---|---|
| Catechol-$IO_4^-$ and cefdinir | 50 – 250 | $4.5 \times 10^3$ | 0.03 | 100—257 |
| Catechol-$IO_4^-$ and cefepime | 20 - 250 | $6.05 \times 10^3$ | 0.02 | 80 – 316 |

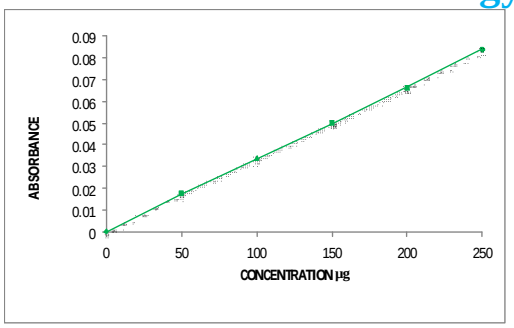

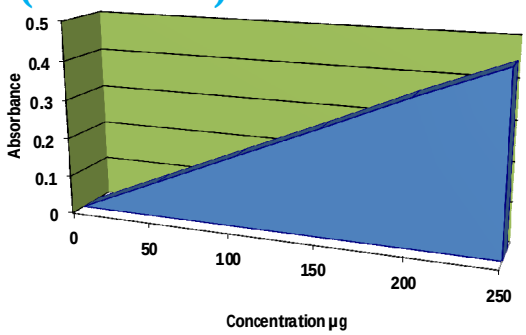

Fig.1.1 Linearity of Cefepime

(3D) Fig.1.2 Linearity of Cefdinir

*F. Precision and Accuracy*

The precision and accuracy of the methods in the determination of cefdinir and cefepime were tested by measuring the absorbance of six replicates each containing approximately 3/4 th of the Beer's law limit concentrations. The percentage of relative standard deviations and confidence limits (0.05 and 0.01 levels) in the methods are presented below.

Table. III. Precision and Accuracy

| Cefdinir | Amount of Drug * | | % Error | % R.S.D | % Range of Error | |
|---|---|---|---|---|---|---|
| | Taken mg | Found mg | | | 95% Confidence Limit | 99% Confidence Limit |
| Catechol IO4- reagent and cefdiir | 0.25 | 0.247 | 1.174 | 2.657 | ±1.6 | ±2.92 |
| | 0.15 | 0.148 | 1.3 | 1.26 | ±1.32 | ±2.92 |
| Catechol-$IO_4^-$reagent cefipime | 0.20 | 0.197 | 1.172 | 1.27 | ±1.3 | ±1.98 |
| | 0.25 | 0.247 | 1.174 | 2.655 | ±1.6 | ±2.92 |

To justify the suitability of the proposed methods, known amounts of Cefdinir ( or cefepime ) was added to the quantities of previously analyzed samples (in dry form) and then analyzed again. The results are incorporated in Table-IV.

Table-IV. Results of analysis of formulations and Recovery experiments

| Sample | Labeled Amount | Amount found | %Recovery |
|---|---|---|---|
| Ciplacef | 125 mg | 124.86 mg | 99.88 |
| Cefast | 125 mg | 124.55 mg | 99.64 |
| Cepime | 500 mg | 499.6 mg | 99.92 |
| Megapime | 500 mg | 495.75 mg | 99.15 |

## III. RESULTS AND DISCUSSION

Based on the results furnished in Tables I. –IV it can be inferred that the method proposed for the spectrophotometric determination of cefdinir ( cefepime) is simple, rapid, sensitive and specific with reasonable precision and accuracy. The methods have been extended to determine cefdinir (or cefepime) different pharmaceutical preparations.

The proposed method appears to be superior to many of the reported methods7-9 and so they can be employed in routine determinations. Catechol is readily oxidisable by sodium meta per iodate to form o-benzoquinone. Cefdinir ( cefepime ) by virtue of its strong electron donating group, (-$NH_2$) oxidative coupling reaction takes place with electron deficient o-benzo quinone to form indo dye.

## IV. CONCLUSION

Hence the authors conclude that the proposed spectrophotometric methods are sensitive and reproducible for the analysis of cefdinir ( cefepime) in pharmaceutical dosage forms with short analysis time.

## V. ACKNOWLEDGEMENTS

The authors express their sincere thanks to Prof.B.Syama Sundar former Vice chancellor of Yogi Vemana University,Kadapa A.P for his valuable suggestions and continuous encouragement.

**Abstract**

Crystal and molecular structure of newly synthesized compound 5-bromo-7-methoxy-1-methyl-1*H*-benzoimidazole (BMMBI) has been authenticated by single crystal X-ray diffraction, FT-IR, FT-Raman, $^{1}$H-NMR, $^{13}$C-NMR and UV-Visible spectroscopic techniques; compile both experimental and theoretical results which are performed by DFT/B3LYP/6-311++G(d,p) method at ground state in gas phase. Visualize nature and type of intermolecular interactions and crucial role of these interactions in supra-molecular architecture has been investigated by use of a set of graphical tools 3D-Hirshfeld surfaces and 2D-fingerprint plots analysis. The title compound stabilized by strong intermolecular

hydrogen bonds N...H-O and O...H-O, which are envisaged by dark red spots on $d_{norm}$ mapped surfaces and weak Br...Br contacts envisaged by red spot on $d_{norm}$ mapped surface. The detailed fundamental vibrational assignments of wavenumbers were aid by with help of Potential Energy distribution (PED) analysis by using GAR2PED program and shows good agreement with experimental values. Besides frontier orbitals analysis, global reactivity descriptors, natural bond orbitals and Mullikan charges analysis were performed by same basic set at ground state in gas phase. Potential reactive sites of the title compound have been identified by ALIE, Fukui functions and MEP, which are mapped to the electron density surfaces. Stability of BMMBI have been investigated from autoxidation process and pronounced interaction with water (hydrolysis) by using bond dissociation energies (BDE) and radial distribution functions (RDF), respectively after MD simulations. In order to identify molecule's most important reactive spots we have used a combination of DFT calculations and MD simulations. Reactivity study encompassed calculations of a set of quantities such as: HOMO-LUMO gap, MEP and ALIE surfaces, Fukui functions, bond dissociation energies and radial distribution functions. To confirm the potential of title molecule in the area of pharmaceutics, we have also calculated a series of drug likeness parameters. Possibly important biological activity of BMMBI molecule was also confirmed by molecular docking study.

**Keywords:** Benzoimidazole; Supra-molecular architecture; BDE; RDF; molecular docking.

## 1. Introduction

Benzimidazole is a fused heterocyclic compound formed by the merger of benzene and imidazole, occupied a remarkable place among various heterocycles by virtue of their greater use in medicinal chemistry, drug discovery, structurally related to purine bases and is found in a variety of natural products, such as vitamin B12. Benzimidazole nucleus is termed "master key" as it is an important core in many bioactive compounds, key building block prevalently present of numerous compounds DNA intercalator [1], anticancer [2], cytotoxic, antitumor [3], Hv1 proton channel inhibitor [4], agonist neurotransmitter serotonin receptors, antiulcer [5], antifungal [6], analgesic and anti-amoebic [7]. At the same time, owing to the coordination ability of azoles, the benzimidazole chelating ligands have been extensively studied in the modelling biological systems [8]. In addition, these compounds have been used as organic ligands [9], liquid crystals [10], OLED's [11], chemo sensing [12] and in corrosion science [13]. Sundaraganesan et al. [14] have been investigated the vibrational spectra and DFT studies of benzimidazole. Miranda et al. [15] reported bis-(1*H*-Benzimidazol-2- yl)-methanone: new preparation method, crystal structure, and vibrational spectroscopy and DFT

calculations. Sudha et al. [16] investigated molecular structure, vibrational spectroscopic, first-order hyperpolarizability and HOMO, LUMO studies of 2-aminobenzimidazole. Most recently, Sundaraganesan et al. [17] carried out investigation of FT-IR, FT-Raman, dispersive Raman, NMR spectroscopic studies and NBO analysis of 2-Bromo-1*H*-Benzimidazol by density functional method. To our knowledge, crystal structural analysis, computational studies, MD simulations have no testimony till now. In this present study, we report synthesis, supra-molecular architecture of BMMBI along with detailed spectral investigation by FT-IR, FT-Raman and NMR, correlate these results with computational results and they shows good agreement. New molecular structures with great potential to be practically applied in the area of materials science, medicine, pharmacology are being proposed every day. An inexpensive and widely used tool for investigation of these structures is based on computational molecular modelling, mostly on DFT calculations and MD simulations. Thanks to these approaches various important reactive properties can be obtained for molecular structures that haven't been synthetized yet [18, 19]. Beside determination of molecule's "hot spots", the strength of molecular modelling lies in the fact that various spectra can be simulated with very high precision, if the proper levels of theory are used. This helps not only for characterization of compounds, but also to the structure confirmation of new and not synthetized molecules. In this particular work we have simulated IR and NMR spectral information in order to determine specificities of this newly synthetized molecule. Beside spectral investigation of the title molecule, in this work we have applied DFT calculations in order to determine global and local reactive properties [20]. Reactive properties predicted by this study were used in order to draw certain conclusions about the degradation properties of BMMBI molecule, because, as other pharmaceutical molecules, it could end up in various water resources [21]. Thanks to the fact that pharmaceutical molecules are highly stable and that natural conditions and conventional degradation pathways are not efficient enough for their removal, great attention of the scientific community is focused to the solving of this problem [21-23], especially by means of advanced oxidation processes [22, 24-28]. For these tasks computational molecular modelling turned out to be particularly useful [29-32].

## 2. Material and methods

### 2.1. General remarks

The reagents and solvents used for synthesis were of Analar grade and used without further purification. The synthesis was carried out under anaerobic condition (oxygen free inert atmosphere). $^{1}$H-NMR and $^{13}$C-NMR spectra were recorded on Bucker 400MHz

spectrometer operating at room temperature in DMSO-$d_6$ as solvent. The chemical shifts values (δ) are reported in parts per million (ppm) using TMS as an internal standard. FT-IR spectrum (Fig.S1-supporting material) was recorded in the range 4000-400 $cm^{-1}$ region with an ATR module ALPHA-T Bruker FT-IR spectrophotometer. FT-Raman spectrum (Fig.S2-supporting material) of the solid compound was recorded on a Bruker RFS 100/s (Germany) using 1064 nm line of Nd:YAG laser as excitation wavelength 1064nm in the region 4000-0 $cm^{-1}$.

**2.2. Synthesis of 5-bromo-7-methoxy-1-methyl-1H-benzoimidazole (BMMBI)**

Take a mixture of 4-bromo-6-methoxy-N1-methylbenzene-1,2-diamine (800 mg, 3.461 mmol), trimethylorthoformate (417.6 μL, 3.80 mmol) and para-toluene sulfonic acid (catalytic amount) in toluene (13 mL) and then the reaction mixture was refluxed for 2 hours at 105°C. Reaction was monitor by TLC. After, completion of reaction by TLC, the crude products purified by column chromatography to give 5-bromo-7-methoxy-1-methyl-1H-benzoimidazole as beige solid (amount 820 mg, yield 78.8%) [33]. (Scheme-1 supporting information-Fig.S3).

**2.3. X-ray crystallography**

A colourless, needle shaped single crystal of the title compound, with dimensions of 0.5 mm × 0.4 mm × 0.3 mm was selected and mounted on a Bruker APEX-II CCD diffractometer with monochromated MoKα radiation (λ = 0.71073 Å) at 273(2) K. The data was processed with SAINT and corrected for absorption using SADABS [34]. The crystal structure solved by direct method using the program SHELXL [35] and was refined by full-matrix least squares technique on $F^2$ using anisotropic displacement parameters for all non-hydrogen atoms.

**2.4. Computational details**

The optimized geometry of title compound have been obtained by performing DFT calculations at B3LYP/6-311++G(d,p) using Gaussian09 software [36] with X-ray crystallography Cartesian coordinates as the starting geometry without any structural constraints were applied. The optimized geometry parameters were used for calculation of vibrational wavenumbers, isotropic chemical shifts, electronic properties and surface/counter studies. The assignments of the calculated wavenumbers are assisted by the animation option of GAUSSVIEW program, which gives a visual presentation of the vibrational modes [37] and the potential energy distribution values were calculated with the help of GAR2PED software package [38].

Two main programs of the Schrödinger Materials Science Suite 2017-1 (SMSS), Jaguar 9.4 [39] and Desmond [40-43], have been used as well for DFT calculations and MD simulations, respectively. B3LYP exchange-correlation functional [44] with 6-311++G(d,p), 6-31+G(d,p), and 6-311G(d,p) basis sets for obtaining ALIE, Fukui functions and BDEs, have been used respectively. For MD simulation an OPLS 3 force field [40, 45-47] was used. MD parameters also include: simulation time set to 10 ns, temperature set to 300 K, pressure set to 1.0325 bar, and cut off radius set to 12 Å, within isothermal–isobaric (NPT) ensemble class. Solvent was treated by simple point charge (SPC) model [48] was used. For MD simulation one BMMBI molecule was placed into the cubic box with ~3000 water molecules. Noncovalent interactions have been detected also by Jaguar program, relying to the method of Johnson et al. [49, 50] Maestro GUI [51] was used in the cases of activities with Schrödinger Materials Science Suite 2017-1. In order to investigate the charge transfer due to the excitation, a Multiwfn [52-55] program was used. Electron density variation and $C_{+/-}$ functions were visualized with the VMD program [56-62]. A Tachyon [63] ray tracing library, as implemented in VMD, was used for the rendering of figures.

### 2.5. Hirshfeld surface and finger print surface analysis

Hirshfeld surfaces [64] and the allied 2D fingerprint plots [65] are unique for any crystal structure, which are proposed as an effective way to discern intermolecular interactions between molecules that are responsible for the molecular arrangement in the crystalline state and the nature of packing of molecules in their solid-state are calculated by using Crystal Explorer [66] and which accepts a structure input file in the CIF format. The Hirshfeld surface fingerprint plots were generated using two distances, $d_e$, the distance from the point to the nearest nucleus exterior to the surface, and $d_i$, the distance to the nearest nucleus interior to the surface. Graphical plots of the molecular Hirshfeld surfaces mapped with a fixed colour scheme red-white-blue, where red highlights shorter contacts which is denoted as $d_{norm}$ values with negative sign, white is used for contacts around the vdW separation represented as $d_{norm}$ equal to zero and blue is for longer contacts which is denoted as $d_{norm}$ values with positive sign.

## 3. Results and discussion

### 3.1. Crystal structural analysis

The title compound crystallizes in triclinic *P*-1 with $a$ = 7.147(5) Å, $b$ = 9.327(6) Å, $c$ =18.214(11) Å, V = 1147.4(13) Å$^3$ and Z = 4.The crystallographic data and structure refinement parameters are summarized in Table S1 (supporting material) and geometric parameters for hydrogen bonds and other intermolecular contacts (Å, º) operating in the

crystal structure of BMMBI in Table S2 (supporting material). The ORTEP diagram of the molecule is shown in Fig.S4 (supporting material). The compound crystallizes with two independent molecules (A and B) in the asymmetric unit in addition to the three water molecules. The benzimidazole rings of both the molecules A and B are planar, the root mean squared deviations of two rings being 0.008 Å in molecule A and 0.005 Å in B. The crystal structure analysis revealed that, in the crystal, the water molecules self assemble to form ribbons along (100) with alternating tetrameric and hexameric clusters (Fig.S5a-supporting material) of water molecules. The hexameric cluster comprises of three water molecules (O1, O2 and O3) linked by six O-H…O hydrogen bonds (Table S2), while the O1 and O2 water molecules form an additional tetrameric cluster, the two adjacent alternating clusters being fused with O1 and O2 water molecules common to both. Two A molecules of the compound are linked into the O3 water molecules of the hexameric cluster via O-H…N hydrogen bonds (Table S2), while two B molecules are linked into the O2 water molecules of the tetrameric cluster (Fig.S5b-supporting material). Thus, in the absence of any direct structure directing interactions between the molecules, the self assembly of water molecules which in turn links with the molecules A and B is very crucial in deciding the supra-molecular architecture (Fig.S5b). The A molecules are further interconnected via short Br…Br contacts (3.592(3) Å) along the crystallographic b axis forming a two dimensional architecture (Fig.S5c). Several $\pi_{aryl}\ldots\pi_{aryl}$ interactions are also observed in the crystal structure which give additional stability to the crystal structure (Fig.S5d, Table S2).

### 3.2. Geometrical parameters

The optimized geometrical parameters with XRD data are given in Table S3 (supporting material) and atom labelling is given in Fig.1**.** In the present case the experimental C-C bond lengths are in the range of 1.4104-1.3785 Å and the calculated C-C bond lengths are in the range of 1.4057-1.3727 Å and the literature data for similar derivatives are, 1.389-1.413 Å [14] and 1.391-1.416 Å [16]. For the title compound, the C-Br bond length is 1.9237 Å (DFT) and 1.9055 Å (XRD) which is in agreement with literature [67]. For the title compound, the bond length C21-N9 = 1.3081/1.3277 Å (DFT/XRD) shows double bond character, while, the bond lengths (DFT/XRD), C11-N9 = 1.3831/1.3866 Å, C10-N16 = 1.3855/1.3816 Å, C21-N16 = 1.3729/1.3397 Å, C1-N6 = 1.4567/1.4627 Å are less than the normal single C-N bond length of about 1.48 Å [68] and the corresponding reported values of C-N bond lengths of similar derivatives are, 1.3211 Å, 1.3855 Å, 1.3853 Å, 1.4071 Å, 1.4596 Å [68]. At C17 position, the bond angles (/DFTXRD) are C19-C17-C6 = 123.5/123.7°, C19-C17-Br5 =119.1/119.2° and C6-C17-Br5 = 117.3/117.1° and the asymmetry in angles is due

to the electronegative bromine atom. The influence of the methoxy group and methyl group are revealed from the bond angles (DFT/XRD) around C18 (C6-C18-C10 = 117.4/117.9°, C6-C18-O8 = 125.2/124.8°, C10-C18-O8 = (17.4/117.3°) and N16 (C1-N16-C10 = 128.4/128.3°, C1-N16-C21 = 126.1/125.2°, C10-N16-C21 = 105.6/106.5°). The interactions between the two rings is evident from the bond angles (DFT/XRD) at C10 and C11, which are respectively, C11-C10-C18 = 121.1/121.7°, C11-C10-N16 = 105.5/104.9°, C18-C10-N16 = 132.9/133.4° and N9-C11-C10 = 110.0/110.5°, N9-C11-C19 = 129.0/128.8°, C10-C11-C19 = 121.0/120.7°.

### 3.3 Hirshfeld surface analysis

The Hirshfeld surfaces of title compound (Fig.S6-supporting material) mapped over $d_{norm}$ range of (A), shape index (B) and curvedness (C) -0.678 to 1.611 Å, 1.0 to 1.0 Å and -4.0 to 0.4 Å. The information present in Table S2 is summarized effectively, the large deep red spots visible on the $d_{norm}$ mapped surfaces indicative of hydrogen bonding contacts and light red spot on the surface indicates weaker and longer contact other than hydrogen bonds. The title compound predominantly exhibits two strong intermolecular hydrogen bonds, one is N---H-O (which is denoted as a and b on $d_{norm}$) while another is O---H-O (which is denoted as c, d, e, f, g, h, i and j on $d_{norm}$ mapped surface), due to the self-assembly of water molecules and former one is H-atom of water link with the nitrogen of imidazole ring (Fig.S6). The appearance of two distinct spikes of almost equal lengths in the 2D fingerprint plots of title compound, which is due to the dominant imidazole/water molecule interactions. The O---H-O (10.8%) and N---H-O (8.4%) intermolecular interactions appear as two distinct spikes of almost equal lengths in the 2D fingerprint plots labelled as A and B, respectively. The H---O/ O---H interactions are represented by a spike in the lower left (donor) and upper right (acceptor) area of the fingerprint plot (mark as A), indicating that H-atom of water interacting with O-atom of water and as well as O-atom of water interacting with H-atom of water leads to the self-assembly of water molecules. The H---N/ N---H interactions are represented by a spike in the upper left (donor) and lower right (acceptor) area of the fingerprint plot (mark as B), indicating that H-atom of water interacting with N-atom of imidazole ring and as well as N-atom of imidazole ring interacting with H-atom of water (Fig.S7-supporting material). The wings marked with black circles in Fig.S7 represent the H···Br interactions and the sharpness of central spike marked with red circles in Fig.S7 is due to H···H contacts title compound. The relative contribution of the different interactions to the Hirshfeld surface was calculated for title compound. It is evident that the H---H contacts can account for about 48.9% of the Hirshfeld surface area; The remaining contribution was mostly due to H---O

10.8%, H---N 8.4%, H---Br 17.9%, C---C 4.2% and C---H 3.0% interactions, with only minor contribution from C---N, C---O, N---N and Br---Br (maximum 5.8%).

### 3.4. IR and Raman Spectra

The rings C10-C11-C19-C17-C6-C18 and N16-C21-N9-C11-C10 are designated as PhI and PhII in the following discussion and the vibrational assignments are presented in Table 1. In the present case, for the title compound, the phenyl CH stretching modes are assigned at 3078 $cm^{-1}$ in the Raman spectrum and at 3103, 3095 $cm^{-1}$ theoretically [69]. For the title compound, the phenyl ring C-C stretching modes are assigned at 1584, 1542, 1423, 1331, 1248 $cm^{-1}$ (IR), 1584, 1549, 1441, 1249 $cm^{-1}$ (Raman), in the range 1586-1251 $cm^{-1}$ (DFT) with PEDs in the range 62-42%. The PED analysis gives ring breathing mode of PhI at 1052 $cm^{-1}$ as expected [69,70] with a PED of 47% and low IR activity. According to literature [71], the ring breathing mode of a poly-substituted phenyl ring is assigned at 1025 $cm^{-1}$ in IR, 1027 $cm^{-1}$ in Raman and 1032 $cm^{-1}$ theoretically. The CH in-plane deformation modes of PhI are assigned at 1185, 1073 $cm^{-1}$ (IR), 1192, 1079 $cm^{1}$ (Raman) and the theoretical values are at 1190 $cm^{-1}$ and 1079 $cm^{-1}$ as expected [69]. The out-of-plane C-H modes are assigned at 830 $cm^{-1}$ and 783 $cm^{-1}$ (DFT) for PhI. According to literature, the C-O-C stretching modes are expected in the range 1200-850 $cm^{-1}$ [69] and for the title compound, the C-O-C vibrations are assigned at 1103 and 959 $cm^{-1}$ theoretically with PEDs 48 and 61%. Experimentally bands are observed at 955 $cm^{-1}$ in the IR spectrum and at 1107, 960 $cm^{-1}$ in the Raman spectrum. In the present case, the methyl $CH_3$ stretching modes are observed at 3050, 3002, 2954, 2925, 2895 $cm^{-1}$ in the IR spectrum, 3054, 3002, 2958, 2931, 2902 $cm^{-1}$ in the Raman spectrum and in the range 3016-2897 $cm^{-1}$ theoretically [69]. The methyl $CH_3$ deformation modes of the title compound are observed at 1456, 1437, 1423, 1408, 1372, 1163, 1125 $cm^{-1}$ (IR), 1444, 1410, 1360, 1027 $cm^{-1}$ (Raman) and in the range 1458-1025 $cm^{-1}$ theoretically [69]. The C-N stretching modes of the title compound are assigned at 1287, 1073 $cm^{-1}$ in IR spectrum, 1288, 1079, 1027 $cm^{-1}$ in Raman spectrum and at 1328, 1295, 1079, 1025 $cm^{-1}$ (DFT) which are in agreement with literature [69]. The C=N stretching mode is observed at 1475 $cm^{-1}$ in IR, 1475 $cm^{-1}$ in Raman and at 1468 $cm^{-1}$ theoretically [69]. The CN stretching modes have PEDs ranging from 35 to 55% with moderate IR intensities and Raman activities. Bromine compounds [69] absorb strongly in the region of 635 ± 85 $cm^{-1}$ due to C-Br stretching vibration and in the present case, band at 618 $cm^{-1}$ (IR), 620 $cm^{-1}$ (Raman) and 620 $cm^{-1}$ (DFT) is as assigned as this mode.

### 3.5. Frontier molecular orbital analysis

HOMO means the ability of the molecule to donate an electron and is directly related to ionization potential, while LUMO means the ability to accept an electron and is directly

related to electron affinity, the energy gap between FMO's calculated by DFT/B3LYP/6-311++G(d,p) method and the pictorial representation shown in Fig.S8 (supporting material). HOMO (MO 60) of π nature is delocalized the entire molecule and LUMO (MO 61) also π-nature, delocalized full molecule except methyl groups, bromine atom. The energy gap between HOMO and LUMO molecular orbitals plays very crucial role in determining properties such as chemical behaviour (reactivity, kinetic stability), spectroscopic properties (optical, electronic, vibrational), the theoretical reactivity indices defined by Par and Pearson [72] (ionization potential (I), electron affinity (A), chemical potential (μ), electronegativity (χ) global hardness (η), global softness (ν) and global electrophilicity index (ω)) and biological activity. The $E_{HOMO}$ and $E_{LUMO}$ energy value, their difference ($\Delta E$=$E_{HOMO}$-$E_{LUMO}$) along with the global reactivity indices are given in Table S4 (supporting material) and the results indicates that the chemical potential of the title compound is negative and it means that the compound is stable.

### 3.6. Molecular Electrostatic Potential

The molecular electrostatic potential (MEP) is an effective tool to predict physiochemical property relationship, study of biological recognition processes and hydrogen bonding interactions. The MEP surfaces of title compound are generated from optimized geometry by DFT/B3LYP/6-311++G(d,p) method and mapped a rainbow colour scheme with red (representing the electron rich region) while blue (represents electron poor region). The molecular electrostatic potentials are mapped over in the range between – 6.424 a.u. (deepest red) through 0 (white) to 6.424 a.u. (deepest blue) (Fig.S9-supporting material). From the MEP plot (Fig.S9), the negative region (red) localized over imidazole nitrogen (C=N) groups are possible sites for electrophilic attack and the positive region (blue) is covers all hydrogen atoms, as possible sites for nucleophilic attack. Also, the pictorial representation electrostatic potential mapped over the $d_{norm}$ surface of the neighbouring molecules shown in Fig.S10 (supporting material) neatly indicates that the electrode potential on the hydrogen bond donors and acceptors in the neighbouring molecules are complementary to one another (red spots close to H-bond acceptors and blue spots close to H-acceptors) thus providing further evidence to the formation O-H---O hydrogen bonds by self assemble of water molecules leads to formation of alternating tetrameric and hexameric clusters and N---H-O hydrogen bonds by interaction of water molecules with nitrogen atom of imidazole ring.

### 3.7. ALIE surfaces, Fukui functions and non-covalent interactions

In order to locate molecule's "hot spots" from the aspect of sensitivity towards electrophilic attacks, besides using the MEP surfaces, it is also possible to employ the concept of ALIE

surfaces, Fig.2. This descriptor is defined as a sum of orbital energies weighted by the orbital densities [73, 74]. The following equation is valid in the case of ALIE surfaces according to the following equation:

$$I(r)=\sum_i \frac{\rho_i(\vec{r})|\varepsilon_i|}{\rho(\vec{r})}, \quad (1)$$

$\rho_i(\vec{r})$ is electronic density of the i-th molecular orbital at the point $\vec{r}$, $\varepsilon_i$ is orbital energy, while $\rho(\vec{r})$ is total electronic density function[75, 76]. Representative ALIE surface is provided in Fig.2.

ALIE surface of the BMMBI molecule indicate three molecule hot spots possibly sensitive towards the act of electrophilic attacks. These molecule sites where electrons are least tightly bound can be seen in the near vicinities of bromine atom Br5 and nitrogen atom N9, characterized by the ALIE values of 190 kcal/mol. Fig.2 also indicates that only one intra-molecular noncovalent bond is formed, between the oxygen atom O8 and carbon atom C1, with corresponding strength of –0.008 electron/bohr$^3$. Further detection of molecule's hot spots has been performed by mapping of the Fukui functions to the electron density surface. In the case of Fukui functions in the finite difference approach, the following equations are valid:

$$f^+ = \frac{\left(\rho^{N+\delta}(r)-\rho^N(r)\right)}{\delta}, \quad (2)$$

$$f^- = \frac{\left(\rho^{N-\delta}(r)-\rho^N(r)\right)}{\delta}$$

where $N$ is number of electrons in reference state of the molecule, while $\delta$ is the fraction of electron which default value is set to be 0.01 [77]. In general, Fukui functions serve to track the changes of electron density as a consequence of charge addition or removal. If the charge is added then the locations where electron density increased (coloured by purple colour in Fig.3a), indicate electrophilic parts of the molecule, while the whole Fukui function is regarded as $f^+$ function. Similarly, if the charge is removed then the locations where electron density decreased (coloured by the red colour), indicate nucleuophilic parts of molecule, while the whole Fukui functions is regarded as $f^-$ function. Fukui functions mapped to the electron density surface in the case of BMMBI molecule are presented in Fig.3. According to the position of purple colour in the case of Fukui $f^+$ function represented in Fig.3a, it can be concluded that near vicinities of atoms C21 and H22 are of electrophilic character. This is in very good agreement with the results related to ALIE surface, according to which its adjacent

nitrogen atom has the lowest ALIE values. Thus, the five member ring of the BMMBI molecule could be sensitive towards electrophilic attacks. According to the Fig.3b, it can be seen that certain portions of red coloured surface are located around methyl groups, designating them as nucleophilic in case of the charge removal.

### 3.8. Nonlinear optical properties

Nonlinear optical (NLO) effect arise from the interactions of electromagnetic fields in various media to produce new fields altered in phase, frequency, amplitude or other propagation characteristics from the incident fields. NLO properties like the dipole moment, polarizability, first and second order hyperpolarizabilities are calculated using B3LYP/6-311++G(d) (5D, 7F). The total molecular dipole moment of the title compound is 5.8031 Debye, polarizability is $2.1686 \times 10^{-23}$ esu, and the first and second order hyperpolarizabilities are $1.5286 \times 10^{-30}$ and $-7.03 \times 10^{-37}$ esu. Here, the first hyperpolarizability of the title compound is 11.76 times that of the standard NLO material urea [77]. The larger component of second order hyperpolarizability is associated with the larger ground state polarization which leads to strong electronic coupling between the ground and the low lying excited state. The NLO properties are also related to the energy gap between HOMO and LUMO. The energy gap of the investigated compound is 4.332 eV which is lower than that of urea (6.7 eV) [77]. Therefore, the investigated molecule is considered good candidate for nonlinear optical applications.

### 3.9. Natural bonding orbital analysis

Natural bond orbital (NBO) calculations were performed using NBO 3.1 program [78] as executed in the Gaussian09 package at the DFT/B3LYP/6-311++G(d,p) method in order to understand various second-order interactions presented in Tables S5 and S6 (supporting material). The important inter-molecular hyper-conjugative interactions are: N9-C21 from N16 of n1(N16)→π*(N9-C21), C10-C11 from N16 of n1(N16)→π*( C10-C11) and C6-C18 from O8 of n2(O8)→π*( C6-C18), with electron densities, 0.34171, 0.47308, 0.38200 e and stabilization energies, 47.61, 32.84, 29.08 kJ/mol. Almost 100% p-character was observed in π-bonding orbitals of N9-C21 (99.82), C10-C11 (99.97), C6-C18 (99.95) and the lone pairs of n1N16(99.99) and n2O18(99.96).

### 3.10. Mulliken atomic charges

The calculation and analysis of Mulliken atomic charges plays crucial role in the application of quantum mechanical calculations to the molecular systems [79]. The Mulliken atomic charges of title compound calculated in gaseous phase by using DFT/B3LYP/6-311++G(d,p) basic set are given in Table S7(supporting material). From the Table S7, all

nitrogen atoms have negative charge and all hydrogen have positive charge. It is worthy to mention that the C21(0.389) atom shows positive sign, it is due to substitution highly electronegative atoms like nitrogen. In imidazole ring azonitrogen (C=N) shows more negative charge when comparative other nitrogen, it may suggest the formation of intermolecular hydrogen bond with water molecules in solid state.

### 3.12. $^{1}$H and $^{13}$C NMR chemical shift analysis

After performing geometry optimization of title compound (BMMBI), then SCF GIAO Magnetic shielding ($^{1}$H and $^{13}$C) calculations has been made by using DFT/B3LYP/6-311++G(d,p) method. The experimental $^{1}$H and $^{13}$C NMR spectra are given in Figs.S11 and S12 (supporting information).The experimental and calculated chemical shift values in ppm relative to TMS of title compound are given in Table S8 **(**supporting material**)**.The signals of the proton spectra were observed in two regions; the first one is around 6.92-8.08/6.55-7.62 and second is one around 3.93-3.97/3.82-3.83 experimental/theoretical chemical shift values (in ppm), respectively. The first group is due to the protons in the aromatic region (imidazole proton (H22) 7.41/7.30, benzene ring protons (H20, H7) 8.08/7.62, 6.92/6.55, the second group is due to methyl group on O (H13, H14, H15) and N(H2, H3, H4) 3.93/3.83 and 3.97/3.82 (experimental/theoretical), respectively. The experimentally and theoretically calculated chemical shift values of $^{13}$C-NMR for aromatic carbons were observed in the range 107.08-147.79/108.68-154.63. The experimentally/calculated chemical shift value of C18, C11 and C21 are also found significantly high due to the impact of electronegative oxygen atom and nitrogen atom, are observed at 147.79/153.03, 145.69/154.63 and 146.17/147.29 (experimental/theoretical), respectively. The upfield signal observed at 33.46 and 56.28 ppm and calculated at 34.75 and 55.14 ppm was assigned to methyl carbon on nitrogen and oxygen at C1 and C12. According to these results, the theoretical chemical shifts are in compliance with the experimental findings.

### 3.12. Reactive properties based on autoxidation and hydrolysis

Computational molecular modelling based on the DFT calculations and MD simulations is very important for the environmental studies [80-83], especially when it comes to the oxidation reactions, which are essential for the degradation and removal of the pharmaceutical pollutants from water resources [84-86]. In order to evaluate sensitivity of molecule towards the autoxidation mechanism, calculations of bond dissociation energies for hydrogen abstraction (H-BDE) could be particularly useful. Fig.4 contains bond dissociation energies for all single acyclic bonds of BMMBI molecule. According to the results in Fig.4, BMMBI molecule cannot be regarded as a molecule sensitive to autoxidation mechanism,

since there are no H-BDE values ranging from 70 to 85 kcal/mol [29, 87-89]. H-BDE values in the range between 85 and 90 kcal/mol [88] are also not present, thus it can be stated that BMMBI is highly stable in the open air or in the presence of oxygen. This also emphasizes the fact that its stability is high and that degradation of this molecule could be hardly initiated by natural conditions. On the other side, the lowest bond dissociation energy (~57 kcal/mol) was calculated for the bond denoted with number 8, indicating that degradation pathway could start by detachment of the methyl group. Stability of BMMBI molecule in water was also evaluated, by means of MD simulation and by calculation of radial distribution functions (RDF). RDF, g(*r*), are useful indicators of the probability for finding a particle in the distance *r* from another particle [90]. Significant RDFs of the BMMBI molecule's atoms have been presented in Fig.5. According to the distance of the maximal g(r) values, the most important atoms are oxygen atom O8 and nitrogen atom N9, located at around 2.7 Å. Also, RDFs of these atoms are characterized by two solvation spheres. The highest maximal g(r) values have been calculated for bromine Br5 and carbon atoms C1 and C12. However, distances of their maximal g(r) values are located at more than 3.5 Å. Nitrogen atom N16 also has significantly high maximal g(r) value, however, it is located at distance of more than 4.5 Å, indicating not so significant interactions with water molecules. In general, the lack of hydrogen atoms with significant RDFs indicates high stability of BMMBI molecule in water.

**3.13. Drug likeness**

In order to initially assess to what extent BMMBI molecule could be considered as orally active, we have calculated a set of parameters recommended by Lipinski, Table 2 [91, 92]. Firstly, it can be seen in Table 2 that AlogP parameter has very competitive value of 2.24. Perspective drug candidate molecules should have less than 5 and 10 HBD and HBA, respectively, which is definitely fulfilled by BMMBI molecule. The mass criterion under 500 is also fulfilled by far in the case of BMMBI. According to the work of Ghose et al. [93], molar refractivity should take values between 40 and 130, while number of atoms should be in the range between 20 and 70. These conditions also go in favour of BMMBI molecule. PSA shouldn't take values above 140 $Å^2$, which is easily accomplished by the BMMBI molecule, due to its size. Veber et al. [94] has also commented that a good oral bioavailability is reflected by less than 10 rotatable bonds, which is also true for BMMBI molecule. Along with Lipinski's rule of five, Congreeveet al. [95] introduced the "rule of three". By Congreeve's hardened criteria, logP value shouldn't take values above 3, molecule mass shouldn't take values above 300, while HBD, HBA and number of rotatable bonds must not take values above 3. Drug likeness parameters provided in Table 2 clearly indicate that

BMMBI molecule fulfils conditions of Congreeve's rule of three, thanks to which title molecule could be considered as lead compound for new drugs.

### 3.14. TDDFT calculations and UV spectra

In this work we have used TD-DFT calculations in order to simulate UV spectra and to investigate the charge transfer within the BMMBI molecule, arising from the lowest energy excitation. UV spectrum of the BMMBI molecule has been presented in Fig.S13 (supporting material), while information regarding the first ten excitations have been provided in Table S9 (supporting material). According to the results provided in Fig.S13 there is only one pronounced absorption peak located at wavelength of 196 nm. Results provided in Table S9 indicate that two most important excitations from the aspect of light absorption are excitations 6 and 7, with corresponding oscillator strengths of 0.9 and 0.3, respectively. Due to the size and structure of BMMBI molecule it can be concluded that the most important part of the molecule, with respect to UV absorption, is benzene ring, which is also confirmed by visualization of natural transition orbitals (NTO), Fig.S14 (supporting material). Results presented in Fig.S14 indicate that hole and particle of NTO 1 match to the frontier molecular orbitals, indicating that the lowest energy excitation is principally depending on the HOMO to LUMO transition. In order to further identify the nature of the lowest energy excitation we will refer to the analysis of *C* functions, Fig.S15 (supporting material), according to the procedure incorporated within the Multiwfn program. Classifications of the excitations can be done by measuring the distance between the barycenters of $C_+$ and $C_-$ functions, provided in Fig.S15. Green coloured surface in the Fig.S15 corresponds to the $C_+$ function, while blue coloured surface corresponds to the $C_-$ function. This distance is also called CT length and besides this quantity it is also useful to measure the $\Delta r$ parameter, whose value also indicates the type of the excitation. Appropriate definitions on CT length and $\Delta r$ parameter can be found can be found in papers [96, 97]. Visualization presented in Fig.S15 indicates that in the case of the first excitation of the BMMBI molecule, CT length has the value of 0.91 Å, while $\Delta r$ parameter has the value of just 0.673 Å. These results indicate that the first excitation is of the local excitation (LE) type, localized within benzene ring.

### 3.15. Molecular docking

PASS [98] is an online tool to predict the biological activity spectrum of a compound. PASS analysis of the compounds predicts the title ligands to be Antineurotic agents with $P_a$ score of 0.68. To further establish their Antineurotic activity, we decided to carry out molecular docking studies of the compound against human acetylcholinesterase [PDB ID: 5HF5]. The PDB structure 5HF5 [99] was selected for docking as the reported structure has

been established from X-ray Crystallographic data with a good resolution of 2.15 Å. Further the enzyme has an attached co-crystallized inhibitor so has a well defined binding site which could be targeted. All docking calculations were performed on AutoDock-Vina software [100]. The 3D crystal structure of PfDHFR-TS was obtained from Protein Data Bank. Before docking the ligands, the protein was prepared by removing co-crystallized waters, ligands and co-factors. The AutoDockTools graphical user interface was used to calculate Geisteger charges, add polar hydrogen and partial charges using Kollman united charges. The active site of the enzyme was defined to include residues of the active site within the grid size of 50 x 50 x 50 Å. The ligand was prepared for docking by minimizing its energy at B3LYP/6-311++G(d,p)(5D, 7F) level of theory. The most popular algorithm, Lamarckian Genetic Algorithm (LGA) available in Autodock was employed for docking. The docking protocol was tested by docking the co-crystallized inhibitor onto the enzyme catalytic site which showed perfect synergy with the co crystallised ligand with RMSD close to zero. Amongst the docked conformations the best scored conformation predicted by AutoDock scoring function was visualized in DSV, LigPlot and Pymol softwares for ligand–protein interactions. The molecule binds at the catalytic site of the substrate by weak non-covalent interactions (Fig.6). Amino acid SER125, ASP74, TYR337, GLY121, TRP86 and TYR124 are the main interacting residues. TRP86 forms H-bond with N atom of the title molecule (Fig.S16-supporting material). TYR124 forms a strong π-π interaction (Fig.S17-supporting material). Docking scores of -6.2 kcal/mol is predicted for the title compound. These results reveal that the ligands bind at the active site of the macromolecule and could restrict or block the functioning of Acetylcholinesterase, thereby acting as antineurotic agents.

## 4. Conclusion

A novel bezoimidazole derivative was synthesized and characterized by XRD, FT-IR, CT-Raman and NMR spectra and MD simulations and DFT calculations were used to predict stability and reactive properties. The predicted geometrical parameters were in good agreement with the experimental geometrical parameters. The theoretically predicted wavenumbers are in agreement with the experimentally observed wavenumbers. From the MEP plot the negative region localized over imidazole nitrogen groups are possible sites for electrophilic attack and the positive region is covers all hydrogen atoms, as possible sites for nucleophilic attack.The first hyperpolarisability of the title compound is 11.76 times that of the standard NLO material urea. ALIE surface and Fukui functions indicate that five member ring could be sensitive towards the electrophilic attacks. According to the distribution of ALIE values on electron density surface, near vicinity of bromine atom could also be

sensitive towards the electrophilic attacks. BMMBI molecule is highly stable, when it comes to the sensitivity towards the autoxidation mechanism, as all H-BDE values are much higher than 90 kcal/mol. MD simulations and RDFs of significant atoms indicate that title molecule is highly stable in water as well. Drug likeness parameters indicate that BMMBI molecule could be considered as one of the lead compounds for the development of new drugs. Study of the first excitation within the BMMBI molecule indicates that the charge transfer is of LE type. Molecular docking studies reveal that the ligands bind at the active site of the macromolecule and could restrict or block the functioning of Acetylcholinesterase, thereby acting as anti-neurotic agents.

**Acknowledgments**

The authors are highly thankful to UGC (UGC MRP2015-16, Proposal Number: 3797) for financial assistance. The authors are highly thankful to Professor V. R. Pedireddi, Solid State &Supramolecular Structural Chemistry Laboratory, School of Basic Sciences, IIT Bhubaneswar for the collection of diffraction data. Part of this work has been performed thanks to the support received from Schrödinger Inc. Part of this study was conducted within the projects supported by the Ministry of Education, Science and Technological Development of Serbia, grant numbers OI 171039 and TR 34019.

**Supplementary Material**

The cif file of the title compound have been assigned CCDC number 1478268 and can be obtained free of cost on application to CCDC 12 Union Road, Cambridge CB21 EZ, UK. (Fax: (+44) 1223 336-033: e-mail: data_request@ccdc.cam.ac.uk).

Highlights

- A novel benzoimidazole derivate is synthesized and characterized by XRD
- The FT-IR and FT-Raman spectra were interpreted
- Local reactivity properties are investigated
- Possible degradation properties are predicted
- Molecular docking study is also done

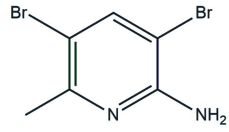
**Keywords:** crystal structure; halogenated compounds; N—H···N hydrogen bonds; $R_2^2(8)$ dimers.

**CCDC reference**: 1532242



**Structural data**: full structural data are available from iucrdata.iucr.org

The title molecule, $C_6H_6Br_2N_2$, is almost planar (r.m.s. deviation for the non-H atoms = 0.012 Å). In the crystal, inversion dimers linked by pairs of N—H···N hydrogen bonds generate $R_2^2(8)$ loops.

**3D view**

**Chemical scheme**

## Structure description

Halogenated organic compounds are known to exhibit diverse biological activities showing anticancer (Nussbaumer *et al.*, 2011), antiviral (De Clercq, 2013), anti-tuberculosis (Beena & Rawat, 2013), anti-malarial (Biamonte *et al.*, 2013), antifungal and anti-diabetic (Hector, 2005) properties. As part of our studies in this area, the crystal structure of the commercially available title compound was determined.

The molecule is almost planar (Fig. 1) with the r.m.s. deviation for the non-H atoms being 0.012 Å. An intramolecular N—H···Br interaction occurs. In the crystal, inversion dimers linked by pairs of N2—H2···N1 hydrogen bonds generate $R_2^2(8)$ loops (Fig. 2, Table 1). The crystal structure does not feature any other interactions, and thus, the supramolecular architecture displayed is zero dimensional.

## Synthesis and crystallization

The title compound was purchased from Avra Synthesis Pvt. Ltd, India, and was used as such. Colourless blocks were grown by recrystallization from methanol solution at room temperature.

$M_r$ = 265.95
Monoclinic, $P2_1/n$
Hall symbol: -P 2yn
$a$ = 13.1047 (16) Å
$b$ = 4.0310 (4) Å
$c$ = 15.7631 (18) Å
$\beta$ = 105.720 (4)°
$V$ = 801.54 (16) Å$^3$
$Z$ = 4
$F(000)$ = 504
Prism
$D_x$ = 2.204 Mg m$^{-3}$
Mo $K\alpha$ radiation, $\lambda$ = 0.71073 Å
Cell parameters from 133 reflections
$\theta$ = 2.4–26.7°
$\mu$ = 10.04 mm$^{-1}$
$T$ = 296 K
Block, colourless
0.26 × 0.22 × 0.20 mm

*Data collection*

Bruker APEXII CCD diffractometer
Radiation source: fine-focus sealed tube
Graphite monochromator
phi and $\varphi$ scans
Absorption correction: multi-scan (SADABS; Bruker, 2009)
$T_{min}$ = 0.085, $T_{max}$ = 0.134
10577 measured reflections
1670 independent reflections
1461 reflections with $I > 2\sigma(I)$
$R_{int}$ = 0.050
$\theta_{max}$ = 26.7°, $\theta_{min}$ = 2.4°
$h$ = −16→16
$k$ = −5→4
$l$ = −19→19

*Refinement*

Refinement on $F^2$
Least-squares matrix: full
$R[F^2 > 2\sigma(F^2)]$ = 0.038
$wR(F^2)$ = 0.108
$S$ = 1.09
1670 reflections
101 parameters
2 restraints
Hydrogen site location: mixed
H atoms treated by a mixture of independent and constrained refinement
$w = 1/[\sigma^2(F_o^2) + (0.0701P)^2 + 0.463P]$ where $P = (F_o^2 + 2F_c^2)/3$
$(\Delta/\sigma)_{max} < 0.001$
$\Delta\rho_{max}$ = 1.03 e Å$^{-3}$
$\Delta\rho_{min}$ = −0.86 e Å$^{-3}$
Extinction correction: SHELXL2016 (Sheldrick, 2015b), $Fc^*=kFc[1+0.001xFc^2\lambda^3/\sin(2\theta)]^{-1/4}$
Extinction coefficient: 0.064 (4)

*Special details*

**Geometry**. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

**Abstract**

*4-(benzofuran-2-yl)-2-methyl-6-phenylpyrimidine(BFMPP) has been synthesized and characterized by FT-IR, $^{1}H$ &$^{13}CNMR$ and Mass spectrometry techniques. Single crystals of title compound were grown by slow evaporation solution growth technique at room temperature and crystal structure has been determined by single crystal X-ray diffraction technique. The title compound(BFMPP) crystallizes in monoclinic space group $P2_1$, with cell dimensions a = 4.803(3) Å, b = 9.498(5) Å, c = 15.557(9) Å, β= 93.25 (4)$^{o}$ and Z = 2. The crystal structure is stabilized by weak C-H…N intermolecular interactions generating a one dimensional C(4) network propagating along the [100] direction and two pi…pi interactions. Further, a detailed analysis of the Hirshfeld surfaces facilitating an understanding of the type and nature of intermolecular interactions in the supramolecular structure is made. The calculated HOMO-LUMO energy gap discloses that charge transfer occurs within the molecule.*

**Keywords:** BFMPP, Crystal structure, X-ray diffraction, Hirshfeld analysis, HOMO-LUMO plots.

## 1. Rationale

ACCEPTED MANUSCRIPT

Heterocycles hold a key point in organic and medicinal chemistry as they act as a bridge between life sciences and biochemical investigations. A significant amount of contemporary investigation is being currently pursued on these compounds worldwide. The pyrimidine rings are nitrogen rich heterocycles, key constituent of many natural, synthetic compounds and shows very interesting pharmacological activity [1-4]. In recent years, pyrimidine derivatives have received significant attention owing to their diverse biological properties, particularly as cytostatic [5-8], immune modulating [9], antitubercular, calcium channel blockers [10], antimicrobial properties [11], herbicides [12] and pesticides [13].

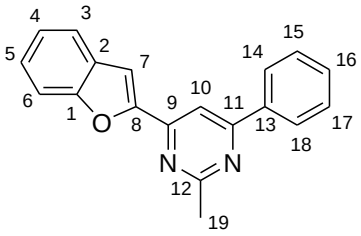
The biological importance of pyrimidine derivatives has motivated significant interest towards the synthesis of 4-(benzofuran-2-yl)-2-methyl-6-phenylpyrimidine(BFMPP) and the structure was characterized well as it would be more useful. Further, various intermolecular interactions are well supported by Hirshfeld surface and fingerprint plots analysis.

## 2. Experimental

### 2.1. General remarks

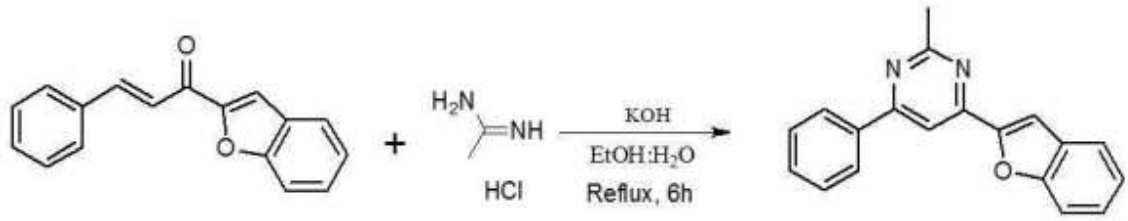
The reagents and solvents used for synthesis were procured from Spectrochem, Sigma Aldrich and used as such received. Reactions were monitor by analytical thin layer chromatography (TLC) and TLC plates were visualized by exposing UV light, KMnO4 solution or by iodine vapors. The FT-IR spectrum was recorded in KBr pellets using JASCO FTIR-4100 spectrometer in the range of 4000 – 400 $cm^{-1}$ at resolution of ± 2 $cm^{-1}$.$^{1}$H &$^{13}$C-NMR spectrum was recorded on JEOL-400 MHz NMR instrument using $CDCl_3$ as solvent. The chemical shifts values (δ) are reported in parts per million (ppm) using TMS as an internal standard. Mass spectrum was recorded on Shimadzu-2010EV with APCI and ESI probes.

### 2.2. Synthesis of 4-(1-benzofuran-2-yl)-2-methyl-6-phenylpyrimidine



To a stirred solution of (1-benzofuran-2-yl)-3-phenylprop-2-en-1-one (0.5g, 2.06mmol) in mixture of ethanol: water (4:1, 5 mL), acetamidine hydrochloride (0.11g, 2.06 mmol), KOH (0.12g, 2.2mmol) was added and the reaction mixture refluxed for 6 hours. After completion of reaction indicated by TLC, the reaction mixture was poured into ice cold water and extracted to ethyl acetate (3 x 20 mL). The organic layer washed with water, brine and dried over anhydrous $Na_2SO_4$. Evaporate the organic layer under reduced pressure to get crude product. The crude product was purified by column chromatography using silica 60-120 mesh and ethyl acetate: petroleum ether (1:9) as eluent to get desire product (0.39g, yield: 68.4%, M.p: 130-133$^{o}$C).

### Method of crystallization



100mg of compound was dissolved in 15mL of ethyl acetate and warmed for 5 minutes. The solution was filtered through Whatmann filter paper and resulting solution was kept at room temperature in conical flask with stopper slightly open. After 5 days, the crystals of BFPP were developed; filtered and suitable crystals for single crystal analysis were selected (**Scheme-1**).

**$^{1}$H NMR (400MHz, $CDCl_3$):** δ 8.20-8.17 (2H, m, Ar-H), 8.05 (1H, s, Py-H), 7.71-7.69 (2H, dd,Ar-H), 7.62-7.53 (4H, m, Ar-H), 7.43-7.39 (1H, m, Ar-H), 7.32 (1H, m, Ar-H), 2.86 (3H, s, Py-CH3).

**$^{13}$C NMR (100 MHz, $CDCl_3$):** δ 168.576 (C12), 165.217 (C9), 156.213 (C11), 155.642 (C1), 153.310 (C8), 136.973 (C13), 130.901 (C14 & C18), 128.915 (C15 & C17), 128.295 (C16), 127.278 (C5), 126.313 (C4), 123.510 (C2), 122.248 (C3), 111.670 (C6), 108.906(C7), 108.124 (C10), 26.204 (C19).

**Mass (m/z):** Calculated: 286.32, Found: 287.59 (M+1)

**Scheme.** Synthesis of 4-(1-benzofuran-2-yl)-2-methyl-6-phenylpyrimidine

**2.3. X-Ray Crystallography**

A suitable colourless, needle shaped single crystal of the title compound with dimensions of0.36mm x 0.20mm x 0.16mm was selected and data was collected on an Oxford diffraction X caliber Gemini diffractometer with graphite monochromated Mo Kα radiation (λ = 0.71073 Å) at 293 K. The CrysAlisProsoftware [14] was used for data collection, reduction and absorption correction. The structure was solved by direct method and refined by full-matrix least-squares methods on $F^2$ using SHELX-97 [15] available in the WinGX package [16]. All the non-hydrogen atoms were refined with anisotropic thermal parameters. The hydrogen atoms were included in the structure factor calculations and treated using a riding model. Molecular graphics and crystal packing were created using *ORTEP* [17] and *MERCURY* [18] packages. The parameter for data collection and structure refinement of compound BFMPP are listed in Table 1.

**2.4. Hirshfeld surfaces**

The Hirshfeld surface analyses were carried out and fingerprint plots were plotted using Crystal Explorer 3.0 [19-25]. When the CIF files were uploaded into the Crystal-Explorer software, all bond lengths to hydrogen were automatically modified to standard neutron diffraction values, i.e. C–H = 1.083 Å.

**3. Data, value and validation**

**3.1. Crystal and molecular structure description of BFMPP**

The molecular structure of BFMPP determined by X-ray diffraction is depicted in **Figure 1**. BFMPP crystallizes in the monoclinic space group $P2_1$with cell dimensions *a* = 4.803(3) Å, *b* = 9.498(5) Å, *c* = 15.557(9) Å, β= 93.25 (4)$^o$ and Z = 2.The molecule is almost planar with root mean squared deviation (considering non-H atoms) being 0.101 Å. The dihedral angle between the benzene (A), the pyrimidine

ring (B) and the benzofuran ring (C) are 4.79 (A/B), 10.76 (A/C) and 8.42(1)°(B/C) respectively. The crystal structure is stabilized by weak C-H…N intermolecular interactions (Table 2 and **Figure 2**) running into C(4) chains along [100] and two pi…pi interactions. Hence, the supra molecular architecture exhibited is one dimensional.

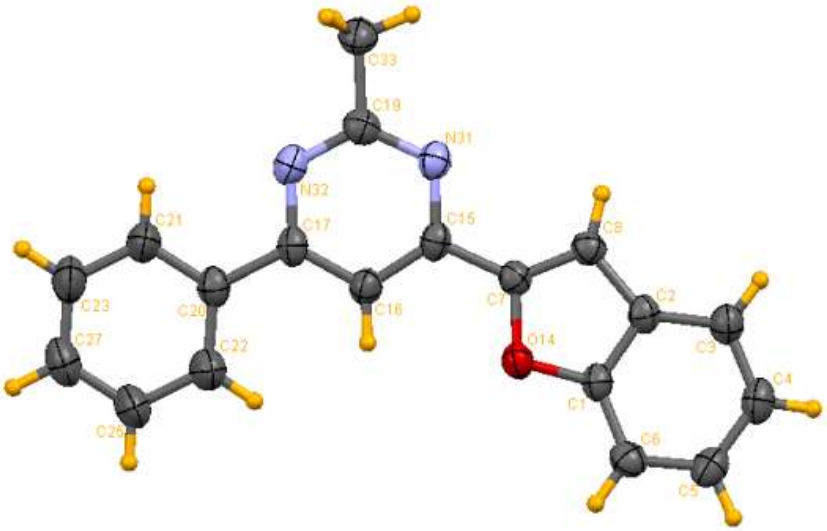


**Figure 1.** *ORTEP* view of the molecule with atom numbering scheme for non-hydrogen atoms

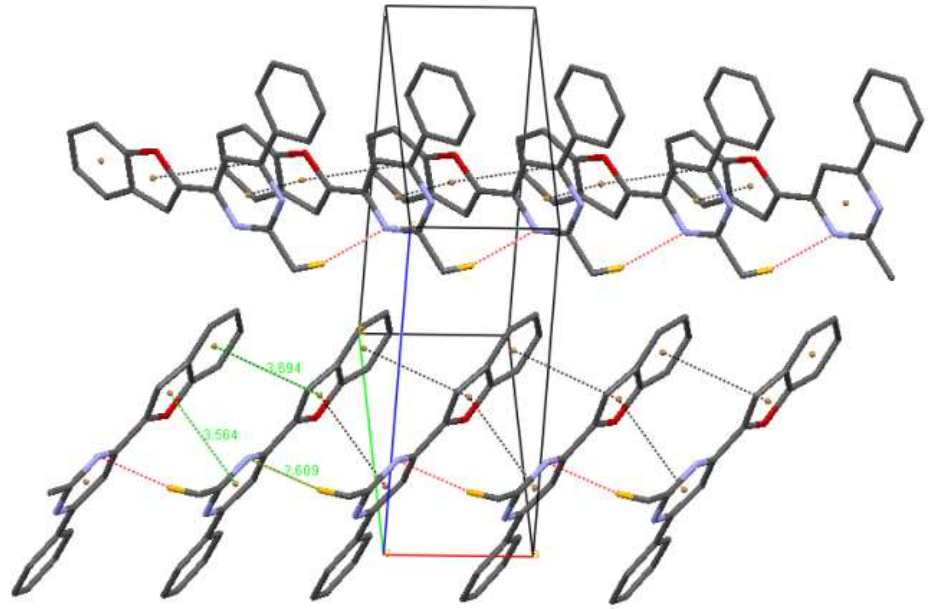

**Figure 2.** Crystal packing of BFMPP

### 3.2. Hirshfeld surface analysis

The Hirshfeld surfaces of title compound illustrated in **Figure 3**, showing surfaces that have been mapped over a $d_{norm}$(A), shape index (B) and curvedness (C) range of -0.111 to 1.143 Å, -1.0 to 1.0 Å and -4.0 to 0.4 Å, respectively. The predominant interactions between the methyl hydrogen of pyrimidine ring and the nitrogen of pyrimidine ring, which can be seen in the Hirshfeld surfaces as the bright red spot marked as A in **Figure 3** and clearly seen in **Figure 4**. In the 2D fingerprint plots (**Figure 5**), the C-

H···N intermolecular interactions appear as two distinct spikes circled with green color. Prominent pairs of sharp spikes of almost equal lengths in the fingerprint plots (**Figure 5**) are characteristics of nearly equal C(donor)···N(acceptor) distances and generate a one dimensional C(4) network propagating along the [100] direction. The upper spike (**Figure 5**) corresponds to the donor spike (H atom of methyl group interacting with N-atoms of the pyrimidine ring), with the lower spike being an acceptor spike (N-atomsof the pyrimidine ring interacting with H- atom of methyl group). The wings marked in Figure 5 (circled with black) are due to the C···H contacts. A significant difference in terms of H···H contacts appears asspikes (marked as red circles in **Figure 5**). The relative contribution of the different interactions to the Hirshfeld surface was calculated for title compound. It is evident that the H···H contacts can account forabout 50.5% of the Hirshfeld surface area; the remaining contribution was mostly due to C···H 28.2%,N···H 6.5%, O···H 3.3% and C···C 6.0% interactions, with only minor contribution from C···N, O···C and O···N (maximum 5.5%).

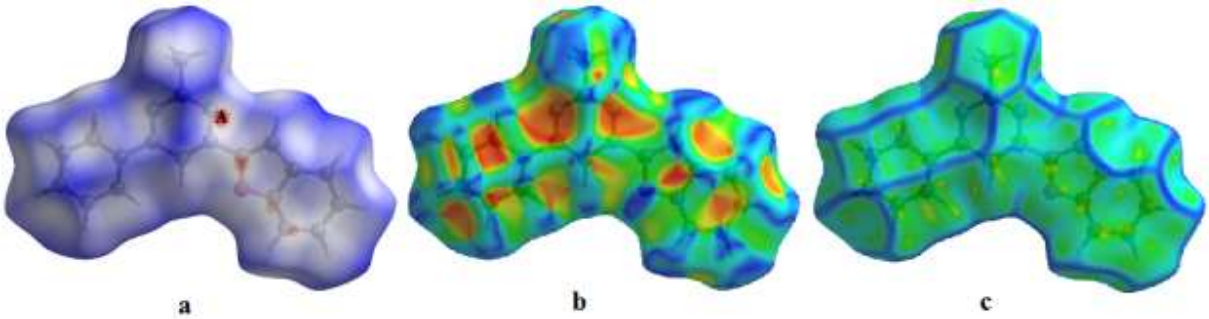

**Figure 3.** Hirshfeld surfaces of BFMPP.

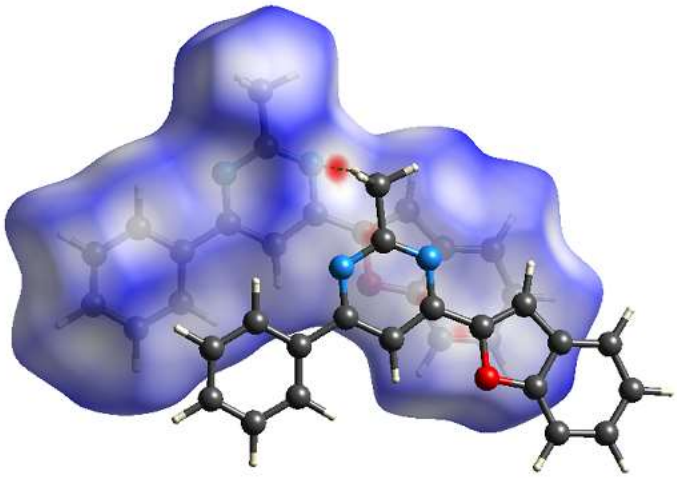

**Figure 4.** C-H…N intermolecular interactions mapped on $d_{norm}$ surface.

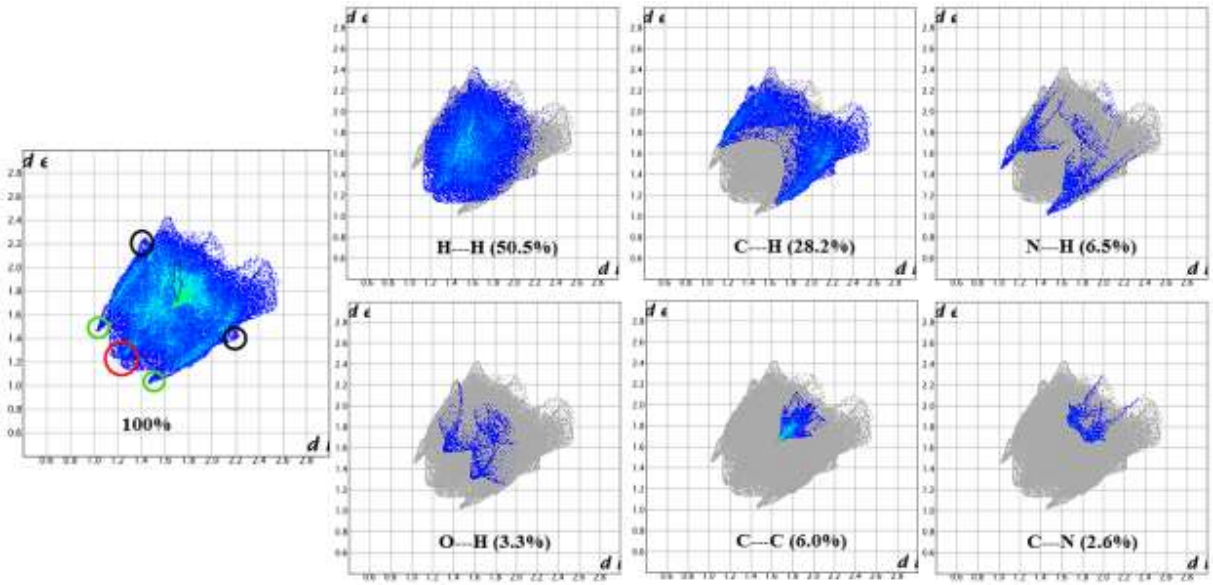

**Figure 5.** 2D Fingerprint plots of BFMPP.

### 3.3.Frontier molecular orbital analysis

The HOMO-LUMO energy plots of BFMPP has been obtained from Crystal Explorer with Tonto program using DFT/Becke88LYP/6-31G(d) method and the pictorial representation shown in **Figure 6**. The HOMO (MO 75) lies at -6.28 eV and whereas the LUMO (MO 76) is located at -2.2 eV. In the title compound, the HOMO of π nature is delocalized all over the molecule except phenyl ring, methyl group and LUMO in addition to this on the phenyl ring except methyl group. Accordingly, the HOMO-LUMO transition implies an electron density transfer from the benzofuran ring to phenyl ring through the pyrimidine ring, and that the frontier orbital energy gap is 4.08 eV. The global chemical descriptors associated with a molecular system are: ionization potential (I) = $-E_{HOMO}$= 6.28, electron affinity (A) = $-E_{LUMO}$= 2.2, chemical potential (μ) = - (I+A)/2 = -4.24, the global hardness (η) = (I-A)/2 = 2.04 ,softness (ν)= 1/ η = 0.49, electronegativity (χ) = (I+A)/2 = 4.24 and electrophilicity index (ω) = $\mu^2/2\eta$ = 4.406 [26,27]. It is seen that the chemical potential of the title compound is negative and it implies that the molecular system is stable. They do not decompose spontaneously into the elements they are made up of. The hardness signifies the resistance towards the deformation of electron cloud of chemical system under small perturbation encountered during the chemical process.

### 3.4. UV-Visible spectral analysis

The electronic spectra of title compound calculated at TD-DFT/B3LYP/SDD method using optimized geometry and the calculation are performed in methanol. The electronic spectra of title compound shows an electronic absorption band with maxima 344 nm (**Figure S5**)and this transition mainly due to the transition HOMO-LUMO that is the π-π transition predicted. The excitation transitions, CI coefficient, excitation energies, oscillator strengths and wavelength can be seen in Table S1.

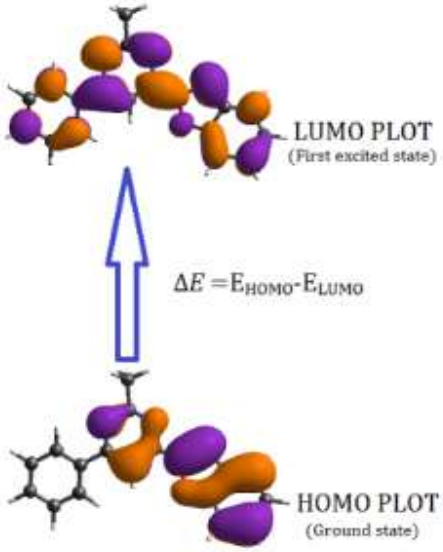

**Figure 6.** HOMO plot and LUMO plot of the title compound (BFMPP).

### 3.5. FT-IR spectral analysis

FT-IR spectrum of title compound is shown in **Figure S1**. Vibrational frequencies of title compound calculated at ground state by using B3LYP/DFT/SDD basic set in gas phase(Table S2).The CH stretching frequency of aromatic rings are theoretically assigned at 3181, 3117, 3090 $cm^{-1}$ for benzofuran ring and 3150 $cm^{-1}$ for pyrimidine ring. For mono-substituted phenyl ring, the CH stretching modes are expected above 3000 $cm^{-1}$[28, 29] and DFT calculations give these modes in the range 3120, 3106, 3094 $cm^{-1}$ and experimentally bands are observed at 3051 $cm^{-1}$. The $CH_3$ stretching modes are expected in the region 2900-3050 $cm^{-1}$[28]. The bands observed at 2925 $cm^{-1}$ and in the range 3060-2939 $cm^{-1}$ (DFT) are assigned as stretching modes of the methyl group. The aromatic ring stretching modes are observed in the range 1585, 1558$cm^{-1}$ and 1598, 1569 $cm^{-1}$ theoretically expected. The C=N stretching modes is observed at1528$cm^{-1}$experimentally and computed 1528 $cm^{-1}$. In present case in-plane and out-of-plane CH deformation observed at above and below 1000 $cm^{-1}$ and good agreement literature values.

### 4. Conclusion

4-(1-benzofuran-2-yl)-2-methyl-6-phenylpyrimidine(BFMPP)has been synthesized and characterized by single crystal X-ray diffraction, FT-IR, $^{1}H$ & $^{13}C$NMR and Mass spectrometry. The X-ray diffraction studies showed that the title BFMPP crystallized in monoclinic space group $P2_1$, with cell dimensions $a$ = 4.803(3) Å, $b$ = 9.498(5) Å, $c$ = 15.557(9) Å, β= 93.25 (4)$^{o}$ and Z = 2.The difference in HOMO and LUMO energies supports the charge transfer interaction within the molecule. The calculated HOMO and LUMO energies were used to semi-quantitatively estimate the ionization potential, electron affinity, electronegativity, electrophilicity index, hardness and chemical potential. The crystal surface analysis carried out by Hirshfeld surface studies and fingerprint plots analysis, which facilitates to understanding the type and nature of intermolecular interactions and as well as packing in the solid-state.

### Acknowledgments

The authors are highly thankful to Prof. T.N. Guru Row, SSCU, IISC, Bangalore, India for the collection of diffraction data. Authors are also thankful to the Department of Science and Technology, New Delhi,

**ABSTRACT**

Nano particles, because of their special properties attracted researchers from both theoretical and practical point of view. Many efforts have been made in the past two decades using novel nanotechnology and nanoscience knowledge to get nanomaterials with determined functionality. Nanomaterials are objects with the three external dimensions at the nanoscale. The main type of nanomaterial used in medicinal application are semiconductor nanomaterials, metal nanoparticles, magnetic nanomaterials, hydro gel nanocomposites, carbon nanomaterials, dendrimers, liposomes, , polymer nanocomposites, and biodegradable polymers. In this article, we have provided a concise review of the most common and popular nanomaterials viz., titania, carbon nanotubes (CNTs), zero-valent iron, zirconia (zirconium oxide), dendrimers, gold and silver nanomaterials which are currently used in medical field. Although expectations are too high but safety of nanomedicine is not yet completely proved. Over the next coming years, it is predicted that nanotechnology going to evolve and expand in different fields of life sciences and its achievements being applied in medicine like diagnostics, tissue engineering and patient improvement which play crucial role in treatment of human diseases and also in improving human physiology.

**KEY WORDS:** Nanomaterials, nanotechnology, carbon nanotubes, nanomedicine.

## 1. INTRODUCTION

Nanotechnology is the "science and technology where dimensions and tolerances are in the range of 0.1 nanometer (nm) to 100 nm play a critical role." Nanotechnology in medicine currently focuses on applications of nanoparticles as well as longer term research that involves the use of manufactured nano-robots to make treatment at the cellular level. Nanotechnology is considered an emerging technology because of its special properties to create new products with totally new characteristics and functions with enormous potential in a wide range of applications. The existing health care system is focused on treating disease rather than preventing disease. Patients are generally not tested until physiological re taken and sent to laboratories for analysis, the results often symptoms are present and they meet with their physicians. When samples of tissue or blood fluid an take several days and can be inconclusive if the disease is at an early stage. Consequently, many diseases are not detected until long after taking root in the body. In addition to various industrial uses, great innovations are foreseen in biotechnology, biology, in metrology, medicine, medical technology, information and communication technology, etc. It is anticipated that nanotechnology will have a huge positive influence on human health. Basically, internal processes of living organisms occur at nanometre scale. Proteins or cell membranes and elementary biological units like DNA are of this dimension. With nanotechnology, these biological units are going to be better guided. Increasing the precision to nanometre scale, makes it an essential feature of procedures and biomedical products in post genomic era. Nanoscale devices are similar in size to large biomolecules such as receptors and enzymes. Nanoscale devices which are smaller than 20 nm can move in and out of blood vessels as they circulate through the human body. Applications of nanotechnology in the field of biomedicine present an opportunity to fight against many dreadful diseases. An area with near-term potential is detecting molecules associated with diseases such as diabetes, cancer, neurodegenerative diseases, mellitus, as well as detecting microorganisms and viruses associated with infections, such as pathogenic bacteria, fungi, and HIV viruses. For example, in the field of cancer therapy, promising novel nanoparticles will respond to externally applied physical stimuli in ways that make them suitable therapeutics or therapeutic delivery systems. Nano technology is even used in biomaterials. For example in orthopedic implants or as scaffolds for tissue engineered products. Nanotechnology prevents non-specific protein adsorption by nano-structured surfaces. By gaining the control over the surface properties at nanolevel, biocompatibility of the materials can be increased.

**Nanomaterials and nanoparticles in medicine: A new approach:** In future, nanotechnology will enable a shift to preventive medicine and the use of "point of care" diagnostics to quickly identify diseases. In contrasts to the laboratory analysis, "point of care" testing is performed closed to the patient, at the time that care is required. Just as kits are available today for women to obtain instant information about pregnancy, portable diagnostic kits will become available to test whether a person is genetically predisposed to a specific disease, or have the earliest symptoms of a disease. Long before any physiological symptoms of the disease are present, a doctor (or even a patient in the comfort of her own home) will be able to take a sample of blood or saliva and insert the sample into a small chip. The chip consists of nanoscale sensors which will detect particular molecules associated with certain diseases, and will quickly provide feedback to the doctor or patient. "Point of care" diagnostics present a significant

The Bapatla College of Arts & Scie
BAPATLA

arket opportunity for companies that can move disease detection out of complex laboratories and into clinics, nursing homes, pharmacies and workplaces. Many companies are now focusing on making diagnostics simpler, smaller and more widely available in the many places patients receive treatment.

**Nanomaterials and Nanoparticles in Biomedical Applications:** The advanced applications of micro- and nanotechnology in medicine are the microchip-based drug delivery systems, which are devices incorporating micrometer-scale pumps, valves and flow channels. They allow controlled release of single or multiple drugs on demand. Micro- and nanotechnology-based methods (e.g. UV-photolithography, chemical vapour deposition, electron beam evaporation, reactive ion etching) can be used for the fabrication of these silicon-based chips. A lot of studies are going, on the applications of micro and nanotechnologies in chips for medical molecular diagnostics. For example protein microarrays (protein chips), DNA microarrays (gene chips), cell chips and lab-on-a-chip devices. These devices or systems are constructed by using micro/nanoscale fabrication methods. They are used for processing, manipulation, delivery, analysis or construction of biological and chemical entities. Inkjet printing methods are used in DNA microarrays for human genomics and in protein microarrays (or protein chips), which are useful for molecular diagnostics. For the detection of diseases either radionuclide-based markers or fluorescence- or surface Plasmon resonance spectroscopy can be applied.

**Carbon nanotubes:** Carbon nanotubes are of diameter of 1-20 nm. Gold-coated silica nanoshells, magnetic iron oxide nanoparticles and carbon nanotubes can transform electro-magnetic energy into heat. By increasing irradiation with an external laser source of near infra-red light or increasing magnetic field causing an increase in temperature which is lethal to cancer cells the very location where these nanoparticles are bound to or internalised within tumour cells, there by blasting them without causing any damage to healthy cells.

**Quantum dots (2-10 nm):** Due to their relatively inexpensive and simple synthesis, quantum dots have already entered the market for experimental biomedical imaging applications. Quantum dots can emit light at any wavelength in the visible and infrared ranges, and can be inserted anywhere, including liquid solution, dyes etc. Quantum dots can be inserted into a variety of organisms through surface ligands for in-vivo research.

**Dendrimers:** Dendrimers are hyper branched, tree-like structures. It contains three different regions: core moiety, branching units, and closely packed surface. It has globular structure and encloses internal cavities. Its size is less than 10 nm. These are used for long circulatory, controlled delivery of bioactive material, targeted delivery of bioactive particles to macrophages and liver targeted delivery. Anionic dendrimers have been shown to have antiviral activity. Having approximately the size of a virus, dendrimers are designed to bind multivalent either to the viral components or to the host cell surface through electrostatic forces, causing inhibition of infection at the stage of entry of virus to the cell. Dendrimer not only inhibit entry of virus but also inhibit its replication. (Gong, 2002). Activity has been shown against HSV, RSV and HIV while Starpharma's Vivage ITM, a vaginal dendrimeric formulation against HIV is currently entering clinical trials phase II (Gong, 2005). Dendrimers have also been shown to exhibit antimicrobial activity. Typically these dendrimers have cationic surface groups, usually lysine.

**Nanotechnology and Nanomedicine: New Medical concept:**

**Nanomedicine:** The use of nanobiotechnology in medicine is termed nanomedicine. Thus, nanomedicine is an offshoot of nanotechnology, referring to highly specific medical treatment at the molecular scale for therapeutic purposes (involving repairing damaged tissues or curing diseases), and for the development of diagnostics for rapid monitoring, targeted cancer therapies, localized drug delivery, improved cell material interactions, scaffolds for tissue engineering and genetics. Nanomedicine can focus on several topics, such as Engineering Topics including, for example, peptide nanoparticles for medical applications, the transition from semiconductors to biochemistry in lithography industry; Clinical Applications (like nanomedicine and protein misfiling diseases); Topics in genetics (e.g. nano structured probes for gene detection in living cells, detecting UV damage to individual DNA molecules with AFM, etc.); Topics in Diagnostics, with its main focus on early diagnosis in vitro and in vivo; Policy Commercialization Topics, including initiative in nano medicine to focus efforts in research, development and applied nanotechnology for improving the diagnostics, therapeutics and treatment of cancer; Experimental Research topics, which are an important basis for preclinical study, like nanodiagnostic imaging; Topics on Basic nanomedicine, Pharmacology Topics and Topics on Oncology and on Toxicology.

**Nanorobots and Nanodevices:** Imagine going to the doctor to get treatment for a persistent fever. Instead of a tablet pill, the doctor sends you to a special medical team which introduces a nano robot into your bloodstream. The robot travels to the appropriate system, detects the cause of your fever and provides medication directly to the affected area. Actually, we are not that far from using such nanodevices in medical procedures. Engineering teams working hard to design nanorobots that will eventually be used to treat everything from hemophilia to cancer. Preliminary design is for the following specific applications:

**Tumours:** Tumours are cells grouped in a clumped mass. The treatment is not to replace them but to destroy timorous cells to minimize the risk of reoccurrence. The technique is intended to be able to treat tumours that cannot be treated via conventional surgery such as [illegible]

nd much less debilitating than conventional surgery, it should be used, if possible, as a replacement for conventional surgery in this application.

**Arteriosclerosis:** This is caused by fatty deposits on the walls of arteries. The device should be able to remove these deposits from the artery walls. This will allow for both improving the blood flow through them and the flexibility of the walls of the arteries. Removing these accumulated fatty acids and leaving these particles into blood stream should allow the body's natural processes to remove the overwhelming preponderance of material.

**Blood clots:** They (fatty acids) cause damage when they travel through the bloodstream where they can block the flow of blood to a vital area of the body. This can result in damage to vital organs in very short order. In most of the cases, these blood clots are only detected when they cause a blockage and damage the organ in question, often but not always the brain. By introducing a nanorobot into the body to blast such clots into smaller pieces before they have a chance to break free and move on their own, the chances of damage can be greatly reduced.

**Nanotechnology in Orthopaedic Implants:** Biomaterials is one of the most important applications of nanotechnology in medicine. Example: in orthopaedic implants or in tissue engineered products. Next generation of orthopaedic implant depends completely on Nanostructured materials.

They create a surface environment more conducive for osteoblast. An important field of application for nanotechnology in medicine is the biomaterials. Example: in orthopaedic implants or in tissue engineered products. Next generation of orthopaedic implant depends completely on Nanostructured function. The nanoscale composition of bone substitute materials emulates the hierarchic organization of natural bone, shows initiation of the desirable formation of an appetite layer. Nanotechnology also improved the quality of surgical blades and cutting performance. Nanofibrous membrane wound dressings containing antibacterial properties reduces postoperative infection rates. Drug delivery, including nanotherapeutics for treating bone cancer and arthritis are the most notable applications of nanotechnology in orthopaedics. Nanotechnology is used in orthopaedics, and likely will play a valuable role in future developments.

**Nanotechnology in Cardiology:** Nanotechnology has various applications in the field of cardiology research not only for diagnostic but also for therapeutical purposes. Recently, University of Michigan researchers developed a nanoparticle that could be the key to a targeted therapy for cardiac arrhythmia, a condition that causes the heart to beat erratically and can lead to heart attack or heart stroke. The cells that cause cardiac arrhythmia are precisely targeted and destroyed within the heart by nanotechnology. The U-M team in their studies conducted on rodents and sheep, found that the treatment successfully kills the cells that cause cardiac arrhythmia while leaving surrounding cells unharmed. In the journal, Science Translational Medicine, they published their findings.

**Nanotechnology against Cancer:** The use of nanotechnology in cancer treatment gives a new hope of fighting this dreadful disease. This technology has the capability to destroy cancer tumours with a minimum effect on healthy organs and tissues. Nano robots can detect and eliminate cancer cells before they form tumours. Cancer treatment through nanotechnology is at research or development stage. National Cancer Institute, The Alliance for Nanotechnology in Cancer in U.S., is promoting innovation and collaboration among researchers to resolve some of the major challenges in the application of nanotechnology to cancer. In addition, there are many universities and companies worldwide working in this area. In a decade or so, cancer can be eliminated completely by these efforts. (Similar to smallpox elimination by vaccines).

**Nanotechnology against antibacterial activity:** Nano $TiO_2$ is excellent photo catalyst used in antiseptic which can not only inhibit reproduction ability of bacterium, but also decompose its structure of cell membrane which will degrade microorganisms completely and thus avoid a second time pollution caused by creatoxin.

Titanium Oxide Nanoparticle is a non-dissolved material which does not dissolve itself when degrades organic contaminant and kills germs. It kills germs and degrades organic contaminants. $TiO_2$ nanoparticle is widely used as UV-resistant material and in the field of producing chemical fibre, printing ink ,plastics, coating, self-cleaning ceramics, self-cleaning glass, air purification, antibacterial material, , chemical industry and sewage treatment, cosmetics- natural white moisture protection cream ,sunscreen cream, beauty and whitening cream, moistening refresher, morning and night cream, skin protecting cream , vanishing cream and face washing milk. They are also used in powders in make-up and foods packing material.

Coating for paper-making industry: $TiO_2$ nano particles are used for improving the opacity and impressionability of the paper. Ferrotitanium alloy, carbide alloy, Titanium etc. can be produced from these nanoparticles, in the metallurgical industry, astronautics industry. It is also used in manufacture of moisture sensor, gas sensor and conducting materials.

## 2. CONCLUSION

Nanotechnology in modern medicine and nanomedicine is in infancy, having the potential to change medical research dramatically in the 21st century. Due to their small sizes, surface area modification capacity and unique biological properties, nanomaterials have a broad scope of application in analytical, imaging, detection, diagnostic and therapeutic purposes and procedures, such as targeting cancer, gene delivery systems, improving cell-material

interactions, scaffolds for tissue engineering, and drug delivery and provide innovative opportunities in the fight against incurable diseases. Thanks to nanotechnology tools and techniques, there has been a huge progress on understanding the function of biological structures and their interaction and integration with several non-living systems, but there are still open issues to be answered, mainly related to biocompatibility of the materials and devices which are introduced into the body. The vision is to improve health by enhancing the efficacy and safety of nanosystems and nanodevices. In addition, early diagnosis of cancer causing tumour, blood clot which might lead to a heart attack or diabetes helps to cure them with a minimum treatment. In the coming years, nanotechnology will play a key role in the medicine of tomorrow providing revolutionary opportunities for early disease detection, therapeutic procedures and diagnostics to improving health and enhancing human physical abilities, and enabling precise and effective therapy tailored to the patient.

## ABSTRACT

*Almotriptan is an anti-migrain drug prescribed to treat severe migraine headaches and vascular headaches and for acute treatment of migraine attacks with or without aura. In the present study, degradation behavior of almotriptan was studied by subjecting the drug to various International Conference on Harmonization-recommended stress conditions. Also, a stability indicating high-performance liquid chromatography method was established for analysis of the drug in the presence of various degradation products. An acceptable separation of the drug and its degradation products was achieved on a C-18 column at 40°C using a mobile phase comprised of methanol, acetonitrile and acetic acid in the ratio of 75:20:5 (v/v/v) at a flow rate of 1 mL/min. The detection wavelength was 231 nm. The method was validated for linearity, precision, accuracy, selectivity, specificity, and robustness. The method was found to be linear over a concentration range of 20–120 - µg/mL (n = 6). The value of slope was found to be 3933.6x ppm with correlation coefficient of 0.9996 and relative standard deviation (RSD) of 0.5673%. RSD values ranged from 1.651% to 0.5670% in the case of intra-day precision studies, whereas the values ranged from 1.0470% to 0.3843% in the case of inter-day precision. Validation parameters were evaluated according to the International Conference on Harmonization (ICH) Q2R1 guidelines. Using HCl, NaOH, $H_2O_2$, thermal, UV radiation and water performed the forced degradation studies. Almotriptan is more sensitive towards oxidative degradation condition. The developed method was successfully applied for the quantification and hyphenated instrumental analysis. The results obtained from the stress testing reveal that almotriptan drug substance is particularly unstable under acidic, alkaline and thermal degradation conditions. Therefore, care should be taken in the manufacturing process and storage of this product in order to avoid degradation, since if the drug is degraded it could result in decrease of therapeutic activity and safety.*

**Keywords:** Almotriptan, HPLC, Stress testing, Stability-indicating, Acidic, Neutral, Alkaline, Oxidation, Photolysis, Tablets, Forced degradation

## INTRODUCTION

A forced degradation or stress testing studies are the intentional degradation of the API and/or DP to an appropriate extent by means of various stress conditions include acidic, alkaline, neutral hydrolysis conditions, pH, temperature, light, oxidizing agents, and mechanical stress [1-3]. Forced degradation studies are designed to generate product-related variants and develop analytical methods to determine the degradation products formed during accelerated pharmaceutical studies and long-term stability studies. Any significant degradation product should be evaluated for potential hazard and the need for characterization and quantitation [4,5].

Almotriptan is a selective agonist of 5-HT1B/D receptors (Figure 1) [6]. The therapeutic activity of almotriptan for the treatment of migraine headache can most likely be attributed to the agonist effects at the 5-$HT_{1B/D}$ receptors on intracranial blood vessels and sensory nerves of the trigeminal system, which result in cranial vessel constriction, and inhibition of pro- inflammatory neuropeptide release. Due to presence of the indole moiety it is susceptible to undergo degradation. Almotriptan binds with high affinity to 5-HT1D, 5-HT1Band 5-HT1F receptors and has weak affinity for 5-HT1A and 5-HT7 receptors, with no significant affinity or pharmacological activity at 5-HT2, 5-HT3, 5-HT4, 5-HT6, alpha or beta adrenergic, adenosine (A1 and A2), angiotensin - (AT1 and AT2), dopamine (D1 and D2), endothelia (ETA and ETB) or tachykinin (NK1, NK and NK3) binding sites. The IUPAC name is 1[[[3-[2-(Dimethyl amine) ethyl]-1Hindol5yl] methyl] sulfonyl] pyrrolidine hydroxybutanedioate (1:1). The empirical formula is $C_{17}H_{25}N_3O_2S.C_4H_6O_5$, representing a molecular weight of 469.56.

In the literature, various analytical methods analytical methods such as RP-HPLC and spectrometry methods have been reported for the determination of almotriptan in formulations. A stability-indicating assay method helps in establishing the inherent stability of a drug, providing assurance on detection changes in identity, purity, and potency of the product. To date, no report is available on the stability studies of almotriptan in bulk under the various stress conditions (acidic, neutral, alkaline, oxidative, thermal, and photolytic stress) specified in the ICH guidelines for stress testing of a drug substance. Using the reversed-phase high performance liquid chromatography (RP-HPLC) method, degradation studies were performed on the drug after exposing the drug to various stress conditions [7-11].

### Experimental Procedure

Almotriptan was obtained as a gift sample from Natco Pharma Ltd, Hyderabad, India. The branded formulation of almotriptan was procured from the local market. Analytical reagent (AR) NaOH and $H_2O_2$ were purchased from S.D. Fine-Chem. Ltd., Mumbai, India. HCl, acetonitrile, methanol, and orthophosphoric acid (HPLC grade) was from Merk India (Mumbai). All other chemicals were of analytical grade.

***Almotriptan stock standard solution***

Accurately weighed 100 mg of almotriptan powder was transferred to a 100-mL volumetric flask; to this, 30 mL of water was added, then the mixture was sonicated for 40 s. The final volume was made up with water, and the resulting solution was vortexed for 1 min (1 mg/mL).

***Instrumentation and chromatographic conditions***

Chromatography was performed by using a LC-10 ATVP Shimadzu pump (Japan) equipped with a SPD-10 A VP UV-visible detector. The data was processed using Spinchrom Software. The separations were carried out using a C-8 RP column (Thermo Hypersil, BDS, 150 Å~ 4.6 mm, S-5 µ), which was operated at 40°C. The mobile phase comprised of methanol, acetonitrile and acetic acid in the ratio of 75:20:5 (v/v/v). The flow rate was adjusted at 1 mL/min, and the wavelength of detection was 231 nm. Specificity testing was done on a Waters (Milford, MA) Delta 600 HPLC equipped with a 600 controller pump, 2996 photodiode array (PDA) detector, and a degasser module. Empower 2 Software was used for data acquisition and processing. For the investigation of photo stability of the drug, a stability chamber (KBF 240, WTB Binder, Tuttlingen, Germany) equipped with light sources was used, as defined under option 2 of the ICH guideline Q1B. In this chamber, the combination of two black lights OSRAM L73 lamps and four white fluorescent OSRAM L20 lamps formed the light bank. The spectral distribution of black light lamps was between 345 and 410 nm with a maximum output set at 365 nm, whereas the output of white fluorescent lamps was similar to that specified in ISO 10977 (1993). Both UV and visible lamps were put on simultaneously. The chamber was maintained at 40°C and 75% relative humidity (RH). The samples were exposed for a total period of 10 days. Thermal degradation of the drug was investigated using a hot air oven maintained at 60°C for 15 days.

***Mobile phase selection***

In order to select a suitable mobile phase for the analysis of almotriptan, various combinational ratios of various solvents were tried on the basis of trial and error. Considering the system suitability parameters viz., tailing factor, number of theoretical plates, retention time etc. and the mobile phase found to be most suitable for analysis was acetonitrile, methanol and acetic acid in the ratio of 20:75:05 (v/v/v). The mobile phase was filtered through 0.45 µ filter paper to remove particulate matter and then degassed by sonication. Flow rate employed for analysis was 1.0 mL/min and the concentration was detected at 231 nm.

***Preparation of standard solution***

Ten tablets of almotriptan 2.5 mg were weighed and powdered. A portion equivalent to 10 mg of almotriptan was accurately weighed and transferred to a 10 ml volumetric flask, sufficient amount of mobile phase was added to dissolve it and volume was made upto to 10 mL. Aliquots of stock solution were further diluted with mobile phase up to 10 mL to get concentration of 20, 40, 60, 80, 100, and 120 - µg/ml for the linearity study [12-16].

***Forced decomposition (stress) studies***

Forced decomposition studies were performed under different conditions as mentioned in ICH QIA (R2) [17,18].

***Acid hydrolysis***

Forced degradation in acid media was performed by adding an aliquot of stock solution (1 mg/ml) of almotriptan to 10 ml each of methanol and 0.1 M HCl and refluxing the mixture at 60°C for approximately six hours. The solution was then left to reach room temperature, neutralized to pH 7 by the addition of 0.1 M NaOH, and diluted to 100 ml with the mobile phase so as to get a final concentration of 10 µg/ml.

***Alkaline hydrolysis***

Alkali - induced, forced degradation was performed by adding an aliquot of stock solution (1 mg/ml) of almotriptan to 10 ml each of methanol and 0.1 M NaOH, and refluxing the mixture at 60°C for approximately six hours. The solution was then left to reach room temperature, neutralized to pH 7 by addition of 0.1 M HCl, and diluted to 100 ml with the mobile phase, so as to get a final concentration of 10 µg/ml.

***Oxidative degradation***

To study the effect of oxidizing conditions, an aliquot of stock solution (1 mg/ml) of almotriptan was added to 10 ml of 30% $H_2O_2$ solution and the mixture was refluxed at 60°C for approximately six hours. The solution was left to reach room temperature and diluted to 100 ml with the mobile phase, so as to get a final concentration of 10µg/ml.

***Thermal degradation***

To study the effect of temperature, approximately 50 mg almotriptan was stored at 100°C in a hot air oven for 24 hours. It was then dissolved in 10 ml of methanol and the volume was adjusted to 50 ml with the mobile phase. The above solution was further diluted with the mobile phase, to give a solution of final concentration equivalent to 10 µg/ml of almotriptan

***Photolysis***

To study the effect of UV light, approximately 50 mg of almotriptan was exposed to short and long wavelength UV light (254 nm and 366 nm, respectively) for 24 hours, and then dissolved in 10 ml of methanol. The volume was made up by the mobile phase in a 50 ml volumetric flask, and then 1 ml of stock solution was further diluted with the mobile phase to give a solution of final concentration equivalent to 10 µg/ml of almotriptan.

Twenty microliters of the resulting almotriptan solution was injected into the HPLC system and the chromatograms were recorded. The stability samples were analyzed using a PDA detector to determine the peak purity.

***Method validation***

**Linearity and range:** A calibration curve of almotriptan was prepared in water for the establishment of linearity. For the same, a stock solution of the drug (1 mg/mL) was prepared in water. The concentrations ranging from (20–120 µg/mL) were prepared after suitable dilution (n = 6). The samples were filtered through a 0.45-µ-membrane filter prior to HPLC analysis. All

the determinations were done in triplicate. The linearity plots were constructed, and linear regression was applied on the data [19,20].

**Precision:** To determine the repeatability (intra-day precision) and intermediate precision (inter-day precision) of the method, the almotriptan solution at nominal standard concentration (100 µgmL-1) and sample solution (100 µgmL-1) were analyzed in six replicates on the same day (intra-day precision) and daily for six times over a period of three days (inter-day precision). The results were expressed as % RSD of the measurements [21].

**Accuracy:** Accuracy of the proposed method was determined using recovery studies. The recovery studies were carried out by adding different amounts (20%, 40%, and 60%) of the pure drug to the pre-analyzed formulation. The solutions were prepared in triplicates and the % recovery was calculated.

**Specificity and selectivity:** The specificity of the method was established through the study of resolution factors of the drug peak from the nearest resolving peak and also among all other peaks [22].

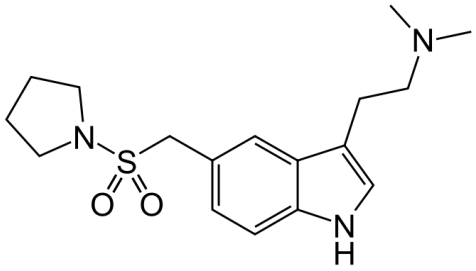
**LOD and LOQ:** The LOD and LOQ were determined at signal-to-noise ratios of 3:1 and 10:1, respectively, by injecting a series of dilute solutions with known concentrations.

**Robustness:** Robustness of the method was investigated by varying the chromatographic conditions, such as, change of flow rate (± 10%), organic content in the mobile phase (± 2%), wavelength of detection (± 5%), and pH of the buffer in the mobile phase (± 0.2%). Robustness of the developed method was indicated by the overall % RSD between the data, at each variable condition.

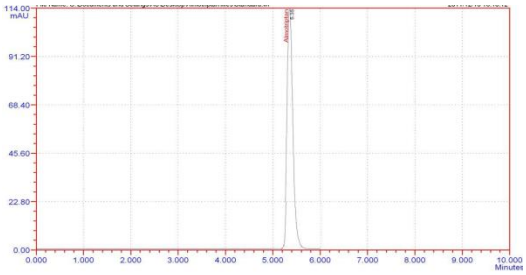
**Solution stability:** The solution stability was carried out by storing standard solutions of almotriptan in tightly capped volumetric flasks at -20°C for seven days. These solutions were assayed after seven days against fresh samples.

## RESULT AND DISCUSSION

Forced degradation study was carried out by subjecting the drug to acid and alkaline hydrolysis, chemical oxidation and photolytic conditions and it chromatograms were showed in Figure 2. The forced degradation studies of almotriptan tablet formulation was done on stress degradation by using 0.1N HCl and product degradation was found to be 21.84% for 8hrs, stress degradation by hydrolysis under alkaline conditions by using 0.1 N NaOH was found to be 27.84% for 8hrs, Dry heat induced degradation was done by using 90 ºC temperature was found to be 27.18% for 48 hours. Using hydrogen peroxide 30% did oxidative degradation and product degradation was found to be 20.62% for 6hrs. Photolytic degradation was found to be Photolytic degradation (VIS) 71.57% for 48 hrs and Photolytic degradation (UV) 33.3% for 48 hours [23-27].

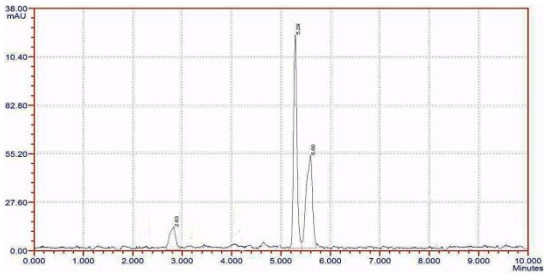


Maximum degradation of almotriptan was observed in Photolytic degradation (VIS), followed by decomposition under Photolytic degradation (UV), alkaline and thermal photolysis. Minimum degradation of drug was observed in acid hydrolysis and oxidative conditions. Percent degradation of drug under all stressed conditions is included in Table 1.



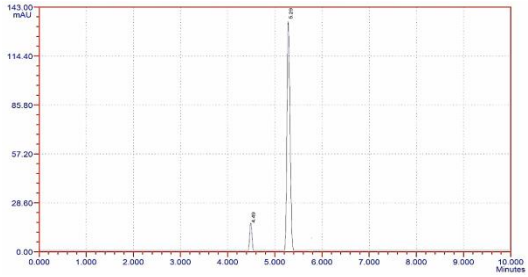
| Stress conditions | Degradation studies (Hrs.) | AM | |
|---|---|---|---|
| | | % Assay | % Degradation |
| Control | | 99.9 | ----- |
| Acid hydrolysis | 8 | 78.06 | 21.84 |
| Base hydrolysis | 8 | 72.06 | 27.84 |
| Hydrolytic | 8 | 78.50 | 21.4 |
| Oxidative | 6 | 79.28 | 20.62 |
| Thermal | 48 | 72.72 | 27.18 |
| Photolytic(VIS Light) | 48 | 80.5 | 19.5 |
| Photolytic (UV Light) | 48 | 66.6 | 33.3 |

**Table 1:** Forced degradation study results.



### *Method validation*

The method was validated with respect to parameters like linearity, precision, accuracy, specificity and robustness (Figure 1).



Standard chromatogram

| Photolytic (UV Light) | 48 | 66.6 | 33.3 |

**Table 3:** Linearity.

| S. No | Concentrations µg/ml | Area of the peak |
|---|---|---|
| 1 | 20 | 80521.4 |
| 2 | 40 | 156326 |
| 3 | 60 | 234462 |
| 4 | 80 | 310114 |
| 5 | 100 | 397319 |
| 6 | 120 | 472596 |

***Precision***

Table 4 shows the results of intra and inters –day precision studies. From the intra and day studies, the % RSD value was found to be in the range of 1.6510% to 0.5670%: whereas, in the case of inter-day studies, the values ranged from 1.0470% to 0.3843%.

**Table 4:** Intra and Inter day precisions.

| S.NO | Concentration (µg/ml) | Intra-day precision mean n = 3 | % Amount calculated | % RSD | Inter-day precision mean n = 3 | % Amount calculated | % RSD |
|---|---|---|---|---|---|---|---|
| 1 | 15 | 14.83 | 98.87 | 1.651 | 15.03 | 100.2 | 1.047 |
| 2 | 30 | 29.96 | 99.87 | 0.408 | 30.03 | 100.1 | 0.4078 |
| 3 | 45 | 44.93 | 99.84 | 0.567 | 45.06 | 100.1 | 0.3843 |

***Accuracy***

The data obtained from the recovery studies is represented in Table 5. The recovery was in the range of 97.65% to 101.67%.

**Table 5:** Data recovery studies.

| Time | AM | |
|---|---|---|
| | % Assay | % Difference |
| Initial | 99.29 | --- |
| 12 $^{th}$ hr | 98.71 | 0.58 |
| 18 $^{th}$ hr | 98.89 | 0.4 |
| 24 $^{th}$ hr | 98.68 | 0.61 |

***Robustness***

The method was found to be robust by varying the temperature of column as shown in Table 6.

**Table 6:** Robust to vary the temperature of column.

| S. No | Variations | Chromatographic parameters | |
|---|---|---|---|
| | | Tailing factor | Theoretical plates |
| 1 | 34% of methanol in the mobile phase | 1.14 | 9638 |

| | | | |
|---|---|---|---|
| 2 | 24% of methanol in the mobile phase | 1.88 | 8854 |
| 3 | Flow rate at 0.9ml/min | 0.96 | 6240 |
| 4 | Flow rate at 1.1ml /min | 1.11 | 9685 |
| 5 | pH change of mobile phase | 1.16 | 9677 |
| 6 | pH change of mobile phase | 1.39 | 9942 |

## CONCLUSION

The proposed method described a new RP-HPLC were developed and validated as per ICH guidelines, the standard deviation and % RSD calculated for the proposed method are low, indicating high degree of precision of the method. The recovery study performed show the high degree of accuracy and has the use of inexpensive solvent where it has the ability to separate these drugs from their degradation products, related substance; excipients found in tablet dosage forms and can be applied, for the routine analysis in quality control laboratory.

## Abstract

We have report a facile, ecofriendly and cost-effective approach to remove toxic heavy metal ions of Pb(II) by magnetically separable reduced graphene oxide/iron oxide (RGO/$Fe_3O_4$) nanocomposite synthesized via green method utilizing *Murrayakoenigii* (Mk) leaves extract as reducing and capping agent. The synthesized RGO/$Fe_3O_4$ nanocomposite were characterized using Fourier transform infrared spectroscopy (FTIR), powder X-ray diffraction (XRD), field emission scanning electron microscopy (FE-SEM), transmission electron microscopy (TEM), nitrogen adsorption-desorption (BET), vibrating sample magnetometer (VSM) and Raman spectroscopy measurements. RGO/$Fe_3O_4$ nanocomposite was used for the removal of Pb(II) from aqueous solution by batch adsorption experiments. The results show that adsorption was followed the pseudo-second-order kinetic model. The adsorption isotherm data fitted well with Freundlich model and Langmuir isotherm, the monolayer adsorption capacity was found to be 48 mg/g at 301K. The results show that the as synthesized RGO/$Fe_3O_4$ nanocomposite acts an efficient

ACCEPTED MANUSCRIPT

adsorbent for removal of Pb(II) from aqueous solutions. The overall results of the study indicate that this newly synthesized magnetically separable RGO/$Fe_3O_4$ nanocomposite may be potentially utilized for many environmental remediation applications.

## 1. Introduction

Fast industrialization has led to an increased release of wastewater including heavy metals (Hg, Cr, Cd, As and Pb), which have dangerous effects on the environment. Among these, Pb(II) was one of the most toxic heavy that causes major environmental health disorders [1,2]. The Pb(II) and their compounds were frequently used in modern society, such as fuels, printing inks and storage battery industries [3]. The Pb(II) revelation may cause damage to organs including liver, kidneys, heart and also cause edema to the immune system [4]. Thus efficient removal of Pb(II) from aqueous system is very important and has become a challenging assignment for scientists. There were numerous processes that have been developed to restrict heavy metal pollution like chemical precipitation, ion-exchange, membrane filtration, electrode deposition, solvent extraction, and bio adsorption [5-10]. Among these methods, adsorption is one of the most assure and extensively used methods because it is straightforward and relatively low-cost. Many researchers have tried to find easily and low-cost obtainable adsorbents to remove hazardous metal ions, such as zeolites, clays and plant waste materials [11-13]. Recently, the application based on graphene/$Fe_3O_4$nanocomposite in sample preparation to sorb trace analytes has gained significant importance [14]. In this process, iron nanoparticles were homogeneously secured onto the surface of the sheets with the support of –COOH on GO, which disallowed the

ACCEPTED MANUSCRIPT

agglomeration of $Fe_3O_4$ nanoparticles and inhibited their growth. These magnetite/reduced graphene oxide nanocomposite exhibited excellent removal efficiency and fast separation from water by an external magnetic field. It is evident from the available literature that the synthesis of magnetic reduced graphene oxide shows excellent applications [15-21]. On the other hand, the oxygen containing functional groups on RGO have strong complexation capacities with metal ions and therefore, it is apt to remove radionuclides and heavy metal ions from wastewater.

Using organic solvents like $C_6H_6$, $NaBH_4$, $N_2H_4$, and $CO_2$ is highly reactive and potentially hazardous to the environment. Hence, the accessible synthesis methods were environmentally unfriendly, complex, expensive and time consuming. Therefore, it is still a great challenge to develop eco-friendly synthesis methods. To the best of our knowledge, no reports on green synthesis of magnetite reduced graphene oxide (RGO/$Fe_3O_4$) composite using Murraya*konenigii* leaves extract. In this article, firstly RGO/$Fe_3O_4$ nanocomposite was fabricated via reduction of $Fe^{3+}$ ion and GO by *Murrayakonenigii* leaves extract as a reducing and stabilizing agent. The RGO/$Fe_3O_4$ nanocomposite was employed as magnetically recycled adsorbent for the removal of Pb(II) from aqueous solution.

## 2. Materials and Methods

### 2.1 Materials

Graphite powder and $FeCl_3$ $6H_2O$ were purchased from Sigma Aldrich and used as received without further purification. All solutions were prepared in double distilled water.

### 2.2. Preparation of the extract

Fresh *Murrayakoenigii* leaves were collected and thoroughly washed with deionized water, then chopped into small pieces. 20 g of *Murrayakoenigii* leaves was heated with 100 mL distilled

ACCEPTED MANUSCRIPT

water at 60 ºC for 2 h. Subsequently, the mixture was permitted to cool to room temperature and aqueous extract centrifuged at 8000 rpm then was easily obtained by filtration.

### 2.3. Preparation of the RGO using the aqueous extract of *Murrayakoenigii* leaves

The GO was prepared from natural graphite powder by a modified Hummers method [22]. The RGO was prepared through phytochemical reduction of a colloidal suspension of GO. For the preparation of RGO, 60 mg of GO was dispersed in 50 mL Milli-Q water by ultrasonication for 35 min. The suspension was thoroughly mixed with an appropriate volume of *Murrayakoenigii* leaves extract and magnetically stirred under reflux conditions for 5 h at 60 °C. The obtained product was centrifuged at 10,000 rpm and then dried at 100 °C. The mechanism of reduction is due to the complex phytochemical constituents. The phytochemicals such as Apigenin, Luteolin and ascorbic acid present in the leave extracts helps in the reduction of GO. The detailed reduction mechanism of GO to RGO was well established and explained by Thakur et al. [23].

### 2.4 Preparation of $Fe_3O_4$ magnetic nanoparticles

An aqueous solution of 50 mL of 1 mM iron (III) chloride was prepared and subsequently 10 mL of *Murrayakoenigii* leaves extract was added with continuous stirring. Further, 1.0 M NaOH solution was added to the above mixture and continued stirring for another 3 h. After 3 h the formation of $Fe_3O_4$ magnetic nanoparticles (MNPs) are marked by the appearance of the intense black precipitate. The resulting solution was cooled to room temperature and the obtained black product was isolated by applying an external magnetic field and washed with ethanol and dried in a vacuum oven at 80 °C for 12 h that results nano $Fe_3O_4$.

### 2.5 Preparation of RGO/$Fe_3O_4$ nanocomposite

ACCEPTED MANUSCRIPT

The RGO/$Fe_3O_4$ nanocomposite was synthesized by phytochemical method and the procedure is as follows. First, 0.1 g of GO was mixed with double distilled water and dispersed using ultrasonication. To this dispersed GO solution, 0.2 M 100 mL of $FeCl_3.6H_2O$ solution was added drop wise. Then, the aqueous extract of *Murrayakoenigii* leaves was added to the above mixture with continuous stirring and the resulting solution was stirred magnetically for 1 h. Further, the resulting reaction mixture was refluxed for 5 h at 80 °C. The obtained RGO/$Fe_3O_4$ nanocomposite was separated and washed with deionized water and absolute ethanol and then dried in vacuum oven at 100 °C for 2 h. The $Fe_3O_4$: RGO (2 wt%) nanoadsorbent was obtained and used for further studies.

**2.6 Characterization techniques**

FTIR measurements of *Murrayakoenigii* leaves extract, the as-synthesized RGO/$Fe_3O_4$ nanocomposite were made with Thermo Nicolet FTIR-200 thermoelectron corporations at room temperature. The powder X-ray diffraction (XRD) patterns were obtained RGO/$Fe_3O_4$ sample using Bruker AXS D8 advanced diffractometer at room temperature using Cu Kα (λ= 0.15406 nm) radiation generated at 40 kV and 30mA with scan rate of 0.02° per min from 5 to 80°. Morphology and size of the as synthesized RGO@$Fe_3O_4$ nanocomposite were investigated by transmission electron microscopy (JEOL JEM-3010) machine operated at 200 kV. A For the magnetization measurement, a vibrational sample magnetometer (VSM, Lakeshore 7410) was used at room temperature.

**2.7 Point of Zero charge**

The $pH_{PZC}$ (point of zero charge) is the pH when the charge on the surface of RGO/$Fe_3O_4$ nanocomposite is zero. The procedure of $pH_{PZC}$ drift method [24] could be described as follows: To a series of 250 mL conical flasks, 50 mL of 0.01 N NaCl was added. Then, the initial solution

ACCEPTED MANUSCRIPT

pH values (say pH initial) were adjusted in range between 2 and 9 with intervals of one using 0.01 N HCl solutions and 0.01 N NaOH. After constant value of $pH_{initial}$ had been reached, 0.010 g of RGO/$Fe_3O_4$ nanocomposite was added into each conical flask and caped them immediately. These solutions were stirred for 12 h to reach equilibrium. After 12 h, pH of solution was measured noted as $pH_{final}$. The $pH_{PZC}$ of RGO/$Fe_3O_4$ nanocomposite is the point when $pH_{initial}$ = $pH_{final}$.

**2.8 Batch adsorption experiments**

The adsorption of Pb(II) ion on to the RGO/$Fe_3O_4$ nanocomposite was studied in aqueous solution by batch adsorption experiments with pH range (Initial pH of the solution) varied from 2 to 7 at 301K. Pb(II) stock solution was prepared with different concentrations and then 3.5 mg of magnetic nanoadsorbent was added to 25 mL of each Pb(II) ion solution. The initial pH of Pb(II) ion was adjusted by using 0.1 M NaOH/HCl solution. The solution mixture was ultrasonicated at room temperature for 15min and transferred to 100mL Erlenmeyer flask was shaken in a thermostatic incubator (200 rpm) at 300K. Following that the magnetic nanoadsorbent was removed magnetically from the solution. The concentration of Pb(II) ions was determined using AAS(ShimadzuAA-6300). The amount of Pb(II) adsorbed by the RGO/$Fe_3O_4$ nanocomposite at equilibrium was obtained using the following equation.

$$q_e = \frac{(C_i - C_e)V}{M} \qquad (1)$$

where, $q_e$ (mg/g) is the equilibrium adsorption capacity of Pb(II), $C_i$ and $C_e$ are the initial and equilibrium concentrations (mg/L) of Pb(II), M is the adsorbent dosage (mg) and V is the volume of the solution (L). The percentage removal (%R) of Pb(II) from aqueous solution was calculated using the following equation:

ACCEPTED MANUSCRIPT

$$Adsorption(\%) = \frac{(C_i - C_e)}{C_i} \times 100 \qquad (2)$$

## 3. Results and discussion

### 3.1. FT-IR analysis

The FT-IR analysis was carried out to identify the possible functional groups and the formation the RGO/$Fe_3O_4$nano composite. Fig. 1 shows the FT-IR spectra of *Murrayakoenigii* leaves extract RGO/$Fe_3O_4$ nanocomposite respectively. FT-IR spectra of leaves extract show peaks at 3328, 2952, 1658, 1449 and 1122 $cm^{-1}$. The sharp and intense band at ~3328 is ascribed to the O-H stretching vibration corresponding to the polyphenol groups. The band at 2952 $cm^{-1}$ can be assigned to methyl C-H stretching vibrations and the one at 1642 $cm^{-1}$ is due to the C=O stretching of aldehydes in the leave extract. The other peaks observed are due to stretching C=C aromatic ring and C-OH stretching vibrations. In contrast to leave extract FT-IR spectra of RGO/$Fe_3O_4$ show slight shift in these peaks along with a few new peaks Fig. 1B. It is worth noticing that the intense and relatively sharp –O-H stretching vibration observed ~ 3328 $cm^{-1}$ in leave extract has become broad and weak in RGO/$Fe_3O_4$ composite. This shows that polyphenol groups present in leave extract has significant contribution for the formation of $Fe_3O_4$. In addition to other bands a sharp peak ~585 $cm^{-1}$ appears in RGO/$Fe_3O_4$ composite sue to the characteristic Fe-O stretching. It is worth mentioning that the slight shift in FT-IR bands in composite compared to pure leave extract might be due to the binding nature of these functional groups with the metal oxide RGO composite.

### 3.2 Powder XRD analysis

ACCEPTED MANUSCRIPT

The powder XRD patterns of GO, RGO and RGO/$Fe_3O_4$ composite are shown in Fig. 2. As can be seen that the graphene oxide (GO) shows a diffraction peak at 2θ of 10.1° corresponds to the (001) plane [25]. The reduced graphene oxide prepared after the reduction of GO with *Murrayakoenigii* leaves extract showed a broad diffraction peak at 2θ of 24.3° (002). Moreover, the XRD analysis of RGO/$Fe_3O_4$ nanocomposite exhibit major diffraction peaks at 30.2°, 35.5°, 43.2°, 53.5° and 62.6° which can be indexed to(220), (311), (400), (422) and (440) planes of the cubic phase $Fe_3O_4$ (JCPDS card no. 19-0629) with a face centered cubic structure [26].

### 3.3. TEM and SEM analysis

The morphology and structure of RGO/$Fe_3O_4$ nanocomposite were studied by TEM and SEM. From Fig. 3(A) TEM image of RGO/$Fe_3O_4$ nanocomposite exhibited significant changes in the surface morphology and roughness, visually demonstrating the presence of $Fe_3O_4$ nanoparticles. The $Fe_3O_4$ nanoparticles with an average size of ~12 nm were homogeneously assembled on the surface of RGO sheets, and no big agglomeration of $Fe_3O_4$ particles or large vacancy on RGO is observed. Nevertheless, it can be observed that the $Fe_3O_4$ nanoparticles are still strongly deposited on the surface of RGO sheets due to, the strong interaction between $Fe_3O_4$ nanoparticles and RGO sheets. The SEM measurement (Fig. 3B) explored that the nanocomposite obsessed a hierarchy dimensional morphology. The large RGO flakes showed slightly wrinkled surface and the $Fe_3O_4$ nanoparticles appeared a bright dots, densely and evenly deposited on both sides of RGO sheets.

### 3.4 BET isotherms

The BET specific surface area and porosity of GO, RGO/$Fe_3O_4$ nanocomposite samples are determined by $N_2$ adsorption-desorption isotherms at 77 K using liquid nitrogen as an adsorbent. Fig. 4 shows BET isotherms of GO and RGO/$Fe_3O_4$ samples, which characterize

ACCEPTED MANUSCRIPT

"type IV" isotherms with H3 hysteresis loops representing the mesoporous nature of the respective samples. The BET specific surface area for RGO/$Fe_3O_4$ nanocomposite sample is 58 $m^2$ $g^{-1}$. However, the modified Hummers method route obtained GO nanostructure specific surface area shows 76 $m^2$ $g^{-1}$ (Fig. 4), this is relatively higher than the RGO/$Fe_3O_4$ nanocomposite [27]. The decreased surface area in the RGO/$Fe_3O_4$ nanocomposite is sowed to the preferential blocking of the pores by the large size nanocrystalline $Fe_3O_4$ MNPs.

### 3.5. Raman spectra

The Raman spectrum of graphene oxide is generally described by two specific features such as G and D modes which are indicated to the $E_{2g}$ phonon of $sp^2$ carbon atom and breathing mode of kpoint photons of $A_{1g}$symmetry, respectively [28-31]. The prepared graphene oxide exhibited D and G modes at 1342 and 1610 $cm^{-1}$ Fig. 5 (a) and the reduced graphene oxide (RGO) was blue shifted to 1334 and 1600 $cm^{-1}$ Fig. 5 (b). Moreover, to the after mentioned carbon peaks, the characteristics $A_{1g}$ mode of $Fe_3O_4$ was found at 670 $cm^{-1}$ [32-34] confirming the hybrid structure of RGO/$Fe_3O_4$ nanocomposite Fig. 5C.

### 3.6. Magnetic behavior of RGO/$Fe_3O_4$ nanocomposite

Studying the magnetic behavior of the synthesized magnetically separable RGO/$Fe_3O_4$ nanocomposites is essential. In this respect, VSM analysis was carried out at room temperature for both the bare $Fe_3O_4$ nanoparticles and the RGO/$Fe_3O_4$ nanocomposites, and the results are shown in Fig. 6. The bare $Fe_3O_4$ nanoparticles and RGO/$Fe_3O_4$ nanocomposites showed typical S-like curve magnetization hysteresis loops with no coercivity, inferring that they exhibit super-paramagnetism, while their magnetization behaviors were removed in the absence of the applied magnetic field. The saturated magnetization value observed for the pristine $Fe_3O_4$and RGO/$Fe_3O_4$ nanocomposites were 15.3 emu $g^{-1}$, 12.6 emu $g^{-1}$, which was higher than that of the

ACCEPTED MANUSCRIPT

magnetic RGO/$Fe_3O_4$ nanocomposites. This can be ascribed to the presence of graphene in the nanocomposites. The advantage of the RGO/$Fe_3O_4$ nanocomposite is it can be easily separable by an external magnetic from the mixture reaction after the catalytic reaction.

### 3.7 Influence of pH value

The pH of solution is one of the most significant variables, influence of the pH value on the removal of Pb(II) ion by RGO/$Fe_3O_4$ nanocomposite was studied at pH 2-7, 301K and different Pb(II) initial concentrations of 30, 40 and 50 mg/L. As shown in Fig. 7A, the percentage removal of Pb(II) increased with an increase in pH from 2 to 5 and decreased with an increased pH 6-7 and the nanocomposite showed a maximum removal of 96% at pH 5.0, initial concentration of 30 mg/L. According to speciation diagram [35] at pH $\leq$5, lead predominately exists as $Pb^{2+}$, between pH 5-8 as $Pb(OH)^{+}$ and beyond pH 8 as $Pb(OH)_2$. Hence, the decrease in Pb(II) removal at higher pH is due to the formation of Pb(II) as Pb $(OH)^{+}$, and $Pb(OH)_2^0$ and $Pb(OH)_3^-$ at different pH values [36]. As less effect was observed when the initial concentration of Pb(II) was as 40 or 50 mg/L and the adsorption capacity of RGO/$Fe_3O_4$ nanocomposite was below 60%. The pH value of the solution can affect the surface charge of RGO/$Fe_3O_4$ nanocomposite this impacts the adsorption of metal ions on the magnetic adsorbent. At lower pH Pb(II) removal was inhibited due to the $H^{+}$ competed with Pb(II) for adsorption sites[37], which significantly affected Pb(II) adsorption at low pH medium. This is also supported from the pH PZC results. The pH PZC of RGO/$Fe_3O_4$ nanocomposite was found to be 4.5 (see Fig. 8). When the solution pH was below pH PZC the Pb(II) removal was low due to increased concentration of positive charges. In the pH range of ~4-5.5 due to the electrostatic attraction between positively charged Pb(II) and negative surface of RGO/$Fe_3O_4$ nanocomposite there is increased removal of Pb (II).

ACCEPTED MANUSCRIPT

### 3.8 Adsorption kinetic studies

Fig. 7(B) shows the adsorption behavior of Pb(II) on the RGO/$Fe_3O_4$ nanocomposite at an initial concentration of 30 mg/L, pH at 5.0 and 301K as a function of contact time. The adsorption rate of Pb(II) on RGO/$Fe_3O_4$ nanocomposite was almost finished within 35 min and then gradually reached equilibrium in 80 min. The pseudo first order and pseudo second order kinetic models were used to examine the kinetics of exclusion on the RGO/$Fe_3O_4$ nanocomposite [38-40]. The linear form of pseudo first order kinetic model is explained by the equation:

$$\log(q_e - q_t) = \log q_e - \left(\frac{k_1}{2.303}\right) t \qquad (3)$$

where $k_1$ ($min^{-1}$) is the pseudo first order rate constant of adsorption, $q_e$ and $q_t$ are the amount of the Pb(II) removal per unit mass of biosorbent (mg/g) at equilibrium and at time t (min). The pseudo first order kinetic constant was found out from the slope of the plot of log ($q_e$-$q_t$) vs. t. The $R^2$ value is very less indicative of that the adsorption of Pb(II) ions does not pursue pseudo first order kinetic model (Table 1). The kinetic data were further investigated using pseudo second order kinetic model. The linear form of pseudo second order kinetic model is elucidated by the equation:

$$\frac{t}{q_t} = \frac{1}{k_2 q_e^2} + \left(\frac{1}{q_e}\right) t \qquad (4)$$

where$k_2$ (g/mg $min^{-1}$) is the pseudo second order rate constant of adsorption, qe and qt are the amount of the Pb(II) removal per unit mass of biosorbent (mg/g) at equilibrium and at time t (min). The values of $K_2$ and qe can be calculated from the slope intercept of t/$q_t$ vs. t (Table 1). From the removal kinetics shown in Fig. 9 the slope explained good linearity with the correlation coefficient value ($R^2$) 0.999, indicating that the removal kinetic follow the pseudo second order

ACCEPTED MANUSCRIPT

rate model. The adsorption system obeyed the pseudo second order kinetic model for the entire adsorption period.

### 3.9 Adsorption isotherms

To quantify the sorption capacity of Pb(II) ions onto RGO/$Fe_3O_4$ nanocomposite was understand by, two parameter equations namely Langmuir [41] and Freundlich [42] isotherm models. The freundlich isotherm is another form of approach for the adsorption isotherm on heterogeneous surfaces. The freundlich model is considered as multisite adsorption, when the adsorbate surface has heterogeneity (Fig. 10A). The linearized form of the freundlich isotherm model is represented as below;

$$\log q_e = \log k_f + \frac{1}{n} \log C_e \qquad (5)$$

Where $k_f$ (mg/g) is a constant relating the sorption capacity and 1/n is an empirical parameter relating the sorption intensity. The values of Freundlich constants $k_f$ and 1/n obtained from plots of log $C_e$ vs. log $q_e$ (Table. 2).

Langmuir isotherm assumes that there is monolayer coverage on adsorbent surface and no subsequent interaction among adsorbed molecules (Fig. 10B). The linearized form of the Langmuir isotherm is represented as follows:

$$\frac{C_e}{q_e} = \frac{C_e}{q_m} + \frac{1}{q_m b} \qquad (6)$$

where $q_e$ is the equilibrium metal ion concentration on the sorbent (mg/g), $q_m$ is the monolayer sorption capacity of the sorbent (mg/g), $C_e$ is the equilibrium metal ion concentration in the solution (mg/L) and b is the Langmuir constant related to the free energy of sorption. The values of $q_m$ (mg/g), and b were calculated from the slope and intercept of $C_e/q_e$ versus $C_e$ (Table 2).

ACCEPTED MANUSCRIPT

The maximum monolayer sorption capacity was found to be 48.26 mg/g of Pb(II) onto RGO/$Fe_3O_4$ nanocomposite. Another parameter in the Langmuir isotherm a dimension less separation factor (RL) is defined as follows.

$$RL = \frac{1}{1 + bC_i} \qquad (7)$$

where $C_i$ (mg/g) is the initial metal concentration, b is the Langmuir constant. For favorable sorption, RL must lie within 0 to 1, where RL >1, RL=1 and RL<0 indicate the unfavorable linear and irreversible sorption. In this study, the RL is 0.0785 which lies between 0 and 1. This indicates a highly favorable adsorption and increasing adsorption efficiency at higher Pb(II) concentrations. For all cases, the Langmuir equation fits the experimental data better than the Freundlich isotherm. It is clear that the Freundlich model could not fit all the experimental data well, as $R^2$ values are generally lower than the Langmuir model. The adsorption capacity of the present RGO/$Fe_3O_4$ nanocomposite is compared with that reported for other materials in Table 3. It should be noted that the prepared material showed a better Pb(II) adsorption capacity than other organic-molecule-capped nanoparticles and a value similar to the best adsorption capacity among the reported materials.

**3.10 Desorption and reusability**

It is desirable for any adsorbent to retain the adsorption capacity when regenerated to be reused further that makes the adsorbent economically viable. Therefore the regeneration of the adsorbent was carried out using 0.2 M HCl that leads to the desorption of the Pb(II) from the adsorbent surface. The acidic pH favours the desorption of Pb(II) from the RGO/$Fe_3O_4$ adsorbent. This is due to the fact that higher concentration of hydrogen ion makes the surface positively charge due to higher protonated groups that helps in desorption of positively charged

ACCEPTED MANUSCRIPT

Pb(II) ions. It is also evident from our pH studies that at low pH the adsorption capacity of RGO/$Fe_3O_4$ was found to be lesser due to competition between protonated groups and Pb(II) ions. This result also supports the greater desorption of Pb(II) at acidic pH. Further, the regenerated RGO/$Fe_3O_4$ adsorbent was further tested for adsorption of Pb(II) to check the feasible reusability of the adsorbent. The results showed that the regenerated adsorbent shows 95, 89 and 81% removal for first, second and third cycle respectively. This result indicates that RGO/$Fe_3O_4$ is a promising adsorbent that can be regenerated and be reused.

## 4. Conclusion

In this work, we studied a novel and environmentally benign route for the synthesis of RGO/$Fe_3O_4$ nanocomposite. The particles in synthesized nanocomposite showed spherical shape and was explored by transmission electron microscope. The powder XRD and FT-IR results confirm the formation of RGO/$Fe_3O_4$ nanocomposite. The super paramagnetic property of the nanocomposite was confirmed by vibrating sample magnetometer at room temperature. A strong electrostatic attraction present between RGO/ $Fe_3O_4$ nanocomposite and Pb(II) at different pH and plays a vital role in the adsorption. The maximum adsorption capacity was found to be 48 mg/g at pH 5 and temperature 301 K. The adsorption data best fits Langmuir isotherms model and adsorption follows second order kinetics. We also have demonstrated that the adsorbent can be easily removed by magnetic separation with external magnet. These features of magnetically separable RGO/$Fe_3O_4$ nanocomposite make it a promising and recyclable adsorbent for many environmental remediation applications.

**Abstract**

*4-(benzofuran-2-yl)-2-methyl-6-phenylpyrimidine(BFMPP) has been synthesized and characterized by FT-IR, $^{1}H$ &$^{13}CNMR$ and Mass spectrometry techniques. Single crystals of title compound were grown by slow evaporation solution growth technique at room temperature and crystal structure has been determined by single crystal X-ray diffraction technique. The title compound(BFMPP) crystallizes in monoclinic space group $P2_1$, with cell dimensions a = 4.803(3) Å, b = 9.498(5) Å, c = 15.557(9) Å, β= 93.25 (4)$^{o}$ and Z = 2. The crystal structure is stabilized by weak C-H…N intermolecular interactions generating a one dimensional C(4) network propagating along the [100] direction and two pi…pi interactions. Further, a detailed analysis of the Hirshfeld surfaces facilitating an understanding of the type and nature of intermolecular interactions in the supramolecular structure is made. The calculated HOMO-LUMO energy gap discloses that charge transfer occurs within the molecule.*

**Keywords:** BFMPP, Crystal structure, X-ray diffraction, Hirshfeld analysis, HOMO-LUMO plots.

## 1. Rationale

ACCEPTED MANUSCRIPT

Heterocycles hold a key point in organic and medicinal chemistry as they act as a bridge between life sciences and biochemical investigations. A significant amount of contemporary investigation is being currently pursued on these compounds worldwide. The pyrimidine rings are nitrogen rich heterocycles, key constituent of many natural, synthetic compounds and shows very interesting pharmacological activity [1-4]. In recent years, pyrimidine derivatives have received significant attention owing to their diverse biological properties, particularly as cytostatic [5-8], immune modulating [9], antitubercular, calcium channel blockers [10], antimicrobial properties [11], herbicides [12] and pesticides [13].

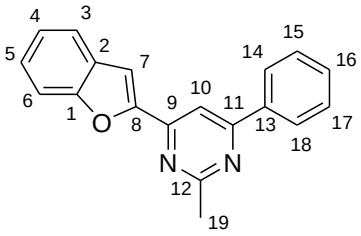
The biological importance of pyrimidine derivatives has motivated significant interest towards the synthesis of 4-(benzofuran-2-yl)-2-methyl-6-phenylpyrimidine(BFMPP) and the structure was characterized well as it would be more useful. Further, various intermolecular interactions are well supported by Hirshfeld surface and fingerprint plots analysis.

## 2. Experimental

### 2.1. General remarks

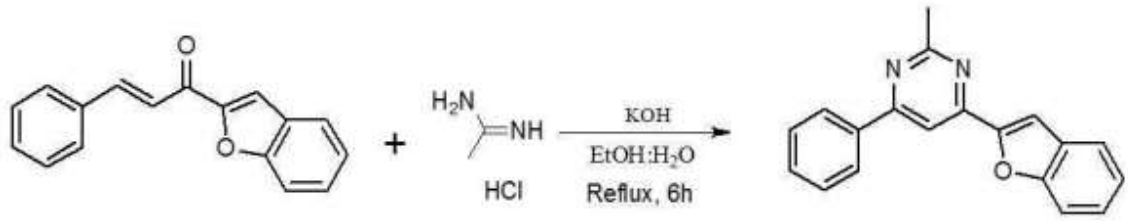
The reagents and solvents used for synthesis were procured from Spectrochem, Sigma Aldrich and used as such received. Reactions were monitor by analytical thin layer chromatography (TLC) and TLC plates were visualized by exposing UV light, KMnO4 solution or by iodine vapors. The FT-IR spectrum was recorded in KBr pellets using JASCO FTIR-4100 spectrometer in the range of 4000 – 400 $cm^{-1}$ at resolution of ± 2 $cm^{-1}$.$^{1}$H &$^{13}$C-NMR spectrum was recorded on JEOL-400 MHz NMR instrument using $CDCl_3$ as solvent. The chemical shifts values (δ) are reported in parts per million (ppm) using TMS as an internal standard. Mass spectrum was recorded on Shimadzu-2010EV with APCI and ESI probes.

### 2.2. Synthesis of 4-(1-benzofuran-2-yl)-2-methyl-6-phenylpyrimidine



To a stirred solution of (1-benzofuran-2-yl)-3-phenylprop-2-en-1-one (0.5g, 2.06mmol) in mixture of ethanol: water (4:1, 5 mL), acetamidine hydrochloride (0.11g, 2.06 mmol), KOH (0.12g, 2.2mmol) was added and the reaction mixture refluxed for 6 hours. After completion of reaction indicated by TLC, the reaction mixture was poured into ice cold water and extracted to ethyl acetate (3 x 20 mL). The organic layer washed with water, brine and dried over anhydrous $Na_2SO_4$. Evaporate the organic layer under reduced pressure to get crude product. The crude product was purified by column chromatography using silica 60-120 mesh and ethyl acetate: petroleum ether (1:9) as eluent to get desire product (0.39g, yield: 68.4%, M.p: 130-133$^{o}$C).

### Method of crystallization



100mg of compound was dissolved in 15mL of ethyl acetate and warmed for 5 minutes. The solution was filtered through Whatmann filter paper and resulting solution was kept at room temperature in conical flask with stopper slightly open. After 5 days, the crystals of BFPP were developed; filtered and suitable crystals for single crystal analysis were selected (**Scheme-1**).

**$^{1}$H NMR (400MHz, $CDCl_3$):** δ 8.20-8.17 (2H, m, Ar-H), 8.05 (1H, s, Py-H), 7.71-7.69 (2H, dd,Ar-H), 7.62-7.53 (4H, m, Ar-H), 7.43-7.39 (1H, m, Ar-H), 7.32 (1H, m, Ar-H), 2.86 (3H, s, Py-CH3).

**$^{13}$C NMR (100 MHz, $CDCl_3$):** δ 168.576 (C12), 165.217 (C9), 156.213 (C11), 155.642 (C1), 153.310 (C8), 136.973 (C13), 130.901 (C14 & C18), 128.915 (C15 & C17), 128.295 (C16), 127.278 (C5), 126.313 (C4), 123.510 (C2), 122.248 (C3), 111.670 (C6), 108.906(C7), 108.124 (C10), 26.204 (C19).

**Mass (m/z):** Calculated: 286.32, Found: 287.59 (M+1)

**Scheme.** Synthesis of 4-(1-benzofuran-2-yl)-2-methyl-6-phenylpyrimidine

**2.3. X-Ray Crystallography**

A suitable colourless, needle shaped single crystal of the title compound with dimensions of0.36mm x 0.20mm x 0.16mm was selected and data was collected on an Oxford diffraction X caliber Gemini diffractometer with graphite monochromated Mo Kα radiation (λ = 0.71073 Å) at 293 K. The CrysAlisProsoftware [14] was used for data collection, reduction and absorption correction. The structure was solved by direct method and refined by full-matrix least-squares methods on $F^2$ using SHELX-97 [15] available in the WinGX package [16]. All the non-hydrogen atoms were refined with anisotropic thermal parameters. The hydrogen atoms were included in the structure factor calculations and treated using a riding model. Molecular graphics and crystal packing were created using *ORTEP* [17] and *MERCURY* [18] packages. The parameter for data collection and structure refinement of compound BFMPP are listed in Table 1.

**2.4. Hirshfeld surfaces**

The Hirshfeld surface analyses were carried out and fingerprint plots were plotted using Crystal Explorer 3.0 [19-25]. When the CIF files were uploaded into the Crystal-Explorer software, all bond lengths to hydrogen were automatically modified to standard neutron diffraction values, i.e. C–H = 1.083 Å.

**3. Data, value and validation**

**3.1. Crystal and molecular structure description of BFMPP**

The molecular structure of BFMPP determined by X-ray diffraction is depicted in **Figure 1**. BFMPP crystallizes in the monoclinic space group $P2_1$with cell dimensions *a* = 4.803(3) Å, *b* = 9.498(5) Å, *c* = 15.557(9) Å, β= 93.25 (4)$^o$ and Z = 2.The molecule is almost planar with root mean squared deviation (considering non-H atoms) being 0.101 Å. The dihedral angle between the benzene (A), the pyrimidine

ring (B) and the benzofuran ring (C) are 4.79 (A/B), 10.76 (A/C) and 8.42(1)°(B/C) respectively. The crystal structure is stabilized by weak C-H…N intermolecular interactions (Table 2 and **Figure 2**) running into C(4) chains along [100] and two pi…pi interactions. Hence, the supra molecular architecture exhibited is one dimensional.

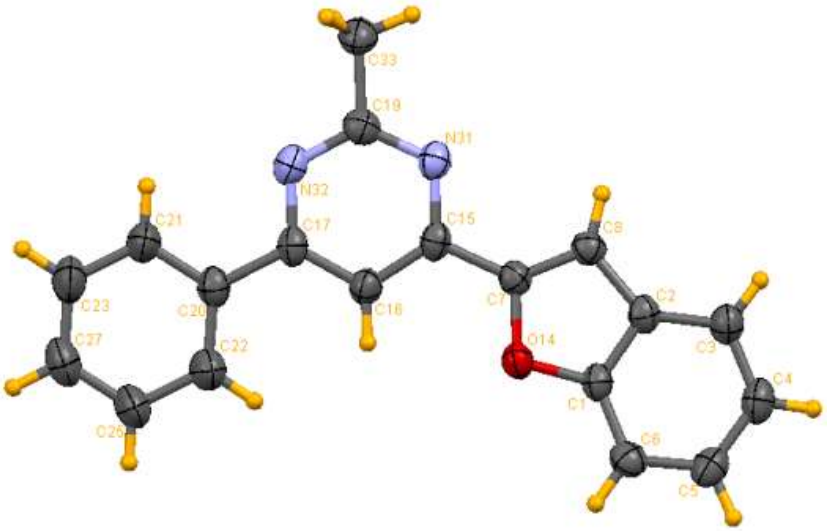


**Figure 1.** *ORTEP* view of the molecule with atom numbering scheme for non-hydrogen atoms

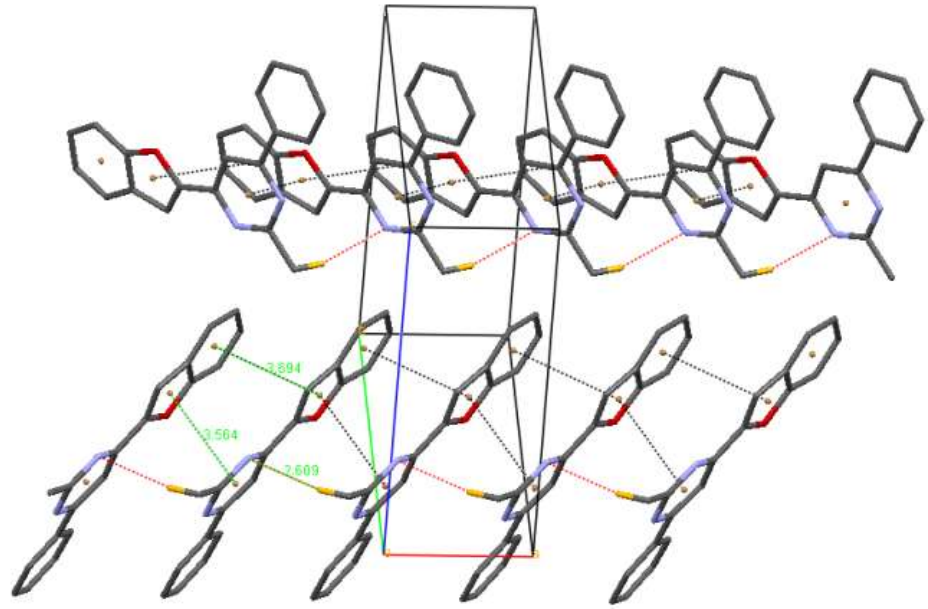

**Figure 2.** Crystal packing of BFMPP

### 3.2. Hirshfeld surface analysis

The Hirshfeld surfaces of title compound illustrated in **Figure 3**, showing surfaces that have been mapped over a $d_{norm}$(A), shape index (B) and curvedness (C) range of -0.111 to 1.143 Å, -1.0 to 1.0 Å and -4.0 to 0.4 Å, respectively. The predominant interactions between the methyl hydrogen of pyrimidine ring and the nitrogen of pyrimidine ring, which can be seen in the Hirshfeld surfaces as the bright red spot marked as A in **Figure 3** and clearly seen in **Figure 4**. In the 2D fingerprint plots (**Figure 5**), the C-

H···N intermolecular interactions appear as two distinct spikes circled with green color. Prominent pairs of sharp spikes of almost equal lengths in the fingerprint plots (**Figure 5**) are characteristics of nearly equal C(donor)···N(acceptor) distances and generate a one dimensional C(4) network propagating along the [100] direction. The upper spike (**Figure 5**) corresponds to the donor spike (H atom of methyl group interacting with N-atoms of the pyrimidine ring), with the lower spike being an acceptor spike (N-atomsof the pyrimidine ring interacting with H- atom of methyl group). The wings marked in Figure 5 (circled with black) are due to the C···H contacts. A significant difference in terms of H···H contacts appears asspikes (marked as red circles in **Figure 5**). The relative contribution of the different interactions to the Hirshfeld surface was calculated for title compound. It is evident that the H···H contacts can account forabout 50.5% of the Hirshfeld surface area; the remaining contribution was mostly due to C···H 28.2%,N···H 6.5%, O···H 3.3% and C···C 6.0% interactions, with only minor contribution from C···N, O···C and O···N (maximum 5.5%).

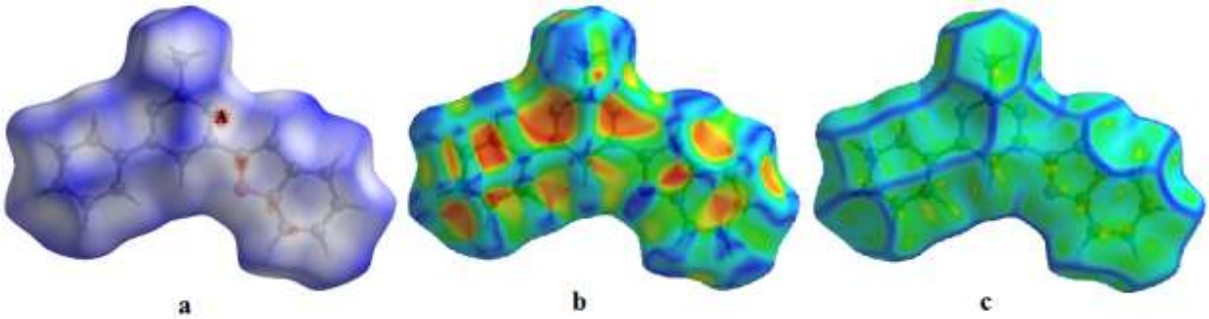

**Figure 3.** Hirshfeld surfaces of BFMPP.

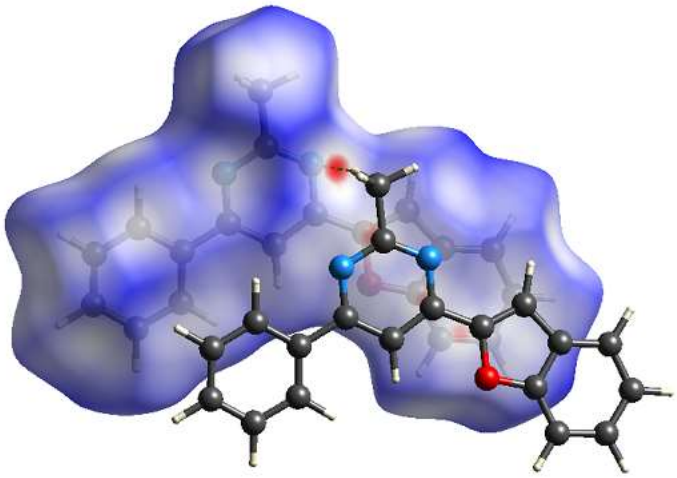

**Figure 4.** C-H…N intermolecular interactions mapped on $d_{norm}$ surface.

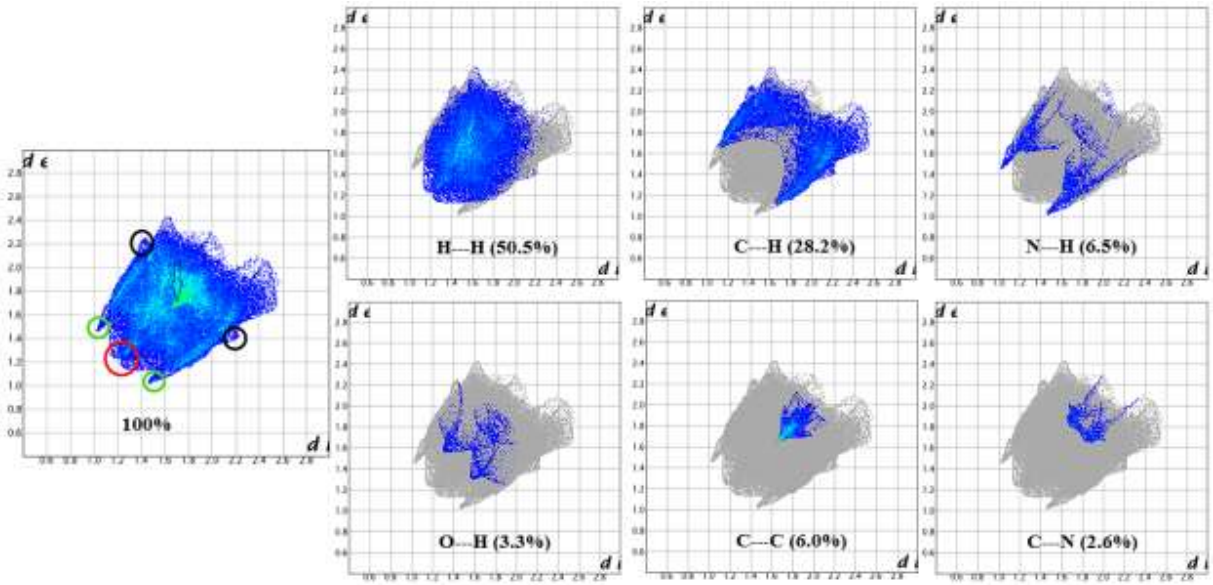

**Figure 5.** 2D Fingerprint plots of BFMPP.

### 3.3.Frontier molecular orbital analysis

The HOMO-LUMO energy plots of BFMPP has been obtained from Crystal Explorer with Tonto program using DFT/Becke88LYP/6-31G(d) method and the pictorial representation shown in **Figure 6**. The HOMO (MO 75) lies at -6.28 eV and whereas the LUMO (MO 76) is located at -2.2 eV. In the title compound, the HOMO of π nature is delocalized all over the molecule except phenyl ring, methyl group and LUMO in addition to this on the phenyl ring except methyl group. Accordingly, the HOMO-LUMO transition implies an electron density transfer from the benzofuran ring to phenyl ring through the pyrimidine ring, and that the frontier orbital energy gap is 4.08 eV. The global chemical descriptors associated with a molecular system are: ionization potential (I) = $-E_{HOMO}$= 6.28, electron affinity (A) = $-E_{LUMO}$= 2.2, chemical potential (μ) = - (I+A)/2 = -4.24, the global hardness (η) = (I-A)/2 = 2.04 ,softness (ν)= 1/ η = 0.49, electronegativity (χ) = (I+A)/2 = 4.24 and electrophilicity index (ω) = $\mu^2/2\eta$ = 4.406 [26,27]. It is seen that the chemical potential of the title compound is negative and it implies that the molecular system is stable. They do not decompose spontaneously into the elements they are made up of. The hardness signifies the resistance towards the deformation of electron cloud of chemical system under small perturbation encountered during the chemical process.

### 3.4. UV-Visible spectral analysis

The electronic spectra of title compound calculated at TD-DFT/B3LYP/SDD method using optimized geometry and the calculation are performed in methanol. The electronic spectra of title compound shows an electronic absorption band with maxima 344 nm (**Figure S5**)and this transition mainly due to the transition HOMO-LUMO that is the π-π transition predicted. The excitation transitions, CI coefficient, excitation energies, oscillator strengths and wavelength can be seen in Table S1.

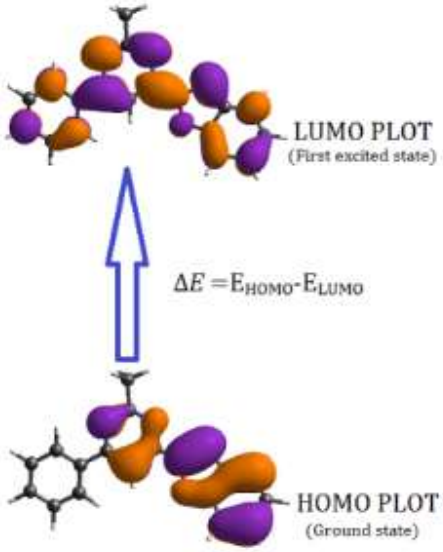

**Figure 6.** HOMO plot and LUMO plot of the title compound (BFMPP).

### 3.5. FT-IR spectral analysis

FT-IR spectrum of title compound is shown in **Figure S1**. Vibrational frequencies of title compound calculated at ground state by using B3LYP/DFT/SDD basic set in gas phase(Table S2).The CH stretching frequency of aromatic rings are theoretically assigned at 3181, 3117, 3090 $cm^{-1}$ for benzofuran ring and 3150 $cm^{-1}$ for pyrimidine ring. For mono-substituted phenyl ring, the CH stretching modes are expected above 3000 $cm^{-1}$[28, 29] and DFT calculations give these modes in the range 3120, 3106, 3094 $cm^{-1}$ and experimentally bands are observed at 3051 $cm^{-1}$. The $CH_3$ stretching modes are expected in the region 2900-3050 $cm^{-1}$[28]. The bands observed at 2925 $cm^{-1}$ and in the range 3060-2939 $cm^{-1}$ (DFT) are assigned as stretching modes of the methyl group. The aromatic ring stretching modes are observed in the range 1585, 1558$cm^{-1}$ and 1598, 1569 $cm^{-1}$ theoretically expected. The C=N stretching modes is observed at1528$cm^{-1}$experimentally and computed 1528 $cm^{-1}$. In present case in-plane and out-of-plane CH deformation observed at above and below 1000 $cm^{-1}$ and good agreement literature values.

### 4. Conclusion

4-(1-benzofuran-2-yl)-2-methyl-6-phenylpyrimidine(BFMPP)has been synthesized and characterized by single crystal X-ray diffraction, FT-IR, $^{1}H$ & $^{13}C$NMR and Mass spectrometry. The X-ray diffraction studies showed that the title BFMPP crystallized in monoclinic space group $P2_1$, with cell dimensions $a$ = 4.803(3) Å, $b$ = 9.498(5) Å, $c$ = 15.557(9) Å, β= 93.25 (4)$^{o}$ and Z = 2.The difference in HOMO and LUMO energies supports the charge transfer interaction within the molecule. The calculated HOMO and LUMO energies were used to semi-quantitatively estimate the ionization potential, electron affinity, electronegativity, electrophilicity index, hardness and chemical potential. The crystal surface analysis carried out by Hirshfeld surface studies and fingerprint plots analysis, which facilitates to understanding the type and nature of intermolecular interactions and as well as packing in the solid-state.

### Acknowledgments

The authors are highly thankful to Prof. T.N. Guru Row, SSCU, IISC, Bangalore, India for the collection of diffraction data. Authors are also thankful to the Department of Science and Technology, New Delhi,

# A COMPARATIVE STUDY OF HUMAN DEVELOPMENT INDEX OF SELECTED INDIAN STATES USING STATISTICAL TOOLS

***DR.G.VARALAKSHMI**

**Lecturer in Statistics, D.K. Govt. College (A) For Women, Nellore*

***ABSTRACT***

***This paper tried to find out major factor of Human Development Index like health index, Education index and income index. The objective of this study is found out the trend of human development of Indian states and to suggest measures for improving human development. The Human Development Index is a statistical tool used to measure countries overall achievements in its social and economic dimensions.***

***Key words:*** ***Human Development Index; Health Index; Education Index; Income Index.***

## INTRODUCTION

Human development is concerned with what I take to be the basic development idea: namely, advancing the richness of human life, rather than the richness of the economy in which human beings live. In 1990 Human Development Index was developed and launched by Pakistani economist Mahbub-ul-Haq, followed by Amartya Sen, an Indian economist. Human Development Index (HDI), is a comprehensive tool devised by the United Nations for measuring the levels of social and economic developments of the different countries and ranking them accordingly. It is a comparative measure of life expectancy, education, literacy and standard of living. Essentially, Human Development Index, makes use of four parameters for measuring and ranking countries according to their social and economic development which includes the Life Expectancy at Birth, Expected Years of Schooling, Mean Years of Schooling and Gross National Income per Capita. There are six basic pillars of human development: equity, sustainability, productivity, cooperation and security. Now a day's several recent model of development have given lot of importance to human development. It can take place through education, health and family welfare and also influenced by legal, political and social environments in the society. It's very much required for economic, social and cultural developments in society.

In 2004 Gustav Ranis in his study to define the important Interrelations between human development (HD) and economic growth (EG). Region of India. In 2005 Rajarshi Majumder in his study entitled that Human Development in India. In 2009 Purusottam Nayak in his study entitled that Human Development in North-eastern . In 2010 Santanu Ray and Purusottam Nayak in his study entitled that Human Development in North East India. The development goal is to create conditions where people can live a long and healthy life and benefit in knowledge. The Human Resource Development Index is one of the important indicators of economic development for each country and is considered to have an effective role in economic development. The importance of the Human Development Index is put to review on the Indian economy. Trends change each of the three human resource development indexes during the 30-year period from 1980 to 2010. In this article, we consider the relationship between GDP and three indicators of human resources in India. In addition, we will evaluate the relationship and mutual effects of each of the three indicators of human resource development in the Indian economy using the latest (2010) formula provided by the United Nations. In this study, GDP or income act as the dependent Variables and the three indicators of long life, health and education act as independent variables.

## OBJECTIVES OF THE STUDY

1. To suggest measures for improving the human development
2. To analyze the trend of human development of Indian states

## RESEARCH DESIGN AND METHODOLOGY &HYPOTHESIS

| | |
|---|---|
| **Data:** | Secondary |
| **Data source:** | Research papers, Books, Periodicals, Journals and Government websites etc. |
| **Period of study:** | 2001 to 2012 |
| **Type of Research:** | Combination of descriptive and explorative research |
| **Tools:** | Simple statistical tools such as time series cross section analysis etc. |
| **Universe size:** | East zone, West zone, South zone, North zone, north east zone ,Central zone |

| | |

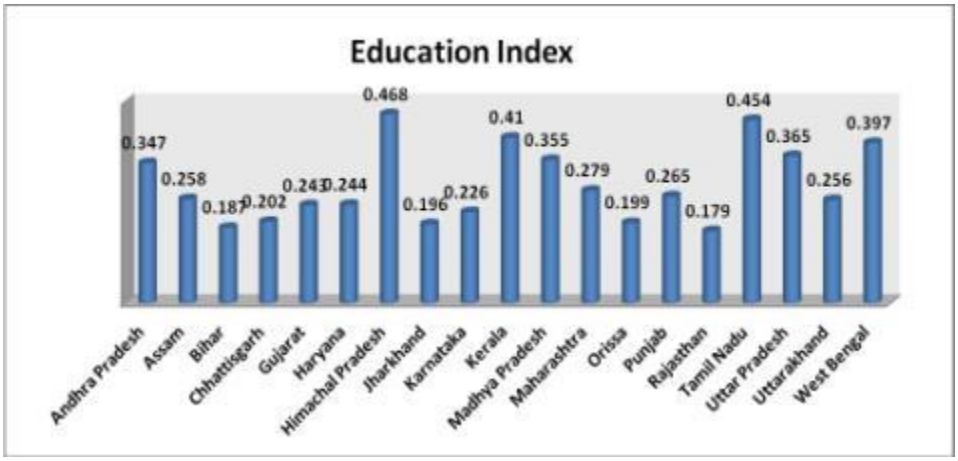
**Interpretation**

In this study using the data of life expectancy at birth researchers prepare the health index and providing the ranking on the basis of health index. Kerala has taken highest rank following Punjab, Maharashtra, then and Madhya Pradesh, Andhra Pradesh, Assam and Bihar. But the Karnataka, Tamil Nadu has obtained moderate rank.



**Education Index**

**Table 3.** Education Index

| State | Mean Years Of Schooling (Years) (2004/05) | School Life Expectancy (Years) (2007/08) | Education Index | Rank |
|---|---|---|---|---|
| Andhra Pradesh | 3.06 | 9.66 | 0.347 | 7 |
| Assam | 3.96 | 9.54 | 0.258 | 10 |
| Bihar | 2.97 | 9.58 | 0.187 | 18 |
| Chhattisgarh | 3.39 | 9.31 | 0.202 | 15 |
| Gujarat | 4.54 | 8.79 | 0.243 | 13 |
| Haryana | 4.74 | 9.68 | 0.244 | 12 |
| Himachal Pradesh | 4.88 | 11.05 | 0.468 | 1 |
| Jharkhand | 3.32 | 9.68 | 0.196 | 17 |
| Karnataka | 3.95 | 9.75 | 0.226 | 14 |
| Kerala | 6.19 | 11.33 | 0.41 | 3 |
| Madhya Pradesh | 3.47 | 8.95 | 0.355 | 6 |
| Maharashtra | 5.12 | 9.86 | 0.279 | 8 |

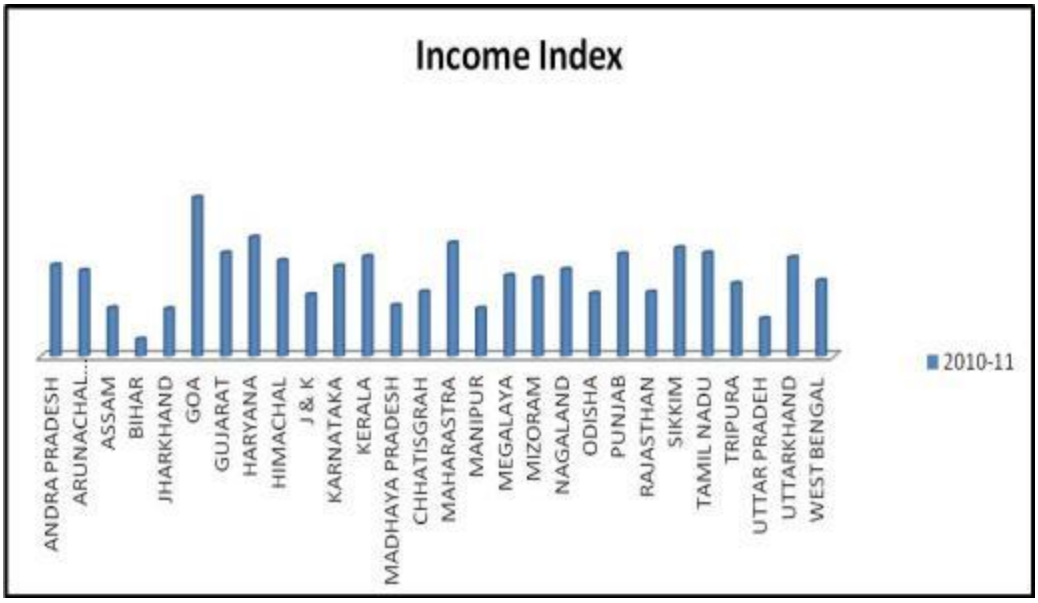
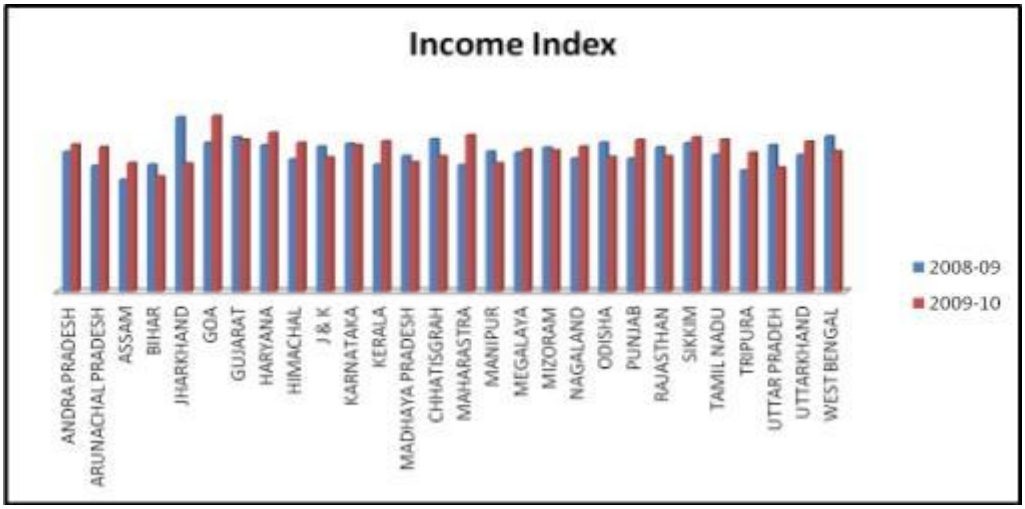
| Punjab | 5.12 | 9.8 | 0.265 | 9 |
| | | | | |

| | | | | |
|---|---|---|---|---|
| Rajasthan | 2.96 | 9.19 | 0.179 | 19 |
| Tamil Nadu | 4.79 | 10.57 | 0.454 | 2 |
| Uttar Pradesh | 3.56 | 9.19 | 0.365 | 5 |
| Uttarakhand | 4.97 | 10.23 | 0.256 | 11 |
| West Bengal | 4.36 | 8.87 | 0.397 | 4 |

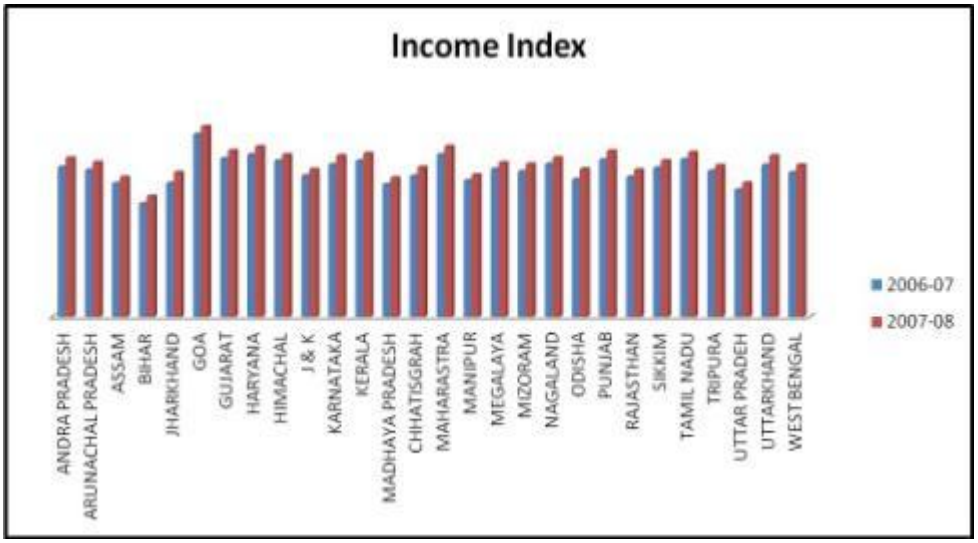
**Source:** UNDP Report 2011



**Interpretation**



After perusal of the data obtained from UNDP report of HDI 2011 on education index, it is clear that Himachal Pradesh has taken highest rank followed by Tamil Nadu and Kerala. Assam, Jharkhand, Bihar and Rajasthan have taken consistently lowest rank. Whereas Punjab, Orissa, Uttarakhand then Maharashtra has a moderate rank in education Index.



**INCOME INDEX**

| Uttar Pradesh | 0.365 | 0.675633 | 0.251 | 0.061898 | 10 |
| West Bengal | 0.397 | 0.775316 | 0.503 | 0.154824 | 4 |

**Interpretation**

On the basis of the health index, education index and income index researcher came on conclusion Tamil Nadu has taken highest rank followed by Kerala whereas Bihar, Assam is at lowest rank. The state like Punjab, Gujarat and Karnataka obtained moderate rank.

## FINDINGS

- In this study researcher construct the health index and find the trend of health index from different states during different period of time.
- Researcher found that the Kerala has taken highest rank Punjab, Maharashtra, Madhya Pradesh, Andhra Pradesh, Assam and Bihar has taken a consistency lowest rank. Karnataka, Tamil Nadu has obtained moderate rank in health index.
- According to UNDP report regarding education index Himachal Pradesh has taken highest rank, Tamil Nadu then Kerala. Rajasthan, Bihar, Jharkhand, Assam and Bihar have taken a consistency lowest rank. Punjab, Orissa, Uttarakhand, Maharashtra have obtained moderate rank.
- In this study researcher construct the income index and find the trend of income of different states from different period of time. And also scattered trend of states of India. Goa has taken highest rank then Haryana, Maharashtra and Gujarat. Madhya Jharkhand, Assam and Bihar has taken a consistency lowest rank. Karnataka, Tamil Nadu, Andhra Pradesh have taken moderate rank.
- According to the HDI Tamil Nadu has taken a highest rank followed by Kerala and lowest rank is taken by Bihar and Assam. Punjab, Gujarat, and Karnataka have taken moderate rank.

## SUGGESTION

In this study researcher obtained that some states facing backward situation facing in major area like: education, health facility, low income etc. This study provide help to state government create an awareness activities regarding vocational skills, development for income generation, focus on education system and also providing medical facility and health insurance etc. it is compulsory for every people.

## CONCLUSION

In this study researcher obtained that several states have good health index and highest ranked like Kerala then Punjab, Maharashtra. Some states have good education index and highest ranked like Himachal Pradesh has taken highest rank, Tamil Nadu then Kerala. Some states have good income index and highest ranking like Haryana, Maharashtra, and then Gujarat. But some states have lowest health index and lowest ranked Madhya Pradesh, Andhra Pradesh, Assam then Bihar. Some states have lowest education index and lowest ranked Rajasthan, Bihar, Jharkhand, Assam then Bihar. Some states have lowest income index and lowest ranked Madhya Jharkhand, Assam then Bihar.

# Non-differentiable multi objective fractional minimax programming problem under $[F, \alpha, \rho, d]$-convex functions

**Dr. G Varalakshmi**
Department, of Statistics, D.K. Govt. College for Women (A), Nellore, Andhra Pradesh, India

**Abstract**
In this paper, we derive some theorems and duality theorems on non-differentiable Multiobject Fractional Minimax Programming Under $[F, \alpha, \rho, d]$ convex function.

**Keywords:** $[F, \alpha, \rho, d]$ convex function and Duality

## 1. Introduction

Minimax fractional problems appear in the formulation of discrete and continous rational approximation problems with respect to the Chebyshev Norm [3], in continuous rational games [12], in multiobjective programming [15], in engineering design as well as in some portfolio selection problems discussed by Bajona-Xandri and Martinez legaz [2].

Minimax mathematical programming has been of much interest in the recent past [1, 4, 5, 11, 13, 17, 18, 19]. Schmitendorf [11] established necessary and sufficient optimality conditions for minimax problem. Tanimoto [14] applied these optimality conditions to define a dual problem and derived duality theorms, which were extended for the fractional analogue of generalized minimax problem by Yadav and Mukherjee [18].

Motivated by various concepts of generalized convexity, Liang *et al*. [8, 9] introduced a unified formulation of generalized convexity, which was called $[F, \alpha, \rho, d]$- convexity and obtained some corresponding optimality conditions and duality results for the single objective practional problems and multiobjective problems. Recently, Liang and Shi [10] obtained sufficient conditions and duality theorems for minimax fractional problem under $[F, \alpha, \rho, d]$-convexity. Lia *et al*. [7] derived necessary and sufficient conditions for nondifferentiable minimax fractional problem with generalized convexity and applied these optimality conditions to construct one parametric dual model and also discussed duality theorems, Lai and Lee [6] obtained duality theorems for two parametric-free dual models of non-differentiable minimax fractional problem involving generalized convexity assumptions. Recently, Mishra *et al*. [12] established duality results for one parametric and two parametric-free dual models of nondifferentiable minimax fractional programming problem under generalized univexity.

But no serious attempt in utilizing multiobjective fractional minimiax under $[F, \alpha, \rho, d]$-convexity. Hence in this Paper an attempt is made to fill the gap in the aim of research by developing some theorems based on $[F, \alpha, \rho, d]$ convex function.

## 2. Formulation

We now consider the following non-differentiable minimax fractional programming problem.

### 2.1. Primal Problem

$$(FP)\quad \min_{x \in R^n} \sup_{y \in Y} \frac{f_i(x, y) + (x^t, Bx)^{\frac{1}{2}}}{h_i(x, y) - (x^t, Dx)^{\frac{1}{2}}},$$

$$\text{Subject to } g_j(x) \leq 0,\ x \in X,$$

Where Y is a compact subset of $R^m, f_i, h_i : R^n \times R^m \to R$ are $C^1$ on $R^n \times R^m$ and $g_j : R^n \to R^p$ is $C^1$ on $R^n$. B and D are nxn positive semidefinite matrices.

Let $S = \{x \in X : g(x) \leq 0\}$ denote the set of all feasible solutions of $(FP)$. For each $(x, y) \in R^n \times R^m$, we define

$$\phi(x, y) = \frac{f_i(x, y) + (x^t, Bx)^{\frac{1}{2}}}{h_i(x, y) - (x^t, Dx)^{\frac{1}{2}}},$$

Such that for each $(x, y) \in s \times Y, f_i(x, y) + (x^t, Bx)^{\frac{1}{2}} \geq 0$ and $h_i(x, y) - (x^t, Dx)^{\frac{1}{2}} > 0$. For each $x \in s,$ we define

$$J(x) = \left\{ j \in J \quad g_j(x) = 0 \right\}. \text{ where } J = \{1, 2, ..... p\}$$

$$Y(x) = \left\{ y \in Y : \frac{f_i(x, y) + (x^t, Bx)^{\frac{1}{2}}}{h_i(x, y) - (x^t, Dx)^{\frac{1}{2}}} = \sup_{z \in Y} \frac{f_i(x, z) + (x^t, Bx)^{\frac{1}{2}}}{h_i(x, z) - (x^t, Dx)^{\frac{1}{2}}} \right\},$$

$$k(x) = \left(s, t_i, \bar{y}\right) \in N \times R_+^s \times R^{ms} : 1 \leq s \leq n+1, t = (t_1, t_2 ..... t_s) \in R_+^s$$

$$\text{with } \sum_{i=1}^{s} t_i = 1, \ \bar{y} = (\bar{y}_1, \bar{y}_2 ..... \bar{y}_s) \text{ with } \bar{y}_i \in Y(x) \ (i = 1, 2, .... s)$$

Since f and h are continuously differentiable and Y is compact in $R^m$, it follows that for each $x^* \in s, y(x^*) \neq \phi$, and for any $\bar{y}_i \in Y(x^*)$, we have a positive constant

$$k_0 = \phi(x^*, \bar{y}_i) = \frac{f_i(x^*, \bar{y}_i) + (x^{*t}, Bx^*)^{\frac{1}{2}}}{h_i(x^*, \bar{y}_i) - (x^{*t}, Dx^*)^{\frac{1}{2}}}$$

We shall need the following generalized Schwartz inequality.
Let B be a positive semidefinite matrix of order n. Then for all $x, w \in R^n,$

$$x^t Bw \leq (x^t Bx)^{\frac{1}{2}} (w^t Bw)^{\frac{1}{2}} \tag{21.1.1}$$

We observe that equality holds if $Bx = \lambda Bw$ for some $\lambda \geq 0$. Evidently, if $(w^t Bw)^{\frac{1}{2}} \leq 1,$ we have $x^t Bw \leq \left(x^t Bw\right)^{\frac{1}{2}}$.

If the functions $f_i$, $g_i$ and $h_i$ in problem $(FP)$ are continuously differentiable with respect to $x \in R^n$.

**2.2. Dual Formulation**

$$(D) \qquad \max_{(s, t^*, \bar{y}) \in K(z)} \ \sup_{(z, \mu, v, w) \in H(s, t_i^*, \bar{y})} \frac{\sum_{i=1}^{s} t_i^* \left\{ f_i(z, \bar{y}_i) + z^t Bw \right\} + \sum_{j=1}^{p} \mu_j g_j(z)}{\sum_{i=1}^{s} t_i^* \left\{ h_i(z, \bar{y}_i) - z^t DV \right\}}$$

Where $H(s, t_i^*, \bar{y})$ denote the set of all $(z, \mu, v, w) \in R^n \times R_+^p \times R^n \times R^n$
Satisfying

$$\nabla \left( \frac{\sum_{i=1}^{s} t_i^* \left\{ f_i(z, \bar{y}_i) + z^t Bw \right\} + \sum_{j=1}^{p} \mu_j g_j(z)}{\sum_{i=1}^{s} t_i^* \left\{ h_i(z, \bar{y}_i) - z^t DV \right\}} \right) = 0$$

$$\begin{cases} w^t\, Bw \le 1, \quad (z^t\, Bz)^{\frac{1}{2}} = z^t\, Bw, \\ v^t\, Dv \le 1, \quad (z^t\, Dz)^{\frac{1}{2}} = z^t\, Dv \end{cases}$$

If the set $H(s, t^*, \bar{y})$ is empty, we define supremum over it to be $-\infty$. For convenience, we use the notation:

$$\psi(\square) = \left[\sum_{i=1}^{s} t_i^* \left\{h_i(z, \bar{y}_i) - z^t Dv\right\}\right]\left[\sum_{i=1}^{s} t_i^* \left\{f_i(\cdot, \bar{Y}_i) + (\cdot)^t, Bw\right\} + \sum_{j=1}^{p} \mu_j g_j(\cdot)\right]$$

$$-\left[\sum_{i=1}^{s} t_i^* \left\{f_i(z, \bar{y}_i) + z^t, Bw)\right\} + \sum_{j=1}^{p} \mu_j g_j(z)\right]\left[\sum_{i=1}^{s} t_i^* \left\{h_i(\cdot, \bar{Y}_i) - (\cdot)^t\, Dv\right\}\right]$$

Suppose that

$$\sum_{i=1}^{s} t_i^* \left\{f_i(z, \bar{y}_i) + z^t Bw\right\} + \sum_{j=1}^{p} \mu_j g_j(z) \ge 0 \quad \text{and} \quad \sum_{i=1}^{s} t_i^* \left\{h_i(z, \bar{y}_i) - z^t Dv\right\} > 0, \quad \text{For all } (s, t^*, \bar{y}) \in k(z),$$

$(z, \mu, w, v) \in H(s, t^*, \bar{y})$.

**3. Definition**

Let $R^n$ be the n-dimensional Euclidean space and X and open set in $R^n$.

**Definition (3.1):** A functional $F: X \times X \times R^n \to R$ is said to be sublinear if $\forall x, \bar{x} \in X$

(i) $F(x, \bar{x}; a_1 + a_2) \le F(x, \bar{x}; a_1) + F(x, \bar{x}; a_2)\ \forall\, a_1, a_2 \in R^n$

(ii) $F(x, \bar{x}; \beta a) = \beta F(x, \bar{x}; a)\ \forall \beta \in R_+$ And $\forall a \in R^n$.

By (ii) it is clear that $F(x, \bar{x}, 0) = 0$.

**Definition (3.2)**

[8, 9] given an open set $x \subset R^n$, a number $\rho \in R$, and two functions $\alpha: X \times X \times \to R_+ \setminus \{0\}$ and $d\left(\cdot, \cdot\right) X \times X \to R$, a differentiable function $\zeta$ over x is said to be $(F, \alpha, \rho, d)$ - convex at $\bar{x}$, if for any $x \in X$, $F: X \times X \times \to R^n \to R$ is sublinear, and $\zeta$ (x) satisfies the following condition.

$$\zeta(x) - \zeta(\bar{x}) \ge F\left(x, \bar{x}; \alpha(x, \bar{x}) \nabla \zeta(\bar{x})\right) + \rho d^2(x, \bar{x})$$

**Definition (3.3)**

Given an open set $x \subset R^n$, a number $\rho \in R$, and two functions $\alpha: X \times X \times \to R_+ \setminus \{0\}$ and $d\left(\cdot, \cdot\right) X \times X \to R$, a differentiable function $\zeta$ over x is said to be $(F, \alpha, \rho, d)$ -Pseudo convex at $\bar{x}$, if for any $x \in X$, there exists a sublinear functional $F: X \times X \times R^n \to R$ such that $\mu(x) < \mu(\bar{x}) \Rightarrow F\left(x, \bar{x}; \alpha(x, \bar{x}) \nabla G(\bar{x})\right) - \rho^2 d^2(x, \bar{x})$

Further $\mu$ is said to be strictly $F(\alpha, \rho, d)$ -Pseudo convext at $\bar{x}$ if for any $x \in X$, there exists a sublinear functional $FiX \times X \times R^n \to R$

Such that

$F\left(x, \bar{x}; \alpha(x, \bar{x}) \nabla \zeta(\bar{x})\right) \ge -\rho d^2(x, \bar{x}) \Rightarrow \zeta(x) > \zeta(\bar{x})$.

**4. Necessary optimality condition**

If $x^*$ is a solution of problem $(FP)$. Assuming $z_{\bar{y}}(x^*)$ to be empty, there exist $(s, t^*, \bar{y}) \in k(x^*)$, $w, v \in R^n$ and $\mu^* \in R_+^p$ satisfying

$$\nabla\left(\frac{\sum_{i=1}^{s} t_i^*\left\{f(x^*, \bar{y}_i)+x^{*t}Bw\right\}+\sum_{j=1}^{p}\mu_j^* g_j(x^*)}{\sum_{i=1}^{s} t_i^*\left\{h(x^*, \bar{y}_i)-x^{*t}DV\right\}}\right)=0$$

$$\sum_{j=1}^{p}\mu_j^* g_j(x^*)=0$$

$$t_i^* \in R_+^s \ (i=1, 2, ..... s), \ \sum_{i=1}^{s} t_i^* = 1$$

$$w^t\ Bw \le 1, \quad (x^{*t}\ Bx^*)^{\frac{1}{2}} = x^{*t}\ Bw,$$

$$v^t\ Dv \le 1, \quad (x^{*t}\ Dx^*)^{\frac{1}{2}} = x^{*t}\ Dv$$

**5. Duality Theorems**

**5.1. Theorem (Weak Duality):** Suppose that x and $(z, \mu, v, w, s, t, \bar{y})$ are respectively the feasible solution for $(FP)$ and (D). Also assume that $\psi(\square)$ is $[F, \alpha, \rho, d]$-Pseudo Convex at z and the inequality $\frac{\rho}{\alpha(x, z)} \ge 0$. Holds, then

$$\sup_{y\in Y} \frac{f_i\ (x, y)+(x^t, Bx)^{\frac{1}{2}}}{h_i\ (x, y_i)-(x^*, Dx)^{\frac{1}{2}}} \ge \frac{\sum_{i=1}^{s} t_i^*\left\{f_i\ (z, \bar{y}_i)+z^tBw\right\}+\sum_{j=1}^{p}\mu_j g_j(z)}{\sum_{i=1}^{s} t_i^*\left\{h_i\ (z, \bar{y}_i)-z^tDV\right\}}$$

**Proof:** By means of a contradiction, suppose that

$$\sup_{y\in Y} \frac{f_i\ (x, y)+(x^t\ Bx)^{\frac{1}{2}}}{h_i\ (x, y)-(x^t\ Dx)^{\frac{1}{2}}} < \frac{\sum_{i=1}^{s} t_i\left\{f_i\ (z, \bar{y}_i)+z^tBw\right\}+\sum_{j=1}^{p}\mu_j g_j(z)}{\sum_{i=1}^{s} t_i\left\{h_i\ (z, \bar{y}_i)-z^tDv\right\}}$$

For $y \in Y$. If we replace y by $\bar{y}_i$ in the above in equality and sum up after multiplying by $t_i$, then we have

$$\left[\sum_{i=1}^{s} t_i\left\{f_i\ (x, \bar{y}_i)+(x^t\ Bx)^{\frac{1}{2}}\right\}\right]\left[\sum_{i=1}^{s} t_i\left\{h_i\ (z, \bar{y}_i)-z^tDv\right\}\right]$$

$$<\left[\sum_{i=1}^{s} t_i\left\{f_i\ (z, \bar{y}_i)+z^tBw\right\}+\sum_{j=1}^{p}\mu_j g_i(z)\right]\left[\sum_{i=1}^{s} t_i\left\{h_i\ (x, \bar{y}_i)-(x^t\ Dx)^{\frac{1}{2}}\right\}\right]$$

Using the generalized Schwartz inequality and (2.2.2) we get

$$\phi(x) \le \left[\sum_{i=1}^{s} t_i\left\{h_i\ (z, \bar{y}_i)-z^tDv\right\}\right]\left[\sum_{i=1}^{s} t_i\left\{f_i\ (x, \bar{y}_i)+(x^t\ Bx)^{\frac{1}{2}}+\sum_{j=1}^{p}\mu_j g_j(x)\right\}\right]$$

$$-\left[\sum_{i=1}^{s} t_i\left\{f_i\ (z, \bar{y}_i)+z^tBw\right\}+\sum_{j=1}^{p}\mu_j g_j(x)\right]\left[\sum_{i=1}^{s} t_i\left\{h_i\ (x, \bar{y}_i)-(x^t\ Dx)^{\frac{1}{2}}\right\}\right]$$

$$<\sum_{j=1}^{p}\mu_j g_j(x)\sum_{i=1}^{s} t_i\left\{h_i\ (z, \bar{y}_i)-z^tDv\right\}$$

Since $\sum_{i=1}^{s} t_i \left\{ h_i(z, \bar{y}_i) - z^t Dv \right\} > 0 \ \sum_{j=1}^{p} \mu_j g_j(x) \le 0,$

It follows that $\psi(x) < 0 = \psi(z)$

As $\psi$ (.) is $(F, \alpha, \rho, d)$ - Pseudo Convex at z. Therefore $F\left(x, z; \alpha(x, z)\nabla\psi(z)\right) < -\rho d^2(x, z),$ that is

$$F(x, z; \alpha(x, z)\left[\sum_{i=1}^{s} t_i \left\{ h_i(z, \bar{y}_i) - z^t Dv \right\}\right] \nabla \left[\sum_{i=1}^{s} t_i \left\{ f_i(z, \bar{y}_i) + z^t Bw + \sum_{j=1}^{p} \mu_j g_j(z) \right\}\right]$$

$$-\left[\sum_{i=1}^{s} t_i \left\{ f_i(z, \bar{y}_i) \times z^t Bw \right\} + \sum_{j=1}^{p} \mu_j g_j(z)\right] \nabla \left[\sum_{i=1}^{s} t_i \left\{ h_i(z, \bar{y}_i) - z^t Dv \right\}\right] < -\rho d^2(x, z)$$

On multiplying the above inequality by

$$\frac{1}{\alpha(x, z)\left[\sum_{i=1}^{s} t_i \left\{ h_i(z, \bar{y}_i) - z^t\, Dv \right\}\right]^2}$$ and using the sublinearity of F, we have

$$F(x, z; \nabla \left( \frac{\sum_{i=1}^{s} t_i \left\{ f_i(z, \bar{y}_i) + z^t\, Bw \right\} + \sum_{j=1}^{p} \mu_j g_j(z)}{\sum_{i=1}^{s} t_i \left\{ h_i(z, \bar{y}_i) - z^t\, Dv \right\}} \right) < \frac{-\rho d^2(x, z)}{\alpha(x, z)\left[\sum_{i=1}^{s} t_i \left\{ h_i(z, \bar{y}_i) - z^t\, Dv \right\}\right]^2}$$

Using the fact that $\frac{\rho}{\alpha(x, z)} \ge 0,$

We have

$$F\left( x, z; \nabla \left( \frac{\sum_{i=1}^{s} t_i \left\{ f_i(z, \bar{y}_i) + z^t\, Bw \right\} + \sum_{j=1}^{p} \mu_j g_j(z)}{\sum_{i=1}^{s} t_i \left\{ h_i(z, \bar{y}_i) - z^t\, Dv \right\}} \right) \right) < 0 \qquad (5.1.1)$$

In the right of (2.2.1) in equality (5.1.1) contradicts F(x, z; 0) =0.

**Theorem (5.2) (Strong Duality)**

Suppose that $\bar{x}$ is optimal for $(FP)$ and $\nabla g_j(\bar{x}),\ j \in J(\bar{x})$ is linearly independent. Then there exist $(\bar{s}, \bar{t}, \bar{y}^*) \in k(\bar{x})$ and $(\bar{x}, \bar{\mu}, \bar{v}, \bar{w}) \in H(\bar{s}, \bar{t}, \bar{y}^*)$ such that $(\bar{x}, \bar{\mu}, \bar{v}, \bar{w}, \bar{s}, \bar{t}, \bar{y}^*)$ is feasible for (D).

Further, if the weak duality (theorem 5.1) holds for all feasible $(z, \mu, v, w, s, t, \bar{y})$ of (D), then $(\bar{x}, \bar{\mu}, \bar{v}, \bar{w}, \bar{s}, \bar{t}, \bar{y}^*)$ is optimal for (D) and the two objectives have the same extreme values.

**Proof:** Since $\bar{x}$ is optimal for $(FP)$ and $\nabla g_j(\bar{x}),\ j \in J(\bar{x})$ is linearly independent. Then by necessary condition there exist $(\bar{s}, \bar{t}, \bar{y}^*) \in k(\bar{x})$ and $(\bar{x}, \bar{\mu}, \bar{v}, \bar{w}) \in H(\bar{s}, \bar{t}, \bar{y}^*)$ such that $(\bar{x}, \bar{\mu}, \bar{v}, \bar{w}, \bar{s}, \bar{t}, \bar{y}^*)$ is feasible for (D) and the two objective values are equal. The optimality of $(\bar{x}, \bar{\mu}, \bar{v}, \bar{w}, \bar{s}, \bar{t}, \bar{y}^*)$ for $(FP)$ thus follows from weak duality (Theorem 5.1).

**Theorem (5.3) (Strict Converse Duality)**

Let $\bar{x}$ and $(\bar{z}, \bar{\mu}, \bar{v}, \bar{w}, \bar{s}, \bar{t}, \bar{y}^*)$ be optimal solutions for $(FP)$ and (D) respectively. Also suppose that $\psi$ (.) is strictly $[F, \alpha, \rho, d]$-Pseudo Convex at $\sum$, for all $(\bar{s}, \bar{t}, \bar{y}^*) \in k(\bar{x})$, $(\bar{z}, \bar{\mu}, \bar{w}, \bar{v}) \in H(\bar{s}, \bar{t}, \bar{y}^*)$, and the inequality $\frac{\rho}{\alpha(x, z)} \ge 0$ holds, and $\nabla g_j(\bar{x}),\ j \in J(\bar{x})$ is linearly independent. Then $\bar{z} = \bar{x};$ that is, $\bar{z}$ is optimal for $(FP)$.

**Proof:** We shall assume that $\bar{z} \neq \bar{x};$ and exhibit a contradiction. Since $(\bar{z}, \bar{\mu}, \bar{v}, \bar{w}, \bar{s}, \bar{t}, \bar{y}^*)$ is feasible for (D), it follows that

$$\nabla\left(\frac{\sum_{i=1}^{\bar{s}} \bar{t}_i \left\{f_i(\bar{z}, \bar{y}_i^*) + \bar{z}^t B\bar{w}\right\} + \sum_{j=1}^{p} \bar{\mu}_j g_j(\bar{z})}{\sum_{i=1}^{s} \bar{t}_i \left\{h_i(\bar{z}, \bar{y}_i^*) - \bar{z}^t D\bar{v}\right\}}\right) = 0$$

The above inequality along with the sublinearity of F and $\frac{\rho}{\alpha(\bar{x}, \bar{z})} \geq 0$

$$F(\bar{x}, \bar{z}; \nabla\left[\frac{\sum_{i=1}^{\bar{s}} \bar{t}_i \left\{f_i(\bar{z}, \bar{y}_i^*) + \bar{z}^t B\bar{w}\right\} + \sum_{j=1}^{p} \bar{\mu}_j g_j(\bar{z})}{\sum_{i=1}^{\bar{s}} \bar{t}_i \left\{h_i(\bar{z}, \bar{y}_i^*) - \bar{z}^t D\bar{v}\right\}}\right] = 0$$

$$\geq \frac{-\rho d^2(\bar{x}, \bar{z})}{\alpha(\bar{x}, \bar{z})}$$

Which together with the sublinearity of F and $\alpha(\bar{x}, \bar{z}) > 0$ yields

$$F\left(\bar{x}, \bar{z}; \alpha(\bar{x}, \bar{z})\right) \nabla \left[\frac{\sum_{i=1}^{\bar{s}} \bar{t}_i \left\{f_i(\bar{z}, \bar{y}_i^*) + \bar{z}^t B\bar{w}\right\} + \sum_{j=1}^{p} \bar{\mu}_j g_j(\bar{z})}{\sum_{i=1}^{\bar{s}} \bar{t}_i \left\{h_i(\bar{z}, \bar{y}_i^*) - \bar{z}^t D\bar{v}\right\}}\right] \geq -\rho d^2(\bar{x}, \bar{z})$$

Using strict $[F, \alpha, \rho, d]$- Pseudo convexity of $\psi(.)$, we obtain $\psi(\bar{x}) > \psi(\bar{z})$

Since $\psi(\bar{z})$ =0, then we have $\psi(\bar{x}) > 0,$ that is

$$\left[\sum_{i=1}^{\bar{s}} \bar{t}_i \left\{h_i(\bar{z}, \bar{y}_i^*) - \bar{z}^t D\bar{v}\right\}\right] \left[\sum_{i=1}^{\bar{s}} \bar{t}_i \left\{f_i(\bar{x}, \bar{y}_i^*) + (\bar{x}^t B\bar{w})\right\} + \sum_{j=1}^{p} \bar{\mu}_j g_j(\bar{x})\right]$$

$$> \left[\sum_{i=1}^{\bar{s}} \bar{t}_i \left\{f_i(\bar{z}, \bar{y}_i^*) + \bar{z}^t B\bar{w}\right\} + \sum_{j=1}^{p} \bar{\mu}_j g_j(\bar{z})\right] \left[\sum_{i=1}^{\bar{s}} \bar{t}_i \left\{f_i(\bar{z}, \bar{y}_i^*) + (\bar{z}^t B\bar{w})\right\} + \sum_{j=1}^{p} \bar{\mu}_j g_j(\bar{z})\right]$$

$$\left[\sum_{i=1}^{\bar{s}} \bar{t}_i \left\{h_i(\bar{x}, \bar{y}_i^*) - (\bar{x}^t D\bar{v})\right\}\right] \qquad (5.3.1)$$

The relations (2.1), (2.2.2), (5.3.1) and

$\sum_{j=1}^{p} \bar{\mu}_j g_j(\bar{x}) \leq 0$ Imply

$$\sup_{y \in Y} \frac{f_i(\bar{x}, y) + (\bar{x}^t \bar{B}x)^{\frac{1}{2}}}{h_i(\bar{x}, y) - (\bar{x}^t D\bar{x})^{\frac{1}{2}}} > \frac{\sum_{i=1}^{\bar{s}} \bar{t}_i \left\{f_i(\bar{z}, \bar{y}_i^*) + \bar{z}^t B\bar{w}\right\} + \sum_{j=1}^{p} \mu_j g_j(\bar{z})}{\sum_{i=1}^{s} \bar{t}_i \left\{h_i(\bar{z}, \bar{y}_i^*) - \bar{z}^t D\bar{v}\right\}} \qquad (5.3.2)$$

Since $\bar{x}$ is optimal for $(FP)$ and $g_j(\bar{x}), j \in J(\bar{x})$ is linearly independent, by strong duality (Theorem 5.2), there exist $(\bar{s}, \bar{t}, \bar{y}^*) \in k(\bar{x})$ and $(\bar{x}, \bar{\mu}, \bar{v}, \bar{w}) \in H(\bar{s}, \bar{t}, \bar{y}^*)$ such that $(\bar{x}, \bar{\mu}, \bar{v}, \bar{w}, \bar{s}, \bar{t}, \bar{y}^*)$ turns to be an optimal solution of (D) and

$$\sup_{y\in Y} \frac{f_i(\bar{x}, y) + (\bar{x}^t \bar{B}x)^{\frac{1}{2}}}{h_i(\bar{x}, y) - (\bar{x}^t D\bar{x})^{\frac{1}{2}}} = \frac{\sum_{i=1}^{\bar{s}} \bar{t}_i \left\{f_i(\bar{z}, \bar{y}_i^*) + \bar{z}^t B\bar{w}\right\} + \sum_{j=1}^{p} \bar{\mu}_j g_j(\bar{z})}{\sum_{i=1}^{\bar{s}} \bar{t}_i \left\{h_i(\bar{z}, \bar{y}_i^*) - \bar{z}^t D\bar{v}\right\}}$$

Which contradicts the fact of (5.3.2). Hence $\bar{x} = \bar{z}$.

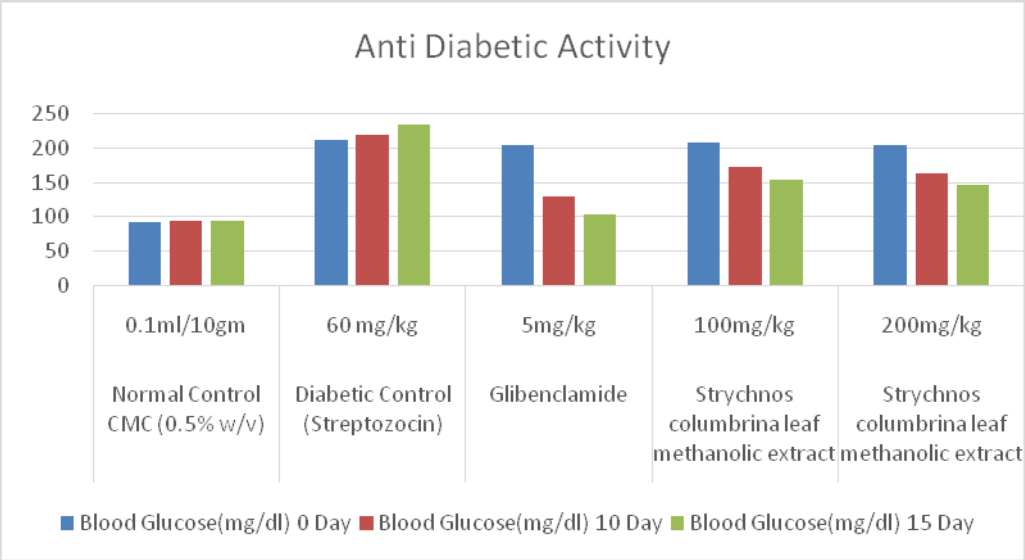
**ABSTRACT**

*Strychnos colubrina* L. belongs to family Loganiaceae was known as snake wood tree.The methanolic extracts from Strychnos colubrina L. leave collected from different provinces in Penchalakona of Nellore district were prepared by decoction and maceration with methanol and evaluated for their antidiabetic, diuretic and analgesic activities. Methanolic extracts from *Strychnos colubrina* L. leaves (SCM) were evaluated for anti diabetic effect in Streptozocin (STZ) induced diabetes in rats. The blood sugar levels were analysed as indices of diabetes. 200 mg/kg b.w. of the extract showed a greater reduction in blood glucose level which was comparable to glibenclamide. To find out diuretic efficacy, SCM of leaves were administered to experimental rats orally at doses of 100 and 200 mg/kg and compared with Furosemide (20 mg/kg,o.p) as the standard. The rats treated with SCM of leaves in a dose of 200 mg/kg shown near similar urine output and electrolytes excretion when compared to the respective control. The analgesic activity of SCM of leaves is estimated using tail flick in mice. Results demonstrated that SCM of leaves exhibited a potent dose-dependent analgesic activity in all tested models for analgesia. This report could be used for medicinal and pharmaceutical exploration in the future.

**Keywords:** Methanolic extract, snake wood tree, Streptozocin, glibenclamide, Furosemide, Lipschitz test, tail flick method.

## INTRODUCTION



Plants form the basis of various traditional medicines throughout the world. Phyto medicines derived from green plants have been used by about 65% of the world's population. All though there are many ways to control diseases because of their secondary complications, phytomedicines are preferred due to minimum side effects and easy usage and preparation. The use of medicines and food supplements derived from plant has been increased in recent years. Botanists, microbiologists, Ethno pharmacologists, and chemists are searching the earth for phytochemicals and drugs which could be used for the treatment of many stubborn infectious diseases in a green and natural way. Today we have more concern with lifestyle disease like depression, cancer and heart troubles caused by stress and faulty nutrition. Because these diseases have emotional components, there is a growing concern that English medicine is largely unable to cure them all but it offers a temporary relief from pain and disease symptoms. So there is an urgent need for alternative therapy, to cover a good health for all. Herbal therapy will be one of the practices to overcome the illness (Gupta,and Chime, 2000).Many traditional and local plants are used for the treatment of diabetes mellitus throughout the world (Marles and Fransworth, 1995). Ayurvedic medicines are called the elixirs of life and they have an important role in improving health and disease treatment from ancient days to this modern time. Plant medicines provide good means for the treatment of many diseases that are either absent or incurable in other systems of medicine. Herbal plants, which form the backbone of alternative medicine, have in the last few decades been the subject for very intense pharmacological studies; this has been brought by the agreement of the value of medicinal plants as an important source of new compounds of therapeutic values in the drug development. Due to these facts over the past twenty years, a considerable revival of interest in the use of herbal medicine in the world has come up.

Diabetes mellitus is a metabolic disorder initially characterized by a loss of glucose homeostasis with disturbances of carbohydrate, fat and protein metabolism resulting from defects in insulin action, insulin secretion, or both (Barcelo and Rajpathak, 2001). If the glucose level in the blood remains high over a long period of time, this can result in long-term damage to organs, such as the kidneys, nerves, heart, liver, eyes and blood vessels. Complications in some of these organs can lead

to death (Pari and Saravanan, 2004). Diuretics, also called water pills, are drugs used to increase the quantity of water and salt excreted from the body as urine. There are three types of prescription diuretics. They are often prescribed to help treat high blood pressure, but they are used for other conditions as well. These medicines, when used for longer periods, may show side effects. An analgesic is a medicine that takes away the physical pain but these medicines, when used on a long-term basis, will give bad impact on vital organs like kidneys etc.

In this research work, I have examined the unexplored properties of medicinal plant *Strychnos colubrina* scientifically for its antidiabetic, diuretic and analgesic activities. In spite of its extensive use in folk, ayurvedic, herbal and tribal medicine the above properties of leaves of *Strychnos colubrina L.* were not properly reported. Hence the present study has been taken for this analysis.Various plant parts of *Strychnos colubrina L.*are being used in the Indian Ayurvedic system for the cure of various diseases.In Ayurveda, it is called Kupilu-lataa, Kuchilaalataa. Whereas in Maharashtra the folklore name

is Kaajar-vel. In Malayalam, its common name is Vallikanjiram and Modirakanjiram.

This taxon is found in Western Peninsular India covering parts of Karnataka and Kerala; it is so farrecorded at penchalakona of Nellore district in Eastern PeninsularIndia. Theexistence of the plant also recorded in Chittoor District particularly at Brahmadevudigundam (Mamandur), Kambakkam hills, Ambakkam, Sadhumalammakona, (Madhava Chetty, *et al.*, 2011). First Red list of Medicinal plants of Andhra Pradesh, India – Conservation Assessment and Management planning is reported it as an Endangered Species in Andhra Pradesh, India[1]. Woody climbers; very bitter, with tendrils[2]. *Strychnos colubrina L.*Wood is also used for malarial fever and cutaneous eruptions and Rheumatism. The tribal people used the root of this plant for the snake bite. Fruit is used to prevent Mania. Leaves and roots are boiled in oil and applied to rheumatic swellings. Root is purgative, febrifugal, anthelmintic. The roots, wood, bark, and seeds contain alkaloids (bark wood), consisting of brucine and strychnine. Beta-sitosterol has been reported in the plant[3]. The Order exhibits febrifuge and tetanic properties. Itis very rich in alkaloids- brucine, bakankosine, curine, curarine, gelsemidine, gelsemine, gelseminine. gelsemoidine, koumine, kouminicint, kouminidine, kouminine, protucurarine, protocuridine, rrotocurine, sempervine, sempervirine, spigeline, struxine, strychnicine. Strychnine, tubocurarine. The presence of a glucoside, aesculin, has been recorded[3].

## MATERIALS AND METHODS

*Plant collection and identification*

The plant material (leaves) of *Strychnos colubrina L.* of family Loganiaceae, were collected from Penchalakona forest of the Eastern Ghats, Nellore district, Andhra Pradesh in July 2017. The plant was identified with the help of' The flora of Nellore district' and 'Flora of Madras'[4,5]. The leaves of *Strychnos colubrina L.* plant material were shade dried, powdered and stored in desiccators until further use. All the specimens at different leaf stages were documented in the form of herbarium sheets which have been deposited in the Herbarium, Department of Botany, Vikramasimhapuri University, P.G Centre, and Kavali, Andhra Pradesh, India.

The powdered material was then extracted using solvents methanol in the ratio 1:10 using Soxhlet apparatus. (Khan *et al.*, 1988). The solvent was evaporated under reduced pressure in the rotatory evaporator to get methanol extract. The components were separated to the solvents based on their polarity. The extract was subjected to the rotary evaporator at $40^{0C}$ to remove the excess solvent from the extract. After extracting all colouring material, the solvent was removed by evaporating in a water bath, which gave rise to a solid isolate of extract used for determining antidiabetic, diuretic and analgesic activities.

*Determination of the Ant diabetic activity of Strychnos colubrina methanolic(SCM) leaf extracts*

Healthy Wistar rats (150 to 200 gm) of either sex were selected. Before and during the experiment, rats were fed with the standard diet. After randomization into various groups and before initiation of the experiment; the rats were acclimatized for a period of 7 days under standard environmental conditions of temperature, relative humidity, and dark/light cycle. Blood samples were collected through tail vein puncture method at weekly intervals over a period of 28 days. Animals described as fasting, which were deprived of food and water for 18 hours.

Table 4: Maximum possible effects of drugs in tail flick model of analgesia in rats.

| S.No | Drugs | Dose | % Maximum possible effect in seconds | | |
|---|---|---|---|---|---|
| | | | 30 | 60 | 90 |
| 1 | Vehicle CMC (0.5%w/v) | 0.1ml/10gm | ----- | ---- | --- |
| 2 | Standard (Pentazocin) | 30mg/kg | 44.85 | 63.39 | 76 |
| 3 | *Strychnos colubrina* leaf methanolic extract | 100mg/kg | 9.25 | 15.87 | 23.22 |
| | | 200mg/kg | 19.16 | 26.79 | 50.63 |

After fasting, DM was induced by IP injection of Streptozocin (STZ) at a dose of 60 mg/Kg. The animals were given to drink 5% glucose solution overnight to overcome the drug-induced hypoglycemia. After 72 hrs, STZ-treated animals were treated as diabetic when the fasting blood glucose levels observed above 200 mg/dL with glucosuria[6]. Fasting blood glucose was measured by glucose oxidase-peroxidase (GOD-POD) method (Trinder, 1969) in mg/dl using a digital glucometer (Braun Omnitest REZ, Germany).

5 rats in each group which were as follows:

Group I: Normal control (saline).

Group II: Streptozocin treated control (60 mg/kg.ip).

Group III: Streptozocin (60 mg/kg) + Standard drug-Glibenclamide (5mg/kg, p.o).

Group IV: Streptozocin (60 mg/kg) + Test 1(100 mg/kg)

Group V: Streptozocin (60 mg/kg) + Test 1(200 mg/kg)

The vehicle, Test samples, and Glibenclamide were administered once daily for 15 days from the day of induction. Blood was drawn from the tail tip of rat and the blood glucose level was estimated on 0, $10^{th}$ and $15^{th}$ day of experiment with the help of glucometer using strip method.

*Determination of the Diuretic activity of Strychnos colubrina(SCM) leaf extracts*

The diuretic activity in Wistar rats was studied by the Lipschitz Test[7] (1943). The test is based on water and sodium excretion in test animals and compared to rats treated with a high dose of Furosemide.

Four groups of Wistar rats were used to evaluate the diuretic activity of methanolic extract of leaves of *Strychnos colubrina*(SCM)by using metabolic cages. The group I served as normal control given vehicle (CMC 0.5% w/v in normal saline), group II with Furosemide (20 mg/Kg, p.o), Groups III and IV with 100 mg/kg, 200 mg/ doses ofSCM respectively.Immediately after the treatment with the standard and test all the rats were hydrated with saline (15 ml/kg) and placed in the metabolic cage, specially designed to separate urine and feces and kept at 21°C±0.5°C.

Estimation of Urinary Electrolytes

Urine electrolytes (sodium, potassium, and chloride) were determined by Ion Selective Electrode method as described by the user manual of the biochemical kits (NRI Technologies, Malleswaram, Bengaluru)

5 rats in each group which were as follows:

Group I: Normal control (CMC 0.5% w/v in normal saline).

Group II: Furosemide (20 mg/kg, p.o).

Group III: Test 1(100 mg/kg)

Group IV: Test 1(200 mg/kg)

The total volume of urine collected after 24 hrs was measured at the end. During this time no water and food were given to rats. Different parameters like total urine volume and amount of sodium, potassium, and chloride in the urine were measured and calculated respectively. The ratio of Sodium to Potassium ions is also estimated.

*Determination of the Analgesic activity of Strychnoscolubrinamethanolic (SCM)leaf extracts:*

Analgesia was measured using a modified method of D. Amour and Smith[8] called as tail flick method using an analgesiometer. The tail flick method was commonly used to measure the analgesic activity. The tail flick method was utilized to study the analgesic activity in rats. A radiant heat automatic tail flick analgesiometer was used to measure reaction latencies. (Using tail flick analgesiometer type 812, UGO BASILE®, Germany). Animals were divided into four groups of 5 ratseach. Group, I served as normal control and received the vehicle (CMC 0.5% w/v in normal saline), where group IIwas injected by Pentazocin 30 mg/kg, i.p to act as a positive control. Group III and IV received SCM at doses 100 mg/kg and 200 mg/kg respectively. All drugs were injected intraperitoneally (i.p)30 min prior to the experiment. The pain was induced by giving radiant heat on the tail of the mice 5 cm away from the tip of the tail. Mice were held loosely during the test.Percentage of analgesia was calculated using the following formula:

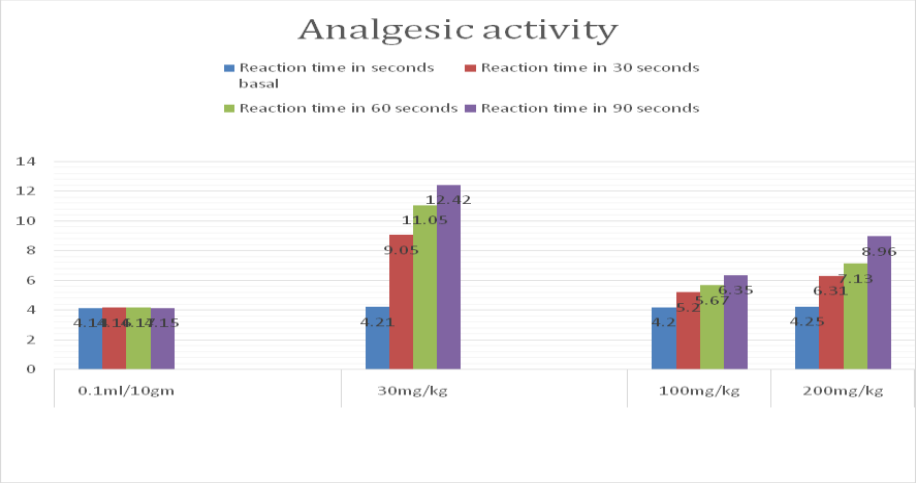
% Analgesia = MPE=TL-BL / ML-BL × 100

Where M.P.E. = Maximum possible effect, M.L. = Maximum latency or cut off time

T.L. = Test latency, B.L. = Basal latency or control latency

5 rats in each group which were as follows:

Group I: Normal control (CMC 0.5% w/v in normal saline)



Group II: Pentazocin (30 mg/kg, i.p)

Group III: Test 1(100 mg/kg)

Group IV: Test 1(200 mg/kg)

Reaction time was recorded as the interval time of exposing the tail to the light beam and the withdrawal of the tail. The latency period for responses was noted at various time intervals. The basal reaction time of animals to radiant heat was recorded by locating the tipm(Last 1-2 cm) of the tail on the radiant heat source. The tail removal from the radiant warmth was taken as an endpoint. The cutoff time of 15 seconds was used to avoid tail injury by radiation[9]. The latent period of the tail-flick response was determined at 30, 60 and 90 minutes after the administration of standard and test.

**RESULTS**

Graph 3: Showing Analgesic Activity.

*The effect of Strychnos colubrina methanolic (SCM) leaf extracts on blood Glucoselevel*

Administration of streptozotocin produced 229.6% increase in fasting blood glucose levels of diabetic control rats compared to the normal control rats and the increased glucose levels in group I rats was maintained over a period of four weeks. Administration of *Strychnos colubrina* methanolic (SCM) leaf extracts to streptozotocin-induced diabetic rats for four weeks produced a significant blood glucose reduction (Table 1). Change orreduction in blood glucose level was observed from the first week by both SCM extract and glibenclamide. At the end of 4th week, 100 mg/kg b.w. of extract produced 27.2% blood glucose reduction in group IV rats. Similar to group IV rats, there was a lowering of 29.2% blood glucose in the rats treated with 200 mg/kg b.w. of the extract. Among the two doses of the extracts used, 200 mg/kg b.w. of the extract showed a greater reduction in blood glucose level which was comparable to glibenclamide.

*The diuretic effect of Strychnos colubrina methanolic (SCM) leaf extracts*

In this model when compared to control group the *Strychnos colubrina* methanolic (SCM) leaf extractstreated groups at different dose levels (100and 200 mg/kg) was noted with a great increase in the urine volume and also profoundly increased the excretion of ions like Sodium, Potassium and Chloride in urine.100 mg/kg b.w. of extract produced 81.4% of total urine output, 92.4% sodium ions, 91.2% potassium ions and 59.3% chloride ions excreted in group III rats. Similarly in group IV rats, there was 89.9% of urine output,94.4% sodium ions, 95.3% potassium ions and 61.23% chloride ions excreted in the rats treated with 200 mg/kg b.w. of the extract. Among the two doses of the extracts used, 200 mg/kg b.w. of the extract showed a greater diuretic effect by pumping out more urine and ions which was comparable toFurosemide (standard).

*Analgesic effect of Strychnos colubrina methanolic (SCM) leaf extracts*

In tail flick test, SCM in a concentration-dependent manner, exhibited significant analgesic activity by increasing the latency time of responses in rats in the two tested doses 100mg/kg and 200 mg/kg, as can be seen in Table 3. In comparison to standard drug (Pentazocin)100 mg /kg of SCM produced 30% and 200 mg/kg of SCM produced 66% analgesic activity in tail flick examination. Between two tested samples, 200 mg/kg has shown more analgesic activity than the former one.Maximum possible effects of drugs in tail flick model of analgesia in rats is shown in table 4.

## DISCUSSION

The effect of two different doses of *Strychnos colubrine* methanolic (SCM) leaf extracts on the fasting blood glucose levels of diabetic rats is given in Table 1 and graph 1. In the diabetic rats, the methanolic extract at a dose of 200 mg/kg b.w. produced a 29.2% fall in the blood glucose levels at the end of the experimental period. The glibenclamide treated diabetic rats showed a greater reduction in the blood glucose level than the extract treated rats. Even though there was a reduction in blood glucose levels with 200 mg/kg b.w. of the extract, the decrease was much lower when compared to group III (glibenclamide) animals.

Analgesics are drugs that act on the central or peripheral nervous system to relieve pain selectively without altering consciousness[10]. Basically analgesics act by increasing the threshold for pain and changing the physiological response to pain.The analgesic activity of SCM was studied by the tail flick tests, which is a standard pharmacological model for the analysis of pain by natural products[11]. Tail flick method is used generally for centrally acting analgesics[12]. Results have shown that a single dose administration of standard Furosemide and *Strychnos colubrina* methanolic (SCM) leaf extracts significantly increased the urine output along with an increase in the elimination of Sodium, Potassium, and Chloride ions. *Strychnos colubrina* methanolic (SCM) leaf extracts of 200 mg/Kg produced a comparable diuretic activity with standard Furosemide.

## CONCLUSION

The present study demonstrates that *Strychnos colubrina* methanolic (SCM) leaf extracts act as a potent antidiabetic, diuretic, and analgesic agent. The analgesic activity may be due to its ability to activate opioid receptors in the central nervous system. It may also inhibit endogenous pain substances, which are involved in the peripheral analgesia. The results obtained here with support the folkloric claims regarding the plant and its medicinal values. This paper helps in formulating natural principles to combat drug resistance of certain. It is, therefore, implied the isolation and proper characterization of the active constituents from the extracts of this plant species as possible antidiabetic, diuretic and analgesic agent.Quantitative analysis of the active compound in *Strychnos colubrina L.* leaf extracts should be further studied in the nearest future. Hencethis report provides insight into the medical potential of the phytomedicine and for further research on these drugs.

**CONFLICTS OF INTEREST**

"**Bioplastics are the workhorse material** of the modern economy"

## ABSTRACT

Plasticsthat have been universally used in our daily lives are now causing serious environmental problems. Petroleum derived plastics dominate the packaging industry even today. It accounts for the largest usage of plastics worldwide and is used in numerous applications.Millions of tons of these non- degradable plastics accumulate in the environment each year. Bioplastics are a suitable alternative to petroleumbased plastics. They are highly complex and sophisticated materials that can help make plastic products more sustainable and eco-friendly. Bioplastics today are a large family of materials with differing properties and applications. The review is an attempt to investigate the facts about different types of bioplastics, their current status, major advantages and other related issues.

Key words: Bio-plastics, Petro-plastics, Sustainability

## INTRODUCTION:

Plastics have become a vital part of our life.The environmental crisis arising from the use of petroleum based non-degradable plastics led the globe to find alternatives. Biomaterial based plastic is one such alternative.They comprise bio-based materials featuring identical properties compared to their fossil-based versions as well as new materials featuring additional properties. These add-on qualities like biodegradabilityand bio-based property can reduce the impact on environment significantly.Moreover, the emission of greenhouse gases during production and degradation of bioplastics is very low when compared to conventional plastics.

## BIOPLASTICS: THE NOVEL MATERIALS

Bioplasticsare novel materials of 21st century and would be of great importance to the material world (Mohanty etal.,2002).The keen interest in bioplastics started way back in early 20th century when Henry Ford usedcorn and soybean oils to manufacture his automotive parts (Stevens E.S.,2003). Bioplastics are made from a number of renewable resources such as plant oils, cellulose, starches, sugars, carbohydrates, bacteria and algae. Bioplastics are not single substances; they comprise of a whole family of materials with differing properties and applications. According to European Bioplastics,a plastic material is defined as a bioplastic, if it is either bio-based orbiodegradableor features both the properties(Eu.Bio.,2016). Bioplastics are eco-friendly alternative to traditional plastics and are extracted from renewable resources like corn, sugarcane, cellulose, potato or starch. These are 100% degradable, equally resistant and versatile, already used in agriculture, textile industry, medicine and forpackaging.

## CLASSIFICATIONOF BIOPLASTICS:

The world of bioplastics has exploded, and there is an amazing breadth of materials that can be classified as bioplastics. The term bioplastic refers to several groups of plastics namely bio-based plastics(from renewable resources) and bio-degradable including compostable plastics.

### Biobased plastics

Biobased plastics are those that are derived from plant-based polymers, such as corn starch, sugarcane or cellulose, potatoes, rice, soy, wheat and vegetable oil and are not derived from petroleum resources.The Business-NGO (non-government organization) Working

Group for Safer Chemicals and Sustainable Materials defines bio-based bioplastics as "plastics in which 100% of the carbon is derived from renewable agricultural and forestry resources such as corn starch, soybean protein and cellulose" (Alvarezetal.,2011)

**Biodegradable bioplastics**

Biodegradable bioplastics are fully degraded by microorganisms without leaving any visible toxic remainders. The term "biodegradable" refers to materials that can disintegrate naturally into biogas and biomass (mostly carbon dioxide and water) as a result of being exposed to a microbial environment and humidity (Alvarezetal.,2011)

**Compostable bioplastics**

Compostable bioplastics will biodegrade in a compost site. Microorganisms break it down into carbon dioxide, water, inorganic compounds and biomass leaving no toxic residues.The most commonly used raw material is corn starch, which is converted into a polymer with similar properties to traditional polyethylene plastic products. Other compostable plastics available are made from potato starch, soya bean protein, cellulose as well as from petroleum and its bye products. This shows that compostable plastics may be derived from both plantbased and petroleumderived polymers.

**TYPES OF BIOPLASTICS**:

Bioplastics are currently used in disposable items like packaging, containers, straws, bags and bottles, and in non-disposable carpets, plastic piping, phone casings, 3-D printing, car insulation and medical implants.

**A. Starch based plastics**

Starch is the key raw material for bioplastics which is found in seeds and in tubers or roots of the plants. Most of the starch produced worldwide is derived from corn (Asaf,2008). Today, thermoplastic starch, accounting for about 50% to 80% of the global bioplastics market, is the most significant and widely used bioplastic.Applications of thermoplastic starch are bags, yogurt tubs, cups, plant pots, cutlery, diaper foil, coated paper and cardboard.

**Polylacticacid (PLA)**: Polylactic acid is the polymer with the highest potential for a commercial production as bioplastic.PLA is a 100% bio-based plastic that is currently being used in packaging applications.Polylactic acid, the secondmost important bioplastic of the world in regard to consumption in volume(Garima etal). It is derived from renewable resources like corn starch or sugar cane. PLA is biodegradable and suitable for the manufacture of compostable packaging products.

**ii.PSM (Plastarch Material)**: PSM is a biodegradable, thermoplastic resin. It is composed of starch combined with several other biodegradable materials. PSM is currently used for a wide variety of applications in the plastic market, such as food packaging and utensils, personal care items, plastic bags, temporary construction tubing, industrial foam packaging, industrial and agricultural film, window insulations, construction stakes, and in horticulture (GGP,2009-10)

**iii. MATER-BI** : MATER-BI is biodegradable and compostable bioplastic synthesized mainly by starches, cellulose, vegetable oils and their combinations. BIO BIG is the world"s largest brand of certified compostable bags and films made from Mater-BI (NOVAMONT)

**B. Cellulose based Bioplastics**: Produced using cellulose esters and cellulose derivatives.

**i.Cellophane:** Cellophane is made from cellulose which is biodegradable.Cellophane films can be coloured and are well known as candy wrappings. The biodegradable films are available in a wide range of grades, and they can be used to pack products ranging from cheese to coffee and chocolates (O.J.P.C.,2018).

**ii.Cellulose acetate**: Cellulose acetate is thermoplasticwhich is rather expensive and rarely used in packaging applications.

**iii.Polybutylene succinate (PBS):** Biodegradable, particularly used in packaging industry.Other applications include disposable products such as tableware or medical articles.

In agriculture, PBS finds interest in the fabrication of mulching films or delayed release of materials for pesticides and fertilizers.

**C. Microbial synthesis**:

**I.Poly hydroxybutyrate (PHB)**: Poly hydroxybutyrate (PHB) is biodegradable; used in a wide variety of fields including packaging, ropes, bank notes and car parts. PHB has potential applications in a wide variety of fields such as industrial, biomedical, agricultural, domestic, and automobile.

**ii.Polyhydroxyalkanoate (PHA): PHAs** are polyesters produced in nature by numerous microorganisms through bacterial fermentation of sugar or lipids (Jingnanetal,2009). They are biodegradable and are used in the production of bioplastics. PHA is often used for medical applications such as sutures, slings, bone plates and skin substitutes; it is also used for single-use food packaging.

**D. Synthesis from oils**:

**Polyamides 11:** PA11 a biopolymer derived from natural oil known by the trade name Rilson B commercialized by Arkoma. It is prized for its thermal resistance that makes it valued for use in car fuel lines, pneumatic air brake tubing, electrical anti-termite cable sheathing and oil and gas flexible pipes and control fluid umbilicals(Nifisaetal.,2015).It is non biodegradable.

**E. Other Biopolymers :**

**Polyethylene(PE):** Polyethylene (PE) is a bio-based polymer generally extracted from sugar used in carry bags, films and bottles.

**Polyethylene terephthalate(PET):** Polyethylene terephthalate (PET) is one of the major polymers produced worldwide representing about 18 % of world polymer production and comes in third after Polyethylene and Polypropylene. It is known for its use in beverage bottles.Coca Cola introduced Plant Bottle Technology where the PET had been made from bio-based mono-ethylene glycol from sugarcane and terephthalic acid from petrochemicals.

**Polyglycolic acid** (PGA): This is used in medicine and specialized applications.

**Polyhydroxyvalerate** (PHBV): Used for films and paper coatings, with possible markets including biomedical applications and veterinary science.

**Polyvinyl alcohol** (PHV): Used in packaging designed to dissolve in water to release products such as laundry detergent, pesticides, and hospital washables.

**Polycaprolactone(PCL)**: Biodegradable polyester, with low melting temperature and easily biodegradable. Widely used for mulch, seeding containers andbiomedical applications.

**Poly butyrate adipate terephthalate (PBAT)**: PBAT is a biodegradable and compostable biopolymerandis known for its flexibility and toughness which makes it ideal for combination with other biodegradable polymers that are brittlewith high modulus and strength.Widely used in garbage bags, wrapping films, disposable plastic products.

**Polyethylene furanoate(PEF)** PEF, a new polymer that is expected to enter the market in 2020. PEF is made entirely from vegetable raw materials and is also recyclable. It is considered to be the packaging material of the future, particularly for food and beverages.PEF finds applications in the packaging industry for fruit juices, milk, soft drinks, fresh tea or water.

**Bioplasticspackaging:** Bioplastic packaging is being used extensively in a wide array of industries including textiles, consumer goods , automotive and transport sectors.In 2018, global production capacities of bioplastics amounted to about 2.11 million tons with almost 65 percent of the volume destined for the packaging market,the biggest market segment within the bioplastics industry(Euro.Bio).There is a high demand for packaging made from bioplastics to be used for wrapping organic foods as well as for premium and branded products with a particular requirement. All types of bioplastics used in packaging offer one

overcome the environmental impact.Bio-PET and PLA are the major types of bioplastics
for packaging around the world.

**Advantages of Bioplastics:** Bioplastic is a much younger industry than conventional c
oil plastics. Bio-based plastics often shows good performance and a better environme
footprint when compared to conventional plastics. They have a less carbon footprint
helps to save resources and reduce crude oil dependency. Bioplastics can help the pla
industry and plastics consuming brands grow more sustainably. Bioplastics and
bioeconomy overall have the potential to unite the agricultural, chemical and indus
sectors. Bioplastics and bio-economy also help to create new jobs elsewhere both within
industry as well as in the entire value chain.

**Disadvantages of Bioplastics**:Although bioplastics show promising potential as
alternative to conventional plastics, it is equally important to consider their drawbacks. M
people believe that bioplastics are biodegradable. This is only partially true, as so
bioplastics are biodegradable while others are not (Grabianowski,2018). Surprisingly, m
bioplastics won't degrade at all, if placed in landfill with other garbage. Although bioplas
don't result in fossil-fuel emissions, they do require large amounts of fertilizers and pestici
(Grabianowski,2018). More over Bioplastics are basically designed to be composted,
recycled. Another drawback of bioplastics is their indistinguishability. To overcome th
users must be educated about bioplastics and proper recycling techniques to discern wh
bioplastics are biodegradable and which are compostable (Creative Mechanisms Staff, 201
Further, most bioplastics require high temperatures to degrade, and most cities lack t
infrastructure for proper bioplastic composting. As a result, many bioplastics end up in t
trash, are deprived of oxygen, and release harmful methane into the environment (Ch
2017).Waste collection and resource management needs to be standardized along with t
packaging industry to create some synchronized systems for waste to resource managemer
Bioplastics are often produced from genetically modified food crops such as corn, potatoe
and soybeans, a practice that carries a high risk of contaminating our food supply. Also, co
and soybean producers typically apply large amounts of chemical pesticides and fertilize
that pollute our air and water.

**Innovations in the field of Bioplastics continues –**

- Researchers around the world continue to develop greener varieties of Bioplastics th
can be more effectively reduce plastic pollution and the carbon footprint.
- More durable bioplastics are being designed for automotive,electronics and consume
goods such as Electrolux's new refrigerator made from corn and sugarcane bioplasti
material.
- Newer bioplastics are being made in laboratories from straw, wood chips and foo
waste.
- Bioplastics can be genetically engineered from Pseudomonas by the mutation of som
of the genes involved in the β-oxidation pathway.

**Conclusion:** Even though the production of bioplastics is costly, their applicationsare o
interest owing to the drawbacks of conventional plastics.Industrial progress in packaging
technology in future appears to be moving towards newer breed of bio-materials. The trend i
to maximize the production of bioplastics by enhancing the properties of bioplastics
producing microorganisms, plants and algae. It is clear that bioplastics can reduce many o
the environmental problems posed by the conventional plastics.

### ABSTRACT

Plastics are synthetic or semi-synthetic materials which are typically polymers of high molecular mass obtained from petroleum and natural gas. Bioplastic is the universal term for polymers made of renewable biomass sources. Bioplastics are an alternative to traditional plastics. As a consequence, bioplastic is biodegradable in about 180 days in opposition to traditional plastics, which remain in the environment for 500 to 1000 years. Bioplastics are made of different sources of biomass, such as corn or potato starch and cellulose. These substances are naturally produced by plants. Biodegradable plastics are the type of plastics that undergo decomposition over a period of time under composting conditions. The global biodegradable plastics market accounts for less than 1% of the overall plastics market, however, it is expected to grow at a fast pace over the next 5 years. Organic

**Abstract**

In the present study, the title compound 1,7-bis(4-bromophenyl)heptane-1,7-dione (BBPHD) was synthesized according to the procedure described in literature, and its solid state crystal structure was characterised by the single crystal x-ray diffraction study. The complete crystallographic information has been reported in the present work. Physicochemical characterization by various spectral tools such as FT-IR, FT-Raman, $^{1}$H-NMR, $^{13}$C-NMR and UV-visible, have been performed as well and these results have been correlated with the theoretical data. The ground state geometrical optimization of the title compound has been performed using the DFT/B3LYP/6-311++G(d,p) level of theory in gas phase. Extracted molecular structure obtained by x-ray difractometry has been used as the starting molecular structure for geometrical optimizations. Computationally obtained structural and geometric parameters are in good

agreement with the experimentally obtained values. The experimental FT-IR and FT-Raman spectral data were compared with the theoretical spectral data and the complete assignment of vibrational wave numbers has been done on the basis of potential energy distribution (PED). In addition, reactive properties have been addressed on the basis of frontier molecular orbital analysis, global chemical reactivity descriptors, natural bond order (NBO) analysis, nonlinear optical (NLO) properties, molecular electrostatic potential (MEP) and average local ionization energy (ALIE) surfaces. Molecular dynamics (MD) simulations have been used in order to study the influence of water to the title compound. The docked ligand forms a stable complex with feruloyl esterase inhibitor and could be considered as a lead compound for the development of new antioxidant drug.

**Key words:** DFT; Hirshfeld surfaces; ALIE; RDF; Molecular docking.

## 1. Introduction

Owing to their abundance in natural products and pharmacologically active compounds, the significance of halogenated compounds is increasing [1-3]. This class of molecules has been successfully applied for the development of paints, dyes, adhesives, flame retardants, imaging agents in medical diagnosis, hydraulic and heat transfer fluids, refrigerants, solvents and in materials science [4-6]. Halogenated aromatic organic substrates are of great importance for the organic chemistry transformations, especially in the area of cross-coupling chemical reactions [7]. Although the halogenation is frequently followed by toxic chemicals, this procedure is highly developed and frequently used. There are number of advantages when it comes to the employment of halogens for the development of new molecules. For example, the introduction of carbon-halogen bond increases the thermal and oxidative stability, which leads to the lower sensitivity towards the oxidation by the liver P450 detoxification [6]. The same group of authors also indicates that carbon halogen bond increases the biological membrane permeability. Halogenated compounds are especially important in the area of agriculture and halogenation proved to be an important tool for development of efficient agricultural products. Jeschke [8] reports the information that since 2010, 96%of launched agricultural products, including herbicides, fungicides, insecticides/acaricides and nematicides, are containing halogen atoms. Positive effects of halogen atoms and halogen-containing groups are owed to steric and electronic effects [9], polarity of carbon-halogen bond [10] and pKa values effects [8]. One of the most important parameters in terms of pharmacokinetics, molecular lipophilicity, turned out to be adjustable by the substitution with halogen atoms [11]. Recently, Chen et al. [12] reported specific

nematic liquid crystal (LC) whose synthesis is based on the title compound (BBPHD). Taking into account the importance of their work, and importance of BBPHD for the synthesis of some other new specific nematic liquid crystals, we have decided to study BBPHD in details by spectroscopic and computational approaches. Density functional theory (DFT) represents irreplaceable tool for performing efficient and inexpensive computational studies in many areas [13-16]. DFT calculations with the hybrid exchange correlation functional B3LYP (Becke's three parameter (B3) exchange in conjunction with the Lee-Yang-Parr's (LYP) correlation functional) are of particular significance for studying systems comprising of extensive electron conjugation and/or electron lone pairs [17-20]. These structures have been the subject of many experimental and theoretical studies, especially when it comes to understandings of their structure, molecular properties and reaction mechanisms. Computational molecular modelling based on DFT calculations has become practically indispensable tool for evaluation and prediction of various properties of molecules and structures [21, 22], while in this work DFT calculations have been used in order to address global and local reactivity descriptors, including frontier molecular orbitals, MEP and ALIE surfaces and Fukui functions. DFT calculations were also used for confirmation of spectroscopic characterization and elucidation of vibrational specificities. Natural bond orbital (NBO) analysis has also been performed. Because newly synthetized molecules such as BBPHD might find place in the new pharmaceutical products, it is quite possible that they might end up in different water resources [23-27]. The introduction of halogen atoms also increases the persistency of compounds in environment, and in the same time hardening their degradation. This motivated us to also computationally study the degradation properties by calculation of bond dissociation energies for hydrogen abstraction (H-BDE) and stability in water by molecular dynamics (MD) simulations, another very important component of molecular modelling. Solid state crystal structure of BBPHD is elucidated by the single crystal X-ray diffraction studies, while contribution and quantification of various intermolecular interactions in crystal structure has been determined by the Hirshfeld surface analysis.

## 2. Material and methods

### 2.1. General remarks

The synthesis of BBPHD was carried according to the procedure reported in paper by Chen et al. [12]. Colourless prism like suitable crystals used for the structure determination was obtained by slow evaporation of ethanol at ambient temperature. FT-IR spectrum (Fig.S1-

supporting information) of title compound was recorded using the KBr pellets in the range of 4000-600 $cm^{-1}$ region, with the ATR module ALPHA-T Bruker FT-IR spectrophotometer. FT-Raman spectrum (Fig.S2-supporting information) of the title compound was recorded by Bruker RFS 100/s (Germany) using the Nd:YAG laser source, excitation wavelength of 1064 nm and spectral resolution of 2 $cm^{-1}$. $^{1}H$ and $^{13}C$-NMR spectra of the title compound was recorded (in ppm) on Bruker 400MHz spectrometer in $CDCl_3$ as solvent and TMS as internal standard.

**2.2. Data Collection and refinement details**

A suitable prism like crystal was selected and mounted on a Bruker APEX-II CCD diffractometer using the graphite monochromated MoKa ($\lambda$ = 0.71073 Å) radiation and detector (CCD). The crystal was kept at 296(2) K during data collection. The structure was solved using the Olex2 software [28] employing the olex2.solve [29] structure solution program and using the Charge Flipping. The structure was refined with the ShelXL [30] refinement package using the Least Squares minimization. All of the non-hydrogen atoms were revealed in the first difference Fourier map itself and were refined anisotropically. All of the hydrogen atoms were positioned geometrically, with C-H = 0.96 Å for methyl H, C-H = 0.93 Å for aromatic H, and refined using the riding model with $U_{iso}(H) = 1.5U_{eq}(C)$ for methyl hydrogens and $U_{iso}(H) = 1.2U_{eq}(C)$ for aromatic hydrogens. The nitrogen bound hydrogen atom was located in a difference map and was refined isotropically with the bond length restraint of N-H = 0.86(2) Å. All of the geometrical calculations were carried out using the program PLATON [31] within the WinGXsuite [32]. The molecular and packing diagrams were generated using the MERCURY program [33].

**2.3. Computational details**

Molecular structure of BBPHD is extracted from the X-ray structure for computational studies. The molecular geometry optimization, vibrational analysis, frontier orbital analysis (HOMO-LUMO), MEP, surface analysis and Mullikan atomic charges were calculated at DFT/6-311G++(d,p)(5D, 7F) level using Gaussian 09 program package [34]. The assignment and PED analysis of wave number were performed by GaussView5.0 program [35] and GAR2PED software package [36]. For better agreement of calculated wavenumber numbers with experimental values, the wave numbers were scaled by the scaling factor of 0.9613 [37]. Schrödinger Materials Science Suite 2017-3 [38] was also used for computational study of global and local reactive properties of the newly synthetized BBPHD molecule. Particularly, Jaguar 9.7

program [39] has been used for DFT calculations, combined with Desmond program [40-43] for simulations based on molecular dynamics. Computational study based on DFT approach with SMSS has been also done with Becke-Lee, Parr i Yang (B3LYP) [44] exchange-correlation functional with 6-311++G(d,p), 6-31+G(d,p) and 6-311G(d,p) basis sets, in order to respectively obtain ALIE, Fukui functions and bond dissociation energies (BDE). Molecular dynamics simulation has been done with OPLS3 force field [40, 45-47], with simulation time of 10 ns, temperature of 300 K, pressure of 1.0325 bar and cut off radius of 12 Å. System was of isothermal–isobaric (NPT) ensemble class, while the simple point charge (SPC) solvent model [48] was chosen for the modelling of solvent properties. A single BBPHD molecule was placed into the cubic box with approximately 3000 water molecules. Analysis of electron density between atoms has been performed according to the works of Johnson et al. [49, 50], in order to identify formation of intra-molecular non-covalent interactions. Maestro GUI [51] was used for the preparation of input files and analysis of results when Schrödinger Materials Science Suite 2017-3 was employed.

### 2.4 Conformational Analysis

The solid structure of the title compound has been determined, by the X-ray diffraction spectroscopic technique, to be planar with $C_s$ symmetry, but it can be considered as near-$C_{2v}$ as well. Such configuration allows more efficient packing and facilitates the intermolecular interaction between the molecular layers. Very interestingly, the optimized strict $C_{2v}$ structure was verified to be a minimum with all computed frequencies being positive. The two carbonyl groups prefer to point away from the skeleton of the molecule to maintain up to a 6 kcal/mol more stable configuration than when one of them would eclipse any of the $CH_2$ units. Nevertheless, detailed conformational analysis revealed that other possible non-planar (*np*) forms can possibly exist, and their calculated energies are expected to be very comparable with the experimentally reported one. Understanding these conformations is of great importance, as the molecular structure in the crystalline packing could be sensitive to several parameters such as temperature and pressure. To explore the possible stable forms beside the one determined experimentally, detailed conformational analysis at the B3LYP/6-311++G(d,p) has been performed. The internal rotations about the C2-C3, C3-C4 and C5-C6 (Fig.S3-supporting information) were calculated and show three possible non-planar forms (*np*-1, *np*-2 and *np*-3, respectively) within a stability range of less than 1 kcal/mol compared to the $C_s$ form. The large-

amplitude rotation about these bonds exhibits a barrier in a range of 2-3 kcal/mol in the non-condensed phase, indicating the feasibility of the formation of other packing pattern when harsh conditions are applied.

### 2.5. Hirshfeld surfaces

We examined molecular surfaces, packing of molecules in their crystal structure, highlighting the contribution of significant inter molecular interactions between molecules that are responsible for the molecular arrangement in the crystalline state through Hirshfeld surface analysis. Hirshfeld surfaces [52-54] and the related 2D finger print plots (FP) [55-57] are unique for any crystal structure and provide a quantitative measure of the intermolecular interactions on the surface [52, 58]. The Hirshfeld surface analysis and finger print plots of BBPHD was generated by using Crystal Explorer 3.0 software [59] which accepts structure input file in the CIF format. The surfaces are mapped using a fixed colour scale red, white and blue, where red highlights contacts shorter than the sum of van der Waals (vdW) radii which is represented by negative sign values of $d_{norm}$, white for contacts around vdW separation with $d_{norm}$ values equal to zero, and blue for contacts longer than vdW sum with positive sign $d_{norm}$ values.

## 3. Result and discussions

### 3.1. Crystal structure analysis

The title compound crystallizes in orthorhombic space group *Abm2*, with the following unit cell parameters: $a$ = 7.1227(11) Å, $b$ = 42.536(4) Å, $c$ = 5.8126(6) Å and Z = 4. The molecule exhibits crystallographic inversion symmetry located at the C10 carbon atom and there is half-molecule in the asymmetric unit. The molecule is almost planar with root mean squared deviation of all atoms (excluding H-atoms) being 0.076Å. The crystal structure features C2-H2…$\pi_{aryl}$ and C5-H5…$\pi_{aryl}$ interactions, forming a three dimensional grid like architecture. The packing of molecules in the crystal lattice is shown in Fig.S4 (supporting information). The crystallographic data and refinement parameters are summarized in Table 1.

### 3.2. Hirshfeld surfaces

3D Hirshfeld surfaces and 2D finger print analysis illustrations of the title compound (BBPHD) are shown in Fig.5 (supporting information), where surfaces have been mapped over $d_{norm}$ and shape index -1.0-1.0 Å. A red spot close to the H2 hydrogen atom on the $d_{norm}$ surface and the centroid of the aromatic ring arises as a result of C2-H2…$\pi_{aryl}$ interactions present in the crystal. Similarly, a faint red spot close to H5 atom on the $d_{norm}$ surface is due to weak C5-

H5…$\pi_{aryl}$ interactions (Fig.S5a). The dark red spots close to the centroid of the two aromatic rings in the shape index is a result of the two C-H…$\pi_{aryl}$ interactions. The two C-H…$\pi_{aryl}$ interactions are mapped over the $d_{norm}$ surface to support the presence of these interactions (Fig. S5b). The relative contribution of different interactions to the Hirshfeld surface was calculated for BBPHD. It is evident from Fig.S5(c) that the H···H contacts account for about 34.7% of the total Hirshfeld surface area; the remaining contribution was mostly due to C···H (25.8%), O···H (12.4%), Br···H (15.0%), Br···Br (9.3%) interactions and only minor contribution from other interactions.

**3.3. Geometrical parameters**

In the present case the experimental C-C bond lengths are in the range of 1.4104-1.3785 Å and the calculated C-C bond lengths are in the range of 1.4057-1.3727 Å [60]. For the title compound, the C-Br bond length is 1.9237 Å (DFT) and 1.9055 Å (XRD), which is in agreement with the literature data [61]. The C=O bond length (1.1988) agrees with the reported literature values [60]. At C8 position, the bond angles (/DFTXRD) are C3-C8-C9 = 123.5/123.7°, C3-C8-Br1 =119.1/119.2° and C9-C8-Br1 = 117.3/117.1° and the asymmetry in angles is due to the electronegative bromine atom.

**3.4. IR and Raman spectra**

Table 2 contains the wavenumbers (calculated and observed) with vibrational assignments, while the atom labelling is provided in Fig.1. Phenyl rings at C5 and C27 are designated as PhI and PhII, respectively. The carbonyl stretching C=O vibrations [62-64] appear at 1668 $cm^{-1}$ (IR), 1680 $cm^{-1}$ (Raman) and theoretically at 1679 and 1678 $cm^{-1}$. The bands observed at 679, 662 $cm^{-1}$ (IR), 658, 551 $cm^{-1}$ (Raman) and at 678, 667, 553 $cm^{-1}$ (DFT) are assigned as C=O deformation modes [62]. The phenyl C-H stretching modes are assigned at 3081, 3062 $cm^{-1}$ (spectrum), 3079, 3059 $cm^{-1}$ (Raman) and in the range 3082-3064 $cm^{-1}$ based on DFT calculations [62, 65]. The ring stretching modes of the phenyl ring are assigned in the range 1558-1269 $cm^{-1}$ theoretically. The bands observed at 1570, 1530, 1450, 1374 $cm^{-1}$ (IR) and at 1565, 1279 $cm^{-1}$ (Raman) are assigned as the phenyl ring stretching modes. The band at 1042 $cm^{-1}$ (IR), 1042 $cm^{-1}$ (Raman) and 1040 $cm^{-1}$ (DFT) is assigned as the ring breathing mode of the para substituted phenyl ring [65], which is in agreement with the reported values at 1062 $cm^{-1}$ (IR) and 1061 $cm^{-1}$ (DFT) [66]. The in-plane and out-of-plane CH deformations are assigned theoretically in the range 1276-1087 $cm^{-1}$ and 965-788 $cm^{-1}$, respectively. Experimentally, these

modes are assigned at 1156, 1087 $cm^{-1}$ (IR), 1279, 1088 $cm^{-1}$ (Raman) and 963, 815, 801 $cm^{-1}$ (IR), 968, 818, 798 $cm^{-1}$ (Raman). The $CH_2$ stretching modes are assigned in the range 2965-2865 $cm^{-1}$ in IR spectrum, 2965-2877 $cm^{-1}$ in Raman spectrum and in the range of 2962-2873 $cm^{-1}$based on DFT calculations [62,67]. The $CH_2$ bending modes are observed in the ranges 1450-759 $cm^{-1}$ in the IR spectrum and 1440-738 $cm^{-1}$ in the Raman spectrum. According to the DFT calculations, these modes are in the range of 1453-706 $cm^{-1}$. The C-C stretching modes are assigned in the range 1173-780 $cm^{-1}$computationally. Bromine compounds [62] absorb strongly in the region of 635±85 $cm^{-1}$, due to the CBr stretching vibration and in the present case, bands at 615 $cm^{-1}$ (IR), 624 $cm^{-1}$ (Raman) and 616 $cm^{-1}$ (DFT) are assigned to this mode. Varghese et al. [68] reported the CBr stretching mode at 632 $cm^{-1}$ theoretically.

**3.5. NMR spectra analysis**

Chemical shift ($^{1}H$ and $^{13}C$) values of the investigated molecules have been computed with GIAO/B3LYP method [69] and compared with experimental values (Table S1-supporting information). The chemical shift values of $^{1}H$-NMR spectrum of title compound show two ranges; first one is consequence of the chemical shift of aliphatic C-H protons, which occurred in the range of 1.39-2.95/1.29-3.02 ppm (experimental/theoretical). The chemical shift of hydrogen atom attached to carbon near to the carbonyl group is higher than expected. H21, H22, H40 and H41 resonate at high frequency 2.95/3.02 (experimental/DFT), due to influence of carbonyl groups. Second one, around 7.60-7.81/7.69-8.06 (experimental/theoretical) ppm, occurred due to the aromatic protons. Chemical shift values of $^{13}C$-NMR for aromatic carbon atoms in general have values higher than 100 ppm [70,71]. Computational and experimental $^{13}C$ NMR values of carbon atoms of methylene groups of aliphatic chain are in good agreement as well: C17, C36 (24.02/27.40), C13 (28.97/32.69) and C20, C39 (38.37/42.69) ppm (experimental values/computational values). The chemical shift value at 199.26/205.26 ppm (experimental/computational) is assigned to the carbonyl carbon atoms C2 and C24. Signals observed in range of the 128.26-135.82/134.04-153.80 ppm (experimental/computational) correspond to carbon atoms of phenyl rings. From above result shows, the theoretical chemical shifts are good in agreement with experimental findings.

**3.6. Electronic properties and frontier molecular orbital analysis**

Chemical reactivity and kinetic stability of molecules depend upon the energy gap between HOMO and LUMO orbitals. These molecular orbitals are often known as frontier

molecular orbitals (FMOs). Based on the energy gap between frontier orbitals, molecules are frequently classified into soft and hard molecules. Energy gap between frontier orbitals is a critical parameter for prediction of the biological activity and transport properties. Frontier molecular orbitals have been visualized in Fig.S6 (supporting information). It can be seen that HOMO (MO109) is localized mainly at the carbonyl group and partially at the aliphatic chain, while LUMO (MO110) is localized mainly at the benzene ring and partially at the carbonyl group. Based on the HOMO to LUMO transitions, it can be concluded that the transfer of electron cloud occurs mainly from carbonyl group to benzene ring. In the present case, the calculated energy values of HOMO and LUMO are -7.20 eV and -2.16 eV, respectively and the energy gap between HOMO and LUMO is 5.04 eV. The higher the energy gap between HOMO-LUMO is, the harder the molecule is. In order to understand the chemical reactivity of title compound, global reactivity parameters were evaluated by DFT method. Single point calculation was carried out at DFT/6-311++G(d,p) level of theory. Vertical ionization potential (IP) and vertical electron affinity (EA) parameters have been calculated. These parameters were defined according to the following equations:

$$IP = E_{n-1(\text{cation})} - E_{N(\text{neutral})},$$

$$EA = E_{N(\text{neutrail})} - E_{N+1(\text{anion})},$$

where $E_{N+1(\text{anion})}$, $E_{N(\text{neutral})}$ and $E_{N-1(\text{cation})}$ are total energies of anion, neutral and cation forms of investigated molecule, respectively [72, 73]. These parameters were used in order to calculate the values of global reactivity descriptor, summarized in Table S2 of the Supplementary Materials. TD-DFT calculations have been performed at B3LYP/6-311++G(d,p) level of theory, while theoretical UV transitions have been characterized by vertical excitation energies, wavelength and oscillator strength. These results are summarized in Table S3 of the Supplementary Materials. The UV spectrum of the title compound (Fig.S7-supporting information) is characterized by electronic absorption band located at 268 nm, which is the consequence of the transitions: HOMO-1→LUMO and HOMO→LUMO+1(π-π transition).

### 3.7. Nonlinear optical properties

With regards to optoelectronic applications [74], the NLO active materials receive significant attention. Some of the properties that are important for optoelectronic applications can be obtained by DFT calculations and these include dipole moment, polarizability, first and

second hyperpolarizabilities. Respectively, these parameters have been calculated to be 4.102 Debye, $4.149\times10^{-23}$ esu, $6.227\times10^{-30}$ esu and $-71.736\times10^{-37}$ esu. It is interesting to notice that the first hyperpolarizability of the title compound is 31.98 times higher than in the case of urea, revealing possibility of the title compound to possess representative NLO properties, comparable with similar derivatives [75].

### 3.8. Molecular electrostatic potential

Analysis of charge distribution by mapping of MEP to the electron density surface is valuable approach in molecular modelling, when it comes to the biological recognition, hydrogen bonding interactions and visualization of reactive molecular sites [76, 77]. Optimized molecular structure was used for the generation of 3D MEP and 2D counter surfaces plots with rainbow colour scheme (electron reach regions are represented with red colour, while electron poor regions are represented with blue colour). For the title compound MEP took values from– 5.56a.u. (red) to 5.56a.u. (blue). MEP and surface analysis diagram of title compound, Fig.2, show that negative regions are mainly localized over oxygen atoms of the carbonyl groups, indicating the most sensitive sites towards the electrophilic attacks. On the other side, the maximal positive regions are localized over hydrogen atom of the aliphatic chain as well as phenyl rings, indicating sensitivity towards the nucleophilic attacks.

### 3.9. Natural Bond Orbital analysis

Natural bond orbital (NBO) calculations were performed using NBO 3.1 program [78] as incorporatedin the Gaussian09 package. In this case the DFT/SDD level of theory was used in order to understand various second-order interactions, principal interaction summarized in Tables S4 and S5 (supplementary materials). The strong intermolecular hyper conjugative interactions are: $C_2$-$C_5$ from $O_{16}$ of $n_2(O_{16}) \rightarrow \sigma^*(C_2\text{-}C_5)$ which increases the electron density 0.06345e that weakens the respective bond $C_2$-$C_5$ leading stabilization of 16.61 kJ/mol; $C_2$-$C_{20}$ from $O_{16}$ of $n_2(O_{16})\rightarrow\sigma^*(C_2\text{-}C_{20})$ which increases the electron density 0.05561e that weakens the respective bond $C_2$-$C_{20}$ leading stabilization of 17.56 kJ/mol; $C_{24}$-$C_{27}$ from $O_{35}$ of $n_2(O_{35})\rightarrow\sigma^*(C_{24}\text{-}C_{27})$ which increases the electron density 0.06345e that weakens the respective bond $C_{24}$-$C_{27}$ leading stabilization of 16.61 kJ/mol; and $C_{24}$-$C_{39}$ from $O_{35}$ of $n_2(O_{35})\rightarrow\sigma^*(C_{24}\text{-}C_{39})$ which increases the electron density 0.05561e that weakens the respective bond $C_{24}$-$C_{39}$ leading stabilization of 17.56 kJ/mol. The orbital with low occupation number are high energies are $n_2(O_{16})$, $n_2(O_{35})$ with energies -0.27360, -0.27360a.u. and considerable p-characters100,

99.99% and low occupation numbers 1.90859, 1.90859 while the orbital with high occupation numbers and low energies are: $n_1(O_{16})$, $n_1(O_{35})$ -0.68914, -0.68914a.u. and p-characters, 61.77, 61.77 and occupation numbers 1.97457, 1.97457. Thus, a very close to pure p-type lone pair orbital participates in the electron donation to the $\sigma^*(C_2\text{-}C_5)$ orbital for $n_2(O_{16}) \rightarrow \sigma^*(C_2\text{-}C_5)$, $\sigma^*(C_2\text{-}C_{20})$ orbital for $n_2(O_{16}) \rightarrow \sigma^*(C_2\text{-}C_{20})$, $\sigma^*(C_{24}\text{-}C_{27})$ orbital for $n_2(O_{35}) \rightarrow \sigma^*(C_{24}\text{-}C_{27})$, $\sigma^*(C_{24}\text{-}C_{39})$) orbital for $n_2(O_{35}) \rightarrow \sigma^*(C_{24}\text{-}C_{39})$ interactions in the title compound.

### 3.10. ALIE and MEP surface, Fukui functions and non-covalent interactions

Aside of the MEP surface, in this work ALIE values were mapped to the electron density surface in order to identify the molecule sites where electrons are least tightly bound. This enabled us to detect molecule sites that are the most sensitive towards the electrophilic attacks (Fig.3) [79-82]. The analysis of electron density between atoms revealed that the intra-molecular non-covalent interactions in the case of BBPHD molecule didn't form. The lowest ALIE values in the case of BBPHD molecule were calculated in the near vicinity of bromine atoms, with corresponding values of ~205 kcal/mol. On the other side, the highest ALIE values were calculated in the near vicinity of all hydrogen atoms with the corresponding values of ~342 kcal/mol. Additional insights into the local reactive properties of BBPHD molecule were obtained thanks to the calculation of Fukui functions, which are in the case of Jaguar program for DFT calculations obtained by the finite difference approach according to the following equations:

$$f^{+} = \frac{\left(\rho^{N+\delta}(r) - \rho^{N}(r)\right)}{\delta}, \qquad (1)$$

$$f^{-} = \frac{\left(\rho^{N-\delta}(r) - \rho^{N}(r)\right)}{\delta}, \qquad (2)$$

where $N$ represents the number of electrons in reference state of the molecule, while $\delta$ is fraction of electron which default value is set to be 0.01 [83]. After mapping of the values of the Fukui functions to the electron density surface the following corresponding surfaces have been obtained, Fig.4. In general Fukui functions track the changes in electron densities which are consequence of change in the overall charge of the observed molecule. The change in overall molecular charge influences the values of electron density at the molecular surface. By tracking of these changes in electron density, Fukui functions allow detection of molecule sites with electrophilic and nucleophilic properties. In this regard, purple colour for Fukui $f^{+}$ function in

Fig.4a is positive colour and indicates sites with increased electron density after the addition of charge. In Fig.4a it can be seen that blue-to-purple colour is located in the near vicinity of carbon atoms connected with oxygen atoms, which marks them as an electrophilic ones. On the other side, red colour for Fukui $f^-$ function is a negative colour and indicates sites with decreased electron density after the removal of charge. Inspection of Fig.4b indicates that the red colour is located in the central part of the molecule, marking this area as nucleophilic.

### 3.11. Sensitivity towards autoxidation and water

Taking into account the negative environmental impact of the pharmaceuticals, in this work we have also studied the sensitivity of BBPHD molecule towards the autoxidation mechanism [24, 84]. Oxidation mechanism represents one of the most important pathways for degradation of pharmaceuticals [85-88]. Thanks to the correlation between bond dissociation energies for hydrogen abstraction (H-BDE) and sensitivity towards the autoxidation mechanism, computational molecular modelling techniques can be used for determination of the molecule sites where degradation could start [89-95]. Fig.5 contains information about the H-BDE values. According to the results presented in Fig.5, for BBPHD molecule it can be concluded that it is highly stable towards the autoxidation mechanism, since there are no H-BDE values in the region between 70 and 90 kcal/mol [96, 97]. In the same time the lowest BDE value has been calculated for bromine atoms indicating that degradation could start by detaching of these atoms. Sensitivity towards water molecules was investigated by molecular dynamics simulation. The information on the obtained trajectories were used in order to calculate Radial Distribution Functions (RDF) for all atoms of the BBPHD molecule, with the goal to identify atoms with the most important interactions with water. RDFs were calculated with respect to the distance between the observed atom of the BBPHD molecule and oxygen atom of the water molecule. Representative RDFs have been presented in Fig.6. According to the results provided in Fig.6 it can be seen that BBPHD molecule has significant stability in water, as there are no hydrogen atoms with sharp g(r) curves located at distances below 2 Å. The highest g(r) value was calculated for bromine atoms, however their maximal g(r) values are located at distance of around 3.5 Å. On the other side, maximal g(r) values carbon atoms C16 and C35 are located at the distances lower than in case of the bromine atoms, but their maximal g(r) values are much lower. Maximal g(r) values of the carbon atoms C8 and C30 are somewhere between bromine

atoms at carbon atoms C16 and C35, however their peaks are located at high distances of over 4.5 Å.

### 3.12. Molecular docking

Based on the molecular structure, PASS (Prediction of Activity Spectra) [98] online tool for prediction of different types of activities has been applied. According to the results of PASS analysis, which have been summarized in Table 3, the title compound could serve as feruloyl esterase inhibitor, with probability to be active (Pa) value of 0.936. Antioxidants are necessary to control degenerative reactions produced by reactive oxygen and nitrogen species. These species are involved in several ailments including cancer and heart diseases. Several literatures suggest that heptane derivatives show promising antioxidant activities [99, 100]. Ferulic acid is the most abundant hydroxycinnamic acid in the plant world and is one of the most promising sources of antioxidants [101]. Feruloyl esterase is a class of enzymes used in biocatalysis for refinement of hydroxycinnamic acids. These compounds have shown to have antioxidant and antibacterial properties, FAEs and their hydrolytic or transesterification products are of great interest for various biotechnological applications, in particular as modified natural antioxidants or food flavour precursors [102].It prevents low-density lipoprotein from oxidation, exhibits inhibitory effects on tumour promotion [103] and protects against certain chronic diseases such as coronary heart disease and some cancers [104, 105]. Therefore the feruloyl esterase inhibitor is used as a target for docking study. High resolution crystal structure of feruloyl esterase inhibitor was downloaded from the RSCB protein data bank website with PDB ID: 1UWC. All molecular docking calculations were performed on Auto Dock-Vina software [106] and as reported in literature [74, 107]. The ligand binds at the active site of the substrate by weak non-covalent interactions and these interactions are depicted in Fig.S8 (supporting information). Amino acids forms strong hydrophobic interaction with the ligand. The docked ligand forms a stable complex with feruloyl esterase inhibitor (Fig.S9-supporting information) and got a binding affinity value of -5.7 kcal/mol (Table 4). Thus the title compound can be a lead compound for developing new antioxidant drug.

## 4. Conclusion

The title compound, 1,7-bis(4-bromophenyl)heptane-1,7-dione was characterized by single crystal XRD, FT-IR, FT-Raman as well as NMR spectroscopic studies. Within the framework of DFT, the vibrational wavenumbers are theoretically predicted and compared with

experimental wavenumbers. Conformation analysis shows that the two carbonyl groups prefer to point away from the skeleton of the molecule to maintain up to a 6 kcal/mol more stable configuration than when one of them would eclipse any of the $CH_2$ units. MEP plot showed that the negative regions are mainly localized over the oxygen atoms of the carbonyl groups while the maximal positive regions are localized over the hydrogen atom of the aliphatic chain as well as phenyl rings. The first hyperpolarizability of the title compound is 31.98 times that of urea. ALIE surfaces revealed that the near vicinity of bromine atoms could be the most sensitive parts of the BBPHD molecule in terms of electrophilic attacks. Additionally, Fukui functions revealed that the central part of BBPHD molecule could be considered as important reactive center when charge is added or removed. The values of H-BDE indicate that BBPHD molecule is highly stable towards the autoxidation mechanism, while the remaining BDE values indicate that degradation process might start with detaching of bromine atoms. Molecular dynamics study indicated that BBPHD molecule is highly stable in water as well, since there are no hydrogen atoms with significant interactions with water molecules. PASS analysis predicts feruloyl esterase inhibitor activity for the title compound and the docking studies suggest that the title compound can be a lead compound for developing new antioxidant drug.

[3]Department of Botany, Vikrama Simhapuri University, Kavali, Nellore Dt, Andhra Pradesh.

## ABSTRACT

Plastics are economical, light, sturdy, corrosion resistant materials. Synthetic polymers are being utilized extensively in both food and commercial industries.The most commonly used non-degradable solid waste is polythene which is a linear hydrocarbon polymers consisting of long chains of the ethylene monomers. At present the Polythene is playing an important role in packaging of goods, food, medicine and garbage. The extensive use of these plastics leading to their accumulation in nature has several undesirable effects on the environment and human wellbeing. Burning of this plastic waste and burying of the plastics releases harmful toxic material which is a major pollutant in environment. At room temperatures,most of the plastic polymers are found to be non-toxic. When they are heated, they release toxic materials into food stuffs and thus they cause serious disorders in human and his domestic animals. Several microbes have a potentiality to decay the plastic waste to a larger extent. Present study deals with the types of plastics and their applications and decaying efficiency of microbes. Biodegradable plastics are environment friendly; they have an expanding range of potential applications in various fields of human endeavor.

**Key words**: Biodegradation; Biodegradable Plastics; Microorganisms; Hydrocarbons; Pollution

## INTRODUCTION:

Roughly 250 million tones of synthetic polymersare produced worldwide each year. These polymers areextremely stable, and do not readily enter into the degradationcycles of the biosphere. Environmental pollution bysynthetic polymers, such as waste plastics and water-solublesynthetic polymers in wastewater has been recognizedas a biggest environmental threat. In order to support unrelenting sustainabledevelopment throughout the world, this problemmust be addressed.

This accumulation of plastic waste has been produced serious hazard to biological sustainability. The environmental concerns include air, water and soil pollution. The dispersal of urban and industrial wastes contaminates the soil. The soil contaminations are mainly made by human activities. Environmental pollution is caused by synthetic polymers, such as wastes of plastic and water-soluble synthetic polymers in wastewater.Many animals die of waste plastics either by being caught in the waste plastic traps or by swallowing the waste plastic debris to exert ruinous effects on the ecosystem. Some of the plastic products cause human health problems because they mimic human hormone. Vinyl chloride is classified by the International Agency for the Research on Cancer (IARC) as carcinogenic to humans. It has also shown to be a mammary carcinogen in animals. PVC is used in numerous consumer products, including adhesives, detergents, lubricating oils, solvents, automotive plastics, plastic clothing, personal care products (such as soap, shampoo, deodorants, fragrances, hair spray, nail polish) as well as toys and building materials. Styrene is classified by IARC as possibly carcinogenic to humans and is shown to cause mammary gland tumors in animal

Scanned with CamScanner

studies. It also acts as an endocrine disrupter. BPA has been linked with premature birth, intrauterine growth retardation, preeclampsia and still birth. It has also been noted that prolonged exposure to BPA shows a significant effect on the sex hormones (progesterone) in females. Burning plastics usually produce some noxious gases like furans and dioxins which are dangerous greenhouse gases and play an important role in ozone layer depletion. In fact, dioxins cause serious problems in the human endocrine hormone activity, thus becoming a major concern for the human health. Dioxins also cause very serious soil pollution, causing a great concern for scientific community worldwide. Phthalates and Bisphenol A are closely related in thyroid causing dysfunction in humans.

Polyethylene terephthalate (PET) is used in making Drink bottles, peanut butter jars, plastic films, microwavable packaging etc. Polylactic acid (PLA) is a biodegradable thermoplastic that can be converted into a variety of aliphatic polyesters derived from lactic acid. Polyetherimide (PEI) A high-temperature, chemically stable polymer. Phenolics (PF) or (phenol) is a high-modulus, relatively heat-resistant and excellent fire resistant polymer used for insulating parts in electrical fixtures, paper laminated product and thermally insulation foams.

In view of this, the biodegradation of plastics has been studied extensively for the past three decades. Some types of plastic have been shown to be biodegradable, and their degradation mechanisms have progressively become clearer. This paper reviews the recent advances in this area.

**Microbes with biodegradable nature:**

Bacteria like Bacillus megatserium, Pseudomonas sp., Azotobacter sp., Ralstonia eutropha, Halomonas sp, Bacillus brevis, Acidovorax delafieldii, Paenibacillus amyloticus, Bacillus pumilus, Bordetella petrii, Pseudomonas aeruginosa, Shewanella sp. are some examples of bioplastic degrading bacteria. In past years polyethylene degrading bacteria has been reported such as, Acinetobacter baumannii, Arthrobacter spp, Viscosus spp, Pseudomonas spp, Arthrobacter viscosus, Bacillus amyloliquefaciens, B. thuringiensis, B. mycoides, B. cereus, Staphylococcus, Pseudomonas stutzeri, Xylosus spp, Pseudomonas fluorescens, Rahnella aquatills, Micrococcus luteus, Lylae, Paenibacillus macerans, Flavobacterium spp, Delftia acidovorans, Ralstonia spp Rhodococcus erythropolis, Pseudomonas aeruginosa and Bacillus brevies etcThe microbial species are associated with the degrading materials were identified as bacterial genus like (Pseudomonas, Streptococcus, Staphylococcus, Micrococcus, Moraxella) .

The growth of many fungi can also cause small-scale swelling and bursting, as the fungi penetrate the polymer solids. In recent years fungal strains have been reported for p;astic degradation such as Aspergillus versicolar, Aspergillus flavus, Chaetomium spp Mucor circinellodies species etc. The polythene bags were degraded by some fungal species identified such as, Aspergillus niger, A. ornatus,nidulans, A. cremeus, A. flavus, A. candidus and A. glaucus were the predominant species. The microbial species are associated with the degrading materials were identified fungi (Aspergillus niger, Aspergillus glaucus), . Sanchez et al., has reported that the PCL-degrading fungi, Aspergillus sp is effective in biodegradation as plastics studies.

Many studies on fungal degradation of the bioplastic have also been performed including Paecilomyces lilacinus, Fusarium moniliforme, Aspergillus flavus, Thermoascus aurantiacus, Tritirachium album, Paecilomyces verrucosum and Aspergillus. On the other hand, polylactic acid (PLA) is subjected to degradation by only two genera of fungi

Scanned with CamScanner

(Penicillium roqueforti and Tritirachium album) reported that Aspergillus niger van Tieghem had the ability to degrade PVC. PHB and polyesters are degraded by many fungal genera such as Acremonium, Cladosporium, Debaryomyces, Emericellopsis, Eupenicillium, Fusarium, Mucor, Paecilomyces, Penicillium, Pullularia, Rhodosporidium, and Verticillium. Similarly, PCL is degraded by Aspergillus, Aureobasidium, Chaetomium, Cryptococcus, Fusarium, Rhizopus, Penicillium, and Thermoascus. PEA is degraded by Aspergillus, Aureobasidium, Penicillium, Pullularia. Fungus like Alternaria solani, Spicaria sp., Aspergillus terreus, Aspergillus fumigates, Aspergillus flavus were isolated from soil where plastic have been dumped. These caused significant weight loss in the PS PUR blocks in the shaken cultures, reaching up to 100% in case of the isolate Fusarium solani .

Several actinomycetes including Amycolatopsis sp, Amycolatopsis sp, Saccharothrix, Kibdelosporangium aridum, Actinomadura keratinilytica T16-1, Amycolatopsis thailandensis, Streptomyces bangladeshensis, and Streptomyces thermoviolaceus subsp were reported as bioplastic degraders. Cryptococcus sp, and Pseudozyma Antarctica were reported to be bioplastic-degradings yeasts.

## MATERIALS AND METHODS:

### Sample collection:

Soil samples were collected from different areas were brought to the laboratory,preserved under laboratory conditions for further use.Polythene samples of different densities such as 10 micronand 40 micron were purchased from local market.

### Isolation of bacteria:

### Serial dilution method:

1.0 gram of soil sample was transferred into a conical flaskhaving 99ml of sterile distilled water. The mixture wasshaken and serially diluted (Cappuccino and Sherman.,1996).

### Petriplate method:

Further the Isolation of microorganism were carried out byspreading the dilution and the polythene strips of 3×3cmwere cut and placed on the nutrient agar plates. After theincubation the growth of microorganism were seen on thepolythene strips.Screening of polythene degrading microorganismThis was carried out by zone of clearance method where the0.5 concentrations of PEG were used in minimal mediacontaining salts of ammonium and potassium and the zone ofclearance around the colonies were observed by stainingwith Coomassiee blue this indicate its capacity to utilizepolythene as C-source and degrade polythene (Sowmya etal., 2014)

### Characterization and identification of microorganism:

After screening the isolates were characterized by variousmorphological and biochemical test, according to Bergey'smanual of determinative bacteriology (Holt et al., 1994).

### Pre-treatment of polythene:

The polyethylene bags were cut into the small strips andtransferred to a fresh solution having 70 ml Tween 80, 10 mlbleach, and 983 ml distilled water and stirring for 30 to 60minutes (El-Shafei et al., 1998). Then the strips weretransferred onto a beaker with distilled water and stirred for1 hour. Further, they were aseptically placed in the ethanolsolution 70% v/v for 30

Scanned with CamScanner

min. Finally, the polyethylene stripswere transferred to a Petri dish and used to disinfect thepolyethylene.

**Degradation of Pre Treated Polythene:**

Initially weighed strips of 3×3-cm size of 10 and 40 micronpolythene were aseptically transferred to the conical flaskcontaining 50 ml of nutrient broth medium and inoculatedwith bacteria (0.5ml). Control was maintained with plasticdiscs in the microbe-free medium. Different flasks will bekept in a shaker for 10, 20, 30 and 40 days respectively.After the respective duration of shaking, the polythene stripswere collected, washed thoroughly using distilled water,shade-dried and then weighed for final weight andpercentage weight loss were calculated using below formula.(Usha, et al. 2011)

Weight loss % = Initial weight - Final weight/ Initial weightx 100

**RESULTS:**

Various bacteria and fungi were recovered from different areas.Areas selected were petrol pump, hospital and local area.Maximum Degradation percentage was observed during 20days intervals in case of Staphylococcus species which shows no degradation in 10 micron whereas 10% for40 micron polythene and in case of Bacillus species,degradation percentage for 10 micron polythene was13.3% and 5% for 40 micron respectively and minimumdegradation was shown by Bacillus species and Pseudomonas species.During 10 day's time interval maximum degradation for 10and 40 micron polythene was shown by Bacillus species.

**DISCUSSION:**

Microorganisms play a vital role in biological decompositionof materials, including synthetic polymers in naturalenvironments. In the depolymerization process two categoriesof enzymes are actively involved in biological degradationof polymers: extracellular and intracellular depolymerases(Gu et al., 2000). During degradation, exo-enzymes frommicroorganisms break down complex polymers yieldingsmaller molecules of short chains, e.g., oligomers, dimers, andmonomers, and are smaller that can pass the semipermeableouter membranes of the microbes, and thenutilized as carbon and energy sources (Frazer, 1994;Hamilton et al., 1995).In the current study, two types of polythenes were used forthe observing the degradation percentage and those werehigh density and low density polythene of 40 micron and 10micron respectively. The degradation percentage increaseswith increase in size of the polythene that is the minimumdegradation is seen in the case of 10 micron polythenefollowed by maximum degradation by 70 micron polythenealong with moderate degradation by 40 micron polythene.As per the study concern the types of polythene used was 10and 40 micron, so in this case the maximum degradation wasshown by 40 micron polythene where as 10 micron showedthe minimum degradation.

**CONCLUSION:**

Several recent surveys have been described the harmful effect of plastic waste on the terrestrial and aquatic ecosystems, and thus, it has became one of themost important environmental threat. To the get rid of such a menace, people usually put them in landfills or burn it, but both these practices cause very serious problems to the environment and the ecosystem. Some plastics are designed to be biodegradable and can be broken down in a controlled environment such as landfill. Biodegradation of waste plastic is an innovative are of research solving many environmental problems. This review discusses on the literature of

Scanned with CamScanner

microbes used for biodegradation of plastic waste. Most of the plastic wastes are degrade by the microorganisms. Based on these literatures available one could conclude that in order to enhance biodegradation of plastics waste the following approaches could be adopted as the biodegradation studies of plastics in dumped soil.This knowledge is useful for the moleculardesign of biodegradable polymers and for the molecularevolution and breeding of degradation enzymes andmicrobes. Our increased understanding will contributetowards the development of biotechnology for polymerwaste treatment.Many different strains of bacteria mostly Bacillus sp. and fungi are involved in the degradation of plastic and its hydrocarbons. The degradative action of microbes on the polymeric material and their breakdown to the non living substrate plays a promising role in eco-friendly management of toxic wastes and chemical pollution in future.

# USE PATTERN OF E-SODHSINDHU CONSORTIUM AMONG RESEARCH SCHOLARS AND STUDENTS OF SRI VENKATESWARA UNIVERSITY,TIRUPATI : A STUDY

(About Use of General E-Learning Resources)

**P. Vijay Mahesh Kumar,**
Librarian,
PRR & VS Govt College, Vidavaluru, SPSR Nellore
Email: vijaysimhapuri@gmail.com

**Dr.A.V. Kishore**
Assistant Professor,
Dept of Library & Information Science Dravadian University

**C. Kumari,**
Assistant Librarian,
Sri Venkateswara College of Engineering & Technology, Chittor.

**Abstract:** This paper explains about terms and definitions of Digital libraries, e resources in E-sodh sindhu followed by aims and objectives of E- Resources , Internet, Internet Users. . It also explains how remarkable change had occurred with advent of E- sodh sindhu with reference to both print and online e-Journals. It also explains about subscription, usage and ease of publishing the Journal in terms of Money and Time.

**Kewords :** INFLIBNET, Consortia, E-SodhSindhu, Repository, Networking, Digital Library, Higher Education, Digital Library Consortium, NLIST, INDEST –AICET Consortium, Digital India., Internet.

## 1.0 Introduction:

Role of librarians as custodian, book keeper, changed according to information scientist, knowledge manager, information officer with the advent of technological changes with refers to e- resources like e-books-Journals, databases, repositories. E-Shodh Sindhu: UGC -Infonet Digital Library Consortium recently changed to E –Shodh Sindhu consortium for Higher Education E -resources in order to provide quality e –resources to support learning and research activities covering full text, bibliographical and factual databases. This has emerged as a super gateway for university academic community in India providing access to expensive scholarly resources since 2004 at free of cost. The consortium initiated providing access to current and archival 15,000 e- journals and databases extending the benefit to 139 – State universities, 40 central universities, 22 – deemed universities, 15 law universities, 6 of IUCs of UGC, 72 – AICIT E funded colleges, 4000colleges and IITs, IIMs, IISc etc. Available in the E -Shodh Sindhu Collection 135000 E – Books, 40 Resources, 16 databases and15000+ Electronic resources.

## 2.0 Developmen of Digital Libraries

A Digital library is a special Library with a focused collection of digital objects that can including text, visuals, me trails, audio material, video tapes, storage as electronic media formats organizing, storing and retrieval of information in the library collection. The digital library content can be access remotely via computer networks, the academic institutions using digital libraries for institutional repositories and electronic resources for scholarly communication. Digital Libraries are searchable repositories of scientific material and their efficiency depends on progress achieved in information systems, the bibliometric approach to digital libraries are predicts that information system that does not rely on the core properties of the language will not be optimal.

## 3.0 Objectives of study :

A) To evaluate level of understanding regarding e-Sodh Sindhu among student, teaching, and research peer groups.
B) To understand purpose of usage on e-Sodh Sindhu

## 4.0 Review of Literature :

Arora, Jagdish (2003) found the efforts made by Indian libraries and institutions towards the formation of consortia of libraries for buying access to electronic resources. Cooperation amongst institutions for sharing their library resources has been practiced for decades. Consortia- based subscriptions" to journals everywhere in the world. Shared subscriptions to electronic resources through consortia of libraries is a feasible strategy to meet the pressures such as diminishing budgets, increased user demands, and rising costs of journals. The libraries and information Centers, with their d diminishing (or at best static) financial allocations, have to consider new ways to consolidate global resources in order to maximize their limited financial resources. Yi and others (2004) discussed the advantages of consortium acquisition and the s et up of local mirror sites as well as efficiency of the consortium acquisition for electronic resources based on the review and discussion it further makes detailed analysis on the necessity of the consortium acquisition and role of consortium acquisition on the library electronic resources development.Ali, Naushad (2005) examines the use of electronic information services among the users of IIT Library, Delhi. The study found that Boolean logic and truncation are the most often used search facilities by IIT users, lack of trained staff infrastructural facilities such as printers, terminals would discourage users from accessing e- resources and majority users facing difficulty while browsing. Dillion, LF, and Hahn, K (2002) In spring of 2001, a large -scale online survey was administered to the whole faculty and sample of graduate students at the university of Maryland. Email messages were sent to all the participants i.e. 3500 inviting them to fill out online survey. The response rate was 39 for the faculty member s. About half of the faculty

## 5.0 Methodology :

Survey method is employed to collect data from the user community on usage of E-Sodh sindhu by using structured questionnaire which is distributed to Teachers , students, and Research scholars of both Sri Venkateswara University and Sri Padmavathi University. Total of 100 questionnaire were distributed and 60 respondents we received. The questionnaire was distributed personally by visiting departments, hostels, library. The collected data 60 filled questionnaire were analyzed. The analyzed data were presented in the form of tables and graphs. A simple statistical technique percentage method is used to analyze the questionnaire.

## 6.0 Data Analysis and Interpretations:

## 7.0 Findings:

- More than half of respondents satisfied with the E-Sodhu Sindhu for their Academics
- Half of respondents not satisfy with the Internet speed In the library to freely access E-Sodhu Sindhu.
- Half of respondents satisfy with the E- Sodhu Sindhu as it useful in paper writing/ seminars.
- All most all respondents satisfy E-Sodhu Sindhu as it is useful in their research.

## 8.0 Suggestions :

- Conducting orientation programme on E-Sodhu Sindhu
- Conducting Workshops
- Conducting Seminars
- Conducting awareness programmes
- Conducting Training Programmes

# A Novel approach for Privacy Protection in Web Collaboration for Software Engineering using Component based Multi Attribute Restriction Model

V.Samatha[1], Lecturer in Computer Applications, PRR & VS Govt. College, Vidavalur, SPSR Nellore Dist., Andhra Pradesh.

Dr. M.V.Srinath[2], Sengamala Thayaar Educational Trust Women's College, Mannargudi, Tamil Nadu.

## Abstract

In a collaborative environment, not all the user has access to the entire resource present in the system. Each user has their own access to certain resources which is restricted according to their nature of job and their responsibilities. The user profile is one which represents the list of users and their access permissions. To restrict the users from accessing illegal resources is not permitted for them. By adapting the user profile based approach, the users can be restricted from accessing the illegal resource or component. The web based collaborative development has many issues and restricting multiple users in various aspects is still a challenging issue. To solve the problems in collaborative software development the novel approaches namely "Component Based Multi Attribute Restriction Model" has been proposed. The method maintains the software objects as components and maintains several user profiles. For each user, a list of components with attributes has been maintained. Based on the profile with requesting attributes, the model validates the user access. Based on identified attributes claimed and attributes given access, the method estimates the Component Access Measure (CAM). The estimated CAM value has been used to validate the client access in the collaborative environment. The method produces efficient results on web based collaborative model and improves the software development performance.

**Keyword:** Collaborative environment, Software development, Component Based Multi Attribute Restriction Model, User profiles.

## 1. Introduction

The collaborative environment is one which contains large number of users as the actors and each actor can perform different actions in the same resource which is shared between the users of the environment. In particular, the development work of the software development process can be performed by two different units of employees, so that an update or modification performed on any part of the development process should reflect on the original resource. This helps the organization to coordinate any process with the employees of its own but located in different part of the country or the world. In modern development system, each part of the system is considered as a component. The software is the collection of statements which can be executed by the computing device. Such statements have various parts and each part has its own dedicated job to perform. Such tiny tasks can be poured into a container which performs a single job as dedicated. In this way, there are number of components that are present in the software development system. The component has its own job to

be performed and it accesses various properties or methods of the system. Internally the component can invoke number of operations or components and each of them would access various properties of the system. In a collaborative environment, each user has their own access to certain resources which is restricted according to their job and responsibilities. The profile of the user is the one which represents the list of customers and their granted permissions. To avoid the users from access to illegal resources which are not permitted for them, the user profile based approach can be used. For example, if a programmer exists, then he/she can access certain components which perform certain computations but they cannot access certain components which performs modification of another component designs or system design which is allowed only for the designer of the system. By adapting the user profile based approach, the users can be restricted from accessing the illegal resource or component. The capacity to make effective, the collaborative environments is more crucial for network systems. The resources and abilities of a set of individuals permit the complicated issues and project to be finished. The present state of software system and network technology permits the cooperative method to increase further than the traditional environment. Collaborative Environments (CEs) square measure platforms and distributed software system which allows each and every individual and the cluster shared among them to perform in several parts, together with analysis, business and learning. Inside the CE, entity is categorized into different classes and different projects to complete the given tasks. Collaborative background suffers from a major issue which has to be self-addressed by providing security, privacy and management for entities those who use the background. Enabling certain secrecy in CEs needs the utilization of privacy strategy which permits individuals to stipulate however they need their confidential data to be utilized by others members. Some additional approaches are needed for the privacy strategy to be processed throughout the method. Since, it is a dynamic environment, when a single collaborator will amendment a specific role, action or with whom collaborating is taken place throughout runtime. Any protection system for CEs should be ready to decide and conclude when the scenario changes and what data to be shared between them.

## 2. Literature Review

There are number of approaches which has been proposed earlier for the restriction of users in the collaborative environment. This section discuss about various methods relate to the problem of access restriction in collaborative environment.

In recent years, large number of organizations have begun to collaborate in order to glean new insights and reach new markets so that they can gain competitive advantages which help them to generate revenue, or reduce operational and also the cost used for development. Computers and communication networks have created unprecedented opportunities to develop new integrated and sophisticated environments that make it possible for information sharing and resource exchange across boundaries of organizations. Proliferation of the Internet and web-based technologies such as Grid and Cloud computing also enables the development of large scale distributed applications and systems. Collaboration has become a daily routine. On the other hand, many environments used for collaboration can be victims of both malicious attacks and inadvertent damage. The number of reported cyber-attacks increased six fold in three years according to[1]. There are more than one lakh known viruses and worms. Every week, there are on average 200 new ones reported [2]. Not only their numbers are on the rise, but these attacks are also becoming increasingly sophisticated and severe. The number of large-scale attacks has also grown exponentially. Finally, these environments are vulnerable to insider attacks.

Allyson (2015) has shown that one of the major threats for distributed environments is unauthorized accesses by insiders. The problem of security is prominent in collaborative environments that span over multiple organizations [3]. It is estimated that the cost of PC viruses in businesses is approximately $50 billion in damages in the year 2003. 20,000 phishing complaints were reported in May 2006, when compared to the previous year 34% increase taken place, according to the US Department of Justice report. In the year of 2009

alone, hackers attacked 75% of enterprises worldwide [4]. Even FBI partners were attacked. According to Fox News, in 2010 a data breach cost organizations an average of $8.2 million, up 7% from the year before. The total costs of breach have grown every year since 2006. The average cost of one compromised record in 2010 is $214, a 5% increase from 2009. There is also a reported 39% increase of cyber-attacks on federal government in 2010[5]. The pervasion of these intrusions and attacks brings up a great deal of concerns on security and privacy when designing and using these environments. Cooperating parties must strive to maintain a balance between sharing resources while keeping safety and privacy.

Collaborative business environment based enforcing the contexts sensitive policies contain the elements which are tied to changing the contractual relationships for enforcing the access control policies to obtain from the external sources [6]. Collaborative virtual environment based path restricted parallel Q-learning algorithm[7] proposed a path restriction by Q-learning algorithm is to improve the effect of collaborative navigation control by constructing the exact distance between virtual environment based mobile agent and its destination of reinforcement learning into a status function.

Context Aware Method is used for controlling strategies, enabling the client to make use of the context of data. An upgrade of RBAC model was proposed by [8] with the apprehension of environment condition with the goal of providing security mindful applications [9]. Assets are likewise bound with situation data under which execution takes place [10]. A CBAC model may likewise hold distinctive shifting ranges for allowing asset utilization [11].

The proximity-based approaches are about restricting the users of collaborative environment according to the proximity value computed for any user. Ardagna et. al., (2006) is an improvement of the most well-known Location-based Access Control (LBAC), which itself is a unique instance of CBAC, where the condition is area [12]. In PBAC, access direction depends on the reach ability of the end client to particular resources for deciding access controls. Hasan (2013) discussed setting mindful security arrangement implementations in which he conveyed context mindfulness into security systems to let the approval of security procedure capably adjusted by the movements of setting information in this way giving dynamical, advanced and steady security setting[13].In Rodriguez et.al.,(2004) a critical representation is exhibited where healthcare workers are currently concentrated; they are continually hinting at change zone during their consistent work, which fuses passing by patients, discovering assets, for instance, restorative records or counseling with different authorities[14]. Kolter, pernul and kernchen [15] describes the solutions to provide the privacy protection for utilizing the two main elements and also explores the idea of collaborative privacy management for users in World Wide Web. The first parts have been tasked with giving experiences, feedback and rating is known as privacy community about the private policies of web service providers. This privacy community acts as the privacy architecture of central element [15].

## 3. Research Methodology

### 3.1 Component Based Multi Attribute Restriction Model:

The component based multi attribute restriction model as shown in Figure receives the user request and identifies the list of components and their attributes required to process the request. Then the method performs the behavior analysis of the user on accessing the various components. Based on the result of behavior analysis, the method performs multi attribute access restriction. The method has number of stages and each will be discussed in detail in this section.

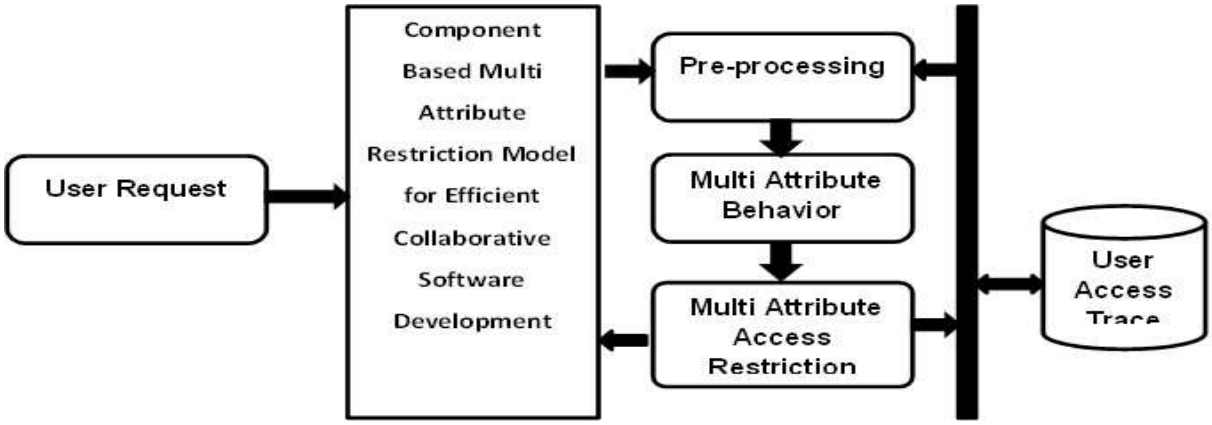

Figure.1 Architecture of Component based Multi- Attribute Restriction model

### 3.1.1 Pre-processing

The method maintains a large set of logs about the access performed by various users. Whenever a user access as the resource from the collaborative environment and a request is being processed at that time, the method monitors the list of properties or attributes that have been modified or accessed. Such information has been stored in the form of traces and at the preprocessing stage, with a request to access and collect, the method identifies the number of attributes the traces produced while accessing the same attributes. From the traces the method removes the incomplete one and using the rest the method splits each attribute access and their status.

**Algorithm**

Input: Access Trace At, User Request Ur

Output: Pre-processed Trace Pt

Step1: Start

Step2: Read user request Ur

Step 3: read access trace At.

Step 4: identify list of traces of user previous request Ur.

$$\text{Trace set Pt} = \sum_{i=1}^{size(At)} At(i).request == Ur$$

Step 5: for each trace Ti

If Ts(i) !t∈ $\sum Attributes(Ts)$ then

Remove the trace as incomplete.

Else

Leave the trace.

End

End

Step6: Stop.

### 3.1.2 Behaviors on collaborative environment

The users of the collaborative environment could perform various activities like read, write and delete. However not the entire user can perform such activities. They can be restricted in different levels according to various parameters. In this section we brief the list of actions the user can perform.

#### 3.1.2.1 Access Completeness

The user of the environment can access the resource according to his access control provided. Each user of the environment does not have access to all the resources. Each resource has different access permission towards different resources. However it cannot be sure that the legitimate user accesses the resource in genuine manner. For example, the user claims to read or modify the data present in the collaborative environment. In this behavior, the user completes the service access and finishes the service in success stage. This helps the service provider to maintain the public auditing. The user in the collaborative environment would perform any action on the service access and the service would navigate through number of actions and the user completes all the actions of the service access. This makes the service access as the complete one.
The Table 1 shows the details of service access with complete state and each access of the service has finished with complete states.

Table 1 Details of trace with complete state

| Service | State I | State II | State III | State IV | State V |
|---|---|---|---|---|---|
| S001 | C | C | C | C | C |
| S002 | C | C | C | C | C |
| S003 | C | C | C | C | C |

#### 3.1.2.2 Hanging Access

The hanging access is the problem of incomplete one and the user leaves the access in the middle. The service would have number of states in the access and the user starts the access and leaves in the middle itself. The user completes set of middle states and does not complete the remaining states. This makes the service access as incomplete one and questions the public auditing to be provided. The environment does not identify the state, which state the user has completed and in which it must be closed. The user would have crossed set of states and does not complete the remaining states of the service access.

The Table 2 shows the details of service access with hanging state and the service access S002, has finished with INC mode, which specifies the hanging state.

Table 2 Details of trace with hanging state

| Service | State I | State II | State III | State IV | State V |
|---|---|---|---|---|---|
| S001 | C | C | C | C | C |
| S002 | C | C | INC | - | - |
| S003 | C | C | C | C | C |

### 3.1.2.3 Incomplete Access

Even though there are number of states present in the service access the user completes the few states, but he may initialize another state and does not complete that one. This introduces the incomplete state in the service access. Such state is identified to produce the incomplete state trace.

The Table 3 shows the details of service access with incomplete state and the service access S002, has finished with IC mode, which specifies the incomplete state.

Table 3 Details of trace with incomplete state

| Service | State I | State II | State III | State IV | State V |
|---|---|---|---|---|---|
| S001 | C | C | C | C | C |
| S002 | C | C | IC | - | - |
| S003 | C | C | C | C | C |

### 3.1.3 Multi Attribute Behavioral Analysis

The problem of access control in a collaborative environment has been studied in various situations. A detailed study has been made of many methods. Still the methods suffer from poor performance in access control affecting the performance of the collaborative systems. The multi attribute behavior analysis model uses different attributes to compute the trustworthy of the user. The method receives the request from the user and identifies the set of all attributes being accessed to complete the process. Based on identified attributes, the method collects the traces produced by accessing the attributes. Using the traces available, the method performs behavioral analysis to computes the trustworthiness of accessing the same attributes and also others. Based on the trustworthy value, the access of the request is decided by this method. This technique improves the performance of the collaborative environment and that of the throughput also.

The multi attribute behavior analysis model maintains traces of the access of various uses of the collaborative environment. The method monitors the behavior of users of the environment and generates patterns of access at each time window. The method computes the trust weight for the user on that basis on the request the use of restricts the user and control over malicious access. Using the result of pre-processing, the method computes the trust factor for each attribute on the basis of the previous trace. The method computes the trust factor on each attribute on the basis of the user's behavior represented by the access trace and based on the completeness of the access and how genuine the user has accessed the attributes in earlier days. Based on multi attribute trust factor the method computes trustworthy measure called CAM to decide the access control for the user.

**Algorithm**

Input: Pre-processed Trace Ts

Output: CAM

Step1: start

Step2: read preprocessed trace Ts

Step 3: identify list of all attributes of the access

Attribute set As = $\sum_{i=1}^{size(Ts)} Ts(i).Attribute! \in As$

Step 4: for each attribute Ai

Compute number of access Na = $\sum_{i=1}^{size(Ts)} Ts(i).Attribute == Ai$

Compute number of successful access Nsa = $\sum_{i=1}^{size(Ts)} Ts(i).Attribute == Ai \&\& Status == Success$

Compute trust factor Tf = $\frac{Nsa}{Na} \times size(Ts)$

End

Step 5 : compute cumulative access measure CAM = $\frac{\sum Tf}{Numberofattributes}$

Step 6: stop

The above discussed algorithm computes the trust factor for each attribute and based on them the cumulative access measure is computed.

### 3.1.4 Multi Attribute Access restriction

At this stage, the method first performs preprocessing using the input user request and the user access trace. Then the method performs the multi attribute behavior analysis using the preprocessed trace. Based on computed trust factor and the cumulative access measure the method performs access restriction.

**Algorithm**

Input: User Request Ur

Output: Boolean

Step1: start

Step2: read user request Ur.

Step 3: perform preprocessing

Step 4: cumulative access measure CAM = perform multi attribute behavior analysis

Step 5: if CAM >TTh //trust threshold

Allow access

Else

Deny the request.

End

Step 6: stop.

The above discussed algorithm computes the access trust measure and cumulative access measure from behavior analysis. Based on the trust measure the method performs the access restriction.

## 4. Results and Discussion

The proposed work was implemented in two stages, viz, multi attribute behavior analysis approach and component based multi access restriction approach. The comparison is carried out with existing algorithms. The proposed multi attribute behavior analysis approach has been executed and assessed for proficiency. The technique produces proficient outcomes in every one of the elements of the nature of the administration in synergistic condition. The strategy has been tried and assessed utilizing different reproduction parameters. The component based multi-level access restriction approach has been executed and assessed for productivity. The technique produces effective outcomes in every one of the variables of nature of administration in community oriented condition.

### 4.1 Comparison of CBAR with RBAC and MABA using Security Efficiency

An evaluation of security efficiency generated by various methods and it depicts clearly that the stated approach has obtained higher efficiency related to other approaches is shown in figure.2.

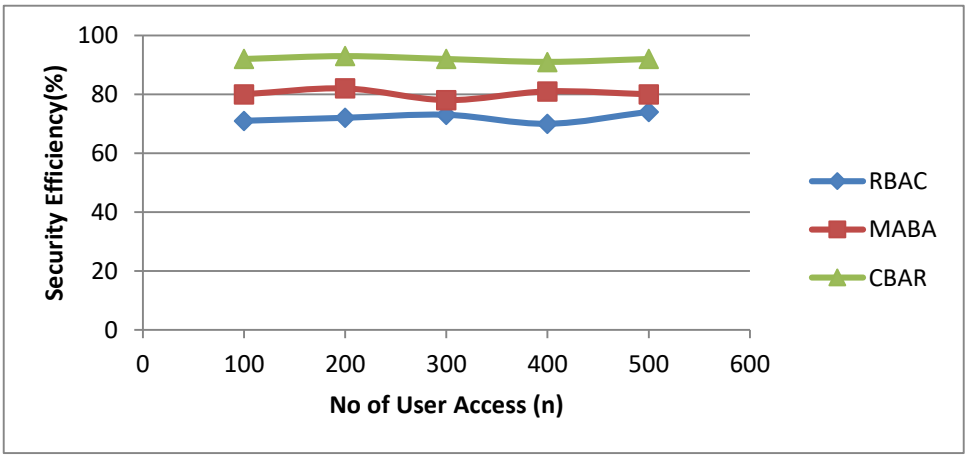

Figure.2 Comparison of security efficiency

### 4.2 Comparison of CBAR with MABA and RBAC using Fault classification Ratio

The evaluation results of false classification ratio generated by various methods and it depicts clearly that the stated approach has obtains a smaller false classification ratio related to other approaches is shown in figure.3.

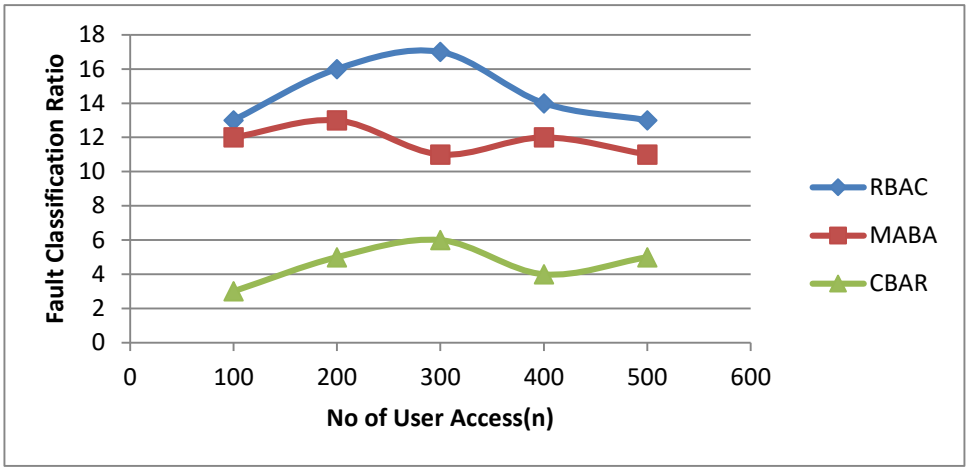

Figure 3 Comparison of false classification ratio

### 4.3 Comparison of CBAR with MABA and RBAC using Query Execution Time

The evaluation of time complexity generated by various methods and the stated approach has obtained less time compared to other approaches is shown in figure.4.

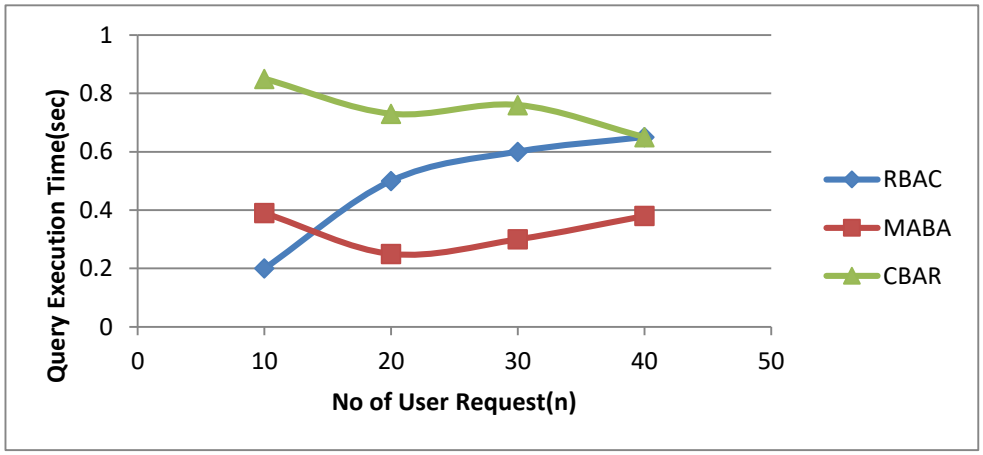

Figure.4 Comparison of Query Execution Time

### 4.4 Comparison of CBAR with MABA and RBAC using Client Hit Ratio

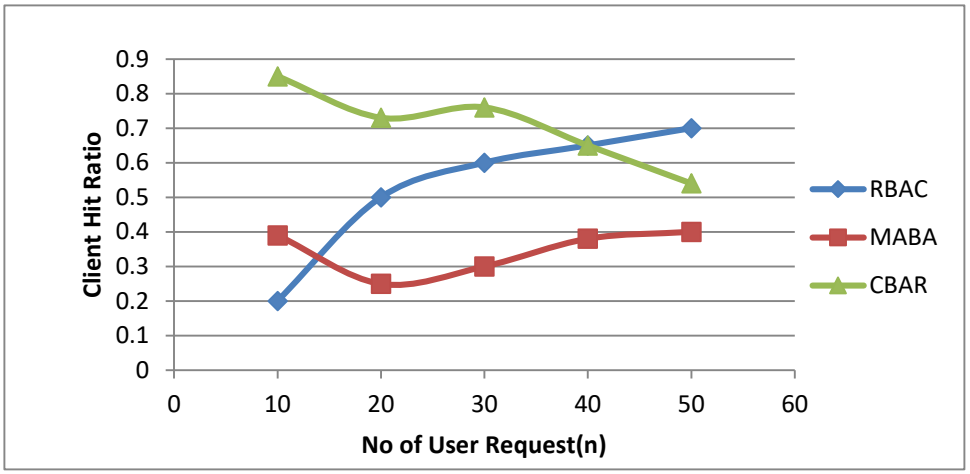

Figure 5 Comparison of Client Hit Ratio

The evaluation of hit ratio generated by various methods and the stated approach has obtained higher hit ratio compared to other approaches is shown in figure.5.

## 5. Conclusion

In this work, the researcher has proposed a novel Component based Multi- Attribute Restriction model for improvement of the security in a collaborative environment and the quality of service. The method preprocesses the previous traces to eliminate the noisy data traces. The method first receives the request from the user and identifies the component being claimed. Later the method detects the list of attributes being required. Then the method collects the traces being accessed on the attributes. Each trace has been validated for its completeness and noisy records have been removed from the trace. Then the method performs the multi attribute behavior analysis to compute the trust factor. On the basis of trust factor the method compute the cumulative access measure. The computed trust factor and the access measure have been used to restrict the user from accessing the component maliciously. The method has produces efficient results on access restriction and increases the throughput performance.

**ABSTRACT**

The collaborative environment (CE) is one which contains large number of users as actors and each actor can perform different actions in the same resource which is shared. All the users do not have access to the entire resource present in the collaborative system, to restrict data tampering, misuse and illicit use. It is a major problem to provide privacy protection and control for the individuals who use the environment. Ensuring privacy in CEs requires the use of privacy policies which allow individuals to outline how they wish their private information to be used by others. Number of approaches have been proposed earlier for the restriction of users in the collaborative environment. In this paper, we discuss the efficacy of Multi Attribute behavior Analysis Based Restriction as a privacy protection tool in collaborative environment.

## INTRODUCTION:

Collaborative environment has become the back bone for modern information technology sector which supports various activities of the IT sector to be performed in different locations without contradicting location dependency. In a software development system, a number of components are present, performing different tasks. Collaborative environment includes a number of users who have differential access to the resources being used for development of a particular software/program. To protect privacy and operate securely, users are often restricted by user profile based approach. Collaborative Environments (CEs) are distributed software applications and platforms that support both individual and group shared work in many areas, including research, business and learning (Q. Li, M. Abel, J. Barthčs, 2014). Privacy protection is a considerable problem in CEs, and any privacy protection system for CEs must be able to determine and infer how information should be shared as the situation changes.

## ATTEMPTS AT PRIVACY PROTECTION FOR CEs:

Management of personally identifaiable information (PII) and the challenges involved are studied well. An agent-based prototype is described to support automated enterprise management of PII (Korba et.al., 2007). Several data mining techniques are combined to achieve the life cycle of private data, including individual data discovery, social network analysis, knowledge visualization, and effective human-computer interaction. The developed prototype can automate the management of PII within an organization by collecting, analyzing and applying security policies on that PII. One drawback of this approach is that it has the potential to actively monitor and analyze all user activity and behaviours within a collaborative environment. This monitoring can cause concerns among the users of the prototype. The work by Korba et al., (2007) is concerned with the discovery of PII through data mining, the collection of the discovered PII and the management of the collected PII. This differs from the collaborative privacy architecture which does not collect and analyze personal information. As well, while the work by Korba et. al., (2007) discusses the use of privacy policies, it does not detail what these privacy policies should look like.

Kanovich, Rowe and Scedrov (2007) propose an abstract formal model of collaboration which addresses privacy concerns. A state transition system is used to model private data through the use of a syntactic convention on a predicate symbol. The goal of this model is to describe how to generate a collaborative plan by providing some privacy guarantees to the participants. The created concerted plan is a sequence of transitions which will transform the environment from an initial state into a specific goal state. The work by Kanovich, Rowe and Scedrov (2007) has a different definition of privacy. The authors equate privacy with secrecy and are focused on developing a proper balance between the protection and release of information and resources (2007). This differs from the approach to privacy, as privacy is not considered to be just the isolation of private information. Instead, privacy includes the ability to understand how information is being used, why it is being used, and to have some influence over these decisions.

Burnap et. al., (2012) describe a method of using "sticky policies" to retain access control even after information has been moved to an autonomous computer system outside the control of the information owner. This ability is achieved by attaching a privacy policy alongside the private information, while at the same time distributing the access control elements. By attaching the policy with the information, the information gatherer will always have access to the access control document they must check against. Similarly, distributing the access control elements allows both the information collector and the information owner to access the policy decision maker even from different environments. This access will let for the information collector to check their access rights and will allow the information owner to change the access rights (Burnap et. al., 2012). The idea of being able to retain a measure of control over information that has been released into a collaborative environment is an important one.

This approach by Burnap et. al., (2012). shows one technical method to how this could be accomplished. This work differs from the architecture as the access control available through sticky policies only permit access based on roles, and does not take into consideration how an individual may be using the information.

Malik and Dustdar (2011) describe a method for sharing private information in a collaborative working scenario through an expansion to the RBAC NIST standard (2014) The scenarios considered by the authors of this work are similar to the situation, where overlapping teams work to complete shared tasks. In the approach taken by Malik and Dustdar, five main data elements are identified: enterprise, team, task, role and user (Malik and Dustdar, 2011). The use of a task element differs from the approach, which instead considers projects. Malik and Dustdar do not formally describe their privacy policy. However, Malik and Dustdar do identify some privacy requirements that are similar to the privacy rules introduced. The work by Malik and Dustdar is complementary, as they describe issues related to access control, considers information usage and provides extended features through the CPM.

Flight planning in the future collaborative environment (Stéphane Mondoloni, 2015) focused on obtaining using feedback, data sharing and simulation. Enforcing Context-Sensitive Policies in Collaborative Business Environments (Alberto Sardinha, Jinghai Rao, & Norman Sadeh 2007) includes enforcing access control policies whose elements are tied to changing contractual relationships or to information obtained from external sources (e.g. ratings, credit worthiness, export restrictions, etc.). Path-Restricted Parallel Q-Learning Algorithm in Collaborative Virtual

Environment (Zhigang Wang and Li Xiao, 2007) proposed to improve the application effect of the collaborative navigation control, a Q-learning algorithm based on the path restriction is proposed by constructing the absolute distance between a mobile agent of the virtual environment and its destination into a status function of reinforcement learning. Poster's Collaborative data exploration using two navigation strategies (Omar Gomez et. al., 2009) shows how two different modes of collaboration can affect user performance in a specific exploration task. Fair Trade Metaphor as a Control Privacy Method for Pervasive Environments: Concepts and Evaluation (Abraham Esquivel et.al., 2015), presents a proof of concept from which the metaphor of "fair trade" is validated as an alternative to manage the private information of users. This privacy solution deals with user's privacy as a tradable good for obtaining environmental services. Supporting Fine-Grained Concurrent Tasks and Personal Workspaces for a Hybrid Concurrency Control Mechanism in a Networked Virtual Environment (Jun lee et. al., 2012) propose a hybrid concurrency control mechanism that reduces restrictions of non-owners' behaviour and task-surprises in a networked virtual environment. Regulation was proposed as an Enabler for Collaborative Software Development (Allyson F Hardwin, 2015). Widespread availability and adoption of social channels has led to a culture where today's developers participate and collaborate more frequently with one another. TAMRI presents TAMRI, a planning tool for identifying task assignments based on multiple criteria and weighted project goals. Its implementation combines a distributed systems approach with Bayesian networks. The tool can be adapted to specific organizational environments by exchanging the underlying Bayesian network. A Tool for Supporting Task Distribution in Global Software Development (Lamersdorf, A. & Munch, J. 2009) presents an overview of task distribution approaches, gives three application scenarios for the tool, and shows the implementation of the tool as well as its application in the scenarios.

### Multi Attribute Behavioural Analysis

Using the result of pre-processing, the method computes the trust factor for each attribute on the basis of the previous trace. The method computes the trust factor on each attribute on the basis of the users' behaviour represented by the access trace and based on the completeness of the access and how genuine the user has accessed the attributes in earlier days. Based on multi attribute trust factor the method computes trustworthy measure called CAM to decide the access control for the user.

**Algorithm:**

Input: Pre-processed Trace Ts
Output: CAM
Step1: start
Step2: read preprocessed trace Ts
Step 3: identify list of all attributes of the access

Attribute set As = $\sum_{i=1}^{size(Ts)} Ts(i).Attribute! \in As$

Step 4: for each attribute Ai
Compute number of access Na = $\sum_{i=1}^{size(Ts)} Ts(i).Attribute == Ai$

Compute number of successful access Nsa = $\sum_{i=1}^{size(Ts)} Ts(i).Attribute == Ai \&\& Status == Success$

Compute trust factor Tf = $\frac{Nsa}{Na} \times size(Ts)$
End

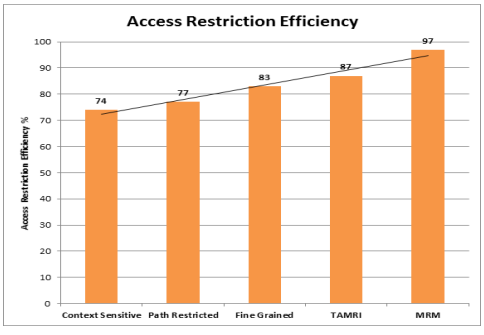
Step 5 : compute cumulative access measure $CAM = \frac{\sum Tf}{Numberofattributes}$

Step 6: stop
The algorithm discussed above computes the trust factor for each attribute and based on them the cumulative access measure is computed.

### Multi Attribute Access Restriction

At this stage, the method first performs pre-processing using the input user request and the user access trace. Then the method performs the multi attribute behaviour analysis using the pre-processed trace. Based on computed trust factor and the cumulative access measure the method performs access restriction.

Algorithm:
Input: User Request Ur
Output: Boolean
Step1: start
Step2: read user request Ur.
Step 3: perform preprocessing
Step 4: cumulative access measure CAM = perform multi attribute behaviour analysis
Step 5: if CAM >TTh //trust threshold
Allow access
Else
Deny the request.
End
Step 6: stop.
The above discussed algorithm computes the access trust measure and cumulative access measure from behaviour analysis. Based on the trust measure the method performs the access restriction.



### RESULTS AND DISCUSSION:

The proposed multi attribute behaviour analysis based restriction model has been implemented and evaluated for its efficiency. The method has been evaluated for its performance by simulating in different conditions. The method has produced the following results and the details of the simulation are presented below.

| Sl.No | Parameter | Value |
|---|---|---|
| 1 | Number of Services | 20 |
| 2 | Number of Users | 100 |
| 3 | Size of Trace | 500 |
| 4 | Tool Used | Advanced Java |

**Table 1: Details Of Simulation**

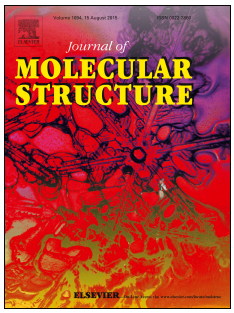
Table 1, shows the details of simulation and the number of services and users being considered for the evaluation purpose.

**Graph 1: Comparison On Access Restriction Efficiency**

Graph 1 shows the comparison on access restriction efficiency produced by different methods. The access restriction efficiency achieved by the proposed system MRM is 96%. The results show that the proposed approach has produced higher efficiency than other methods. This study claims that the proposed mechanism is best to compare than other existing systems regarding access restriction.

When we compared the throughput performance produced by various methods, The throughput value of our proposed system is 98 %. The proposed method shows better results when compared to the other existing systems. So the deduction of access restriction is accurate by this MRM model when compared to other systems.

### CONCLUSION:



In this paper, an efficient Multi Attribute Restriction Model (MRM) has been proposed to improve the access restriction in collaborative environment. The method first receives the user request and identifies the component being claimed. Then the method identifies the list of attributes being required. Then the method collects the traces being accessed on the attributes. Each trace has been validated for its complete and noisy records have

been removed from the trace. Then the method performs the multi attribute behaviour analysis to compute the trust factor. Based on the trust factor, the method computes the cumulative access measure. The computed trust factor and the access measure have been used to restrict the user from accessing the component maliciously. The method has produced efficient results on access restriction and increases the throughput performance.

**Abstract**

In the present study, the title compound 1,7-bis(4-bromophenyl)heptane-1,7-dione (BBPHD) was synthesized according to the procedure described in literature, and its solid state crystal structure was characterised by the single crystal x-ray diffraction study. The complete crystallographic information has been reported in the present work. Physicochemical characterization by various spectral tools such as FT-IR, FT-Raman, $^{1}$H-NMR, $^{13}$C-NMR and UV-visible, have been performed as well and these results have been correlated with the theoretical data. The ground state geometrical optimization of the title compound has been performed using the DFT/B3LYP/6-311++G(d,p) level of theory in gas phase. Extracted molecular structure obtained by x-ray difractometry has been used as the starting molecular structure for geometrical optimizations. Computationally obtained structural and geometric parameters are in good

agreement with the experimentally obtained values. The experimental FT-IR and FT-Raman spectral data were compared with the theoretical spectral data and the complete assignment of vibrational wave numbers has been done on the basis of potential energy distribution (PED). In addition, reactive properties have been addressed on the basis of frontier molecular orbital analysis, global chemical reactivity descriptors, natural bond order (NBO) analysis, nonlinear optical (NLO) properties, molecular electrostatic potential (MEP) and average local ionization energy (ALIE) surfaces. Molecular dynamics (MD) simulations have been used in order to study the influence of water to the title compound. The docked ligand forms a stable complex with feruloyl esterase inhibitor and could be considered as a lead compound for the development of new antioxidant drug.

**Key words:** DFT; Hirshfeld surfaces; ALIE; RDF; Molecular docking.

## 1. Introduction

Owing to their abundance in natural products and pharmacologically active compounds, the significance of halogenated compounds is increasing [1-3]. This class of molecules has been successfully applied for the development of paints, dyes, adhesives, flame retardants, imaging agents in medical diagnosis, hydraulic and heat transfer fluids, refrigerants, solvents and in materials science [4-6]. Halogenated aromatic organic substrates are of great importance for the organic chemistry transformations, especially in the area of cross-coupling chemical reactions [7]. Although the halogenation is frequently followed by toxic chemicals, this procedure is highly developed and frequently used. There are number of advantages when it comes to the employment of halogens for the development of new molecules. For example, the introduction of carbon-halogen bond increases the thermal and oxidative stability, which leads to the lower sensitivity towards the oxidation by the liver P450 detoxification [6]. The same group of authors also indicates that carbon halogen bond increases the biological membrane permeability. Halogenated compounds are especially important in the area of agriculture and halogenation proved to be an important tool for development of efficient agricultural products. Jeschke [8] reports the information that since 2010, 96%of launched agricultural products, including herbicides, fungicides, insecticides/acaricides and nematicides, are containing halogen atoms. Positive effects of halogen atoms and halogen-containing groups are owed to steric and electronic effects [9], polarity of carbon-halogen bond [10] and pKa values effects [8]. One of the most important parameters in terms of pharmacokinetics, molecular lipophilicity, turned out to be adjustable by the substitution with halogen atoms [11]. Recently, Chen et al. [12] reported specific

nematic liquid crystal (LC) whose synthesis is based on the title compound (BBPHD). Taking into account the importance of their work, and importance of BBPHD for the synthesis of some other new specific nematic liquid crystals, we have decided to study BBPHD in details by spectroscopic and computational approaches. Density functional theory (DFT) represents irreplaceable tool for performing efficient and inexpensive computational studies in many areas [13-16]. DFT calculations with the hybrid exchange correlation functional B3LYP (Becke's three parameter (B3) exchange in conjunction with the Lee-Yang-Parr's (LYP) correlation functional) are of particular significance for studying systems comprising of extensive electron conjugation and/or electron lone pairs [17-20]. These structures have been the subject of many experimental and theoretical studies, especially when it comes to understandings of their structure, molecular properties and reaction mechanisms. Computational molecular modelling based on DFT calculations has become practically indispensable tool for evaluation and prediction of various properties of molecules and structures [21, 22], while in this work DFT calculations have been used in order to address global and local reactivity descriptors, including frontier molecular orbitals, MEP and ALIE surfaces and Fukui functions. DFT calculations were also used for confirmation of spectroscopic characterization and elucidation of vibrational specificities. Natural bond orbital (NBO) analysis has also been performed. Because newly synthetized molecules such as BBPHD might find place in the new pharmaceutical products, it is quite possible that they might end up in different water resources [23-27]. The introduction of halogen atoms also increases the persistency of compounds in environment, and in the same time hardening their degradation. This motivated us to also computationally study the degradation properties by calculation of bond dissociation energies for hydrogen abstraction (H-BDE) and stability in water by molecular dynamics (MD) simulations, another very important component of molecular modelling. Solid state crystal structure of BBPHD is elucidated by the single crystal X-ray diffraction studies, while contribution and quantification of various intermolecular interactions in crystal structure has been determined by the Hirshfeld surface analysis.

## 2. Material and methods

### 2.1. General remarks

The synthesis of BBPHD was carried according to the procedure reported in paper by Chen et al. [12]. Colourless prism like suitable crystals used for the structure determination was obtained by slow evaporation of ethanol at ambient temperature. FT-IR spectrum (Fig.S1-

supporting information) of title compound was recorded using the KBr pellets in the range of 4000-600 $cm^{-1}$ region, with the ATR module ALPHA-T Bruker FT-IR spectrophotometer. FT-Raman spectrum (Fig.S2-supporting information) of the title compound was recorded by Bruker RFS 100/s (Germany) using the Nd:YAG laser source, excitation wavelength of 1064 nm and spectral resolution of 2 $cm^{-1}$. $^{1}H$ and $^{13}C$-NMR spectra of the title compound was recorded (in ppm) on Bruker 400MHz spectrometer in $CDCl_3$ as solvent and TMS as internal standard.

**2.2. Data Collection and refinement details**

A suitable prism like crystal was selected and mounted on a Bruker APEX-II CCD diffractometer using the graphite monochromated MoKa ($\lambda$ = 0.71073 Å) radiation and detector (CCD). The crystal was kept at 296(2) K during data collection. The structure was solved using the Olex2 software [28] employing the olex2.solve [29] structure solution program and using the Charge Flipping. The structure was refined with the ShelXL [30] refinement package using the Least Squares minimization. All of the non-hydrogen atoms were revealed in the first difference Fourier map itself and were refined anisotropically. All of the hydrogen atoms were positioned geometrically, with C-H = 0.96 Å for methyl H, C-H = 0.93 Å for aromatic H, and refined using the riding model with $U_{iso}(H) = 1.5U_{eq}(C)$ for methyl hydrogens and $U_{iso}(H) = 1.2U_{eq}(C)$ for aromatic hydrogens. The nitrogen bound hydrogen atom was located in a difference map and was refined isotropically with the bond length restraint of N-H = 0.86(2) Å. All of the geometrical calculations were carried out using the program PLATON [31] within the WinGXsuite [32]. The molecular and packing diagrams were generated using the MERCURY program [33].

**2.3. Computational details**

Molecular structure of BBPHD is extracted from the X-ray structure for computational studies. The molecular geometry optimization, vibrational analysis, frontier orbital analysis (HOMO-LUMO), MEP, surface analysis and Mullikan atomic charges were calculated at DFT/6-311G++(d,p)(5D, 7F) level using Gaussian 09 program package [34]. The assignment and PED analysis of wave number were performed by GaussView5.0 program [35] and GAR2PED software package [36]. For better agreement of calculated wavenumber numbers with experimental values, the wave numbers were scaled by the scaling factor of 0.9613 [37]. Schrödinger Materials Science Suite 2017-3 [38] was also used for computational study of global and local reactive properties of the newly synthetized BBPHD molecule. Particularly, Jaguar 9.7

program [39] has been used for DFT calculations, combined with Desmond program [40-43] for simulations based on molecular dynamics. Computational study based on DFT approach with SMSS has been also done with Becke-Lee, Parr i Yang (B3LYP) [44] exchange-correlation functional with 6-311++G(d,p), 6-31+G(d,p) and 6-311G(d,p) basis sets, in order to respectively obtain ALIE, Fukui functions and bond dissociation energies (BDE). Molecular dynamics simulation has been done with OPLS3 force field [40, 45-47], with simulation time of 10 ns, temperature of 300 K, pressure of 1.0325 bar and cut off radius of 12 Å. System was of isothermal–isobaric (NPT) ensemble class, while the simple point charge (SPC) solvent model [48] was chosen for the modelling of solvent properties. A single BBPHD molecule was placed into the cubic box with approximately 3000 water molecules. Analysis of electron density between atoms has been performed according to the works of Johnson et al. [49, 50], in order to identify formation of intra-molecular non-covalent interactions. Maestro GUI [51] was used for the preparation of input files and analysis of results when Schrödinger Materials Science Suite 2017-3 was employed.

### 2.4 Conformational Analysis

The solid structure of the title compound has been determined, by the X-ray diffraction spectroscopic technique, to be planar with $C_s$ symmetry, but it can be considered as near-$C_{2v}$ as well. Such configuration allows more efficient packing and facilitates the intermolecular interaction between the molecular layers. Very interestingly, the optimized strict $C_{2v}$ structure was verified to be a minimum with all computed frequencies being positive. The two carbonyl groups prefer to point away from the skeleton of the molecule to maintain up to a 6 kcal/mol more stable configuration than when one of them would eclipse any of the $CH_2$ units. Nevertheless, detailed conformational analysis revealed that other possible non-planar (*np*) forms can possibly exist, and their calculated energies are expected to be very comparable with the experimentally reported one. Understanding these conformations is of great importance, as the molecular structure in the crystalline packing could be sensitive to several parameters such as temperature and pressure. To explore the possible stable forms beside the one determined experimentally, detailed conformational analysis at the B3LYP/6-311++G(d,p) has been performed. The internal rotations about the C2-C3, C3-C4 and C5-C6 (Fig.S3-supporting information) were calculated and show three possible non-planar forms (*np*-1, *np*-2 and *np*-3, respectively) within a stability range of less than 1 kcal/mol compared to the $C_s$ form. The large-

amplitude rotation about these bonds exhibits a barrier in a range of 2-3 kcal/mol in the non-condensed phase, indicating the feasibility of the formation of other packing pattern when harsh conditions are applied.

### 2.5. Hirshfeld surfaces

We examined molecular surfaces, packing of molecules in their crystal structure, highlighting the contribution of significant inter molecular interactions between molecules that are responsible for the molecular arrangement in the crystalline state through Hirshfeld surface analysis. Hirshfeld surfaces [52-54] and the related 2D finger print plots (FP) [55-57] are unique for any crystal structure and provide a quantitative measure of the intermolecular interactions on the surface [52, 58]. The Hirshfeld surface analysis and finger print plots of BBPHD was generated by using Crystal Explorer 3.0 software [59] which accepts structure input file in the CIF format. The surfaces are mapped using a fixed colour scale red, white and blue, where red highlights contacts shorter than the sum of van der Waals (vdW) radii which is represented by negative sign values of $d_{norm}$, white for contacts around vdW separation with $d_{norm}$ values equal to zero, and blue for contacts longer than vdW sum with positive sign $d_{norm}$ values.

## 3. Result and discussions

### 3.1. Crystal structure analysis

The title compound crystallizes in orthorhombic space group *Abm2*, with the following unit cell parameters: $a$ = 7.1227(11) Å, $b$ = 42.536(4) Å, $c$ = 5.8126(6) Å and Z = 4. The molecule exhibits crystallographic inversion symmetry located at the C10 carbon atom and there is half-molecule in the asymmetric unit. The molecule is almost planar with root mean squared deviation of all atoms (excluding H-atoms) being 0.076Å. The crystal structure features C2-H2…$\pi_{aryl}$ and C5-H5…$\pi_{aryl}$ interactions, forming a three dimensional grid like architecture. The packing of molecules in the crystal lattice is shown in Fig.S4 (supporting information). The crystallographic data and refinement parameters are summarized in Table 1.

### 3.2. Hirshfeld surfaces

3D Hirshfeld surfaces and 2D finger print analysis illustrations of the title compound (BBPHD) are shown in Fig.5 (supporting information), where surfaces have been mapped over $d_{norm}$ and shape index -1.0-1.0 Å. A red spot close to the H2 hydrogen atom on the $d_{norm}$ surface and the centroid of the aromatic ring arises as a result of C2-H2…$\pi_{aryl}$ interactions present in the crystal. Similarly, a faint red spot close to H5 atom on the $d_{norm}$ surface is due to weak C5-

H5…$\pi_{aryl}$ interactions (Fig.S5a). The dark red spots close to the centroid of the two aromatic rings in the shape index is a result of the two C-H…$\pi_{aryl}$ interactions. The two C-H…$\pi_{aryl}$ interactions are mapped over the $d_{norm}$ surface to support the presence of these interactions (Fig. S5b). The relative contribution of different interactions to the Hirshfeld surface was calculated for BBPHD. It is evident from Fig.S5(c) that the H···H contacts account for about 34.7% of the total Hirshfeld surface area; the remaining contribution was mostly due to C···H (25.8%), O···H (12.4%), Br···H (15.0%), Br···Br (9.3%) interactions and only minor contribution from other interactions.

**3.3. Geometrical parameters**

In the present case the experimental C-C bond lengths are in the range of 1.4104-1.3785 Å and the calculated C-C bond lengths are in the range of 1.4057-1.3727 Å [60]. For the title compound, the C-Br bond length is 1.9237 Å (DFT) and 1.9055 Å (XRD), which is in agreement with the literature data [61]. The C=O bond length (1.1988) agrees with the reported literature values [60]. At C8 position, the bond angles (/DFTXRD) are C3-C8-C9 = 123.5/123.7°, C3-C8-Br1 =119.1/119.2° and C9-C8-Br1 = 117.3/117.1° and the asymmetry in angles is due to the electronegative bromine atom.

**3.4. IR and Raman spectra**

Table 2 contains the wavenumbers (calculated and observed) with vibrational assignments, while the atom labelling is provided in Fig.1. Phenyl rings at C5 and C27 are designated as PhI and PhII, respectively. The carbonyl stretching C=O vibrations [62-64] appear at 1668 $cm^{-1}$ (IR), 1680 $cm^{-1}$ (Raman) and theoretically at 1679 and 1678 $cm^{-1}$. The bands observed at 679, 662 $cm^{-1}$ (IR), 658, 551 $cm^{-1}$ (Raman) and at 678, 667, 553 $cm^{-1}$ (DFT) are assigned as C=O deformation modes [62]. The phenyl C-H stretching modes are assigned at 3081, 3062 $cm^{-1}$ (spectrum), 3079, 3059 $cm^{-1}$ (Raman) and in the range 3082-3064 $cm^{-1}$ based on DFT calculations [62, 65]. The ring stretching modes of the phenyl ring are assigned in the range 1558-1269 $cm^{-1}$ theoretically. The bands observed at 1570, 1530, 1450, 1374 $cm^{-1}$ (IR) and at 1565, 1279 $cm^{-1}$ (Raman) are assigned as the phenyl ring stretching modes. The band at 1042 $cm^{-1}$ (IR), 1042 $cm^{-1}$ (Raman) and 1040 $cm^{-1}$ (DFT) is assigned as the ring breathing mode of the para substituted phenyl ring [65], which is in agreement with the reported values at 1062 $cm^{-1}$ (IR) and 1061 $cm^{-1}$ (DFT) [66]. The in-plane and out-of-plane CH deformations are assigned theoretically in the range 1276-1087 $cm^{-1}$ and 965-788 $cm^{-1}$, respectively. Experimentally, these

modes are assigned at 1156, 1087 $cm^{-1}$ (IR), 1279, 1088 $cm^{-1}$ (Raman) and 963, 815, 801 $cm^{-1}$ (IR), 968, 818, 798 $cm^{-1}$ (Raman). The $CH_2$ stretching modes are assigned in the range 2965-2865 $cm^{-1}$ in IR spectrum, 2965-2877 $cm^{-1}$ in Raman spectrum and in the range of 2962-2873 $cm^{-1}$based on DFT calculations [62,67]. The $CH_2$ bending modes are observed in the ranges 1450-759 $cm^{-1}$ in the IR spectrum and 1440-738 $cm^{-1}$ in the Raman spectrum. According to the DFT calculations, these modes are in the range of 1453-706 $cm^{-1}$. The C-C stretching modes are assigned in the range 1173-780 $cm^{-1}$computationally. Bromine compounds [62] absorb strongly in the region of 635±85 $cm^{-1}$, due to the CBr stretching vibration and in the present case, bands at 615 $cm^{-1}$ (IR), 624 $cm^{-1}$ (Raman) and 616 $cm^{-1}$ (DFT) are assigned to this mode. Varghese et al. [68] reported the CBr stretching mode at 632 $cm^{-1}$ theoretically.

**3.5. NMR spectra analysis**

Chemical shift ($^{1}H$ and $^{13}C$) values of the investigated molecules have been computed with GIAO/B3LYP method [69] and compared with experimental values (Table S1-supporting information). The chemical shift values of $^{1}H$-NMR spectrum of title compound show two ranges; first one is consequence of the chemical shift of aliphatic C-H protons, which occurred in the range of 1.39-2.95/1.29-3.02 ppm (experimental/theoretical). The chemical shift of hydrogen atom attached to carbon near to the carbonyl group is higher than expected. H21, H22, H40 and H41 resonate at high frequency 2.95/3.02 (experimental/DFT), due to influence of carbonyl groups. Second one, around 7.60-7.81/7.69-8.06 (experimental/theoretical) ppm, occurred due to the aromatic protons. Chemical shift values of $^{13}C$-NMR for aromatic carbon atoms in general have values higher than 100 ppm [70,71]. Computational and experimental $^{13}C$ NMR values of carbon atoms of methylene groups of aliphatic chain are in good agreement as well: C17, C36 (24.02/27.40), C13 (28.97/32.69) and C20, C39 (38.37/42.69) ppm (experimental values/computational values). The chemical shift value at 199.26/205.26 ppm (experimental/computational) is assigned to the carbonyl carbon atoms C2 and C24. Signals observed in range of the 128.26-135.82/134.04-153.80 ppm (experimental/computational) correspond to carbon atoms of phenyl rings. From above result shows, the theoretical chemical shifts are good in agreement with experimental findings.

**3.6. Electronic properties and frontier molecular orbital analysis**

Chemical reactivity and kinetic stability of molecules depend upon the energy gap between HOMO and LUMO orbitals. These molecular orbitals are often known as frontier

molecular orbitals (FMOs). Based on the energy gap between frontier orbitals, molecules are frequently classified into soft and hard molecules. Energy gap between frontier orbitals is a critical parameter for prediction of the biological activity and transport properties. Frontier molecular orbitals have been visualized in Fig.S6 (supporting information). It can be seen that HOMO (MO109) is localized mainly at the carbonyl group and partially at the aliphatic chain, while LUMO (MO110) is localized mainly at the benzene ring and partially at the carbonyl group. Based on the HOMO to LUMO transitions, it can be concluded that the transfer of electron cloud occurs mainly from carbonyl group to benzene ring. In the present case, the calculated energy values of HOMO and LUMO are -7.20 eV and -2.16 eV, respectively and the energy gap between HOMO and LUMO is 5.04 eV. The higher the energy gap between HOMO-LUMO is, the harder the molecule is. In order to understand the chemical reactivity of title compound, global reactivity parameters were evaluated by DFT method. Single point calculation was carried out at DFT/6-311++G(d,p) level of theory. Vertical ionization potential (IP) and vertical electron affinity (EA) parameters have been calculated. These parameters were defined according to the following equations:

$$IP = E_{n-1(\text{cation})} - E_{N(\text{neutral})},$$

$$EA = E_{N(\text{neutrail})} - E_{N+1(\text{anion})},$$

where $E_{N+1(\text{anion})}$, $E_{N(\text{neutral})}$ and $E_{N-1(\text{cation})}$ are total energies of anion, neutral and cation forms of investigated molecule, respectively [72, 73]. These parameters were used in order to calculate the values of global reactivity descriptor, summarized in Table S2 of the Supplementary Materials. TD-DFT calculations have been performed at B3LYP/6-311++G(d,p) level of theory, while theoretical UV transitions have been characterized by vertical excitation energies, wavelength and oscillator strength. These results are summarized in Table S3 of the Supplementary Materials. The UV spectrum of the title compound (Fig.S7-supporting information) is characterized by electronic absorption band located at 268 nm, which is the consequence of the transitions: HOMO-1→LUMO and HOMO→LUMO+1(π-π transition).

### 3.7. Nonlinear optical properties

With regards to optoelectronic applications [74], the NLO active materials receive significant attention. Some of the properties that are important for optoelectronic applications can be obtained by DFT calculations and these include dipole moment, polarizability, first and

second hyperpolarizabilities. Respectively, these parameters have been calculated to be 4.102 Debye, $4.149\times10^{-23}$ esu, $6.227\times10^{-30}$ esu and $-71.736\times10^{-37}$ esu. It is interesting to notice that the first hyperpolarizability of the title compound is 31.98 times higher than in the case of urea, revealing possibility of the title compound to possess representative NLO properties, comparable with similar derivatives [75].

### 3.8. Molecular electrostatic potential

Analysis of charge distribution by mapping of MEP to the electron density surface is valuable approach in molecular modelling, when it comes to the biological recognition, hydrogen bonding interactions and visualization of reactive molecular sites [76, 77]. Optimized molecular structure was used for the generation of 3D MEP and 2D counter surfaces plots with rainbow colour scheme (electron reach regions are represented with red colour, while electron poor regions are represented with blue colour). For the title compound MEP took values from– 5.56a.u. (red) to 5.56a.u. (blue). MEP and surface analysis diagram of title compound, Fig.2, show that negative regions are mainly localized over oxygen atoms of the carbonyl groups, indicating the most sensitive sites towards the electrophilic attacks. On the other side, the maximal positive regions are localized over hydrogen atom of the aliphatic chain as well as phenyl rings, indicating sensitivity towards the nucleophilic attacks.

### 3.9. Natural Bond Orbital analysis

Natural bond orbital (NBO) calculations were performed using NBO 3.1 program [78] as incorporatedin the Gaussian09 package. In this case the DFT/SDD level of theory was used in order to understand various second-order interactions, principal interaction summarized in Tables S4 and S5 (supplementary materials). The strong intermolecular hyper conjugative interactions are: $C_2$-$C_5$ from $O_{16}$ of $n_2(O_{16}) \rightarrow \sigma^*(C_2\text{-}C_5)$ which increases the electron density 0.06345e that weakens the respective bond $C_2$-$C_5$ leading stabilization of 16.61 kJ/mol; $C_2$-$C_{20}$ from $O_{16}$ of $n_2(O_{16})\rightarrow\sigma^*(C_2\text{-}C_{20})$ which increases the electron density 0.05561e that weakens the respective bond $C_2$-$C_{20}$ leading stabilization of 17.56 kJ/mol; $C_{24}$-$C_{27}$ from $O_{35}$ of $n_2(O_{35})\rightarrow\sigma^*(C_{24}\text{-}C_{27})$ which increases the electron density 0.06345e that weakens the respective bond $C_{24}$-$C_{27}$ leading stabilization of 16.61 kJ/mol; and $C_{24}$-$C_{39}$ from $O_{35}$ of $n_2(O_{35})\rightarrow\sigma^*(C_{24}\text{-}C_{39})$ which increases the electron density 0.05561e that weakens the respective bond $C_{24}$-$C_{39}$ leading stabilization of 17.56 kJ/mol. The orbital with low occupation number are high energies are $n_2(O_{16})$, $n_2(O_{35})$ with energies -0.27360, -0.27360a.u. and considerable p-characters100,

99.99% and low occupation numbers 1.90859, 1.90859 while the orbital with high occupation numbers and low energies are: $n_1(O_{16})$, $n_1(O_{35})$ -0.68914, -0.68914a.u. and p-characters, 61.77, 61.77 and occupation numbers 1.97457, 1.97457. Thus, a very close to pure p-type lone pair orbital participates in the electron donation to the $\sigma^*(C_2\text{-}C_5)$ orbital for $n_2(O_{16}) \rightarrow \sigma^*(C_2\text{-}C_5)$, $\sigma^*(C_2\text{-}C_{20})$ orbital for $n_2(O_{16}) \rightarrow \sigma^*(C_2\text{-}C_{20})$, $\sigma^*(C_{24}\text{-}C_{27})$ orbital for $n_2(O_{35}) \rightarrow \sigma^*(C_{24}\text{-}C_{27})$, $\sigma^*(C_{24}\text{-}C_{39})$) orbital for $n_2(O_{35}) \rightarrow \sigma^*(C_{24}\text{-}C_{39})$ interactions in the title compound.

### 3.10. ALIE and MEP surface, Fukui functions and non-covalent interactions

Aside of the MEP surface, in this work ALIE values were mapped to the electron density surface in order to identify the molecule sites where electrons are least tightly bound. This enabled us to detect molecule sites that are the most sensitive towards the electrophilic attacks (Fig.3) [79-82]. The analysis of electron density between atoms revealed that the intra-molecular non-covalent interactions in the case of BBPHD molecule didn't form. The lowest ALIE values in the case of BBPHD molecule were calculated in the near vicinity of bromine atoms, with corresponding values of ~205 kcal/mol. On the other side, the highest ALIE values were calculated in the near vicinity of all hydrogen atoms with the corresponding values of ~342 kcal/mol. Additional insights into the local reactive properties of BBPHD molecule were obtained thanks to the calculation of Fukui functions, which are in the case of Jaguar program for DFT calculations obtained by the finite difference approach according to the following equations:

$$f^{+} = \frac{\left(\rho^{N+\delta}(r) - \rho^{N}(r)\right)}{\delta}, \qquad (1)$$

$$f^{-} = \frac{\left(\rho^{N-\delta}(r) - \rho^{N}(r)\right)}{\delta}, \qquad (2)$$

where $N$ represents the number of electrons in reference state of the molecule, while $\delta$ is fraction of electron which default value is set to be 0.01 [83]. After mapping of the values of the Fukui functions to the electron density surface the following corresponding surfaces have been obtained, Fig.4. In general Fukui functions track the changes in electron densities which are consequence of change in the overall charge of the observed molecule. The change in overall molecular charge influences the values of electron density at the molecular surface. By tracking of these changes in electron density, Fukui functions allow detection of molecule sites with electrophilic and nucleophilic properties. In this regard, purple colour for Fukui $f^{+}$ function in

Fig.4a is positive colour and indicates sites with increased electron density after the addition of charge. In Fig.4a it can be seen that blue-to-purple colour is located in the near vicinity of carbon atoms connected with oxygen atoms, which marks them as an electrophilic ones. On the other side, red colour for Fukui $f^-$ function is a negative colour and indicates sites with decreased electron density after the removal of charge. Inspection of Fig.4b indicates that the red colour is located in the central part of the molecule, marking this area as nucleophilic.

### 3.11. Sensitivity towards autoxidation and water

Taking into account the negative environmental impact of the pharmaceuticals, in this work we have also studied the sensitivity of BBPHD molecule towards the autoxidation mechanism [24, 84]. Oxidation mechanism represents one of the most important pathways for degradation of pharmaceuticals [85-88]. Thanks to the correlation between bond dissociation energies for hydrogen abstraction (H-BDE) and sensitivity towards the autoxidation mechanism, computational molecular modelling techniques can be used for determination of the molecule sites where degradation could start [89-95]. Fig.5 contains information about the H-BDE values. According to the results presented in Fig.5, for BBPHD molecule it can be concluded that it is highly stable towards the autoxidation mechanism, since there are no H-BDE values in the region between 70 and 90 kcal/mol [96, 97]. In the same time the lowest BDE value has been calculated for bromine atoms indicating that degradation could start by detaching of these atoms. Sensitivity towards water molecules was investigated by molecular dynamics simulation. The information on the obtained trajectories were used in order to calculate Radial Distribution Functions (RDF) for all atoms of the BBPHD molecule, with the goal to identify atoms with the most important interactions with water. RDFs were calculated with respect to the distance between the observed atom of the BBPHD molecule and oxygen atom of the water molecule. Representative RDFs have been presented in Fig.6. According to the results provided in Fig.6 it can be seen that BBPHD molecule has significant stability in water, as there are no hydrogen atoms with sharp g(r) curves located at distances below 2 Å. The highest g(r) value was calculated for bromine atoms, however their maximal g(r) values are located at distance of around 3.5 Å. On the other side, maximal g(r) values carbon atoms C16 and C35 are located at the distances lower than in case of the bromine atoms, but their maximal g(r) values are much lower. Maximal g(r) values of the carbon atoms C8 and C30 are somewhere between bromine

atoms at carbon atoms C16 and C35, however their peaks are located at high distances of over 4.5 Å.

### 3.12. Molecular docking

Based on the molecular structure, PASS (Prediction of Activity Spectra) [98] online tool for prediction of different types of activities has been applied. According to the results of PASS analysis, which have been summarized in Table 3, the title compound could serve as feruloyl esterase inhibitor, with probability to be active (Pa) value of 0.936. Antioxidants are necessary to control degenerative reactions produced by reactive oxygen and nitrogen species. These species are involved in several ailments including cancer and heart diseases. Several literatures suggest that heptane derivatives show promising antioxidant activities [99, 100]. Ferulic acid is the most abundant hydroxycinnamic acid in the plant world and is one of the most promising sources of antioxidants [101]. Feruloyl esterase is a class of enzymes used in biocatalysis for refinement of hydroxycinnamic acids. These compounds have shown to have antioxidant and antibacterial properties, FAEs and their hydrolytic or transesterification products are of great interest for various biotechnological applications, in particular as modified natural antioxidants or food flavour precursors [102].It prevents low-density lipoprotein from oxidation, exhibits inhibitory effects on tumour promotion [103] and protects against certain chronic diseases such as coronary heart disease and some cancers [104, 105]. Therefore the feruloyl esterase inhibitor is used as a target for docking study. High resolution crystal structure of feruloyl esterase inhibitor was downloaded from the RSCB protein data bank website with PDB ID: 1UWC. All molecular docking calculations were performed on Auto Dock-Vina software [106] and as reported in literature [74, 107]. The ligand binds at the active site of the substrate by weak non-covalent interactions and these interactions are depicted in Fig.S8 (supporting information). Amino acids forms strong hydrophobic interaction with the ligand. The docked ligand forms a stable complex with feruloyl esterase inhibitor (Fig.S9-supporting information) and got a binding affinity value of -5.7 kcal/mol (Table 4). Thus the title compound can be a lead compound for developing new antioxidant drug.

## 4. Conclusion

The title compound, 1,7-bis(4-bromophenyl)heptane-1,7-dione was characterized by single crystal XRD, FT-IR, FT-Raman as well as NMR spectroscopic studies. Within the framework of DFT, the vibrational wavenumbers are theoretically predicted and compared with

experimental wavenumbers. Conformation analysis shows that the two carbonyl groups prefer to point away from the skeleton of the molecule to maintain up to a 6 kcal/mol more stable configuration than when one of them would eclipse any of the $CH_2$ units. MEP plot showed that the negative regions are mainly localized over the oxygen atoms of the carbonyl groups while the maximal positive regions are localized over the hydrogen atom of the aliphatic chain as well as phenyl rings. The first hyperpolarizability of the title compound is 31.98 times that of urea. ALIE surfaces revealed that the near vicinity of bromine atoms could be the most sensitive parts of the BBPHD molecule in terms of electrophilic attacks. Additionally, Fukui functions revealed that the central part of BBPHD molecule could be considered as important reactive center when charge is added or removed. The values of H-BDE indicate that BBPHD molecule is highly stable towards the autoxidation mechanism, while the remaining BDE values indicate that degradation process might start with detaching of bromine atoms. Molecular dynamics study indicated that BBPHD molecule is highly stable in water as well, since there are no hydrogen atoms with significant interactions with water molecules. PASS analysis predicts feruloyl esterase inhibitor activity for the title compound and the docking studies suggest that the title compound can be a lead compound for developing new antioxidant drug.

**Acknowledgment**

The authors are highly thankful to the UGC for financial assistance. The authors are grateful to Prof. K. Saraswathi, Department of Chemistry, S.V. University, Tirupati, for her constant support and encouragement.Part of this work has been performed thanks to the support received from Schrödinger Inc. Part of this study was conducted within the project funded by the Ministry of Education, Science and Technological Development of Serbia, grant III41017.

**Supplementary Material**

The cif file of the title compound have been assigned CCDC number1577497and can be obtained free of cost on application to CCDC 12 Union Road, Cambridge CB21 EZ, UK. (Fax: (+44) 1223 336-033: e-mail: data_request@ccdc.cam.ac.uk).

**Abstract-** In this review, various approaches for nano-formulations for poor soluble and low permeable drugs are focused, advantages and future scope for the nono formulations in pharmaceutical industries are elaborated. For the manufacture of new medicines new manufacturing technology is needed. In the pharmaceutical formulations pellets dosage forms gives the improved results compare to tablet dosage forms. According to ICH BCS (BIOPHARMACEUTICS CLASSIFICATION SYSTEM) drugs class four, Low solubility, Low permeability drugs. Improved use of Low solubility, Low permeability drugs pelletized formulation at Nano level is proposed. Nano level pelletized drug formulations gives the better results compared to normal, micro level pelletized drug formulations.

**Key words-** Analytical method development, Nano-formulation, and Nano-chemistry

## 1. INTRODUCTION

Our daily life is depends on quality of the food we eat, the medicine we use the water we drink, and the air we breathe. The compound which is interacts with a biological organism to produce a biological response that may be favorable or harmful. Favorable is known as medicine, harmful is known as poison. Due to expressed development in the field of science and technology new medications are rapidly coming in to the market for new syndrome. For the manufacture of new medicines new manufacturing technology is needed. In the pharmaceutical formulations pellets dosage forms gives the improved results compare to tablet dosage forms. These dosage forms summarized in terms of safety, purity, efficacy and stability. Final pharmaceutical pellets dosage forms comprises an active pharmaceutical ingredient (API) combined with a varying number of excipients. Some of the Active pharmaceutical ingredients are Low solubility, Low permeability nature (BCS class four). To overcome the low solubility, low permeability problem we are proposing nano level formulations methodology. Very few researchers are worked on the Nano technology applications for drug molecules, even though not related to Nano pelletized formulations. Nano pelletized formulations gives the improved results in controlling of various types of diseases compare to normal, micro level formulations. Due to this reason we are concentrating on nano level pelletized formulations, and its analytical method development. Our ultimate aim is "Best medication for Healthier world" with lesser price.

## 2. OBJECTIVES

- Our daily life is mainly depends on quality of the air, water, food medicine, without these we are unable to assume our life.
- The compound which is interacts with a biological system to produce a biological response that may be Beneficial is known as medicine, harmful is known as poison.
- Manufacturing of medicines are regulated by Food and Drug administration (FDA): International conference on harmonization (ICH): Current good manufacturing practices (cGMP): Pre-approval Inspections (PAIS): World health organization (WHO), ultimate aim is quality of medicines for healthier world.
- The pharmacopeias (USP, B.P, IP, and E.P) necessities for a pharmaceutical dosage form may be summarizing in terms of safety, purity, efficacy and stability.
- Final pharmaceutical formulations comprises an active pharmaceutical ingredient (API) combined with a varying number of excipients.
- The word "Pellet" describes a variety of systematically produced, geometrically defined agglomerates obtained from various starting materials utilizing different processing conditions.

- Pellets have various therapeutic advantages over traditional single units, such as tablets and powder-filled capsules.
- According to ICH BCS (BIOPHARMACEUTICS CLASSIFICATION SYSTEM) drugs class four, Low solubility, Low permeability drugs.
- Improved use of Low solubility, Low permeability drugs pelletized formulation at Nano level is proposed.
- Nano level pelletized drug formulations gives the better results compared to normal, micro level pelletized drug formulations.
- In house Analytical methods have to be developed and validated for the Analysis of nano level drug formulations.
- Our ultimate aim is to produce the best medicines for healthier world with lesser cost.

## 3. IMPORTANCE OF THE PROPOSED AREA IN THE PRESENT CONTEXT

With the aim of producing "Quality medicines in low prices for healthier world", we are reviewing of Nano level pelletized formulations for low solubility, Low permeability drug materials. According ICH these are BCS (BIOPHARMACEUTICS CLASSIFICATION SYSTEM) drugs class four. Very lesser number of researchers doing the research work related to Nano technology applications to drugs formulations, but not doing pelletized formulations in Nano level. These formulations gives the effective medicines with lesser side effects compare to normal, micro level formulations. Nano level pelletized formulations advantages as follows.

- Solubility of the drugs can be increases.
- Permeability of the drug in biological matter can be increases.
- Lesser amount of drug dosage is required to control the disease.
- Side effects are less compare to normal and micro level drug dosage formulations.
- Consumption of drugs dosage frequency is less.

Due to above advantages proposed Review i.e Nano level Pelletized formulations place important role in invention of Medicines.

The compound which is interacts with a biological organism to produce a biological response that may be favorable or harmful. favorable is known as medicine, harmful is known as poison. for example, penicillin reacts with bacterial cause to kill them.

Penicillin

Penicillin is a medicine for Humans due to it interacts with bacteria and kills them. In case of bacteria it is a (biological system) poison.

The articulated development in the field of science and technology utilized as on date merged with relatively stringent new regulations, namely federal drug authority, latestly called as food and drug administration (FDA):International conference on harmonization (ICH): Current good manufacturing practices(cGMP): Pre-approval Inspections(PAIS):World health organization(WHO), like organizations are now serving as a legal binding specifically for the pharmaceutical formulations and drug analysis.

## 4. ROLE OF API'S IN DRUG FORMULATIONS

APIs are core active substances mixed with a carrier in any medication. When any of the active substance is not easily absorbed by the human body; the substance is dissolved into or mixed with an excipient so that the human body easily receives it. Further these actives are used as medications.

4.1. According to ICH BCS (BIOPHARMACEUTICS CLASSIFICATION SYSTEM) drugs class four, Low solubility, Low permeability drugs. Consider example for API(Active pharmaceutical Ingredient)

- ACECLOFENAC ($C_{16}H_{13}Cl_2NO_4$), chemically [(2-{2, 6-dichlorophenyl) amino} phenylacetooxyacetic acid],
- Acyclovir (ACV): It also known as acyclovir is an antiviral medication. It is primarily used for the treatment of virus infections, chickenpox, and shingles.

*4.2. Pellets*

The word "Pellet" has been used to exemplify a variety of systematically produced, geometrically defined agglomerates obtained from various starting materials utilizing different processing conditions. Pellets range in size, typically, between 0.5 – 2.0 mm, though other sizes could be prepared.

4.3. Low solubility, Low permeability drugs pelletized formulations in Nano level, are useful as better medications for various types of diseases. Very few researchers did the work on Nano technology applications for drug molecules, even though not related to Nano pelletized formulations. So we are concentrating on the Nano level pelletized formulations for BCS drugs class four. These

formulations are use full for the society to control the various types' diseases with lesser side effects. Our ultimate aim is "Best medication for Healthier world" with lesser price.

*4.4. Analytical Method Development:* In house Analytical method is useful for the Analysis of Nano level formulated drugs to check the dissolution profile, Assay, stability of the various dosage forms; the method must be validated according to ICH guidelines, Parameters for approval

## 5. RESEARCH AND DEVELOPMENT IN THE SUBJECT

Review subject, Nano level pelletized formulations, literature reveals that

- Nano suspension drug delivery system (DDS) was firstly developed in 1994 for the poorly soluble drugs.
- Pharmaceutical medicinal products "curcumin nano crystal" have a significant role in treatment of various types diseases such as cancers of pancreas or colon or even multiple myeloma, psoriasis or myelodys plastic syndromes (Goel et al., 2008., Liu et al., 2013).
- In recent times all drugs with low solubility like curcumin can be approached by Nano crystal methods,
- One more important study in the field of Nano-formulated curcumin was done by Agarwal et al in 2007 (Garodia et al., 2007). In a study, curcumin was encapsulated with more than 97.5% potency in PLGA and PEG. It has been proved that nano-formulated curcumin represents more efficacy and faster cellular uptake than free curcumin in vitro.

Literature survey reveals that very lesser number of researchers did the work on Nano level pelletized formulations, but it reveals that excellent scope is present on this work because advantages are more on Nano level pelletized formulations

## 6. CONCLUSION

In order to be classified as a "nano pharmaceutical", we suggest the drug product has to meet two major criteria. First, nano engineering has to play a major role in the manufacturing process. Second, the nano material used has to be either essential for the therapeutic activity or has to confer additional and unique properties to the active drug entity. Above literature reviles that Worldwide very less research work is going on Nano level pelletized formulations.

Nano level pelletized drug formulations gives the better results compared to normal, micro level pelletized drug formulations.

ABSTRACT: Methocarbamol and Ibuprofen caplet is combination product of two medications. It is used for to relieve pain associated with muscle spasm such as strains and sprains, back pain, and tense neck muscles. Methocarbamol belongs to a class of medications called muscle relaxants and they reduce muscle spasms. Ibuprofen belongs to a class of medications called nonsteroidal anti-inflammatory drugs (NSAIDs) that reduce pain and inflammation. This medication may be available under multiple brand names and/or in several different forms. This medication consists of related substances (impurities) β-Isomer, Guaifenesin, Dioxylonone, 2-(4-Isobutyryl phenyl) propionic acid. HPLC gradient method is developed for the determination of related substances (individual impurities and Total impurities). Detector wavelength is 220nm.we can obtained good results.

**Important words:** Methocarbamol, Ibuprofen, Muscle spasm, Non-steroidal anti-inflammatory, HPLC, Gradient method, wavelength.

**INTRODUCTION:** Methocarbamol and Ibuprofen caplet is combination product of two medications is used for to relive pain associated with muscle spasm such as strains and sprains, back pain, and tense neck muscles. This combination product contains various related substance (impurities), these are β-Isomer, Guaifenesin, Dioxylonone, 2-(4-Isobutyryl phenyl)prop ionic acid. To determine these related substances (impurities) high performance liquid chromatography, gradient method is developed. It is as follows

**Structures of Methocarbamol and Ibuprofen**

Ibuprofen

**Methodology:** High performance liquid chromatography, gradient method for related substance is developed. For this used

### Reagents:

Acetonitrile HPLC grade, Potassium dihydrogenate phosphate-AR grade, Orthophosphoric acid-AR grade

**Chromato graphic system:**

**Column:** C18, 150×4.6mm, 5µm(Devolosil ODS or equivalent)

**Detector wave length:** 220 nm

**Injection volume:** 10µl

**Runtime:** 50 minutes

**Flow rate:** 1.0ml/min

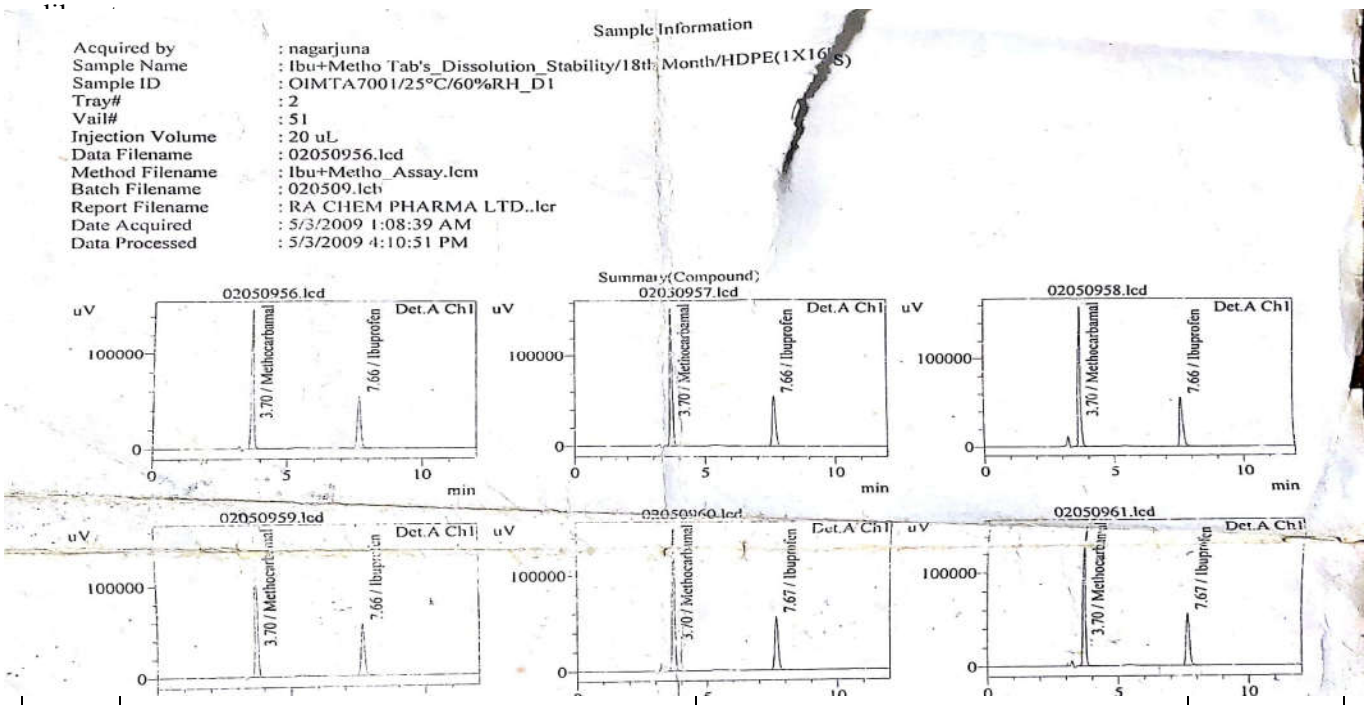
| Time(minutes) | Solution A | Solution B |
|---|---|---|
| 0.01 | 90 | 10 |
| 10 | 75 | 25 |
| 15 | 40 | 60 |
| 20 | 40 | 60 |
| 25 | 90 | 10 |
| 50 | 90 | 10 |

### Preparation of solutions:

**0.1M Potassium dihydrogen ortho phosphate preparation:** Transfer 13.6 g of potassium dihydrogen orthophosphate in 1000 mi of water.

**0.1M orthophosphoric acid preparation:** Transfer 6.5 ml of orthophosphoric acid in 1000 ml of water

### Mobile phase preparation:



**Solution A:** To 800 ml of 0.1M potassium dihydrogen orthophosphate add 100 ml of 0.1M orthophosphoric acid,100 ml acetonitrile and mix well. Adjust the pH of the solution to 3.2 with diluted orthophosphoric or triethyl amine .Filter and degas the solution with 0.45µ filter paper.

**Solution B:** Acetonitrile

**Diluents'**: Mix 500 ml of solution A and 500 ml of Solution B

**Standard solution preparation :** Transfer 50 mg of Methocarbamol WS and 20 mg of Ibuprofen WS into a 10 ml volumetric flask add 2 ml of methanol solution and dissolve and make up to volume with

methanol. Transfer of this solution in to 100 ml volumetric flask and make up to the volume with diluents and transfer 5 ml of the resulting solution in to a 50 ml volumetric flask and make up to the volume with

| | | | |
|---|---|---|---|
| 1 | B-Isomer | 0.74 | 0.82 |
| 2 | Guaifenesin | 0.85 | 0.78 |
| 3 | Dioxylonone | 1.84 | 1.00 |
| 4 | 2-(4-Isobutyryl phenyl)propionic acid | 2.01 | 3.23 |
| 5 | methocarbamol | 1.00 | - |
| 6 | Ibuprofen | 2.45 | |

## Calculation:

For β –Isomer:

$$\frac{Area\ of\ \beta\ Isomer\ in\ sample\ solution}{Area\ of\ methocarbamol\ in\ stand\ solution} \times 0.1 \times 0.82$$

For Guaifenesin:

$$\frac{Area\ of\ Guaifenesin\ in\ sample\ solution}{Area\ of\ methocarbamol\ in\ stand\ solution} \times 0.1 \times 0.78$$

For Dioxylonone:

$$\frac{Area\ of\ Dioxylononein\ sample solution}{Area\ of\ methocarbamol\ in\ stand\ solution} \times 0.1 \times 1.00$$

For 2-(4-Isobutyryl phenyl )propionic acid

$$\frac{Area\ of\ 2-(4-Isobutyryl\ phenyl)propionic\ acid\ in\ sample\ solution}{Area\ of\ Ibuprofen\ in\ stand solution} \times 0.1 \times 3.23$$

For single maximum unknown impurity

$$\frac{Area\ of\ single\ maximum\ un\ known\ impurity\ tn\ sample\ solution}{Area\ of\ methocarbamol\ in\ standard\ solution} \times 0.1 \times 1.00$$

For Total unknown impurities

$$\frac{Area\ of\ Total\ un\ known\ impurities\ in\ sample\ solution}{Area\ of\ methocarbamol\ in\ standard\ solution} \times 0.1 \times 1.00$$

## Total impurities:

Sum of impurity content of β- isomer +Dioxylonone +Guaifenesin +2-(4-Isobutyryl phenyl) Propionic acid +Total un known impurities

**Conclusion:** The proposed method has been found to be better results than previously reported methods, because of its readily available mobile phase, low retention time (tR) and no internal standard. All these factors make this method suitable for quantification of impurities in Methocarbamol and Ibuprofen in pharmaceutical dosage forms without interference and can be successfully used for routine analysis. It can therefore be concluded that it can be used in small laboratories with very high accuracy.

**Abstract**

The title compound 2-(6-hydroxy-1-benzofuran-3-yl) acetic acid (abbreviated as HBFAA) has been synthetized and characterized by FT-IR, FT-Raman and NMR spectroscopic techniques. Solid state crystal structure of HBFAA has been determined by single crystal X-ray diffraction technique. The crystal structure features O-H···O and C-H···O intermolecular interactions resulting in a two dimensional supramolecular architecture. The presence of various intermolecular interactions is well supported by the Hirshfeld surface analysis. The molecular properties of HBFAA were performed by Density functional theory (DFT) using B3LYP/6-311G++(d,p) method at ground state in gas phase, compile these results with experimental values and shows mutual agreement. The vibrational spectral analysis were carried out using FT-IR and FT-Raman spectroscopic techniques and assignment of each vibrational wavenumber made on the basis of potential energy distribution (PED). And also frontier orbital analysis (FMOs), global reactivity descriptors, non-linear optical properties (NLO) and natural bond orbital analysis (NBO) of HBFAA were computed with same method. Efforts were made in order to understand global and local reactivity properties of title compound by calculations of MEP, ALIE, BDE and Fukui function surfaces in gas phase, together with thermodynamic properties. Molecular dynamics simulation and radial distribution functions were also used in order to understand the influence of water to the stability of title compound. Charge transfer between molecules of HBFAA has been investigated thanks to the combination of MD simulations and DFT calculations.

**Key words**: Benzofuran; SCXRD; RDF; BDE; ALIE; Charge transfer analysis.

## 1. Introduction

2-(6-hydroxy-1-benzofuran-3-yl) acetic acid is a derivative of the privileged benzofuran core [1], is one of the key structural units because of its diverse biological profile [2]. The motif is

ubiquitous in natural products, bioactive active compounds and other pharmaceutical interest molecules [3-5]. For the past years, the privileged benzofuran core and its derivatives have attracted the interest of researchers from medicinal and synthetic chemistry due to their assorted biological applications including anticancer [6], antiviral [7], anti-Alzheimer's [8], immunomodulatory, anti-inflammatory [9], antitubercular [10], antidiabetic [11], antidepressant [12] andanalgesic activities [13]. Apart from pharmaceutical applications, the benzofuran derivatives also have important application in the field of dyes [14], polymer chemistry [15] and silver photography [16].

Benzofuran derivatives have been studied extensively; previous studies report the crystal structure, experimental and theoretical aspects. Recently, Gowda et al., reported the crystal structure of 2-(5-methoxy-1-benzofuran-3-yl) acetic acid [17]. Lee et al., reported the crystal structure of 2-(5-ethyl-3-methylsulfanyl-1-benzofuran-3-yl) acetic acid [18]. Yamato et al., reported synthesis, structural properties, electrophilic substitution reactions and DFT computational studies of calix[3]benzofurans using B3LYP/6-31G(d) method [19]. Aruna Kumar et al., carried out synthesis, crystal structural analysis along with detailed vibrational analysis of 1-benzofuran-2-carboxylic acid with in density functional theory [20].

The importance and applications of benzofuran scaffolds taking into account we endeavour synthesis, Hirshfeld surface analysis, and detailed experimental spectroscopic characterization of the 2-(6-hydroxy-1-benzofuran-3-yl) acetic acid (HBFAA) molecule, along with computational study by DFT. According to the best of our knowledge, an assignment of the vibrational spectrum of HBFAA with help of accurate DFT/B3LYP quantum calculation has not been reported. Along with frontier orbital analysis, NBO analysis, NLO calculations and Mulliken atomic charge analysis of the investigated compound calculated by using B3LYP/6-311++G(d,p) basic set in the ground state. And also efforts were made in order to understand global and local reactivity properties of investigated molecule by calculations of MEP, ALIE, BDE and Fukui function surfaces in gas phase. As well as analysis of charge transfer rates between title molecules investigated by Marcus semi-empiric approach. Taking into account that biological important molecules such as HBFAA represent great threat to water resources [21-26], we have also studied sensitivity of HBFAA towards autoxidation and hydrolysis, in order to gain vision into its possible degradation properties.

## 2. Experimental

### 2.1. General remarks

Infra-red spectrum was recorded using KBr pellets on JASCO FT-IR 4100 spectrometer in the range of 4000 – 400 $cm^{-1}$ at resolution of ± 2 $cm^{-1}$. The FT-Raman spectrum was recorded on LabRam HR800 Raman Spectrometer with spectral resolution 0.3 $cm^{-1}$ with a 10mW internal excitation source of laser wavelength 532 nm. $^{1}$H-NMR spectrum was recorded on a JEOL-400 MHz NMR instrument using DMSO-$d_6$ as solvent with chemical shifts being reported as δ units relative to TMS.

### 2.2. Synthesis

**Step-1:** Add resorcinol (5.0 g, 0.045 mmol) to conc. $H_2SO_4$ (25 mL) at 0$^{o}$C. After complete solubility of resorcinol, chloroethylacetoacetate (8.22 g, 0.049 mmol) was added drop by drop and then the reaction mixture was stirred for 24 hours at room temperature. After completion of reaction, the reaction mixture was poured into crushed ice, solid was filter and

washed with water followed by dried in vacuum. The product was recrystallized from ethyl acetate (3.5 g, yield: 70%, purity: 90%).

**Step-2:** Take 4-(chloromethyl)-7-hydroxy-2*H*-chromen-2-one (0.5 g, 2.38mmol) in round bottomed flask, to this add 10% NaOH solution (10 mL) and then the reaction mixture was refluxed for 4 hours. After completion of the reaction, the reaction mixture was poured into ice cold 10% HCl solution. The solid was filter and dried in vacuum to get 2-(6-hydroxy-1-benzofuran-3-yl) acetic acid as off white solid (0.45g, yield: 90%, purity: 96%)(Scheme1)[27].

Suitable crystals for X-ray diffraction studies were obtained by slow evaporation crystal growth technique at room temperature using ethyl acetate as solvent.

**2.3. X-ray Crystallography**

The unit cell parameters and the intensity data at 298K for the title compound was obtained on an Oxford Diffraction Xcalibur Gemini single crystal X-ray diffractometer using graphite monochromated Mo Kα radiation (λ = 0.71073 Å). The CrysAlisPro software [28] was used for data collection, reduction and absorption correction.

The structure of the title compound was solved by direct methods and refined on $F^2$ by full-matrix least-squares procedures. The non-hydrogen atoms were refined using anisotropic thermal parameters. The hydrogen atoms were included in the structure factor calculations at idealized positions using a riding model. Structure solution and refinement were performed using SHELX-97 [29] programs available in the WinG-X package [30]. The Ortex6a [31] and Mercury [32] packages were used for molecular graphics. Crystallographic data and structure refinement are given in the Table1.

**2.4. Hirshfeld surface Analysis**

We examined molecular surfaces, packing of molecules in their crystal structure, highlighting the contribution of significant inter molecular interactions between molecules that are responsible for the molecular arrangement in the crystalline state through Hirshfeld surface analysis. Hirshfeld surfaces [33-35] and the related 2D fingerprint plots (FP) [36-38] are unique for any crystal structure and provide a quantitative measure of the intermolecular interactions on the surface [33, 39]. The Hirshfeld surface analysis and finger print plots of HBFAA was generated by using Crystal Explorer 3.0 software [40] which accepts structure input file in the CIF format. When the cif files were uploaded into the CrystalExplorer software, all bond lengths to hydrogen were automatically modified to typical standard neutron values i.e., C–H = 1.083 Å and N–H = 1.009 Å. The surfaces are mapped using a fixed color scale - red, white and blue, where red highlights contacts shorter than the sum of van der Waals (vdW) radii which is represented by negative sign values of $d_{norm}$, white for contacts around vdW separation with $d_{norm}$ values equal to zero, and blue for contacts longer than vdW sum with positive sign $d_{norm}$ values.

**2.5. Computational details**

All DFT calculations were performed with B3LYP hybrid exchange-correlation functional (three-parameter exchange functional of Becke B3 [41], combined with the Lee-Yang-Parr correlation functional LYP [42]) and with several different basis sets. DFT calculations were performed with Gaussian09 [43] and Jaguar 9.6 [44] programs. Geometrical optimization of the structure extracted from crystallographic information file was geometrically optimized with Gaussian09 program in the gas phase at B3LYP/6-311++G(d,p) level of theory. With

the same software and at the same level of theory, a vibrational analysis has been performed in order to assure that true ground state (characterized only by positive frequencies) has been obtained. The calculated wave numbers were scaled by a scaling factor of 0.9613 to obtain a better agreement with the experimental results [45]. The calculated frequencies were assigned by means of the potential energy distribution (PED) using VEDA4 program [46]. Gaussian09 program was also used for calculations of $^{1}$H-NMR chemical shifts, by using the GIAO approach, while the chemical shifts were calculated with reference to TMS. Further DFT single point energy calculations yielding MEP, ALIE, Fukui functions surfaces and BDE were performed with Jaguar program, with 6-311++G(d,p) basis sets for MEP and ALIE surfaces, 6-311+G(d,p) basis set for Fukui functions and 6-311G(d,p) basis set for BDE.

GaussView 5.0.8 [47] program was employed for preparation and manipulation of input/output files for calculations with Gaussian09 [43] program, while Maestro [48] GUI was employed for preparation and manipulation of input/output files for calculations with Jaguar 9.6 program.

MD simulation was performed with Desmond program [49-52] and with OPLS3 force field [49, 53-55]. The simulation time was 10 ns, while the cut-off radius was taken to be 10 Å. The system was of NPT ensemble class, modelled by placing of one HBFAA molecule into the cubic box with ~2500 water molecules. Simple point charge (SPC) model [56] was used for the modelling of solvent.

In order to investigate charge transfer between molecules of HBFAA, a combination of MD simulations and DFT calculations has been used. Charge transfer rates have been calculated for pairs of HBFAA from both crystal and amorphous phase. Pairs from crystal phase have been extracted from the corresponding crystallographic information file, while MD simulation has been used in order to simulate amorphous phase consisting of 64 molecules of HBFAA. The final snapshot of the MD simulation has been used in order to extract all possible pairs of HBFAA, considering pairs within the radius of 4 Å. For the obtained pairs, charge transfer rates have been calculated according to the Marcus semi-empiric approach [57, 58] which has been widely used for evaluation of optoelectronic properties of prospective molecular structures [59].

## 3. Result and discussion

### 3.1. Structure description

The title compound crystallizes in monoclinic, space group $P2_1/c$ with unit cell dimensions $a$ = 9.2532(14) Å, $b$ = 6.574(10) Å, $c$ = 14.033(2) Å, β= 91.115(15)˚ and Z = 4. *ORTEP* diagram of the title compound is shown in Figure S2. In the initial stage of packing, the molecules are connected into $R^2_2(8)$ dimers via a pair of $O_2$–$H_{22}\cdots O_1$ hydrogen bonds. The adjacent $R^2_2(8)$ synthons are connected via another dimeric $R^2_2(20)$ motifs via $O_4$–$H_{21}\cdots O_1$ hydrogen bonds, and thus, the two hydrogen bonds are bifurcated at the common acceptor $O_1$ atoms. The combined effect is to produce $C^2_2(14)$ chain that propagates parallel to the diagonal of the ab plane (Figure S3a). Further, in the crystal structure, C(5) chains of $C_{13}$-$H_{14}$…$O_3$ intermolecular interactions translate the molecule along the b axis (Figure S3b). The molecules related by 2-fold rotation are interlinked via $C_6$-$H_7\cdots O_2$ intermolecular interactions that link the molecules into C(4) chains along b axis (Figure S3c). The C(4) and C(5) chains together comprise a ribbon architecture running parallel to b axis (Figure S3d).

Thus, the structure overall displays two dimensional architecture. The geometric parameters for hydrogen bonds and other intermolecular contacts are listed in Table2.

**3.2. Optimized geometry**

The optimized geometrical parameters are compared with the XRD data are given in Table 3 and atom labelling is given in Fig. 1. The comparison of results indicate that most of the computational geometrical parameters are slightly more than that of experimental values, attributed to the fact that computational calculations are carried at for an isolated molecule in gas phase while the experimental results are of the molecules in solid state. The geometry of the solid state structure is subjected to intermolecular forces (Van der Waals interactions and crystal packing forces).

The C=O bond C5-O1 in the carboxylic group of the title compound has length of 1.201/1.208Å (DFT/XRD) while, the corresponding bond in the structure of similar reported derivatives has length C11-O2 = 1.217Å [60], C10-O2 = 1.216Å [61], C1-O1 = 1.223Å [62]. Similarly, the C-O bond length (C5-O2) of 1.359/1.304Å is in agreement with the reported values [60-62]. At C5 position the bond angles (DFT/XRD) are O2-C5-O1 = 122.7/123.1º, O2-C5-C6 = 110.3/112.1º and C6-C5-O1 126.9/124.8º. The asymmetry in the angles reveals the interaction between carbonyl and OH groups thereby supporting the existence of the intermolecular hydrogen bonding O2-H22...O1, O4-H21...O1 and C6-H7...O2. The interaction between O1 and H21 atoms and formation of intermolecular hydrogen bond O4-H21---O1 is evident from bond angles (DFT/XRD) O4-C17-C18 = 122.2/121.9º, C18-C17-C15 = 121.4/121.4º, C15-C17-O4 = 116.3/116.7º. The dihedral angle between the benzene ring and furan ring C18-C20-C12-C11 = 179.7º, C11-C12-C13-C15 = -179.6º, O3-C20-C12-C13 = -179.8º and C9-O3-C20-C18 = -179.7º shows good agreement with experimental values of -179.7, 179.1, 179.1 and – 179.8 respectively, and these values indicate that the two rings are planar. In the present case C-C bond lengths of benzene ring are in the range of 1.359-1.386Å and the calculated C-C bond lengths are in the range of 1.386-1.407Å and the values for similar derivatives are 1.371-1.394Å [60], 1.375-1.397Å [61] and 1.376-1.409Å [62]. For the furan ring of the title compound, the bond lengths (DFT/XRD) C9-O3 = 1.376/1.362Å, O3-C20 = 1.365/1.365Å are less than normal single C-O bond length of about 1.43 and the corresponding reported values of C-O bond length of similar derivatives are, 1.374, 1.375Å[60], 1.377, 1.377Å[61], 1.371, 1.377Å [62].

**3.3. Hirshfield surface analysis**

The 3D-Hirshfield surface analysis and 2D- finger print plots of HBFAA illustrated in Figure S4, shows surfaces that have been mapped over $d_{norm}$ (a), shape index (b) and curvedness (c) range of −0.750 - 1.083 Å, -1.0 - 1.0 and -4.0 - 0.4 Å. The investigated compound have dominant interaction between carboxylic acid O-H and oxygen atom (C=O) of carboxylic acid group leads to formation of $R^2_2(8)$ synthon, which can be visualized on Hirshfeld surface as the bright red areas marked with a and b, another dominant interaction between phenolic O-H and oxygen atom (C=O) of carboxylic acid group leads to formation of $R^2_2(20)$ synthon, which can be visualized on Hirshfeld surface as the bright red areas marked with c and d in Figure S4(A) and S4(B). The light red spot labelled as e represent weak C−H···O intermolecular interaction (Figure S4(A)). The $R^2_2(8)$ synthon and $R^2_2(20)$ synthon are formed by O-H···O hydrogen bonds, which are mapped on the $d_{norm}$ surface for visualizing the intermolecular contacts; the dotted lines represent the hydrogen bonds (Figure S4(B)).

In 2D fingerprint plots (Figure S4(C)), the O-H···Ointermolecular interactions appear as two distinct spikes (labeled as a and b) with almost equal length(Figure S4(C) are characteristics of nearly equal O(donor)···O(acceptor) distances leads to the formation of cyclic hydrogen-bonded $R^n_m(X)$ synthon. The upper spike marked as a in Figure S4(C) corresponds to the donor spike (H-atom of carboxylic acid group and phenolic group interacting with oxygen atom (C=O) of the COOH group), with the lower spike marked as b being an acceptor spike (oxygen atom (C=O) of carboxylic acid group interacting with the H-atom of carboxylic acid group as well as phenolic group).The wings encircled with red and black colour represents the C···H and H···H contacts (Figure S4(C)). It is evident that the H···H, O···H and C···H contacts can account for about 32.8%, 38.2% and 14.5% of the total Hirshfeld surface area. The other interactions are C···O, C···C, and O···O have only minor contribution.

**3.4. Vibrational assignments**

The calculated IR spectrum and Raman spectrum are shown (FigureS5 and S6) and assignments for each vibrational mode are given in Table4. In the following discussion, experimental values are compared with B3LYP/6-311G++(d,p) values, are good in agreement.

The carboxylic acid group is characterized by the -OH stretch, C=O stretch, OH out-of-plane deformation, C-O stretch and -OH in-plane deformation. The C=O stretching vibration mode observed as strong band in the region 1850-1550 $cm^{-1}$ [63]. In the present case C=O stretching vibration mode observed at 1750 $cm^{-1}$ in the IR spectrum, 1754 $cm^{-1}$ in the Raman spectrum and calculated value at 1753 $cm^{-1}$ high IR intensity and low Raman activity and with a PED 86%. The C(=O)O stretching mode coupled to OH in plane bending exhibits a band in the region 1250 ± 80 $cm^{-1}$, the B3LYP calculation give C-O stretching mode at 1280 $cm^{-1}$ and experimentally observed at 1282 $cm^{-1}$ (IR spectrum) and 1281 $cm^{-1}$ (Raman spectrum). The -OH in-plane deformation, coupled to the C-O stretching mode is expected in the region 1390±55 $cm^{-1}$ [63]and the band observed at 1312 $cm^{-1}$ in IR spectrum, 1317 $cm^{-1}$ in Raman spectrum and 1314 $cm^{-1}$ theoretically is assigned as the in-plane bending of -OH group which is not pure but contains contribution from other modes also. The deformation modes out-of-plane -OH, in-plane C=O and out of plane C=O are expected in the region 905 ± 65, 725 ± 95 and 595 ± 85 $cm^{-1}$, respectively [63, 64]. These bands are assigned at 909 $cm^{-1}$ (IR), 912 (Raman), 912 (B3LYP) and 617 (IR), 619 (Raman), 619(B3LYP) and 569 (Raman) and 571 (B3LYP), respectively. Ulahannan et al.,[65] reported the γ-OH mode at 926 $cm^{-1}$.

For the hydroxyl (-OH) group provides three normal vibrations; the stretching vibration, in-plane and out-of-plane deformations. The in-plane -OH deformation is expected in the region 1440 ± 40 $cm^{-1}$ [63]. The in-plane -OH deformation reported at 1429 $cm^{-1}$ in IR spectrum, 1428 $cm^{-1}$ in Raman spectrum, and at 1425 $cm^{-1}$ theoretically. For hydroxyl group -OH stretching vibration expected at 3380 ±200 $cm^{-1}$[63]. For title compound DFT calculations give OH stretching band at 3689 $cm^{-1}$ show PED 100% and a strong band observed at 3451 $cm^{-1}$ in the IR spectrum. The stretching of hydroxyl group aromatic moiety ν(C–O) appears at 1194 $cm^{-1}$ in the IR spectrum, 1196 $cm^{-1}$ in the Raman spectrum and the theoretical value is 1194 $cm^{-1}$ (B3LYP) this band is not pure, but contains significant contributions from other modes also and which is expected in the region 1220 ± 40 $cm^{-1}$ [66-68]. The out-of plane -OH deformation is observed at 617 $cm^{-1}$ in the IR spectrum, at 619 $cm^{-1}$ in the Raman spectrum and at 619 $cm^{-1}$ (B3LYP) theoretically, which is expected in the region 650 ± 80

$cm^{-1}$. Varghese et al., reported υ-OH at 3710 $cm^{-1}$ and δ-OH at 1332 $cm^{-1}$ theoretically and C–O stretching at 1245 $cm^{-1}$ in both IR and Raman spectra and 1242 $cm^{-1}$ theoretically [69]. For paracetamol, the C–O stretching mode and out-of-plane -OH are reported at 1240 and 620 $cm^{-1}$, respectively [70].

Compounds have one or more aromatic rings commonly exhibit multiple bands with weak to moderate in nature occur at above 3000 $cm^{-1}$ assigned as aromatic CH stretching vibrations [63, 64]. However, these bands are rarely useful because they overlap with one another bands resulting in stronger absorption in this region. The stretching vibrations bands observed at 3138, 3075, 3057, 3055 $cm^{-1}$ (B3LYP), 3073, 3065, 3054 $cm^{-1}$ (IR spectrum) and 3074, 3053 $cm^{-1}$(Raman spectrum)assigned as the νCH stretching modes for benzofuran ring. For aromatic CH in-plane and out-of-plane deformations are expected above and below 1000 $cm^{-1}$ [63, 64] and for in the present case, the bands assigned at 1250, 1242, 1194 $cm^{-1}$ (DFT), 1245, 1193 $cm^{-1}$ (IR spectrum), 1246, 1196, 1150 $cm^{-1}$ (Raman spectrum) (in-plane deformations) and at 912 $cm^{-1}$ (DFT), 909 $cm^{-1}$ (IR spectrum), 912 $cm^{-1}$ (Raman spectrum) (out-of-plane deformations).

For investigated compound, the phenyl ring C-C stretching modes are assigned at 1589, 1488, 1455, 1429, 1399, 1341 $cm^{-1}$ in the IR spectrum, 1581, 1508, 1487, 1444, 1427, 1392 $cm^{-1}$ in the Raman spectrum and at 1602, 1573, 1459, 1425, 1341 $cm^{-1}$ theoretically. The PED analysis gives ring breathing mode of PhI at 1041 $cm^{-1}$(DFT), 1040 $cm^{-1}$ (Raman spectrum) as expected [71] with a PED of 20% and low IR and Raman activity. According to literature [72, 73], the ring breathing mode of a polysubstituted phenyl ring is assigned at 1032, 1052 $cm^{-1}$ (DFT), 1025 $cm^{-1}$ (IR), 1027 $cm^{-1}$ (Raman) [72].

The vibrations of the $CH_2$ group, the asymmetric stretching ($\upsilon_{as}CH_2$), symmetric stretching ($\upsilon_sCH_2$), scissoring vibration, wagging, twisting and rocking appear in the region 3000 ± 50 $cm^{-1}$, 2885 ± 45 $cm^{-1}$ and 1445 ± 35 $cm^{-1}$, 1200-1100 $cm^{-1}$ and 1100-800 $cm^{-1}$ respectively [63, 66, 74]. The $CH_2$ vibrational modes of title compound are assigned at 2952 $cm^{-1}$ (DFT), 2950 $cm^{-1}$ (IR) , 2951 $cm^{-1}$ (Raman) (asymmetric stretching) and 2919 $cm^{-1}$ (DFT), 2917 $cm^{-1}$ (IR), 2917 $cm^{-1}$ (Raman) (symmetric stretching). In the present case, the scissoring mode of $CH_2$ observed at 1402 $cm^{-1}$ (IR), 1399 $cm^{-1}$ (Raman spectrum) and 1398 $cm^{-1}$ (DFT). The $CH_2$ wagging and twisting modes are assigned at 1341, 1167 $cm^{-1}$ (B3LYP), 1341, 1141 $cm^{-1}$ (IR), 1343, 1163 $cm^{-1}$ (Raman) respectively. The bands calculated at 912 $cm^{-1}$ are assigned as the rocking modes of $CH_2$.

### 3.5. $^1$H NMR spectrum

Precise prediction of molecular geometry measurement is necessary for reliable calculation of nuclear magnetic properties. Hence, after performing the full geometry optimization of title compound by DFT using B3LYP/6-311+G(d,p) basic set, chemical shift values computed by adopting Gauge-Independent Atomic Orbital (GIAO) approach [75, 76]. $^1$H-NMR spectrum provides information about the number of different types of protons and also the nature immediate environment to each of them. The experimental $^1$H-NMR spectrum of investigated compound recorded in DMSO-$d_6$ solvent with TMS as internal standard (Figure S7). The simulated nuclear magnetic spectra is computed by same method and calculated chemical shift values compile with experimental values, shows good in agreement (Table5). $^1$H NMR shows that aliphatic proton (7H and 8H) appeared in the upfield region at δ 3.591 ppm /3.47-3.58 ppm (experimental/ calculated). The signals of the aromatic proton were observed at in

range of δ 6.72-7.66 ppm, which are good in agreement with theoretical value of δ 6.68-7.34 ppm. The chemical shift values 14H in benzofuaran ring is calculated at δ 7.31 ppm which is good in agreement with the experimental value observed at δ 7.33 ppm and shows that the correlation between theoretical and experimental chemical shift values for title compound is good.

**3.6. Frontier Molecular Orbitals Analysis**

Electronic distribution and energy gap between highest occupied molecular orbitals (HOMO) and lowest molecular orbitals (LUMO), combination of these orbitals called as frontier molecular orbitals (FMOs) computed by DFT/B3LYP/6-311++G(d,p) method. The energy gap of HOMO and LUMO orbital reflect the biological activity, kinetic stability, chemical reactivity, Polarisability and hardness-softness of a molecule. The pictorial representation of HOMO-LUMO of the title compound shows (in Figure S8), it has continuous conjugation in it. The HOMO orbitals (electron donor) localized on $C_9$, $C_{11}$, $C_{15}$, $C_{17}$, $C_{18}$ aromatic carbon atoms, partially on phenolic –OH and aliphatic $–CH_2$ group, LUMO orbitals (electron acceptor) localized on $C_{11}$, $C_{12}$, $C_{15}$, $C_{15}$, $C_{17}$ aromatic carbon atoms and partially on phenolic –OH and aliphatic $–H_2C$-C=O group. The calculated energy value of HOMO (MO: 50) is -5.97 eV and LUMO (MO: 51) is -0.93 eV and the energy gap is 5.04 eV, it reflects that the stability whole molecule is appreciably high and less reactive. In order to understand the chemical reactivity of title compound, global reactivity parameters were calculated DFT method. Single point calculation was performed at DFT at 6-311++G(d,p) method. The difference in energies gave the vertical ionization potential (I) and vertical electron affinity (A) defined by equations, $I = E_{N-1} – E_N$, $A = E_N$-$E_{N+1}$, where $E_{N+1}$, $E_N$ and $E_{N-1}$ are the energies of the N+1, N and N-1 electron systems respectively [77, 78].The global chemical reactivity descriptors associated with title molecule are: ionization potential I = 7.7877 eV, electron affinity A = -0.3592 eV, electronegativity $\chi = (I+A)/2$ = 3.7142 eV, global hardness $\eta = (I-A)/2$ = 4.0734 eV, chemical potential $\mu = -(I+A)/2$ = -3.7142 eV and electrophilicity index $\omega = \mu^2/2\eta$ = 0.1227eV[79, 80].Electronic spectra of title compound calculated at TD-DFT/B3LYP/6-311++G(d,p) method and shown in Figure S9. In view of calculated absorption spectra, two absorption bands observed at 219 nm and 269 nm corresponding electron transitions from HOMO-1 to LUMO+1 and HOMO to LUMO, respectively. The transitions, wavelength, oscillator strength, CI coefficients can be seen in Table6.

**3.7. Local reactivity properties (MEP, ALIE and Fukui functions surfaces)**

Molecular electrostatic potential map (MEP) has been used to predict the reactive sites for electrophilic and nucleophilic attack, especially in studies of biological recognition and hydrogen bonding interactions [81, 82].The electrostatic interactions between receptor active sites and a molecule play an important role in determining its bio-reactivity. The molecular electrostatic potential V(r), at a given point r(x, y, z) in the vicinity of a molecule, is defined in terms of the interaction energy between the electrical charge generated from the molecule electrons and nuclei and a positive test charge (a proton) located at r.

Aside of the MEP, another frequently used quantum-molecular descriptor, very useful for the identification of molecule sites prone to electrophilic attacks, is average local ionization energy (ALIE). This descriptor is even better choice when it comes to the identification of molecule sites prone to electrophilic attacks and it is defined in the several papers by the group gathered around Peter Politzer[83-86].Both MEP and ALIE descriptors can be

visualized very intuitively, by mapping of their values to the electron density surface, Figure 2.

In Figure 2, red color marks the lowest values, while the purple color marks the highest values of MEP and ALIE. The electronegative (red) region is localized on the unprotonated atoms of $O_1$. However, the most electropositive region (blue-to-purple region) is located over the electron donating OH ($O_2$ and $O_4$) groups. Therefore, Figure 2 confirms the existence of an intermolecular $O_2$-$H_{22}$--$O_1$ and $O_4$-$H_{21}$--$O_1$ interactions. The value of the electrostatic potential is largely responsible for the binding of a substrate to its receptor binding sites since the receptor and the corresponding ligands recognize each other at their molecular surface [87].On the other side, the lowest ALIE values are located in the near vicinity of six-member and five-member rings, with the corresponding values of 196.18 kcal/mol. It can be seen, however, that ALIE surface doesn't recognize the unprotonated oxygen atom to be sensitive towards the electrophilic attacks. By comparison of MEP and ALIE surfaces in case of the HBFAA, it can be state that unprotonated oxygen atom of HBFAA is rich in electron density, however electron are tightly bound. Hydrogen atoms belonging to OH groups have been characterized by the highest MEP and ALIE values, and it can be expected that these atoms could have significant interactions with water, which will be investigated later.

Fukui functions have also been calculated, according to the finite difference approximation employed in the Jaguar program, and their values have been mapped to the electron density surface, similarly as in the case of MEP and ALIE values, Figure 3. Equations according to which Fukui functions have been calculated are as follows:

$$f^{+} = \frac{\left(\rho^{N+\delta}(r) - \rho^{N}(r)\right)}{\delta}, \tag{1}$$

$$f^{-} = \frac{\left(\rho^{N-\delta}(r) - \rho^{N}(r)\right)}{\delta}, \tag{2}$$

According to equations provided for Fukui functions it can be seen that Fukui $f^{+}$ function reflects the changes in electron density after the addition of the overall charge to the molecule. Oppositely, Fukui $f^{-}$ function reflects the changes in electron density after the removal of overall charge from the molecule.

The location of purple color in case of Fukui $f^{+}$ function indicates the locations where electron density increased after the addition of charge to the molecule HBFAA. It can be seen in Figure 3that such areas are located in near vicinities of hydrogen atoms attached to six-member and five-member ring. On the other side, negative color in the case of Fukui $f^{-}$ function indicates that electron density decreased in the near vicinity of unprotonated oxygen atom, marking it as a potentially important reactive site, same as in the case of MEP surface.

**3.8. NLO properties**

The NLO active materials receive much attention due to their various optoelectronic applications in the field telecommunication, optical mixing, optical phase conjugation and optical interconnection. For the title compound, the dipole moment, polarizability and first hyperpolarizability were calculated at DFT/B3LYP/6-311G++(d,p) (5D, 7F) basic set (listed in Table7) using Gaussian09W package and values are 0.6882 Debye, $10.7107 \times 10^{-24}$ esu and $4.49 \times 10^{-30}$ esu, respectively. The first hyperpolarizability of the title compound is 34.53 times

greater than that of standard NLO material urea [88].Therefore, the title compound is good candidates for future studies on NLO properties.

**3.9. NBO analysis**

The natural bond orbital (NBO) calculations were performed with NBO 3.1 program [89]which is implemented in the Gaussian09 package using B3LYP/ 6 -311++G(d,p) (5D, 7F) method which provides a convenient basis for investigation charge transfer or conjugative interactions in molecular system [90].

The second-order Fock-matrix was carried out to evaluate the donor–acceptor interactions. The interactions result in a loss of occupancy from the localized NBO of the idealized Lewis orbital into an empty non-Lewis orbital. For each donor (i) and acceptor (j) the stabilization energy (E2) associated with the delocalization i → j is determined as

$$E(2) = \Delta E_{ij} = q_i \frac{(F_{i,j})^2}{(E_j - E_i)} \quad (3)$$

$q_i$ → donor orbital occupancy;

$E_i$, $E_j$ → diagonal elements;

$F_{ij}$ → the off diagonal NBO Fock matrix element.

In NBO analysis largerE(2) value shows the intensive interaction between electron-donors and electron-acceptors, and greater the extent of conjugation of the whole system, the possible intensive interaction are given in Table 8 and 9. The second-order perturbation theory analysis of Fock-matrix in NBO basis shows strong intermolecular hyper conjugative interactions are formed by orbital overlap between n(O), and σ*(C-C), π*(C-C), σ*(O-C), π*(O-C), bond orbitals which result in ICT causing stabilization of the system. These interactions are observed as an increase in electron density (ED) in O-C and C-C anti bonding orbital that weakens the respective bonds. There occurs a strong inter molecular hyper conjugative interaction of $O_2$-$C_5$ from $O_1$ of $n_2(O_1)\rightarrow\sigma^*(O_2\text{-}C_5)$ which increases ED (0.10157e) that weakens the respective bonds $O_2$-$C_5$ leading to stabilization of 34.27 kJ/mol and also the hyper conjugative interaction of $C_5$-$C_6$ from $n_2(O_1)$ of $n_2(O_1)\rightarrow\sigma^*(C_5\text{-}C_6)$ which increases ED (0.07320e) that weakens the respective bonds $C_5$-$C_6$ leading to stabilization of 19.45 kJ/mol. There occurs a strong inter molecular hyper conjugative interaction of $O_1$-$C_5$ from $O_2$ of $n_2(O_2)\rightarrow\pi^*(O_1\text{-}C_5)$ which increases ED (0.20006e) that weakens the respective bonds $O_1$-$C_5$ leading to stabilization of 42.74 KJ/mol. There occurs a hyper conjugative interaction of $C_9$-$C_{11}$ from $O_3$ of $n_2(O_3)\rightarrow\pi^*(C_9\text{-}C_{11})$ which increases ED (0.23670e) that weakens the respective bonds $C_9$-$C_{11}$ leading to stabilization of 24.77 KJ/mol and also the hyper conjugative interaction of $C_{12}$-$C_{20}$ from $O_3$ of $n_2(O_3)\rightarrow\pi^*(C_{12}\text{-}C_{20})$ which increases ED (0.45633e) that weakens the respective bonds $C_{12}$-$C_{20}$ leading to stabilization of 25.90 kJ/mol. Again a hyper conjugative interaction of $C_{17}$-$C_{18}$ from $O_4$ of $n_2(O_4)\rightarrow\pi^*(C_{17}\text{-}C_{18})$ which increases ED (0.38606e) that weakens the respective bonds $C_{17}$-$C_{18}$ leading to stabilization of 27.63 kJ/mol. These interactions are observed as an increase in electron density (ED) in C-C and O-C anti bonding orbitals that weakens the respective bonds.

The electron density (ED) is transferred from the n(O) to the anti-bonding π* orbital of the C-C and O-C bonds. The hyper conjugative interaction energy was deduced from the second-order perturbation approach. Delocalization of electron density between occupied Lewis-type (bond or lone pair) NBO orbitals and formally unoccupied (anti bond or Rydberg) non-Lewis

NBO orbitals corresponds to a stabilizing donor-acceptor interaction. Hence the structure 2-(6-hydroxybenzofuran-3-yl)acetic acid is stabilized by these orbital interactions.

The NBO analysis also describes the bonding in terms of the natural hybrid orbital $n_2(O_1)$, which occupy a higher energy orbital (-0.28215 a.u) with considerable p-character (99.88%) and low occupation number (1.84362) and the other $n_1(O_1)$ occupy a lower energy orbital (-0.71498 a.u.) with p-character (41.21%) and high occupation number (1.97774). The NBO analysis also describes the bonding in terms of the natural hybrid orbital $n_2(O_2)$, which occupy a higher energy orbital (-0.35430 a.u) with considerable p-character (99.94%) and low occupation number (1.83167) and the other $n_1(O_2)$ occupy a lower energy orbital (-0.64576 a.u) with p-character (54.48%) and high occupation number (1.97781). The NBO analysis also describes the bonding in terms of the natural hybrid orbital $n_2(O_3)$, which occupy a higher energy orbital (-0.33746 a.u) with considerable p-character (99.94%) and low occupation number (1.74432) and the other $n_1(O_3)$ occupy a lower energy orbital (-0.58492 a.u) with p-character (62.47%) and high occupation number (1.97357). The NBO analysis also describes the bonding in terms of the natural hybrid orbital $n_2(O_4)$, which occupy a higher energy orbital (-0.33072 a.u) with considerable p-character (99.94%) and low occupation number (1.88100) and the other $n_1(O_4)$ occupy a lower energy orbital(-0.61369 a.u) with p-character (55.15%) and high occupation number (1.97904). Thus, a very close to pure (almost 100%) p-type lone pair orbital participates in the electron donation to the $\pi^*(C_{17}\text{-}C_{18})$ orbital for $n_2(O_4)\rightarrow\pi^*(C_{17}\text{-}C_{18})$, $\pi^*(C_{12}\text{-}C_{20})$ orbital for $n_2(O_3)\rightarrow\pi^*(C_{12}\text{-}C_{20})$ and $\pi^*(O_1\text{-}C_5)$ orbital for $n_2(O_2)\rightarrow\pi^*(O_1\text{-}C_5)$ interactions in the compound.

**3.10. Mulliken atomic charge analysis**

The Mulliken atomic charge values have been obtained by the Mulliken population analysis. The charge distribution on the molecule has an important role in the application of quantum chemical calculations, it helpful to describe the processes of electronegativity equalization and charge transfer in chemical reactions [91, 92],also to model of the electrostatic potential outside molecular surfaces [93-95].

The Mulliken population analysis in HBFAA molecule was computed using B3LYP/6-311++G(d,p) basic set and are listed in Table S10. Hydrogen atoms $H_{22}$, $H_{21}$ have maximum positive charge value -0.277 e and -0.262 e, respectively and other hydrogen atoms exhibit net positive charge its magnitudes between 0.143 e and 0.212 e. So, $H_{22}$, $H_{21}$hydrogen atoms have acidic in nature. The presence of more negative charge on oxygen atom ($O_1$, -0.247 e) and a net positive charge on hydrogen atom ($H_{22}$ (0.277 e), $H_{21}$ (0.262 e)) may also support the formation of$O_2$–$H_{22}\cdots O_1$ and $O_4$–$H_{21}\cdots O_1$ intermolecular hydrogen bonding in title compound.

**3.11. Temperature dependence of thermodynamic properties**

Thermodynamic parameters are very important for to obtain reliable relations among structural, energetic, and reactivity characteristics of the molecules. Density Functional Theory is a very well established and efficient tool to predict various statistical thermodynamic properties of the molecules.

The thermodynamic parameters dipole moment, thermal energy and zero point vibrational energies of HBFAA were calculated by using B3LYP/6-311++G (d,p) at 298.15 K and 1 atm pressure are listed in Table S11. Scale factors have been recommended [96] for a removal of anharmonicity effect and perfect predictions in determining the zero-point vibrational

energies, entropy (S), heat capacity (C) and the enthalpy changes (ΔH) in the temperature range 100–1000 K. The results are tabulated in Table S12 from analysis of results we can observed that thermodynamic parameters increase with respective rise of temperature due to molecular vibrational intensities increase with temperature [97].

**3.12. Sensitivity towards autoxidation mechanism and water**

In order to obtain a clearer picture of the local reactivity of molecule HBFAA, in this work we have also analysed sensitivity of title molecule towards the autoxidation mechanism, by DFT calculation of bond dissociation energies for hydrogen abstraction (H-BDE). Degradation is one of the most important mechanisms for the removal of toxic organic compounds [21, 23, 98, 99].In the same time, it is also known that oxidative reactions are highly important for the degradation of toxic organic compounds [100].Since there is a correlation between autoxidation mechanism and H-BDE, in this work we have decided to employ this approach in order to evaluate to what extent HBFAA could be sensitive towards autoxidation, Figure 4.

According to the results provided in Figure 4, it can be concluded that HBFAA could be highly sensitive towards autoxidation mechanism. Namely, if the H-BDE parameter takes values between 70 and 85 kca/mol, it indicates that the observed molecule could be highly sensitive towards autoxidation mechanism [101, 102]. In the same time, values between 85 to 90 kcal/mol could also be indicative of sensitivity towards autoxidation mechanism, however they should be taken with caution [102].HBFAA has two important locations, with respect to the values of H-BDE. Namely, H-BDE in cases of hydrogen atoms $H_6$ and $H_7$ is having values of ~82 kcal/mol, indicating sensitivity towards autoxidation mechanism. Additionally, hydrogen atom $H_{21}$, belonging to OH group, has the H-BDE value of ~86 kcal/mol, which also indicates possible sensitivity towards autoxidation.

Taking into account the importance of water in terms of resource which frequently accommodates organic pharmaceutical pollutants, in this work we have also calculated radial distribution functions (RDF) after MD simulation, with the purpose to identify atoms with the strongest interactions with water molecules. RDFs of atoms with significant interactions have been provided in Figure 5.

Results of RDF indicate that two hydrogen atoms belonging to OH groups have highly pronounced interactions with water molecules. Both of these hydrogen atoms have very sharp g(r) profiles, with their maximal g(r) values located at distance significantly lower than 2 Å. By comparing RDF of two hydrogen atoms it can be concluded that $H_{22}$ has slightly stronger interactions with water molecules, due to the fact that it's maximal g(r) value is significantly higher than maximal g(r) value of the $H_{21}$. Results presented in Figure 5 also indicate that autoxidation mechanism could hardly occur at the site of hydrogen atom $H_{21}$, as this atom has strong interactions with water molecules probably preventing oxidation at this site. Other atoms with relatively significant interactions with water molecules are oxygen atoms $O_2$ and $O_4$, with $O_4$ having slightly stronger interactions.

**3.13. Charge transfer**

Charge transfer between HBFAA has been investigated within the framework of Marcus semi-empiric approach. Within this approach, charge transfer rates can be calculated according to the following expression [57, 58]:

$$k_{ET} = \frac{4\pi^2}{h} \frac{1}{\sqrt{4\pi\lambda k_B T}} t^2 \exp\left[\frac{-\lambda}{4 k_B T}\right]. \quad (4)$$

In the last equation, $\lambda$ mark the reorganization energies of electrons ($\lambda_-$) and holes ($\lambda_+$), while *t* is the charge transfer integral which is in this work calculated in dimmer splitting approximation. Reorganization energies ($\lambda_i$, where *i* can be "–" or "+") have been calculated according to the following equations (4-6):

$$\lambda_1 = E^0(G^*) - E^0(G^0) \quad (5)$$

$$\lambda_2 = E^*(G^0) - E^*(G^*) \quad (6)$$

$$\lambda_i = \lambda_1 + \lambda_2 \quad (7)$$

In equations (4) – (7), $E^0(G^0)$ and $E^*(G^*)$ denote ground state energies of the neutral and ionic states, respectively, $E^0(G^*)$ denotes energy of the neutral molecule at the optimal ionic geometry and $E^*(G^0)$ denotes energy of the charged state at the optimal geometry of the neutral molecule. The aforementioned approach is widely used for evaluation of potential of molecules to be applied in the area of organic electronics [59].

Reorganization energies and average charge transfer rates of electrons and holes in crystal and amorphous phase have been summarized in Table 10. Average charge transfer rates have been obtained by summarizing charge transfer rates for all considered pairs and then dividing with the total number of considered pairs.

Results in Table 10 indicate that charge transfer rate of holes is one order of magnitude higher in comparison with charge transfer rate of electrons. It can be seen also that an average charge transfer rates are higher in the case when molecular pairs have been extracted from the amorphous phase in comparison with crystal phase, which is to be expected due to the higher amount of orbital overlap.

Figures 6.a-d contain molecular pairs of HBFAA taken from crystal phase, while molecular pair of HBFAA with the highest charge transfers from the amorphous phase has been presented in Figure 6.e. Corresponding charge transfer rates have been summarized in Table 11.

According to Table 11, it can be seen that the highest charge transfer rates in the case of pairs from crystal phase have been calculated for molecular pair illustrated in Figure 6b. Thus, it can be concluded that the highest orbital overlap occurs between OH group connected to benzene from one side and furan side chain from the other side. Concerning the amorphous phase and thanks to the illustration in Figure 6e, it can be stated that the highest orbital overlap occurred between atoms connected to benzene ring, i.e. mainly between OH groups.

## 4. Conclusion

The title compound 2-(6-hydroxy-1-benzofuran-3-yl) acetic acid was synthetized and characterized by FT-IR, FT-Raman, NMR and SCXRD techniques. SCXRD studies and Hirshfeld surface analysis shows the investigated molecule stabilised by O-H···O and C-H···O inter molecular interactions. The optimization of molecular structures, vibrational frequencies, frontier molecular orbitals, NLO and NBO analysis of investigated compound carried out using B3LYP/6-311++G(d,p) method. The complete analysis each vibrational mode were performed; results shows that good in agreement between experimental and

calculated vibrational modes. First order hyperpolarizability of HBFAA is 34.53 times greater than that of standard NLO material. Detailed study of local reactive properties has been performed by obtaining MEP, ALIE and Fukui function surfaces. MEP surface indicated the reactive importance of the unprotonated oxygen, while the lowest ALIE values were located in the near vicinities of benzene and furan rings. Fukui $f^+$ function indicated that electron density increases in the near vicinity of three hydrogen atoms when charge is added to the molecule, while Fukui $f^-$ function indicated that electron density decreased in the near vicinity of unprotonated oxygen atom in the case when charge is removed from the molecule. H-BDE values indicated that molecule HBFAA could be highly sensitive towards autoxidation mechanism at molecular sites of hydrogen atoms $H_6$ and $H_7$. On the other side, MD simulation and calculated RDFs indicated that hydrogen atoms $H_{21}$ and $H_{22}$ have very strong interactions with water molecules, which might be very important for understanding the stability of this molecule in water. The analysis of charge transfer rates enabled us to identify for which orientations of molecule HBFAA the highest charge transfer occurs.

Highlights

- Solid state crystal structure and intermolecular contacts are studied by Single crystal X-ray diffraction and Hirshfeld surface analysis.
- The complete vibrational assignments were performed on the basic of the potential energy distribution (PED).
- Most reactive sites are identified.
- MEP, ALIE, BDE and Fukui function have been discussed in detail.
- The analysis of charge transfer rates between title molecules is also done.

ABSTRACT

A new compound *N*-(2,5-dimethyl-4-nitrophenyl)-4-methylbenzenesulfonamide (NDMPMBS) has been derived from 2,5-dimethyl-4-nitroaniline and 4-methylbenzene-1-sulfonyl chloride. Structure was characterized by SCXRD studies and spectroscopic tools. Compound crystallized in the monoclinic crystal system with $P2_1/c$ space group $a = 10.0549$, $b = 18.967$, $c = 8.3087$, $\beta = 103.18$ and $Z = 4$. Type and nature of intermolecular interaction in crystal state investigated by 3D-Hirshfeld surface and 2D-finger print plots revealed that title compound stabilized by several interactions. The structural and electronic properties of title compound have been calculated at DFT/B3LYP/6-311G++(d,p) level of theory. Computationally obtained spectral data was compared with experimental results, showing excellent mutual agreement. Assignment of each vibrational wave number was done on the basis of potential energy distribution (PED). Investigation of local reactivity descriptors encompassed visualization of molecular electrostatic potential (MEP) and average local ionization energy (ALIE) surfaces, visualization of Fukui functions, natural bond order (NBO) analysis, bond dissociation energies for hydrogen abstraction (H-BDE) and radial distribution functions (RDF) after molecular dynamics (MD) simulations. MD simulations were also used in order to investigate interaction of NDMPMBS molecule with 1WKR and 3ETT proteins protein.

## 1. Introduction

$SO_2$–NH group is a key constituent of sulfonamide pharmaceuticals, which are promising chemotherapeutic agents used for treatment of various diseases [1]. Sulfa-drugs possess a wide verity of medicinal chemistry applications such as antiprotozoal [2], antibacterial [3], antifungal [4], insecticidal [5], anti-inflammatory [6], carbonic anhydrase inhibitor [7] and rheumatoid arthritis [8]. Recent literature reports indicate that sulphonamides are also applied in the cases of Alzheimer's [9], cancer [10,11] and HIV [12] diseases as well. Besides pharmaceutical applications, sulphonamides are also used as reagents in analytical chemistry for concentration, separation, selective qualitative and quantitative determination of the 3d transition metal cations [13–15]. Sulfonamide compounds have been studied extensively and numerous experimental and computational reports. Xing et al. reported the crystal structure of 4-methyl-*N*-(4-nitrophenyl)benzenesulfonamide [16]. Sarojini et al. reported synthesis, structural, spectroscopic and computational studies of 4-methyl-*N*-(3-nitrophenyl) benzene sulfonamide combining experimental and theoretical approaches [17]. Rajamani et al. investigated electronic absorption, vibrational spectra, nonlinear optical properties, NBO analysis and thermodynamic properties of *N*-(4-nitro-2-phenoxyphenyl) methanesulfonamide molecule within the Hartree-Fock and

density functional approaches [18]. Govindarasu et al. carried out detailed experimental and computational DFT study of *N*-phenylbenzenesulfonamide [19].

In this paper we report synthesis, detailed spectroscopic and computational characterization of *N*-(2,5-dimethyl-4-nitrophenyl)-4-methylbenzenesulfonamide (NDMPMBS) molecule. In order to uniquely characterize the title compound we have measured FT-IR, Raman and NMR spectra. Spectral data were also computed within DFT approach in order to validate the used level of theory. Computational investigation within DFT approach has proven to be effective tool for investigation of physical and chemical properties of various organic molecules [20–24] and in this study we used it to study both global and local quantum-molecular descriptors of the title compound. Taking into account that organic pharmaceutical molecules such as NDMPMBS represent great threat for water resources [25–30], we have also investigated sensitivity of NDMPMBS towards autoxidation and hydrolysis, in order to gain an insight into its possible degradation properties.

## 2. Material and methods

### 2.1. General remarks

FT-IR spectrum (Fig. 1) was recorded in solid state using KBr disc in the range of 4000–600 $cm^{-1}$ on ATR module ALPHA-T Bruker FT-IR spectrophotometer. FT-Raman spectrum (Fig. 2) was measured for solid sample on Bruker RFS 100/s, Germany using Nd:YAG laser source, excitation wave length 1064 nm with spectral resolution 2 $cm^{-1}$ in the region of 0–4000 $cm^{-1}$.$^{1}$H and $^{13}$C NMR chemical shift values were reported in ppm using TMS as internal standard on Bruker 400 MHz spectrometer.

### 2.2. Synthesis of N-(2,5-dimethyl-4-nitrophenyl)-4-methylbenzenesulfonamide

To a stirred solution of 2,5-dimethyl-4-nitroaniline (0.5 g, 3.01 mmol) in pyridine (5 mL), 4-methylbenzene-1-sulfonyl chloride (0.86 g, 4.51 mmol) was added. The reaction mixture was stirred for 16 h at room temperature. After completion of reaction by TLC, the reaction mixture was diluted with D.M.water and acidified with dilute HCl solution. Solid was filter, washed with D.M.water, MTBE and followed by 1:1 ethyl acetate: hexane. Dried under vacuum to afford (0.67 g, 69%) of *N*-(2,5-dimethyl-4-nitrophenyl)-4-methylbenzene-1-sulfonamide as pale yellow solid (Scheme-1 supporting information). Suitable single crystals were grown by slow evaporation solution growth technique at ambient temperature using chloroform: methanol (1:3) solvent.

### 2.3. X-ray data collection and refinement details

A suitable prism like crystal was selected and mounted on a Bruker APEX-II CCD diffractometer using graphite monochromated MoKa (λ = 0.71073 Å) radiation and detector (CCD). The crystal was kept at 273 (2) K during data collection. The structure was solved using Olex2 software with the olex2. solve [31] structure solution program using Charge Flipping and the structure was refined with the ShelXL [32] refinement package using Least Squares minimization. All the non-hydrogen atoms were revealed in the first difference Fourier map itself and were refined anisotropically. All the hydrogen atoms were positioned geometrically. All H atoms were positioned geometrically, with C–H = 0.96 Å for methyl H, C–H = 0.93 Å for aromatic H, and refined using a riding model with $U_{iso}(H) = 1.5U_{eq}(C)$ for methyl H and $U_{iso}(H) = 1.2U_{eq}(C)$ for aromatic H. The nitrogen bound H atom was located in a difference map and was refined isotropically with the bond length restraint N–H = 0.86 (2) Å. All the geometrical calculations were carried out using the program *PLATON* [33] within the WinGX suite [34]. The molecular and packing diagrams were generated using the software *MERCURY* [35]. The crystallographic data and refinement parameters are summarized in Table 1.

### 2.4. Computational details

Firstly, molecular structure of the title compound was extracted from the single crystal X-ray structure to be used as a starting geometry for geometry optimization. The molecular geometry optimization in gas phase together with vibrational analysis, frontier orbital analysis (HOMO-LUMO), MEP, surface analysis and Mullikan atomic charges calculation were performed at DFT level of theory with B3LYP [36] hybrid exchange-correlation functional and 6-311G++(d,p) (5D, 7 F) basis set, using Gaussian 09 software package [37]. The assignment and PED analysis of wave number were done by GaussView 5.0 program [38] and VEDA4 program [39]. For better agreement of calculated wavenumber number with

experimental values, the wave numbers were scaled by a scaling factor 0.9613 [40]. DFT calculations were also performed with Jaguar 9.6 [41] program with B3LYP functional and 6–311++G (d,p), 6-31 + G (d,p), 6-311G (d,p) basis sets for calculations of ALIE, Fukui functions and BDEs, respectively. MD simulations and RDF calculations were performed with Desmond program [42–45]. Both Jaguar and Desmond programs were used as implemented in Schrödinger Materials Science Suite 2017–2 [45]. In case of the MD simulation, one molecule of title compound was placed in the cubic box with approximately 3000 water molecule. OPLS3 force field [42,46–48] was used and the model was of NPT ensemble class. Simulation time was set to 10 ns, temperature to 300 K, pressure to 1.0325 bar, with cut-off radius set to 12 Å. Simple point charge (SPC) model [49] was used for description of solvent. An approach developed by Johnson et al. [50,51], as implemented in Jaguar program, was applied for the investigation of intra molecular non-covalent interactions.

### 2.5. Hirshfeld surfaces

The 3D-Hirshfeld surfaces [52–54] and the corresponding 2D-fingerprint plots ($d_e$ *vs* $d_i$) [55–57], provides summary and quantification of the intermolecular interactions in the crystal structure [52,58], were generated by using CrystalExplorer3.1 [59] and which accepts a structure input file in the CIF format. The $d_{norm}$ values are mapped onto the Hirshfeld surfaces by using a rainbow colour scheme (red-white-blue): where a red colour indicates contacts shorter than sum of van der Waals radii, white colour denotes for contacts around the *vdW* and blue colour specifies contacts longer than sum of van der Waals radii.

## 3. Result & discussion

### 3.1. Molecular and crystal structure

The *ORTEP* view of the molecule of the title compound is shown in Fig. 3. The dihedral angle between the two benzene rings in the title compound is 85.54 (6)°. The nitro group is essentially planar (rmsd = 0.003 Å) and is tilted to the aniline ring by 25.86 (3)°. The atoms around the sulfonamide $S_{37}$ atom in the title compound are arranged in a slightly distorted tetrahedral arrangement as observed generally in sulfonamides. The biggest deviation is in the angle $O_{33}$–$S_{37}$–$O_{34}$ of 119.34 (1)°, followed by 104.14 (2)° of $O_{33}$–$S_{37}$–$N_{31}$. The V shaped molecular conformation is stabilized by intramolecular C–H···O hydrogen bonds involving $H_{18}$ and $O_{34}$ atoms (Fig. 3, Table 2) that encloses to form a S (6) motif. In the crystal, molecules are linked by pairs of N–H···O hydrogen bonds involving amino nitrogen atom $N_{31}$ as the hydrogen bond donor and sulfonyl oxygen atom $O_{33}$ as the acceptor. These two hydrogen bonds form inversion related $R^2_2$ (8) dimers (Fig. 4(a), Table 2). These dimers are linked by C–H···O hydrogen bonds involving $H_{14}$ hydrogen atom and the sulfonyl oxygen atom $O_{34}$ to form a double C (7) chains propagating along the c-axis direction and forming a ribbon like architecture (Fig. 4(a)). Neighbouring ribbons are linked via offset π … π interactions [*Cg* … *Cg* = 3.9058 (19) Å; interplanar

distance = 3.6104 (19) Å; slippage = 1.490 Å; symmetry code: 1-x,1-y, 1-z] between the nitro aniline rings $C_{11}/C_{12}/C_{13}/C_{15}/C_{16}/C_{18}$ forming a two dimensional sheet parallel to the *ac*-plane, as illustrated in Fig. 4(b).

### 3.2. Hirshfeld surface analysis

The Hirshfeld surfaces of title compound display in Fig. 5(a), the surfaces have been mapped over $d_{norm}$ (A), shape index (B) and curvedness (C) in the range of −0.452 to 1.427 Å, −1.0 to 1.0 Å and −4.0 to 0.4 Å, respectively. Two major interactions are observed, first interaction between sulfonamide $N_{31}$–$H_{38}$ with $O_{33}$ of sulphonamide, which can visualize as dark red areas and labelled as a and a'. Another, interaction between $O_{34}$ of sulfonamide with the $C_{13}$–$H_4$ of nitrobenzene, which can be seen as bright red spots marked as b and b' in Fig. 5(a) and (b), on the $d_{norm}$ mapped surfaces. The upper spike denoted with b (Fig. 5(c)) corresponds to the donor spike ($H_{38}$ atom in $SO_2NH$ group interacting with $O_{33}$ atom of the $SO_2NH$ group), with the lower spike indicate with a corresponding to an acceptor spike ($O_{33}$ atom of the $SO_2NH$ group with $H_{38}$ atom of the $SO_2NH$ group), both are look like sharp spikes with almost same in length and forming inversion dimers that enclose $R^2_2$ (8) loops. Fig. 5(c), depicted H···H contacts appears as spikes, indicate with red circle and the wings encircled with black due to the C···H contacts. From the fingerprint analysis revealed that the H–H (36.5%) and O–H (36.4%) and C–H (17.6%) contacts appears to be a predominant contribution in the crystal packing.

### 3.3. Optimized geometry

Full geometry optimization (shown in Fig. 3) of title compound was carried out for isolated molecules in gas phase at DFT/B3LYP/6–311++G (d,p) method, initially coordinates obtained from X-ray

structure without any constraints. Selected geometrical parameters (bond length (Å), bond angle (°) and torsion angle (°) of investigated compound are listed in Table 3). The comparative study shows a good agreement among the computational and experimental parameters (Supplementary information). The computational geometrical parameters are slightly more than that of experimental values. Because of, the experimental results were based on molecules in the solid state, while the computed values were carried in gas phase for isolated molecule.

### 3.4. Vibrational spectral analysis

The calculated (scaled) wavenumbers, experimental IR, Raman bands and assignments are given in Table 4.

The N–H stretching vibration mode generally measured in region 3500-3300 $cm^{-1}$ [60,61]. In the present case, the bands observed at 3277 $cm^{-1}$ (IR), 3276 $cm^{-1}$ (Raman) and 3488 $cm^{-1}$ (DFT) is assigned as NH stretching vibration mode. The mode (mode no 1) is pure and PED is exactly 100%. The difference between computational and experimental N–H stretching vibration is 171 $cm^{-1}$ for IR and 172 $cm^{-1}$ for Raman, this may due to the N–H–O intermolecular interaction of title molecule in crystal state. The N–H in-plane bending vibration mode is usually expected around 1400 $cm^{-1}$ [17]. In the present case, the bands observed at 1386 $cm^{-1}$ in the IR spectrum, 1384 $cm^{-1}$ in the Raman spectrum and 1391 $cm^{-1}$ for DFT (B3LYP) are assigned to the N–H in plane bending vibration mode, this is good agreement with literature values. The mode number 79 have calculated wave number at 492 $cm^{-1}$ correlate well with experimental Raman spectrum at 493 $cm^{-1}$ assigned as NH out-of-plane bending vibration.

The asymmetric and symmetric stretching modes of the methyl group are expected in the regions 3000 ± 50 $cm^{-1}$ and 2900 ± 45 $cm^{-1}$ [62,63]. For the title compound the stretching modes are assigned at 2981 $cm^{-1}$ (Raman), in the range 2999–2940 $cm^{-1}$ (B3LYP) (asymmetric stretching modes); 2924 $cm^{-1}$ (IR), 2925 $cm^{-1}$ (Raman) and in the region 2929-2895 $cm^{-1}$ (B3LYP) (symmetric stretching modes) as expected. The asymmetric and symmetric deformations vibrations of methyl group generally appear in the region of 1400–1485 $cm^{-1}$ and 1380-1420 $cm^{-1}$, respectively [64–67]. For title compound, the bands calculated at 1449, 1435, 1434, 1432, 1430, 1421 $cm^{-1}$ (B3LYP), experimentally observed at 1448, 1418 $cm^{-1}$ (IR) (asymmetric deformation) and 1367, 1363, 1362 $cm^{-1}$ (B3LYP) (symmetric deformation vibrations), shows good agreement with literature values. For the investigated compound, the rocking modes of methyl group are calculated at 1023, 1021, 1017 and 970 $cm^{-1}$ (B3LYP) and experimentally observed at 970 $cm^{-1}$ in the Raman spectrum, assigned as expected. The $CH_3$ torsion vibrational modes are usually appear in the region 185 ± 65 $cm^{-1}$ [62], the bands assigned at 206, 188, 168 and 28 $cm^{-1}$ (B3LYP).

The stretching vibration modes of aromatic nitro group are expected in range, 1570-1485 $cm^{-1}$ (asymmetric stretching) and 1370-1320 $cm^{-1}$ (symmetric stretching) [68]. For in case of investigated compound, these modes are assigned at 1521, 1502 $cm^{-1}$ (IR), 1520, 1502 $cm^{-1}$ (Raman), 1541, 1505 $cm^{-1}$ (B3LYP) (asymmetric stretching modes); 1300 $cm^{-1}$ (IR and Raman), 1305 $cm^{-1}$ (DFT) (symmetric stretching modes). Both the modes show high IR intensity and Raman activity. The $NO_2$ deformation modes (scissoring, out-of-plane wagging, in-plane rocking and torsion) are expected in the regions 855 ± 40, 760 ± 30, 540 ± 30 and 70 ± 20 $cm^{-1}$ respectively [62]. The bands at 858, 734 $cm^{-1}$ in IR spectrum, 857, 734 $cm^{-1}$ in Raman spectrum and 847 and 732 $cm^{-1}$ (DFT) are assigned as deformation modes of $NO_2$ group of title compound. The reported values of the $NO_2$ deformations modes are 809, 727, 524 $cm^{-1}$ (experimentally), 800, 727, 534 $cm^{-1}$ (DFT) [69].

The asymmetric and symmetric stretching vibrational modes fall in region 1330-1295 $cm^{-1}$ and 1150-1125 $cm^{-1}$, respectively for $SO_2$ group [70]. In the present case, the bands computed at 1267 and 1082 $cm^{-1}$ (DFT), experimentally observed at 1260, 1086 $cm^{-1}$ in the IR spectrum and 1260 and 1085 $cm^{-1}$ in the Raman spectrum are assigned as $SO_2$ asymmetric and symmetric stretching modes. The $SO_2$ stretching mode is not pure, but it contains contribution from other modes. Although the region of the $SO_2$ scissoring (560 ± 40 $cm^{-1}$) and that of $SO_2$ wagging vibration mode (500 ± 55 $cm^{-1}$) partly overlap, the two vibrations appear separately [62]. The DFT calculation of these bands at 567 $cm^{-1}$ and 515 $cm^{-1}$, observed at 566 $cm^{-1}$ and 515 $cm^{-1}$ in the Raman spectrum assigned as wagging and scissoring, respectively. The twisting vibrational mode of $SO_2$ is fall in region 400 ± 50 $cm^{-1}$ and rocking vibrational mode at around 350 $cm^{-1}$ [62]. For the present case, these modes are computed at 426 $cm^{-1}$ and 255 $cm^{-1}$, respectively.

The SN stretching vibration modes are expected in region 905 ± 30 $cm^{-1}$ [62] and in present study, the bands observed at 798 $cm^{-1}$ (IR), 797 $cm^{-1}$ (Raman) and 801 $cm^{-1}$ (B3LYP) assigned as these modes. The PED is 33% with IR intensity (145.02) and Raman activity (44.11) respectively. From the references the CN stretching vibration modes are fall in the region 1275 ± 55 $cm^{-1}$ [62], for the title compound the vibrational modes expected at 1337, 1017 $cm^{-1}$(IR), 1336, 1015 $cm^{-1}$ (Raman) and 1349, 1225, 1017 $cm^{-1}$ (theoretically). The stretching vibration modes for CS generally lie in the region 930-670 $cm^{-1}$ [71]. The CS stretching vibrational wave number for title compound calculated at 629 $cm^{-1}$ and experimentally observed at 632 $cm^{-1}$ (IR and Raman) as expected [71], PED of 21% and with high IR intensity (147.45) and low Raman activity (19.42).

The C–H stretching vibrational modes of substituted benzene ring are generally observed in the region 3000-3100 $cm^{-1}$ [62]. In present case, the C–H modes are assigned at 3102, 3084, 3059 $cm^{-1}$ (IR) and 3101, 3077, 3059, 3045 $cm^{-1}$ (Raman) and 3088, 3087, 3086, 3075, 3050, 3046 $cm^{-1}$ (B3LYP) as expected. The stretching vibration modes (2–7) are pure with PED contribution around 100%. The in-plane and out-of-plane aromatic CH deformation

[a] ν-stretching; δ-in-plane deformation and out-of-plane deformation; τ-torsion; 2,5-dimethyl 4-nitrophenyl and tosyl ring are represented as PhI and PhII; potential energy distribution is given in brackets (%) in the assignment column.

modes are expected above and below 1000 cm$^{-1}$ [62] and for in the case of investigated compound these modes assigned at 1283, 1278, 1260, 1156, 1089 cm$^{-1}$ (IR), 1278, 1260, 1089 cm$^{-1}$ (Raman), 1283, 1278, 1267, 1236, 1095 cm$^{-1}$ (B3LYP) (in-plane deformation) and at 895, 818 cm$^{-1}$ (IR), 895, 817 cm$^{-1}$ (Raman), 896, 818 cm$^{-1}$ (B3LYP) (out-of-plane deformation). The aromatic ring stretching vibrational modes expected in the region 1615-1260 cm$^{-1}$ [62]. For the investigated compound, the bands experimentally observed at 1572, 1502, 1386, 1278 cm$^{-1}$ (IR), 1595, 1573, 1502, 1384, 1278 cm$^{-1}$ (Raman) and in the range of 1596–1278 cm$^{-1}$ (B3LYP) assigned as these modes.

### 3.5. NMR spectral analysis

NMR spectroscopy is one of the important and valuable tool for identification of structural and functional groups of the molecules. $^{13}$C and $^{1}$H NMR chemical shifts values of title compound were recorded in DMSO solvent (TMS as internal standard), calculated in DMSO at GIAO method [72] using DFT/6-311G++(d,p) basic set, which provide information about the number of different types of carbon atoms and the number of different types of protons present in the molecule, respectively. The $^{13}$C and $^{1}$H NMR spectra are given in Fig. 6(a) and (b). Correlated results of experimental and calculated $^{13}$C and $^{1}$H NMR chemical shifts values are given in Table 5.

The result in Table 5 shows that the range of $^{13}$C NMR chemical shift of typical organic molecule usually is > 100 ppm [73,74] the accuracy ensures reliable interpretation of spectroscopic parameters. In $^{13}$C NMR spectrum, upfield signal observed at 16.92, 19.68 and 20.95 ppm and calculated at 16.85, 24.07, 22.09 ppm was assigned to methyl carbon atoms at $C_{23}$, $C_{27}$ and $C_{19}$. The signals for aromatic carbons (tosyl ring and nitrobenzene ring) were observed at 126.57–145.12 ppm and calculated at 124.86–154.11 ppm for DFT. The $C_{15}$ carbon of nitrobenzene ring appears 145.12 ppm due to nitro substitution, calculated as 150.35 ppm. The signal at $C_1$ and $C_6$ carbons of tosyl ring appears at 137.31 ppm (147.51 ppm) and 139.89 ppm (154.11 ppm) (experimental/calculated) due to methyl group as well as sulfonyl group substitution. The signal at 143.59 ppm is assigned as $C_{11}$ carbon of nitrobenzene ring due to amine group substitution, which was calculated at 149.61 ppm, show good agreement.

The title compound have 16 protons occur in three regions, out of which 9 protons attached to methyl groups, one protons is attached nitrogen (N–H proton) and 6 protons are aromatic protons. The 9 methyl protons are occur in the upfield region at δ 2.04, 2.37, 2.42 ppm (experimental) and calculated at 2.01, 2.35, 2.64 ppm, shows good agreement. The N–H proton observed experimental at 10.01 ppm and computed at 6.07 ppm. The phenyl ring protons are observed around at 7.20–7.82 ppm (experimental) which shows good agreement with calculated value 7.45–8.17 ppm.

### 3.6. Electronic spectra and frontier molecular orbital analysis

Electronic spectra of title compound calculated in DMSO as well as methanol solution by TD-DFT/PCM model using B3LYP/6-311G++(d,p) basic set (Table 6). The electronic spectra of the title

compound (in Figure S2 and S3 supporting information) illustrate an electronic absorption band with maxima at 349 nm (DMSO) and 347 nm (methanol), is due to the electronic transition from the ground state to the first excited state. It is mainly described by one-electron excitation from the HOMO (characterizes by the ability of electron donating) to LUMO (characterizes by the ability of electron accepting). Diagrammatic representation of HOMO-LUMO proved in Fig. 7, HOMO (MO 84) is confined on –NH–$SO_2$ group and delocalized over nitrobenzene; LUMO (MO 85) is confined on nitro group, delocalized on benzene ring of nitrobenzene. Consequently, HOMO→LUMO transition implies an electron cloud transfer from –$SO_2$ group to nitro group through the benzene ring of title compound. In case of title compound, the calculated energy values of HOMO and LUMO are −7.01 eV and −2.7 eV, respectively and the energy separation between HOMO and LUMO is 4.31 eV.

In order to understand the chemical reactivity of title compound, global reactivity parameters were calculated DFT method.

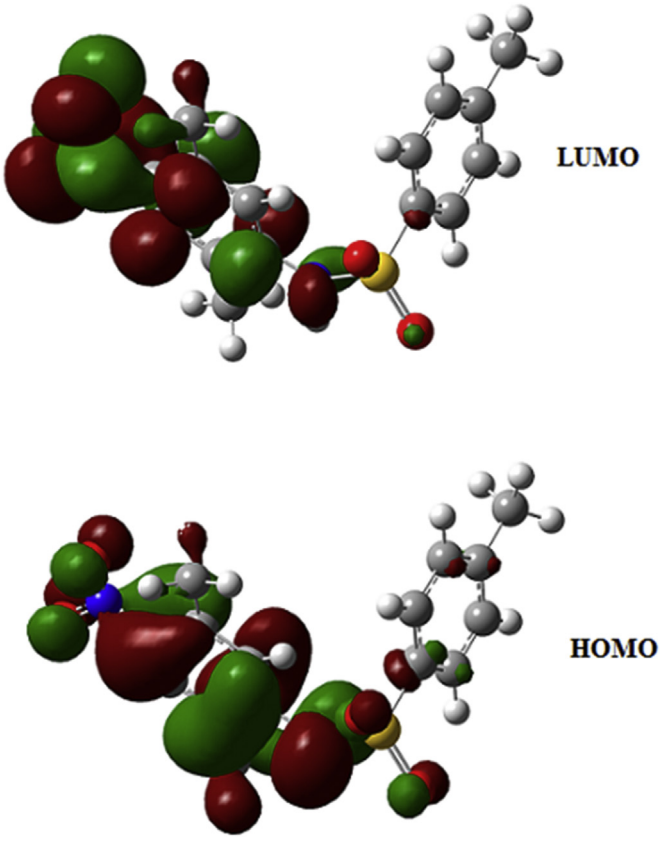

**Fig. 7.** HOMO-LUMO plots of *N*-(2,5-dimethyl-4-nitrophenyl)-4-methylbenzene sulfonamide.

Single point calculation was performed at DFT at 6–311++G (d,p) method. The difference in energies gave the vertical ionization potential (I) and vertical electron affinity (A) defined by equations, $I = E_{N-1} - E_N$, $A = E_N - E_{N+1}$, where $E_{N+1}$, $E_N$ and $E_{N-1}$ are the energies of the N+1, N and N-1 electron systems respectively [75]. The magnitude of global reactivity descriptor values as tabulated in Table 7 were calculated with the help of energies of Ionization potential (I) and electronic affinity (A) utilizing equations provided in the supplementary material.

### 3.7. Local reactivity properties of NDMPMBS – MEP and ALIE surfaces, Fukuifunction surfaces and non-covalent interactions

In order to locate possibly important reactive sites of the newly synthetized NDMPMBS molecule, in this study we have also investigated frequently used quantum-molecular descriptors such as MEP, ALIE and Fukui functions. Values of the aforementioned quantities have been mapped to the electron density surface in order to visualize their distribution within NDMPMBS molecule, Figs. 8–10.

We begin with the identification of possibly important reactive (electrophilic and nucleophilic) sites by the molecular electrostatic potential (MEP) surface, which is a very useful descriptor in studies of biological recognition and hydrogen-bonding interactions [76,77]. The pictorial representation with rainbow colour scheme of electrostatic potential for title compound has been shown in Fig. 8, in the range of −6.012 a. u. to +6.012 a. u. The darkest red colour denotes electron rich regions (V(r) <-6.012 a. u.) that could be sensitive towards electrophilic attacks. According to Fig. 8 these regions are localized over oxygen atoms $O_{33}$ and $O_{34}$ (belonging to sulfonyl group) and oxygen atoms $O_{35}$ and $O_{36}$ (belonging to the nitro group). The darkest blue colour indicates electron poor regions (V(r) > +6.012 a. u.), and therefore the molecule sites that could be sensitive towards the nucleophilic attacks.

Also, the electrostatic potential mapped over the $d_{norm}$ surface of the neighbouring molecules (Figure S4 supporting information) clearly showed that the electrostatic potential on the hydrogen bond donors and acceptors in the neighbouring molecules are to one another (red spots close to H-acceptor and blue spots close to H-bond donors), thus provide further evidence to the $R^2_2$ (8) hydrogen bond pattern formed by N–H–O hydrogen bonds (Figure S4 supporting information). indicates the occurrence of $N_{31}$–$H_{38}$–$O_{33}$, $C_{13}$–$H_{14}$–$O_{34}$ and $C_{17}$–$H_{18}$–$O_{34}$ interactions in title compound. ALIE surface is even more reliable tool than MEP for the identification of molecule sites sensitive towards electrophilic attacks, since ALIE values show molecule areas where electrons are least tightly bound [78–81]. Representative ALIE surface (Fig. 9) of NDMPMBS molecule emphasizes the importance of oxygen atoms $O_{35}$ and $O_{36}$, when it comes to the sensitivity to electrophilic attacks. These molecule sites are characterized by the lowest ALIE values of ~217 kcal/mol. Intramolecular noncovalent interactions have also been visualized in Fig. 9. Two noncovalent interactions were formed between oxygen and hydrogen atoms ($O_{34}$–$H_{18}$ and $O_{36}$–$H_{30}$), with very similar strength of ~0.015 electron/bohr$^3$.

The importance of oxygen atoms $O_{35}$ and $O_{36}$ from the aspect of reactivity has been also confirmed by Fukui functions as well, Fig. 10. Fukui functions give information about the changes in electron density as a consequence of charge addition or removal. Purple color in Fig. 10(a) gives information about where electron density increased after the charge addition, while negative color in Fig. 10(b) gives information where electron density decreased after the charge addition. According to the results presented in Fig. 10(a), electron density could increase in the near vicinity of oxygen atoms $O_{36}$ and $O_{37}$ after the charge addition. On the other side, results in Fig. 10(b) indicate that electron density decreases in the near vicinity of oxygen atoms $O_{33}$ and $O_{34}$ after the charge removal.

**Table 7**
The energy values of global reactivity descriptors (Ionization potential (IP), electron affinity (EA), electro negativity (χ), chemical potential (μ), global hardness (η), global softness (σ) and global electrophilicity (ω)) for title compound.

| Parameter | Value (eV) |
|---|---|
| Ionization potential (IP) | 8.48 |
| Electron affinity (EA) | 1.09 |
| Electronegativity (χ) | 4.78 |
| Chemical potential (μ) | −4.78 |
| Global hardness (η) | 3.69 |
| Global softness (σ) | 0.13 |
| Electrophilicity index (ω) | 3.09 |

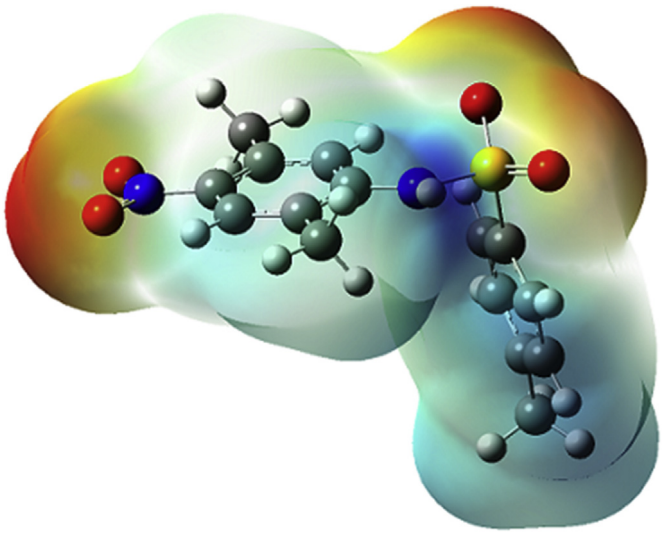

**Fig. 8.** MEP plot of *N*-(2,5-dimethyl-4-nitrophenyl)-4-methylbenzenesulfonamide.

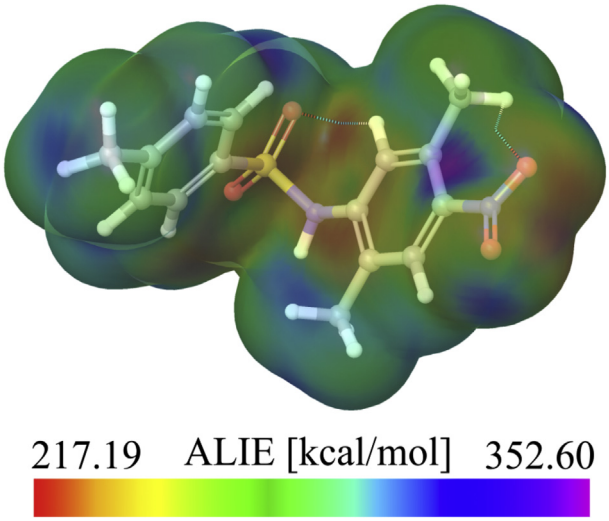

**Fig. 9.** Representative of ALIE surface of *N*-(2,5-dimethyl-4-nitrophenyl)-4-methylbenzenesulfonamide.

### 3.8. Nonlinear optical properties

Nonlinear optical materials occupy a foremost function in nonlinear optics and in particular they have a great impact on information technology and industrial applications. NLO properties find applications in optical communication, telecommunications, optical phase conjugation, frequency mixing, optical mixing, dynamic image processing, signal processing and second harmonic wave generation [82–84]. Total dipole moment ($\mu_o$), anisotropy of the polarizability ($\alpha_{tot}$), mean polarizibility ($\Delta\alpha$), and first-order hyperpolarizibilitiy($\beta$) of NDMPMBS were calculated at DFT/B3LYP/6-311G++(d,p) method and listed in Table 8. The dipole moment and mean polarizability of the title compound are 2.2670

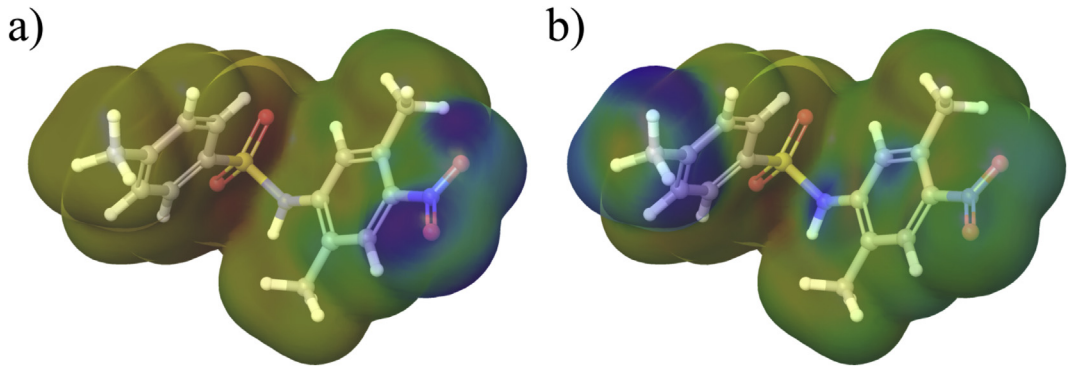

**Fig. 10.** Fukui functions of *N*-(2,5-dimethyl-4-nitrophenyl)-4-methylbenzenesulfonamide.

Debye and 7.4165 × $10^{-24}$ esu. The is first-order hyperpolarizibilitiy(β) of NDMPMBS calculated and is found to be 12.02 × $10^{-30}$ esu which is 92.46 times greater than that of the standard NLO material urea (0.13 × $10^{-30}$ esu) [85]. The highest value of first-order hyperpolarizibilitiy(β) may be due transfer of π-electron cloud from donor (sulphonamide group) to acceptor (nitro group) which makes molecule highly polarized and the possibility of intra molecular charge transfer (ICT).

### 3.9. NBO analysis

The natural bond orbital (NBO) calculations were performed using NBO 3.1 program [86] as executed in the Gaussian09 suite at the B3LYP/6–311++G (d,p) (5D, 7 F) basic set which offers a suitable basis for examining the various interactions in both filled and virtual orbital spaces that could enhance the analysis of inter and intramolecular interactions. The second-order Fock-matrix was carried out to evaluate the donor–acceptor interactions in the NBO basis [87,88]. In NBO analysis large E (2) value shows the intensive interaction between electron-donors and electron-acceptors, and greater the extent of conjugation of the whole system, the possible intensive interaction are given in Tables 9 and 10.

The strong interaction $n_3(O_{35}) \rightarrow \pi^*(N_{32}–O_{36})$ has the highest E (2) value 155.95 kJ/mol and an another interaction has been in $n_1(N_{31}) \rightarrow \pi^*(C_{11}–C_{17})$ with an energy of 23.39 kJ/mol. Table 10 gives the occupancy of electrons and p-character in significant NBO natural atomic hybrid orbital. Almost, a very close to pure p-character was observed in π-bonding of $C_{11}–C_{17}$, $N_{32}–O_{36}$ and lone pairs of $n_2O_{33}$, $n_2O_{34}$, $n_2O_{35}$, $n_3O_{35}$, $n_2O_{36}$, $n_1N_{31}$.

### 3.10. Mulliken atomic charge analysis

The Mulliken atomic charges of investigated compound calculated at DFT/B3LYP/6-31 + G (d,p) method in gaseous state are given in Table 11. It is based on the linear combination of atomic orbitals and therefore the wave function of the molecule are obtained from Mulliken population analysis [89]. The charge distribution on the molecule has an important role in the application of quantum chemistry calculations for the molecular system.

From the analysis of Table 11, hydrogen atoms of title compound shows atomic charges with positive values in the range of 0.138–0.308 and but some H atoms exhibit more positive atomic charges $H_{38}$ (0.308), $H_{14}$ (0.247) and $H_{18}$ (0.266) comparative other hydrogen atoms and possess acidic nature. Due to the presence of more negative atomic charges values on oxygen atom $O_{33}$ (−0.131), $O_{34}$ (−0.100) and nitrogen atom $N_{31}$ (−0.215), net positive atomic charge values on hydrogen atom $H_{38}$ (0.308), $H_{14}$ (0.247) and $H_{18}$ (0.266) may support the formation of hydrogen bonding $N_{31}–H_{38}–O_{33}$, $C_{13}–H_{14}–O_{34}$ and $C_{17}–H_{18}–O_{34}$.

### 3.11. Sensitivity towards autoxidation and stability in water

Modern water purification methods in the case of organic pharmaceutical pollutants are based on the oxidation reactions [90–92]. In terms of computational molecular modelling techniques, the concept of bond dissociation energies (BDE) can be useful for predicting molecule's weak spots where degradation could start. Particularly, bond dissociation energies for hydrogen abstraction (H-BDE) resemble the molecule's sensitivity towards autoxidation mechanism [93–95], while in the same time BDEs for the remaining single acyclic bonds can be very useful for predicting

**Table 8**

[a] E (2) means energy of hyper-conjugative interactions (stabilization energy in kJ/mol).
[b] Energy difference (a.u) between donor and acceptor i and j NBO orbitals.
[c] F (i,j) is the Fock matrix elements (a.u) between i and j NBO orbitals.

where degradation mechanism could start.

Since majority of pharmaceutical pollutants eventually end up in the water resources, it is also of great importance for predictions of degradation properties to understand the stability of molecules in water. This can be done thanks to the molecular dynamics (MD) simulations and radial distribution functions (RDF), which are very useful for the identification of atoms with pronounced interactions with water molecules. The results regarding BDEs are presented in Fig. 11, while Fig. 12 contains information on the most important RDFs.

Results presented in Fig. 11 indicate the absence of H-BDE values lower than at least 90 kcal/mol. This indicates that the title

molecule is not sensitive towards the autoxidation mechanism. Namely, all of the H-BDE values are much higher than the desired threshold of 90 kcal/mol, with the lowest H-BDE values calculated for hydrogen atoms of methyl groups, thanks to which it is expected that the title molecule is stable in the presence of oxygen. The lowest BDE value of the rest of the single acyclic bonds have been calculated in the case of N—S bond, with BDE value of just 41 kcal/mol, indicating that degradation could start precisely by breaking of this bond. Other significantly low BDE values have been calculated in the cases of C—N bond (N belonging to the $NO_2$ group) and C—S bond, with BDE values of around 70 kcal/mol, indicating that detachment of benzene or $NO_2$ group could occur during the degradation.

Calculations of RDFs indicate that six atoms of NDMPMBS have high and sharp RDF curves. However, five of six of the aforementioned atoms have their maximal g($r$) values located at distances of around 4 Å. Certainly, the most important RDF has been calculated in the case of hydrogen atom $H_{38}$, with its maximal g($r$) value located at distance of 2 Å, which indicates significant interactions with water molecules. This hydrogen atom with the most important RDF curve is located adjacent to the bond with the lowest BDE value, indicating that the influence of water could be of importance for the degradation of NDMPMBS.

### 3.12. Drug likeness and molecular docking

Drug likeness properties associated to the Lipinski's rule of five [96,97] for the newly synthetized NDMPMBS molecule have been calculated and summarized in Table 12. According to all parameters provided in Table 12 it can be concluded that newly synthetized NDMPMBS molecule could be considered as a candidate for practical applications in some pharmaceutical formulation. Namely, the AlogP value is 3.67, which is far below the desired threshold of 5. In the same time, prospective drug candidates should have less than 5 and 10 HBD and HBA, respectively. These prerequisites are also fulfilled by the NDMPMBS molecule. Ghose et al. [98], have stated that the molar refractivity should be in the range between 40 and 130, while PSA should take values less than 140 $Å^2$. Inspection of Table 12 clearly indicates that these criteria are satisfied by the NDMPMBS molecule, including the criteria by Veber et al. [99], for the number of rotatable bonds, which should be lower than 10. NDMPMBS molecule is also very close to satisfy the Congreeve's rule of three [100]. Namely, the Congreeve's rule of three is just slightly violated by the NDMPMBS molecule in terms of somewhat higher AlogP value and one more rotatable bond.

Drug likeness parameters motivated us to further investigate NDMPMBS molecule from the aspect of pharmaceutical properties. In order to identify in which direction NDMPMBS molecule could exhibit its biological activity we have employed the Prediction of Activity Spectra for Substances (PASS) online software [101], which screens the biologically activity spectrum of the potential drug candidates taking into account the large training set. The results concerning the predicted biological activities have been summarized in Table 13, where Pa represents the probability for molecule to be active, while Pi represents the probability for molecule to be inactive. Table 13 contains information about activities that are higher than 0.7.

According to the screening of biological activities by PASS it can be seen that NDMPMBS molecule has significantly high probabilities to be active as inhibitor of arylsulfatesulfotransferase and

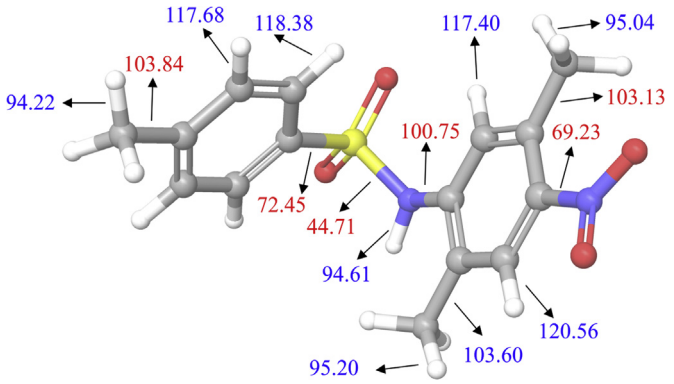

**Fig. 11.** BDE of all single acyclic bonds of *N*-(2,5-dimethyl-4-nitrophenyl)-4-methylbenzenesulfonamide.

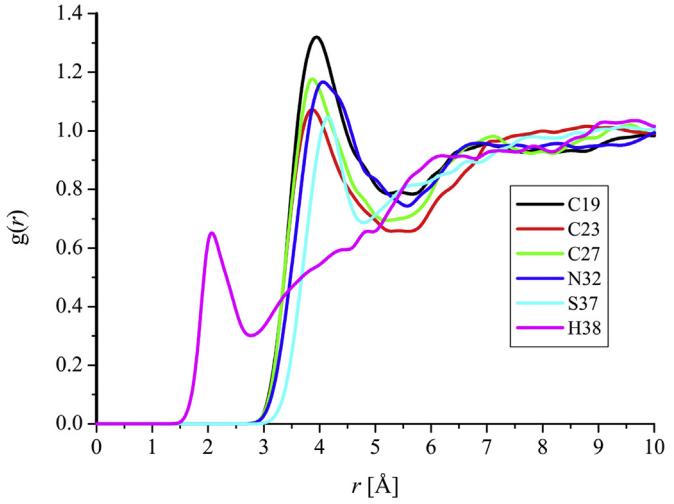

**Fig. 12.** RDF's of atoms of *N*-(2,5-dimethyl-4-nitrophenyl)-4-methylbenzenesulfonamide with significant interactions with water.

**Table 12**
Drug likeness parameters for the NDMPMBS molecule.

| Descriptor | Value |
|---|---|
| Hydrogen Bond Donor (HBD) | 1 |
| Hydrogen Bond Acceptor (HBA) | 2 |
| Mass | 320.40 |
| AlogP | 3.67 |
| Polar surface area (PSA) [Å2] | 97.69 |
| Molar refractivity | 85.34 |
| Number of atoms | 38 |
| Number of rotatable bonds | 4 |

polyporopepsin. Since probabilities for these two activities are very similar, we have decided to investigate how NDMPMBS molecule binds to the representatives of proteins related to arylsulfate-sulfotransferase and polyporopepsin. Using the RCSB protein databank and taking into account the arylsulfatesulfotransferase and polyporopepsin inhibitor acitivites we have chosen to investigate docking of NDMPMBS to proteins with PDB IDs: 1WKR and 3ETT, respectively.

Molecular docking has been performed with Autodock4 tools, while preparation of ligand and proteins has been performed with AutoDock tools [102]. After being imported from the protein databank, proteins have been firstly prepared by the set of the

**Table 13**
PASS predicted biological activities of NDMPMBS.

| Pa | Pi | Activity |
|---|---|---|
| 0.889 | 0.004 | Arylsulfate sulfotransferase inhibitor |
| 0.888 | 0.007 | Polyporopepsin inhibitor |
| 0.860 | 0.005 | Glutamyl endopeptidase II inhibitor |
| 0.850 | 0.003 | Phospholipid-translocating ATPase inhibitor |
| 0.766 | 0.011 | Omptin inhibitor |
| 0.757 | 0.010 | Venombin AB inhibitor |
| 0.744 | 0.003 | Antiprotozoal (Coccidial) |
| 0.758 | 0.023 | Benzoate-CoA ligase inhibitor |
| 0.731 | 0.004 | Aspergillopepsin I inhibitor |
| 0.724 | 0.011 | 2-Hydroxymuconate-semialdehyde hydrolase inhibitor |
| 0.734 | 0.056 | Ubiquinol-cytochrome-c reductase inhibitor |

actions including: removal of water molecules, addition of hydrogen atoms and addition of charges according to Gasteiger-Marsili approach. Protein sites which contained docked molecules from the experimentally obtained results were used as a target search space for docking studies. Fig. 13 contains illustration of the docked NDMPMBS molecule to the surface of the two selected proteins, while binding energies of several representative docking modes have been summarized in Table 14.

Results provided in Fig. 13 and Tables 12–14 indicate great potential of the newly synthesized NDMPMBS molecule for application in pharmaceutical applications. Fig. 13 and Table 14 illustrate that NDMPMBS molecule binds to 1WKR and 3ETT proteins with significantly high binding energies. In both cases binding energy of the most representative docking mode had the value of −7.20 kcal/

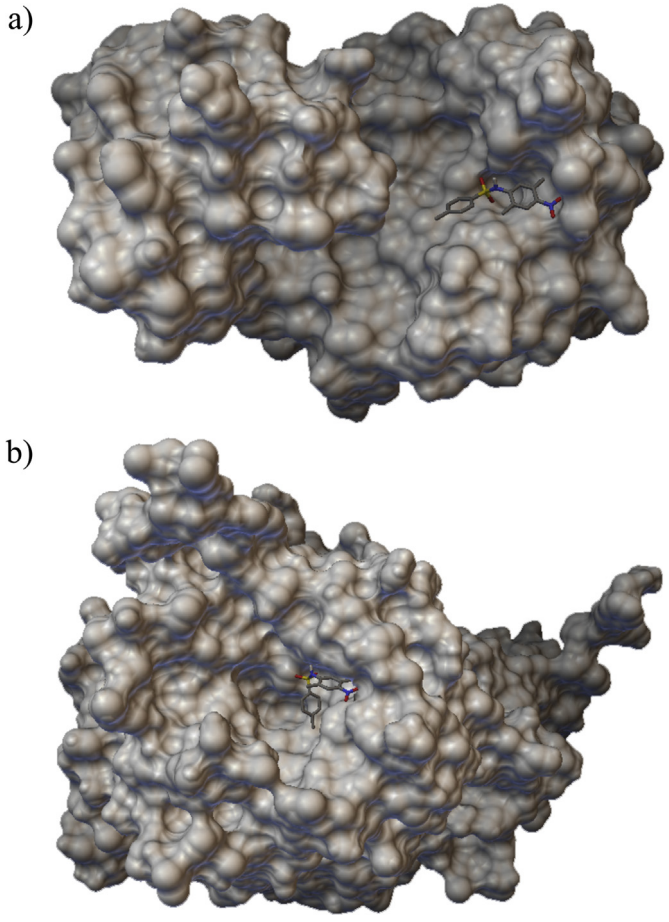

**Fig. 13.** Docked NDMPMBS molecule at the surface of a) 1WKR and b) 3ETT proteins.

**Table 14**
The binding energies of several modes for docking of NDMPMBS against 1WKR and 3ETT

| Mode | Binding energy with 1WKR (kcal/mol) | Binding energy with 3ETT (kcal/mol) |
|---|---|---|
| 1 | −7.20 | −7.20 |
| 2 | −6.96 | −7.12 |
| 3 | −6.90 | −7.12 |
| 4 | −5.77 | −7.01 |
| 5 | −5.76 | −6.97 |
| 6 | −5.70 | −6.85 |
| 7 | −5.62 | −6.78 |
| 8 | −5.61 | −6.66 |
| 9 | −5.46 | −6.97 |
| 10 | −5.45 | −6.79 |

mol. However, the remaining docking modes in the case of 3ETT protein had higher magnitudes of binding energies than in the case of 1WKR protein. Thus, the molecular docking results indicate that the newly synthetized molecule could be considered as a candidate with significant activity against the bacterial arylsulfatesulfotransferase catalytic intermediate (3ETT).

## 4. Conclusion

*N*-(2,5-dimethyl-4-nitrophenyl)-4-methylbenzenesulfonamide has been synthesized and characterized by single crystal X-ray diffraction, FT-IR, FT-Raman, $^{1}H$ and $^{13}C$ NMR. The molecular conformation is stabilized by $C_{17}—H_{18}—O_{34}$ intra-molecular hydrogen bond that encloses to form a S (6) motif. The vibrational spectroscopic studies of title compound were investigated experimentally (FT-IR and FT-Raman) and theoretically. The complete assignment of normal mode of vibrations was done by potential energy distribution analysis. Computationally predicted geometrical parameters are good in agreement with the experimental SCXRD data. HOMO is confined on $-NH-SO_2$ group and delocalized over nitrobenzene; LUMO is confined on nitro group, delocalized on benzene ring of nitrobenzene which gives charge transfer process in the molecular system. The most electrophilic sites are oxygen atoms of sulfonyl group as well as nitro group and neucleophilic sites are amine hydrogen as well as other hydrogen atoms. The is first-order hyperpolarizibilitiy($\beta$) of NDMPMBS calculated and is found to be $12.02 \times 10^{-30}$ esu which is 92.46 times that of the standard NLO material urea. ALIE surfaces and Fukui functions indicate that oxygen atoms $O_{35}$ and $O_{36}$ could be important reactive centres of the NDMPMBS molecule. H-BDE values indicate that NDMPMBS molecule is not sensitive towards the autoxidation, however BDE of the N—S bond has very low value of just 41 kcal/mol, indicating that degradation mechanism could start with the breaking of this bond. Analysis of RDFs indicate that hydrogen atom $H_{38}$ has pronounced interactions with water molecules, which could be also of importance for the degradation of NDMPMBS molecule, since $H_{38}$ is adjacent to the weakest single acyclic bond. Drug likeness parameters indicate high potential of the title molecule for the practical pharmaceutical applications.

## Acknowledgments

The authors are highly thankful to the UGC for financial assistance. Authors are grateful to Prof. K. Saraswathi, Dept. of Chemistry, S.V.University, Tirupati for her constant support and encouragement. The authors are highly thankful to Professor V.R. Pedireddi, Solid State & Supramolecular Structural Chemistry Laboratory, School of Basic Sciences, IIT Bhubaneswar for the collection of diffraction data. Part of this work has been performed thanks to the support received from Schrödinger Inc. Part of this study was conducted within the projects supported by the Ministry of Education, Science and Technological Development of Serbia, grant numbers OI 171039 and TR 34019.

**Abstract-** In this review, various approaches for nano-formulations for poor soluble and low permeable drugs are focused, advantages and future scope for the nono formulations in pharmaceutical industries are elaborated. For the manufacture of new medicines new manufacturing technology is needed. In the pharmaceutical formulations pellets dosage forms gives the improved results compare to tablet dosage forms. According to ICH BCS (BIOPHARMACEUTICS CLASSIFICATION SYSTEM) drugs class four, Low solubility, Low permeability drugs. Improved use of Low solubility, Low permeability drugs pelletized formulation at Nano level is proposed. Nano level pelletized drug formulations gives the better results compared to normal, micro level pelletized drug formulations.

**Key words-** Analytical method development, Nano-formulation, and Nano-chemistry

## 1. INTRODUCTION

Our daily life is depends on quality of the food we eat, the medicine we use the water we drink, and the air we breathe. The compound which is interacts with a biological organism to produce a biological response that may be favorable or harmful. Favorable is known as medicine, harmful is known as poison. Due to expressed development in the field of science and technology new medications are rapidly coming in to the market for new syndrome. For the manufacture of new medicines new manufacturing technology is needed. In the pharmaceutical formulations pellets dosage forms gives the improved results compare to tablet dosage forms. These dosage forms summarized in terms of safety, purity, efficacy and stability. Final pharmaceutical pellets dosage forms comprises an active pharmaceutical ingredient (API) combined with a varying number of excipients. Some of the Active pharmaceutical ingredients are Low solubility, Low permeability nature (BCS class four). To overcome the low solubility, low permeability problem we are proposing nano level formulations methodology. Very few researchers are worked on the Nano technology applications for drug molecules, even though not related to Nano pelletized formulations. Nano pelletized formulations gives the improved results in controlling of various types of diseases compare to normal, micro level formulations. Due to this reason we are concentrating on nano level pelletized formulations, and its analytical method development. Our ultimate aim is "Best medication for Healthier world" with lesser price.

## 2. OBJECTIVES

- Our daily life is mainly depends on quality of the air, water, food medicine, without these we are unable to assume our life.
- The compound which is interacts with a biological system to produce a biological response that may be Beneficial is known as medicine, harmful is known as poison.
- Manufacturing of medicines are regulated by Food and Drug administration (FDA): International conference on harmonization (ICH): Current good manufacturing practices (cGMP): Pre-approval Inspections (PAIS): World health organization (WHO), ultimate aim is quality of medicines for healthier world.
- The pharmacopeias (USP, B.P, IP, and E.P) necessities for a pharmaceutical dosage form may be summarizing in terms of safety, purity, efficacy and stability.
- Final pharmaceutical formulations comprises an active pharmaceutical ingredient (API) combined with a varying number of excipients.
- The word "Pellet" describes a variety of systematically produced, geometrically defined agglomerates obtained from various starting materials utilizing different processing conditions.

- Pellets have various therapeutic advantages over traditional single units, such as tablets and powder-filled capsules.
- According to ICH BCS (BIOPHARMACEUTICS CLASSIFICATION SYSTEM) drugs class four, Low solubility, Low permeability drugs.
- Improved use of Low solubility, Low permeability drugs pelletized formulation at Nano level is proposed.
- Nano level pelletized drug formulations gives the better results compared to normal, micro level pelletized drug formulations.
- In house Analytical methods have to be developed and validated for the Analysis of nano level drug formulations.
- Our ultimate aim is to produce the best medicines for healthier world with lesser cost.

## 3. IMPORTANCE OF THE PROPOSED AREA IN THE PRESENT CONTEXT

With the aim of producing "Quality medicines in low prices for healthier world", we are reviewing of Nano level pelletized formulations for low solubility, Low permeability drug materials. According ICH these are BCS (BIOPHARMACEUTICS CLASSIFICATION SYSTEM) drugs class four. Very lesser number of researchers doing the research work related to Nano technology applications to drugs formulations, but not doing pelletized formulations in Nano level. These formulations gives the effective medicines with lesser side effects compare to normal, micro level formulations. Nano level pelletized formulations advantages as follows.

- Solubility of the drugs can be increases.
- Permeability of the drug in biological matter can be increases.
- Lesser amount of drug dosage is required to control the disease.
- Side effects are less compare to normal and micro level drug dosage formulations.
- Consumption of drugs dosage frequency is less.

Due to above advantages proposed Review i.e Nano level Pelletized formulations place important role in invention of Medicines.

The compound which is interacts with a biological organism to produce a biological response that may be favorable or harmful. favorable is known as medicine, harmful is known as poison. for example, penicillin reacts with bacterial cause to kill them.

Penicillin

Penicillin is a medicine for Humans due to it interacts with bacteria and kills them. In case of bacteria it is a (biological system) poison.

The articulated development in the field of science and technology utilized as on date merged with relatively stringent new regulations, namely federal drug authority, latestly called as food and drug administration (FDA):International conference on harmonization (ICH): Current good manufacturing practices(cGMP): Pre-approval Inspections(PAIS):World health organization(WHO), like organizations are now serving as a legal binding specifically for the pharmaceutical formulations and drug analysis.

## 4. ROLE OF API'S IN DRUG FORMULATIONS

APIs are core active substances mixed with a carrier in any medication. When any of the active substance is not easily absorbed by the human body; the substance is dissolved into or mixed with an excipient so that the human body easily receives it. Further these actives are used as medications.

4.1. According to ICH BCS (BIOPHARMACEUTICS CLASSIFICATION SYSTEM) drugs class four, Low solubility, Low permeability drugs. Consider example for API(Active pharmaceutical Ingredient)

- ACECLOFENAC ($C_{16}H_{13}Cl_2NO_4$), chemically [(2-{2, 6-dichlorophenyl) amino} phenylacetooxyacetic acid],
- Acyclovir (ACV): It also known as acyclovir is an antiviral medication. It is primarily used for the treatment of virus infections, chickenpox, and shingles.

*4.2. Pellets*

The word "Pellet" has been used to exemplify a variety of systematically produced, geometrically defined agglomerates obtained from various starting materials utilizing different processing conditions. Pellets range in size, typically, between 0.5 – 2.0 mm, though other sizes could be prepared.

4.3. Low solubility, Low permeability drugs pelletized formulations in Nano level, are useful as better medications for various types of diseases. Very few researchers did the work on Nano technology applications for drug molecules, even though not related to Nano pelletized formulations. So we are concentrating on the Nano level pelletized formulations for BCS drugs class four. These

formulations are use full for the society to control the various types' diseases with lesser side effects. Our ultimate aim is "Best medication for Healthier world" with lesser price.

*4.4. Analytical Method Development:* In house Analytical method is useful for the Analysis of Nano level formulated drugs to check the dissolution profile, Assay, stability of the various dosage forms; the method must be validated according to ICH guidelines, Parameters for approval

## 5. RESEARCH AND DEVELOPMENT IN THE SUBJECT

Review subject, Nano level pelletized formulations, literature reveals that

- Nano suspension drug delivery system (DDS) was firstly developed in 1994 for the poorly soluble drugs.
- Pharmaceutical medicinal products "curcumin nano crystal" have a significant role in treatment of various types diseases such as cancers of pancreas or colon or even multiple myeloma, psoriasis or myelodys plastic syndromes (Goel et al., 2008., Liu et al., 2013).
- In recent times all drugs with low solubility like curcumin can be approached by Nano crystal methods,
- One more important study in the field of Nano-formulated curcumin was done by Agarwal et al in 2007 (Garodia et al., 2007). In a study, curcumin was encapsulated with more than 97.5% potency in PLGA and PEG. It has been proved that nano-formulated curcumin represents more efficacy and faster cellular uptake than free curcumin in vitro.

Literature survey reveals that very lesser number of researchers did the work on Nano level pelletized formulations, but it reveals that excellent scope is present on this work because advantages are more on Nano level pelletized formulations

## 6. CONCLUSION

In order to be classified as a "nano pharmaceutical", we suggest the drug product has to meet two major criteria. First, nano engineering has to play a major role in the manufacturing process. Second, the nano material used has to be either essential for the therapeutic activity or has to confer additional and unique properties to the active drug entity. Above literature reviles that Worldwide very less research work is going on Nano level pelletized formulations.

Nano level pelletized drug formulations gives the better results compared to normal, micro level pelletized drug formulations.

ARTICLE HISTORY

Received: September 14, 2017
Revised: February 27, 2018
Accepted: March 01, 2018

*DOI:*
*10.2174/1871520618666180718104647*

**Abstract:** ***Background*:** The anti-mitotic activity of podophyllotoxin derivative targeting tubulin enzyme proved them as strong polymerization inhibitors. The introduction of heteroatom along with different heteroaryl systems in naturally obtained lignans created a latitude for design of bioactive components. A novel one-pot sequential propargylation/cycloaddition reaction strategy has been followed to synthesize triazolo-heterolignans.

***Objective*:** To screen anti-proliferative activity of novel heterolignans and to determine their mode of action

***Method*:** SRB assay, Cytotoxicity evaluation, PI uptake for analysis of cell cycle, caspase-3 activity, Western blot analysis and Immunofluorescence and molecular docking studies.

***Results*:** SRB assay of synthesised compounds were provided compound **3a** and **5f** to be highly active among the synthesized compounds. The Compound **3a** showed cell cycle arrest at G2/M phase and **5f** arrest the cells at G1 phase. Compound **5f** displayed caspase 3 mediated apoptotic effect at lower levels. Compound **3a** and **5f** displayed microtubule disassembly inhibition same as paclitaxel and found to be occupying colchicine binding site of tubulin, both ligands were depicted π-cation interaction with Lys352 residue and triazole ring accommodated at the lactone binding site.

***Conclusion*:** A novel one-pot sequential propargylation/cycloaddition reaction has been developed for the synthesis of triazolo-heterolignans. Compound **3a** and **5f** were displayed good cytotoxic activities and found to inhibit microtubule disassembly. The importance of triazole ring of heterolignans has been studied by molecular docking experiments and results were compared.

**Keywords:** Heterolignan, one-pot synthesis, cycloaddition, anti-proliferative, tubulin inhibitor, molecular docking.

## 1. INTRODUCTION

The discovery of bioactive lignans from plant sources against cancer created a new platform to design promising drug like candidates [1, 2]. Few of the lignans or its derivatives became essential drugs for cancer chemotherapy [3, 4]. Podophyllotoxin (**I**) is one of the natural lignans found to be the best ancient anti-neoplastic agent which has produced excellent drugs such as etoposide (**IA**) and teniposide (**IB**) for combating different carcinomas (Fig. **1a**) [5]. The anti-mitotic activity of podophyllotoxin derivative targeting tubulin enzyme proved them as strong polymerization inhibitors. The multifold anti-cancer activity of podophyllotoxin derivatives has drawn the attention of medicinal chemists to explore more synthetic analogs by altering its basic ring system [6]. The introduction of heteroatom along with different heteroaryl systems in naturally obtained lignans created a latitude for design of bioactive components (**II**) [7, 8]. Heterolignans with significant biological activity have been reported by the replacement of 1,3 dioxalo phenyl group with different heteroycles such as thiophene (**III**), oxazole (**IV**) and indole (**V**) [8-13]. In addition, replacement of lactone ring of podophyllotoxin [13] with triazole moiety is also investigated [14]. The heterolignans are one of the leading synthetic subclass of natural carbolignans afforded the potent bioactive agents like azatoxin (**V**) [7]. Based on the reports we have drawn attention to study the effect of series of synthesized compounds towards tubulin inhibitory activity of novel triazolo-heterolignans, comprising of heterocycle (in place of 1,3 dioxalo phenyl) and triazole (as substitute to the lactone) (Fig. **1b**). The validated *insilico* docking studies indicated that, triazole-heterolignan derivatives found to be favourable at tubulin active site when compared with lactone. Herein, we report a novel one-pot sequential propargylation/cycloaddition reaction strategy for the synthesis of triazolo-heterolignans, their biological evaluation and molecular docking studies as tubulin inhibitors.

In continuation of our interest on the synthesis of heterocycles using 1-aryl propargyl alcohols [15-18], we envisaged that the propargylation of thiophenyl azide **1** with propargylic alcohol **2** followed by 1,3 –dipolar cycloaddition reaction would lead to the desired triazolothienolignans (**3**). Firstly, the reaction of thiophenyl azide (**1,** prepared from known alcohol)[16] with 1,3-diphenylprop-2-yn-1-ol (**2a**) was studied. Based on previous work [15-21], propargylation reaction was carried out using *p*TSA to give the propargylated azide (**Int A**, 89%), which upon heating at 80°C in acetonitrile provided the 6-benzyl-3,4-diphenyl-4,8-dihydrothieno[2,3-d][1,2,3]triazolo[1,5-a]pyridine (**3a**) with 89% yield (Scheme **1**). Delightfully, the above two reactions were accomplished in one-pot to obtain **3a** in 76% yield. Similarly, diversely substituted propargylic alcohols **2b** to **2f** having different substitutions at R and $R^1$ were

**Fig. (1).** Bioactive Lignan, heterolignans and triazoloheterolignans.

treated with azide **1** under the above optimized conditions to furnish the triazolothienolignans derivatives **3b-3f** in good yield (75-82%, Scheme **1**).

In the second case, 2-(azidomethyl)-*1H*-indole (**4**) [22] was used as substrate to accomplish the targeted triazole-indololignans. The reactions of **4** with propargylic alcohols **2a-2f** were also successful in providing the corresponding triazoloindolyl analogs **5a-5f** in good yield (78-85%) *via* the developed one-pot sequential propargylation/cycloaddition reactions (Scheme **2**).

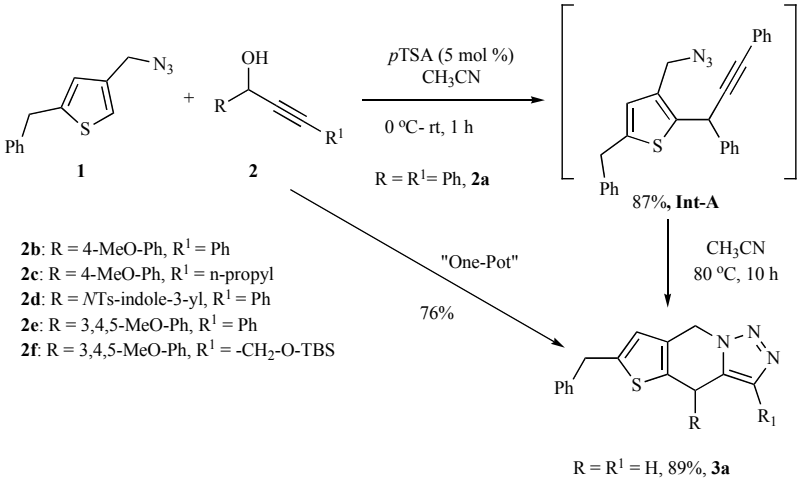
## 2. EXPERIMENTAL DETAILS

The detailed synthetic procedures with spectral interpretations, biological testing protocol and docking methods were provided here.

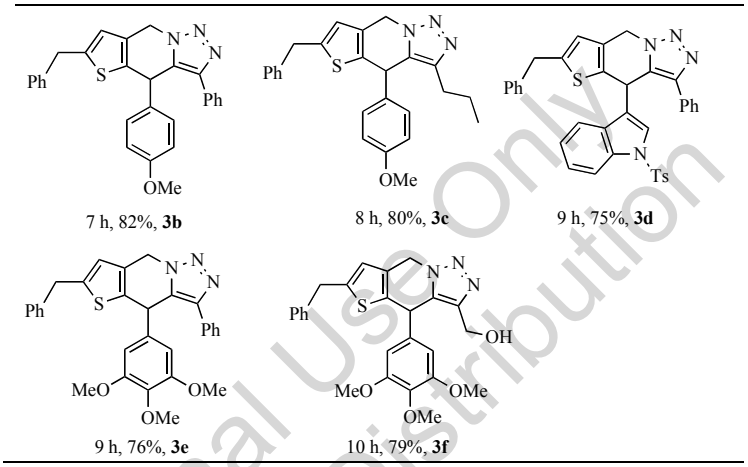
### 2.1. Materials and Methods

All reactions were carried out under inert atmosphere in oven-dried glassware. Reagents and solvents were used without further purification, unless otherwise stated. All reactions were magnetically stirred and monitored by thin-layer chromatography carried out on silica plates using UV-light and anisaldehyde for visualization. Column chromatography was performed on silica gel (60–120 and 100-200 mesh) using hexanes and ethyl acetate as eluent. Evaporation of solvents were conducted under reduced pressure at temperatures less than 45°C. $^{1}$H and $^{13}$C NMR spectra were recorded in $CDCl_3$ and DMSO-d6 solvent on a 300 MHz, 400 MHz and 500 MHz NMR spectrometer. Chemical shifts δ and coupling constants J are given in ppm (parts per million) and Hz (hertz) respectively.

### 2.2. Synthesis

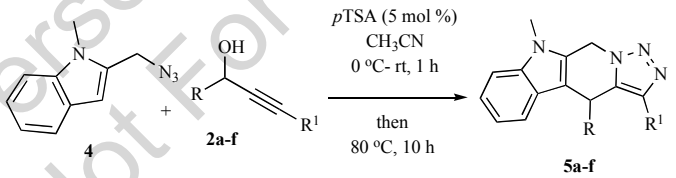


#### *4-(Azidomethyl) 2-benzyl thiophene (1)*



To the mixture of triphenylphosphine (1.9 g, 7.3 mmol) in THF (10 mL) was added diisopropyl azodicarboxylate (1.4 mL, 7.3 mmol), at 0°C and was maintained for 30 min at same temperature. To the reaction mixture was added (5-benzylthiophen-3-yl) methanol [19] (1 g, 4.9 mmol) in THF (10 mL) followed by the addition of DPPA (4.2 mL, 24.0 mmol) at 0°C. The reaction mixture was maintained at room temperature for 3 h. After complete consumption of alcohol (monitored by TLC), water was added to the reaction mixture and extracted with EtOAc (2 x 10 mL). The combined orgonic layer was washed with brine solution and dried over sodium sulfate. The organic layer was evaporated under reduced pressure and purified by column chromatography to give desired compound-as a colorless liquid, 0.96 g, 86% yield, $R_f$ = 0.7 (hexanes: EtOAc = 9:1); $^{1}$H NMR (400 MHz, $CDCl_3$): δ 7.33 (m, 2H), 7.19 (m, 3H), 7.04 (dt, J = 1.5, 0.8 Hz, 1H), 6.74 (d, J = 1.2 Hz, 1H), 4.24 (s, 2H), 4.12 (s, 2H); $^{13}$C NMR (100 MHz, $CDCl_3$): δ 145.8, 139.9, 135.7, 128.6, 126.6, 125.3, 122.3, 49.9, 36.3; IR (KBr): 2910, 2095, 1769, 1451, 1248, 1100, 698 cm-1.

#### *3-(Azidomethyl)-5-benzyl--2-(1,3-diphenylprop-2-yn-1-yl)thiophene (Int-A)*



160 mg, 87% yield, Pale yellow semi solid; $R_f$ = 0.3 (hexanes: EtOAc = 9:1); $^{1}$H NMR (500 MHz, $CDCl_3$): δ 7.38 (dd, *J* = 5.1, 4.3, 3.7 Hz, 4H), 7.27 (dd, *J* = 10.7, 4.3 Hz, 2H), 7.22 (ddd, *J* = 7.5, 5.7, 4.3 Hz, 5H), 7.20-7.13 (m, 4H), 6.55 (d, *J* = 25.4 Hz, 1H), 5.37 (s, 1H), 4.20 (dd, *J* = 32.6, 13.9 Hz, 2H), 3.98 (s, 2H); $^{13}$C NMR (125 MHz, $CDCl_3$): δ 142.7, 140.8, 140.2, 139.6, 131.7, 131.3, 128.7,

### *2.2.1. General procedure for the synthesis of triazole-thienolignans 3a to 3f*

To a stirred solution of azide (1.0 mmol) and propargylic alcohol (1.0 mmol) in 10 mL of acetonitrile was added *p*TSA (5 mol%) at $0^oC$, stirred at room temperature for 1 - 2 h, then the reaction mixture was heated to $80^oC$ for 7 - 10 h. After the completion of reaction (monitored by TLC), The reaction mixture was concentrated under reduced pressure. Purified by column chromatography on silica gel (EtOAc: *n*-hexane) to give the corresponding triazoles.

#### *6-Benzyl-3,4-diphenyl-4,8-dihydrothieno[2,3-d][1,2,3]triazolo[1,5-a]pyridine (3a)*

162 mg, 89% yield, White solid; $R_f$ = 0.4 (hexanes: EtOAc = 7:3); mp 166-168$^oC$; $^1H$ NMR (300 MHz, $CDCl_3$): δ 7.50 (dd, *J* = 7.9, 1.6 Hz, 2H), 7.35-7.28 (m, 2H), 7.26 (dd, *J* = 4.9, 2.6 Hz, 4H), 7.21 (dd, *J* = 4.1, 2.3 Hz, 3H), 7.18 (dd, *J* = 5.2, 3.0 Hz, 2H), 7.02 (dd, *J* = 7.7, 1.7 Hz, 2H), 6.60 (s, 1H), 5.75-5.49 (m, 3H), 4.39-3.76 (m, 2H); $^{13}C$ NMR (100 MHz, $CDCl_3$): δ 146.2, 143.0, 141.7, 139.3, 134.9, 131.0, 130.9, 129.1, 128.7, 128.6, 128.3, 127.7, 127.6, 127.2, 127.1, 126.8, 122.0, 47.0, 40.6, 36.3; IR (KBr): 3453, 3052, 2922, 2855, 1734, 1457, 759 $cm^{-1}$; MS (ESI): *m/z* 420 $(M+H)^+$; HRMS (ESI): *m/z* calcd for $C_{27}H_{22}N_3S$ $(M+H)^+$: 420.1534, found: 420.1557.

#### *6-Benzyl-4-(4-methoxyphenyl)-3-phenyl-4,8-dihydrothieno[2,3-d][1,2,3]triazolo[1,5-a]pyridine (3b)*

160 mg, 82% yield, Light brown solid; $R_f$ = 0.3 (hexanes: EtOAc = 7:3); mp 88-90$^oC$; $^1H$ NMR (500 MHz, $CDCl_3$): δ 7.52 (dd, *J* = 8.2, 1.2 Hz, 2H), 7.33 – 7.26 (m, 4H), 7.26 (s, 1H), 7.25 – 7.20 (m, 3H), 6.99 – 6.88 (m, 2H), 6.78 – 6.68 (m, 2H), 6.59 (s, 1H), 5.70 – 5.48 (m, 3H), 4.05 (q, *J* = 16.0 Hz, 2H), 3.72 (s, 3H); $^{13}C$ NMR (125 MHz, $CDCl_3$): δ 158.8, 146.1, 142.9, 139.3, 135.4, 133.9, 131.3, 130.9**,** 128.7, 128.6, 128.3, 128.2, 127.7, 127.2, 127.0, 126.8, 121.9, 114.4, 55.2, 47.0, 39.8, 36.3; IR (KBr): 3030, 2920, 2843, 1609, 1506, 1251, 758, 701 $cm^{-1}$; MS (ESI): *m/z* 450 $(M+H)^+$; HRMS (ESI): *m/z* calcd for $C_{28}H_{24}N_3OS$ $(M+H)^+$: 450.1640, found: 450.1655.

## 2.3. Biology

### *2.3.1. Cell Culture*

Cancer cells were maintained in DMEM medium supplemented with 10% fetal bovine serum (FBS), 0.1% streptomycin-penicillin, 1% non-essential amino acids and 1% sodium pyruvate. Cells were incubated at 37°C in a 5% $CO_2$ humidified atmosphere and maintained at sub confluency by passaging regularly with trypsin-EDTA.

### *2.3.2. Cytotoxicity Evaluation*

The synthesized test compounds were evaluated for cytotoxicity in four different human cancer cell lines (DU145, Hela, MCF7 and HepG2). A standard SRB assay is used for the determination of cytotoxicity of the synthesized compounds [23]. The sensitivity of the cancer cells to the test compound was expressed in terms of $IC_{50}$, a value defined as the concentration of compound that produced 50% reduction as compared to the control absorbance. $IC_{50}$ values are indicated as means ±SD of three independent experiments.

### *2.3.3. PI Uptake for Analysis of Cell Cycle*

Cell death induced by selected compounds was determined as a measure of PI uptake. Cells were harvested after treatment with compounds at desired concentration and fixed in 70% ethanol at -20 °C for overnight. All cells in the form of a pellet resuspended in PI solution (RNase -0.1 mg/mL, Triton X 100-0.05%, PI-50 µg/mL) and incubated for 1h in dark at room temperature. The excess PI solution was washed away by repeated washings with DPBS. The resultant PI uptake was analyzed by fluorescence activated cell sorting (FACS Calibur System; BD Bio-science, Erembodegem, Belgium) in a FL-2 fluorescence detector (10000 events were recorded for each condition). Flow cytometry data was analyzed using FCS express 4 software (De Novo Software, Los Angeles, CA).

### *2.3.4. Determination of Caspase-3 Activity*

Caspase-3 activity is measured by treating the MCF7 cells with selected compounds using specific fluorogenic substrate Ac-DEVD-AMC. DMSO and paxcitaxel were taken as negative and positive controls respectively. After 48 h treatment, harvested cells were lysed directly in caspase lysis buffer (50 mM HEPES, 5mM CHAPS, 5 mM DTT, pH 7.5). The lysates were incubated with the respective substrate (Ac-LEHD-AMC) in 20mM HEPES (pH 7.5), 0.1% CHAPS, 2mM EDTA and 5 mM DTT at 37°C for 2 h. The release of AMC was analyzed by a fluorimeter using an excitation/emission wavelength of 380/460 ηm, which is directly proportional to caspase-3 activity, respectively. The observed fluorescence values were normalized with total protein concentration estimated by Bradford method and the relative caspase activity was calculated as the ratio of values between mock treated (DMSO) and treated cells.

### *2.3.5. Western Blot Analysis*

Soluble and insoluble protein fraction of compounds treated cells lysates were collected as per the protocol previously explained (Kumar *et al*). Protein samples were separated on 10% SDS-PAGE gel and transferred to a nitrocellulose membrane. The membrane was blocked in 5% BSA for 1h at room temperature, and probed with primary antibodies for β-Tubulin (1:2000), GAPDH (1:2000). The membranes were exposed to HRP conjugated secondary anti-

bodies for 2 h at room temperature and protein expression was detected by using enhanced chemi luminescence (ECL) Western blotting detection reagent (Syngene, GBOX, UK).

### *2.3.6. Immunofluorescence*

Compound treated cells were washed in DPBS and fixed in freshly prepared 3% (w/v) paraformaldehyde (PFA) for 15 min at room temperature. The cells were then permeabilized in 1% (v/v) Triton X-100 for 15 min at room temperature. Cells were then processed for labelling indirect immunofluorescence using the β-Tubulin antibody. The tubulin epitope was visualized with fluorescein isothiocyanate (FITC) - conjugated goat anti-mouse IgG secondary antibody. For each incubation step cells were washed with DPBS. The cover slips were mounted on glass slides with mounting medium containing DAPI. The fluorescent staining pattern was viewed in a confocal laser-scanning microscope (Olympus, Japan).

## 2.4. Docking Methods

The X-ray crystallographic structure of tubulin polymer with colchicine active site (PDB: 1SA0) was attributed from protein data bank [24]. The chain (β-subunit) of tubulin was selected for current docking interpretations, it has prepared and minimized by protein preparation wizard. All the ligands were sketched with 2D-skechter and prepared with Ligprep [25, 26]. The receptor grid around colchicine was generated using Glide module. The extra precision docking protocol of Glide was employed for present docking studies and they were analyzed using Maestro11.1 [27].

# 3. RESULTS AND DISCUSSION

## 3.1. Anti-Proliferative Activity

Having the successful development of methodology to the synthesis of triazolo-heterolignans, next we evaluated their cytotoxic activity against a panel of four different human cancer cells including HeLa (cervical), MCF-7 (breast), DU-145 (prostate) and HEPG-2 (liver) cells using SRB assay [28]. The cytotoxicity results against the tested cell lines are summarized in Table **1**. Among the tested ones, compound **3a**, **3b**, **3c** and **3d** were found to inhibit prostate cancer cell line at lower micromolar concentrations (<20 μM). Compound **3a** and **5f** showed activity $IC_{50}$ <12.92 μM against MCF-7 breast cancer cells. Therefore, compound **3a** having phenyl substitution displayed better anti-cancer activity among the triazolo-thienolignans **3a** to **3f**. With respect to active compounds **3b** and **3d**, phenyl group on triazole ring might significant for maintaining the cytotoxicity, while *n*-propyl group in compound **3c** lowered the potency. Whereas, compound **3e** & **3f** having trimethoxy substitution were found to be inactive. In case of indololignan analogs, reversed interpretations were observed and the compound **5f** found to be active among the triazolo-indololignans **5a** to **5f**. It may be due to the difference in orientation of heterocyclic ring, thiophene/indole. This was studied in molecular docking simulations.

## 3.2. Effect of Compound 3a and 5f on Cell Life Cycle

From the test results, compounds **3a** and **5f** were exhibited good cytotoxic activity with $IC_{50}$ values ranging between 9.42 μM to 25 μM across the four cell lines. Further, the effect of **3a** and **5f** was studied on cell cycle progression of MCF-7 cells. Compound **3a** showed cell cycle arrest at G2/M phase (33%/28.3%) and **5f** arrest the cells at G1 phase (65.2%/58.3%) compared to the control cells treated with DMSO (Fig. **2**).

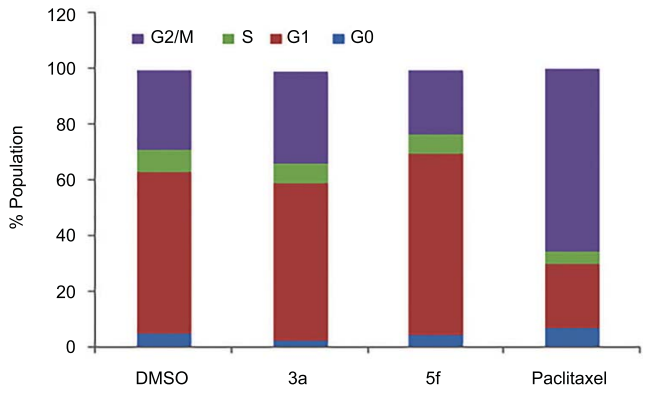

**Fig. (2).** Effect of **3a** and **5f** on cell cycle progression of MCF-7 breast cancer cells.

Personal Use Only

**Fig. (3). a**) Effect of **3a** and **5f** on Caspase 3 activity, **b**) β-Tubulin assay by immunofluorescence and western blot.

### 3.3. Effect of Compound 3a and 5f on Caspase

Further, to evaluate the mode of action, the effect of **3a** and **5f** was investigated on cell proliferation and caspase 3 mediated cell death in MCF-7 cells. It was observed that caspase 3 activity was increased in MCF-7 cells when treated with **3a** and **5f.** In caspase assays, paclitaxel was used as positive control. Interestingly, in **3a** treated cells, the caspase 3 activity is increased but not significant as paclitaxel, whereas in **5f** treated cells caspase3 is significantly activated (Fig. **3a**). Therefore, we sought to understand the specific property of the selected compounds. As series of test compounds prepared based on chemical scaffold that inhibit tubulin polymerization, the effect of **3a** and **5f** was determined on tubulin polymerization in *in vivo* in MCF-7 cells. In this study, after cells exposed to **3a** and **5f** for 48 h, the levels of soluble and insoluble fractions of β-Tubulin in the total cell lysates were analyzed. From these results, **3a** and **5f** treated cells have increased insoluble of β-Tubulin when compared to controls and as similar as paclitaxel (Fig. **3b**).

### 3.4. Tubulin Inhibition Studies

To determine the effect of these **3a** and **5f** on β-Tubulin polymerization in *in vivo*, we also performed immunofluorescence using β-Tubulin specific antibody. For nuclear staining, DAPI counterstain was used to stain nucleus. Results indicate that both the compounds are affecting microtubule disassembly like paclitaxol positive control. Of the two tested compounds, **5f** is more effective in stabilizing the microtubule polymer and inhibiting it from disassembly (Fig. **4**). Due to inhibition of microtubule disassembly, chromosomes are unable to achieve a metaphase spindle configuration leading to prolonged mitotic phase during cell division. This further blocks the progression of mitosis leading to mitotic arrest and triggers apoptosis for cancer cell death or arrest the division of proliferating cells.

## 4. MOLECULAR DOCKING STUDIES

The validated molecular docking studies of **3a** and **5f** were carried out and compared with podophyllotoxin (**I**) structure. Compound **3a** is accommodated at recognized site of colchicine and it has also been observed that triazole moiety is exactly mapped with the lactone ring of podophyllotoxin when overlapped. The phenyl ring on triazole of **3a** is accommodated opposite to the keto group of lactone ring of podophyllotoxin. The substituted thiophene ring

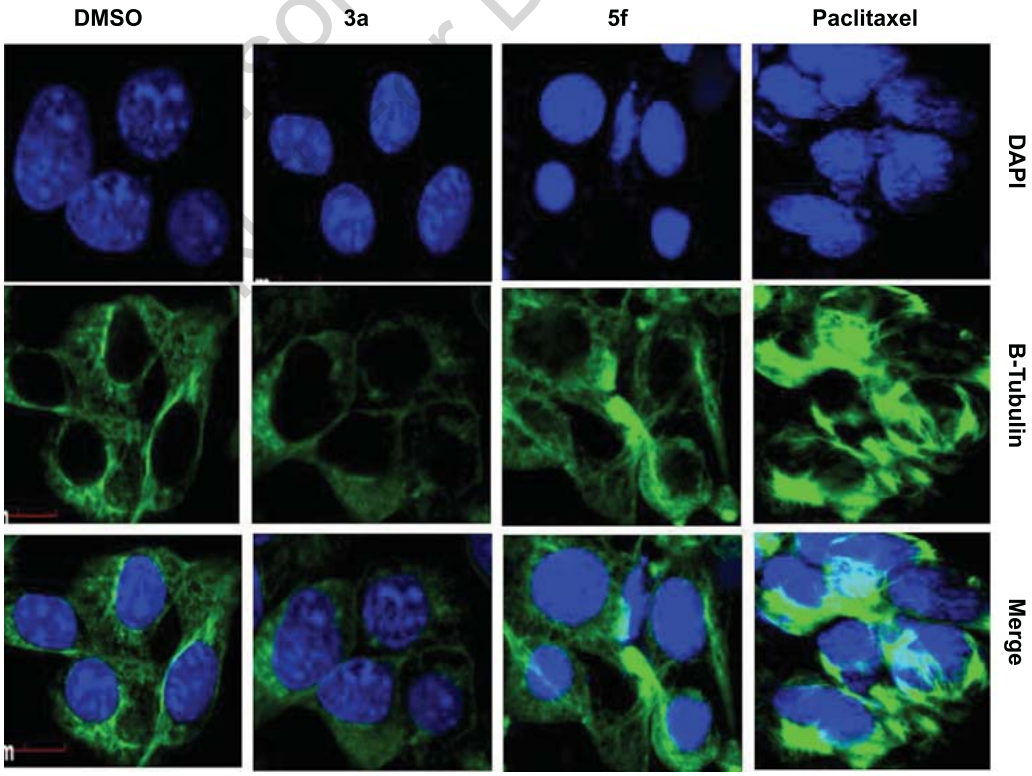

**Fig. (4).** Effect of **3a** & **5f** on β-Tubulin polymerization in DU145 prostate cancer cells.

**Fig. (5). a**) Overlap of **3a** with podophyllotoxin; **b**) **5f** at colchicine binding site of β-Tubulin polymer; green thick sticks indicate active compounds and macromodel sticks indicate active site residues. Green dotted line indicates π-cation and yellow dotted line indicate hydrogen bond.

of **3a** occupied at dioxalane binding position (Fig. **5a**). The axial phenyl ring established the π-cation interaction with Lys352. With respect to the compound **5f**, the hydroxy methyl of triazole found to be making hydrogen bond with backbone of Lys254. The presence of indole nucleus is responsible for contributing two π-cation interactions with Lys352. Whereas, the axial trimethoxy phenyl ring of **5f** not made any interactions with active site residues (Fig. **5b**). In addition, we also deliberated the alignment of inactive compounds **3f** and **5a** with their counter parts **5f** and **3a**. The dissimilar binding mode of inactive **3f** and **5a** at colchicine binding pocket is noticed, when they were overlapped with active **3a** and **5f** (see supporting information). Further, compound **5f** has been overlaid with triazole based podophyllotoxin **II** along with podophyllotoxin (**I**). The binding position of triazole of both **5f** and **II** were occupied lactone imperative site (Figs. **6** & **7**).

## CONCLUSION

In conclusion, a novel one-pot sequential propargylation/ cycloaddition reaction has been developed for the synthesis of triazolo-heterolignans. The anti-proliferative activity of triazole-thienolignans (**3a-3f)** and indololignans (**5a-5f)** against four different cancer cell lines has been carried out and found that **3a** and **5f** exhibited moderate cytotoxic activity. The slight caspase 3 mediated apoptotic effect of compound **5f** has been noticed. Additionally, these compounds found to be inhibiting microtubule disassembly. The molecular docking studies indicated that, compound **3a** and **5f** accommodated within the active site of tubulin and triazole ring of both **3a** and **5f** occupied the lactone binding site of podophyllotoxin.

**Abstract**

*This paper tries to trace out some of the ALLUSIONS that are found in the PASSAGES of Paradise Lost to REFERENCES in the BIBLE. A list of important quotations is taken from "Paradise Lost" by John Milton that would help me to support the statements. All of the important quotes from "Paradise Lost" listed here correspond, at least in some way, to the topic above and by themselves can give great ideas for an essay by offering quotes about the theme of Biblical Allusions in "Paradise Lost."*

**Keywords: Milton-Paradise Lost-Biblical Allusions.**

## Introduction

John Milton was a very important English poet, author of the monumental Paradise Lost (1667), which was one of the great literary masterpieces of the seventeenth century, which was also to have a major influence on literature in his country, and especially on the romantic poets. He was born in 1608 on Cheapside Street in London. Born into a cultured, religious bourgeois family, Milton is intended to take holy orders, but a trip to Italy after his mother's death together with reading the Italian poets Torquato Tasso (1544 - 1595) and Dante (1265 - 1321) would make him want to become a writer.

After studying at Cambridge, he decides against all odds to abandon the all-ready mapped out career in either the church or even at a university to be able to dedicate him to the art of writing. Some say today that already then Milton would have a sense he would leave the world the gift of his production. In any case, at this point, he would retire instead to the family home and would spend a lot of his time reading Greek and Latin classics, as well as studying political and religious history. It is then also he would start writing his first poems.

During the 1640s John Milton wrote a series of political pamphlets. Some would be against the church, both the Catholic and the Protestant, always as a fierce advocate of the freedom of worship.

Others would for the freedom of the press and for the right to divorce and civil liberty, becoming the foremost speaker of his day.

He published his first collection of poems in 1646. He composed the ten books of Paradise Lost between 1658 and 1663. He had first prearranged the work as early as 1640, expecting to write a tragedy titled Adam Unparadised. Paradise Lost was first published in 1667 even though it had been written almost 10 years before. Milton was getting blind by the time he started work on it. To help him with his writing he would get assistants, and most notably the English metaphysical poet Andrew Marvell (1621-1678). A second edition embellished with minor revisions would follow in 1674.

The present paper tries to ground how Milton has used the Biblical Allusions as influential theme in his remarkable epic Paradise Lost.

The poem concerns the Biblical story of the Fall of Man and tells the story of Lucifer, the fallen angel the temptation of Adam and Eve by the fallen angel Satan. More specifically, the poem deals with the Christian view on the origin of man and refer to the temptation of Adam and Eve by Satan as well as their eventual expulsion from the Garden of Eden. The way in which they are rendered by Milton in "Paradise Lost" offers a new reading of the biblical Adam and Eve. Understandably, a great deal of critical and scholarly attention has been devoted to deconstructing Milton's versions of the biblical characters Adam and Eve in "Paradise Lost." A kind of theological settlement through poetry on the origin of man, the work gets its inspiration as much from the Bible for its content as from Virgil's (70 - 19 BC) twelve-book Latin epic poem Aeneid for its form.

Milton's intent, expressed clearly in the epic poem's opening lines, was to "justify the ways of God to men" (Book I, l. 26) that Milton wished to justify where he succeed in fulfilling his purpose to the maximum extent. The Biblical account of the fall in the Book of Genesis, with his epic poem, Paradise Lost, John Milton adds a lot of detail about the complete story of Man, the beginning of Satan, his rise and Man's Fall. Although the ideas for Paradise Lost came from a few pages in the Book of Genesis, Milton's account kept readers wondering what was going to happen next. Because he was going against the church already with Paradise Lost, it was more intriguing for him to take the same ideas in the Bible and extend them into more detail, making Satan look like the Hero and succeeding at what he wanted to do. Satan, the perfect angel, banished from nothing to the pits of Hell, with no chance of return, conjures up a plan to get revenge, building a legacy and an army to overthrow those who put him there.

Then God created the Son, the angels, Man, Heaven, Earth and everything else. Milton faced a difficult task with creating tension about what would happen since God already knew. In Paradise Lost, God is almost emotionless or aloof; he embodies pure reason and pure justice, and every response he gives seems to be cold. In Genesis God is wise and known as the creator and is more the narrator of what is happening than in Milton's epic. Also, He is referred to as Lord God, instead of God, as Milton refers to Him. So, in close the start and fall Man to summarize the creation and reason for human nature are "God gave Man free will, from Man's free will, sin and death came into the world."

## Biblical Allusions

Blind Milton might be when he wrote "Paradise Lost," but to him, the Bible remained an open book. After reading his "Paradise Lost," any one shall appreciate the exactness of his knowledge in using the allusions form the Bible. No doubt there were passages and certain sections of passages of the Scriptures over which Milton had long brooded as being especially suitable for his great project. A study of the allusions emphasizes the specialized theme of Paradise Lost. It is not to look for a balanced treatment of Christianity or of religion.

Genesis is used in great detail for the story of the Fall and the Creation and the early history of the race and Israel. Isaiah alludes to a good many times. The allusion is made to the world-wide extension of the blessing given to Abraham and his seed. Ezekiel furnishes a useful source, especially in the passages about the wheels and eyes instinct with spirit, from which Milton enriches his description of the war in Heaven. The Apocalypse is a very valuable basis for his descriptions of Heaven and Hell.

Every decade of the book of Psalms contributes references. To him, as to the Christian Church in his own and other ages, the Book of Psalms was a treasure-house of devotional and inspirational

writings. It is perhaps surprising to find 360, more than 25% of the whole body of references in this single book. Similarly, there are more references to the theology of the Pauline Epistles than to the life or teachings of Jesus Christ in the Gospels. The single page of Jude's Epistle has more references than the whole of the Gospel according to St. Mark. For Milton, in writing this poem must have had a special fascination in first and last pages of the Bible.

There are hundreds of allusions in Paradise Lost, many of them to the Bible. Rather than list every single possible allusion- which would probably take a few years, some of the more important ones are listed below.

| | | |
|---|---|---|
| Jesus Christ | | (1.4) |
| Moses | | (1.8; 1.338) |
| Adam and Eve | | (1.29) |

| | |
|---|---|
| Revelation | 82 |
| **Total** | **82** |

Total Allusions to New Testament = 490

**Putting all allusions together to the Bible 909 + 490= 1399**

## Conclusion

And of course, the entire poem is one gigantic allusion to the book of Genesis, from which the story of Adam and Eve is taken. Likewise, Milton has taken many references from both Old Testament and New Testament as shown above.

# Representation of Indian Tradition and Culture in the Select Novels of RK Narayan

Abstrct

Ripuram krishnaswamy Iyer Narayanaswami was born in Chennai on 10th October1906 in a middle class South Indian family.All the works of Narayan are located in the imaginary place called 'Malgudi' which is located in south India. South Indian tradition and culture are greatly highlighted in the works of Narayan.As India is a vast country, we find cultural differences from place to place. South Indian tradition and culture may have slight contrast with the other parts of the nation. Though many festivals are celebrated together, variations in celebrations are clearly noticed. The beauty of India lies in similarity in the differences. On the other hand as the novels are written during 1935 to 1952 we can also see age old Indian customs and strong rooted religious believes. Since education was not spread and limited to some sect of people before British and during British, superstitious believes were very much believed. Social evils like unto uchbility, gender discrimination and caste systems are also portrayed in his works.

Key Words:Malgudi, Religion, Education, gender discrimination, untouchbility.

## Introduction

RK Narayan, who was labeled "a small town ironist" always concentrated on gentle humor, weaknesses, and life style of south Indian people. Narayan also addressed the fundamental questions regarding human existence, social evils, sensitive believes and human relations. Narayan also portrayed philosophical touch of Hindu Dharma, Karma and its relevance in

everyday life.Gandhian philosophy is one of the chief concepts in the works of Narayan.Gandhian philosophy shows more impact on finding solutions to Hidhu religious issues. He strongly believesin Gandhian philosophy which did not satisfy the contemporary writers like Mulk Raj Anand and Raja Rao.

In the early novel of Narayan "The man Eater of Malgudi", we can see the orthodox Hindu religious believes and caste mark on the forehead of Nataraj. He symbolizes the strong rooted mystery of Hindu religion. *"I hung up a framed picture of goddess Lakshmi poised on her lotus, holding the bounties of earth in her forehands, and through her grace I did not do badly".*( The man Eater of Malgudi page 7) Natarajdoes prayers to the sun in the early morning and also hangs up the frame of goddess Lakshmi in his parlor. The traditional approach of Narayan is depicted here. His believes in Hindu darma , Indian epics, Puranas, myths and mythologies. He takes the Ramanaya andthe Mahabharata for references and solutions for contemporary issues.

Narayan's thirdnovel "The Dark Room"published in 1938 portrays the southern family culture in the contemporary society. Husband is the head of the family and wife is expected to walk in the footsteps of the husband. Woman is always expected to have lot of patience and always Sita character from the Ramayan is depicted. At the end of the novel Savitri shows modern ideology by thinking of leaving the family and deciding to spend rest of her life in the service of God.

*She at one stage is determined that ' She would dedicate her life to the service of God, numb her senses and memory, forget the world, and spend the rest of the years thus and die, no husband, home or children".*( The Dark Room, page 146)Thus religion is chosen as the last and ultimate source for solace and peace.

The Guide is the ultimate depiction of Hindu religion, swami and saints in Indian colorful society with the distinctive humor. Superstitions, duplicities, believes and stupidities are greatly captured in this novel. Malgudi is portrayed as the combined place of traditionalism and modernism with the character like Rossie, a classical dancer. "*What must happen must happen, no power on earth or heaven can change its course list as no one can change thecourse of that river".* (page15)

The guide also is a satirical humor on Hindu blind believes. Raju, the main character in the novel is worshipped as saint as he is found sitting under a tree alone after release from jail. The local communities believe that he has lot of powers and provide him food and other needs. His meaningless words are positively taken by them with lot of philosophy.

In his recent novel published in 1990 The World of Nagaraj, the character is differently portrayed. Nagarj prefers to spend much of his time writing letters, drinking coffee and doing some leisurely accounting for a friend.Nagaraj is a mild mannered man with a fragile character from a wealthy aristocrat family. He strongly observes the self-imposed calmness and prepares his soul for te silence of death. “You are like Lakshmana, who stood behind Rama, his elder brother, all the time without a murmur or doubt. (The World of Nagaraj page27) This shows the influence of Hindu epics on Narayan and Indian society. MeenakshiMukharjee says “RK Narayan successfully achieves the vision through Malgudi”. The indian joint family system also gets changed in the novel as Nagaraj, his mother and wife Sita are left to themselves as his elder brother settles down in village saying that he needs to take care of fields.

Conclusion

Narayan’s characters in Malgudi represent age old Indian tradition and set the modern ideology with the influence of western culture in the later novels. Early novels show the fragrance of Indian soil, vedas, puranas and epics. The later characters are very much westernized with modern ideology. The spirit of questioning the existing social evils like social inequalities, superstitious believes, untouchbility and caste system are questioned. The thought of questioning is the big change in his early novels to later novels.

**Abstract. Microwave promoted easy, efficient and environment friendly procedure has been devised for the synthesis of a series of pyrazole derivatives in high yields by the reaction of chalcones with phenyl hydrazine hydrochloride under catalyst free, solvent free conditions. The newly synthesized compounds were characterized by NMR ( $^{1}H$ and $^{13}C$), Mass, IR and C, H, N analyses. *In vitro* anti-inflammatory activity of the synthesized compounds was investigated against inhibition of Albumin Denaturation and Membrane Stabilization test methods. Majority of the compounds showed good activity when compared with the standard drugs.**

***Keywords — microwave irradiation, pyrazole derivatives, chalcones, anti-inflammatory activity***

## I. INTRODUCTION

Pyrazole refer to both to class of simple aromatic ring organic compound of heterocyclic diazole series characterized by a 5- member ring structure composed of three carbon atom and two nitrogen atom in the adjacent position and to unsaturated parent compound. These are important organic compounds for pharmaceutical [1] and agrochemical industry [2]. Numerous compounds containing pyrazole moiety are known to exhibit anti-hyperglycemic [3], analgesic [4], anti-inflammatory [5], antipyretic [6], antibacterial [7], antimicrobial [8], antihypertensive [9] and antidepressant [10] activities. They are also used as herbicides [11] and dyestuffs [12]. Pyrazole is a multipurpose lead compound developed by chemical architecture for effective molecules which are biologically active. Several synthetic routes are accorded to the development of pyrazole containing reactions to afford a novel molecule which is an enormous opportunity in the field of medicinal chemistry.[13a-l]

In recent years, microwave assisted organic syntheses have gained enormous attention of the chemists due to their advantages such as shorter reaction times, cleaner products, operational simplicity, higher yields and being a potential alternative to accomplish the effective synthesis of heterocyclic bioactive compounds. [14] Solvent-free reaction condition has been demonstrated to be an efficient technique for various organic reactions. It often leads to a remarkable decrease in reaction time, increased yields, easier workup, enhancement of regio and stereo selectivity of reaction matches with the green chemistry protocol.[15]

Paracetamol is a relatively COX-2 selective, non-steroidal anti-inflammatory drug (NSAID) with analgesic and antipyretic properties. But the continuous use of Paracetamol can cause diarrhea, vomiting, skin rash, dizziness and bitterness in the mouth. Hence there is a need for developing superior anti-inflammatory with better safety profile.

Motivated by the afore-mentioned literature and in continuation of our studies towards developing new methods for the synthesis of pyrazole derivatives having good anti-inflammatory activity[16], we envision our approach towards the design and synthesis of novel structurally diverse series of pyrazole derivatives for their anti-inflammatory activity.

## II. EXPERIMENTAL DETAILS

The reactions were carried out in a round bottom 50 mL flask fitted with reflux condenser, a dropping funnel and in Nitrogen atmosphere. A magnetic stirrer cum hot plate was used for stirring and heating the reaction mixtures. Rota evaporator was used for removing the solvent from the reaction mixture. All the solvents and reagents were dried and purified before use by adopting the standard procedures and techniques. Progress of the reaction and purity of the compounds were monitored by thin layer chromatography (TLC) on aluminium sheet of silica gel 60F254, E-Merck, Germany using iodine as visualizing agent. Melting points (mp) were determined in open capillary tubes using a calibrated thermometer by Guna Digital Melting Point apparatus, expressed in degrees centigrade (°C) and are

© 2018, IJREAM All Rights Reserved.

uncorrected. $^1$H NMR spectra was recorded as solutions in $CDCl_3$ on a Bruker AMX/ VARIAN 400 MHz spectrometer operating at 400 MHz. The $^1$H chemical shifts were expressed in parts per million (ppm) with reference to tetramethylsilane (TMS). The following abbreviations were used while presenting the NMR data: **s** = singlet, **d** = doublet, **t** = triplet, **q** = quartet and **m** = multiplet. All the chemicals used in the present work were obtained from Sd. Fine Chem. Ltd., Boisar, India and Qualigens, Mumbai and were used after purifying them by following the established procedures.

***Preparation of pyrazole derivatives (5a-j)***

In the first step, to a cold solution (below 10°C) of paracetamol (**1**) (0.01 mol), 4-methoxybenzaldehyde (**2b**) (0.01 mol) in ethanol and a chilled solution of NaOH (10 mL of 30% solution) were added. Then the reaction mixture was allowed to stir for 12h. It was diluted with water (100 mL) and acidified with Conc. HCl. The product obtained was filtered, washed with water and recrystallized from ethanol to get pure chalcone (**3a**).

In the second step, a mixture of the chalcone (**3a**) (0.01 mol) and phenyl hydrazine hydrochloride (**4**) (0.01 mol) were taken in flat-bottomed flask and irradiated with microwave radiations in a microwave oven at 490 Watts. The reaction mixture was heated consecutively two times for 2-3 min period each time followed by a 1 min cooling interval between irradiations. To avoid the continuous overheating of the reactants, this method was proposed. In order to maintain the homogeneity of the irradiating field throughout the reaction, the reaction mixture was kept under stirring. The progress of the reaction was monitored by TLC on silica gel using ethyl acetate-hexane (8:2 v/v). After complection of the reaction, the solvent was removed under reduced pressure to get the crude product. The resulting crude product was purified by column chromatography on silica gel (100-200 mesh) using ethyl acetate-hexane (1:1) as eluent to get pure 4-(5-(4-methoxyphenyl)-1-phenyl-4,5-dihydro-1H-pyrazol-3-ylamino)phenol (**5a**). The remaining compounds **5b-j** were prepared by adapting to the above described procedure. The synthetic protocol for the title compounds is presented in **Scheme 1**.

***Physical, analytical and spectral data for the compounds (5a-j)***

4-(5-(4-methoxyphenyl)-1-phenyl-4,5-dihydro-1H-pyrazol-3-ylamino)phenol (**5a**): Yield: 87%; solid. M.P. 80-81 °C; $^1$H NMR (400 MHz, $CDCl_3$): $\delta$ 9.29 (s, 1H, -OH), 8.88 (s, 1H, Ar-NH), 7.46-6.74 (m, 9H, Ar-H), 3.89 (t, 1H, pyrazole-C-H), 3.48 (s, 3H, $OCH_3$), 2.14 (m, 1H, pyrazole-$CH_2$), 0.88 (m, 1H, pyrazole-$CH_2$); $^{13}$C NMR spectrum (100 MHz, $CDCl_3$): $\delta$ 157.4 (C-22), 146.5 (C-10), 143.6 (C-3), 142.5 (C-13), 134.8 (C-19), 131.5 (C-7), 129.8 (C-15, C-17), 125.2 (C-20, C-24), 121.2 (C-16), 116.7 (C-8, C-12), 115.7 (C-9, C-11), 114.6 (C-14, C-18), 114.0 (C-21, C-23), 54.5 (C-25), 50.3 (C-5), 38.7 (C-4); IR (KBr) ($\nu_{max}$ cm$^{-1}$): 3336 (OH), 3217 (NH), 1585 (C=N); LCMS (m/z, %): 360 ($M+H^+$, 100); Anal. Calcd for $C_{22}H_{21}N_3O_2$: C, 73.52; H, 5.89; N, 11.69; %; found: C, 73.60; H, 5.82; N, 11.76%.

(E)-4-(1-phenyl-5-styryl-4,5-dihydro-1H-pyrazol-3-ylamino)phenol (**5b**): Yield: 91%; solid. M.P. 142-146 °C; $^1$H NMR (400 MHz, $CDCl_3$): $\delta$ 9.29 (s, 1H, -OH), 8.88 (s, 1H, Ar-NH), 7.57-6.70 (m, 14H, Ar-H), 6.25 (d, 1H, Ar-**CH**=CH), 6.12 (d, 1H, Py-**CH**=CH), 3.83 (t, 1H, pyrazole-C-H), 2.14 (m, 1H, pyrazole-$CH_2$), 0.88 (m, 1H, pyrazole-$CH_2$); $^{13}$C NMR spectrum (100 MHz, $CDCl_3$): $\delta$ 148.5 (C-10), 145.6 (C-3), 143.8 (C-13), 136.4 (C-21), 134.4 (C-20), 132.7 (C-7), 129.5 (C-15, C-17), 128.8 (C-19), 128.6 (C-23, C-25), 128.5 (C-22, C-26), 127.9 (C-24), 120.8 (C-16), 117.7 (C-8, C-12), 116.7 (C-9, C-11), 114.3 (C-14, C-18), 50.8 (C-5), 37.3 (C-4); IR (KBr) ($\nu_{max}$ cm$^{-1}$): 3339 (OH), 3227 (NH), 1593 (C=N); LCMS (m/z, %): 356 ($M+H^+$, 100); Anal. Calcd for $C_{23}H_{21}N_3O$: C, 77.72; H, 5.96; N, 11.82%; found: C, 77.78; H, 5.85; N, 11.89%.

4-(1,5-diphenyl-4,5-dihydro-1H-pyrazol-3-ylamino)phenol (**5c**): Yield: 93%; solid. M.P.270-272 °C; $^1$H NMR (400 MHz, $CDCl_3$): $\delta$ 9.29 (s, 1H, -OH), 8.88 (s, 1H, Ar-NH), 7.53-6.68 (m, 14H, Ar-H), 3.89 (t, 1H, pyrazole-C-H), 2.14 (m, 1H, pyrazole-$CH_2$), 0.88 (m, 1H, pyrazole-$CH_2$); $^{13}$C NMR spectrum (100 MHz, $CDCl_3$): $\delta$ 147.5 (C-10), 143.6 (C-3), 142.8 (C-13), 135.4 (C-19), 131.7 (C-7), 129.8 (C-15, C-17), 127.6 (C-21, C-23), 127.5 (C-20, C-24), 126.2 (C-22), 121.5 (C-16), 117.0 (C-8, C-12), 116.2 (C-9, C-11), 114.3 (C-14, C-18), 54.8 (C-25), 50.7 (C-5), 38.6 (C-4); IR (KBr) ($\nu_{max}$ cm$^{-1}$): 3344 (OH), 3216 (NH), 1592 (C=N); LCMS (m/z, %): 330 ($M+H^+$, 100); Anal. Calcd for $C_{21}H_{19}N_3O$: C, 76.57; H, 5.81; N, 12.76%; found: C, 76.64; H, 5.78; N, 12.83%.

4-(5-(4-nitrophenyl)-1-phenyl-4,5-dihydro-1H-pyrazol-3-ylamino)phenol (**5d**): Yield: 85%; solid. M.P.207-208 °C; $^1$H NMR (400 MHz, $CDCl_3$): $\delta$ 9.29 (s, 1H, -OH), 8.88 (s, 1H, Ar-NH), 8.29-6.70 (m, 13H, Ar-H), 3.89 (t, 1H, pyrazole-C-H), 2.14 (m, 1H, pyrazole-$CH_2$), 0.88 (m, 1H, pyrazole-$CH_2$); $^{13}$C NMR spectrum (100 MHz, $CDCl_3$): $\delta$ 150.6 (C-19), 147.5 (C-10), 144.6 (C-22), 143.5 (C-3), 142.9 (C-13), 131.8 (C-7), 128.5 (C-15, C-17), 122.8 (C-21, C-23), 121.2 (C-20, C-24), 120.6 (C-16), 117.9 (C-8, C-12), 116.0 (C-9, C-11), 114.1 (C-14, C-18), 50.5 (C-5), 38.6 (C-4); IR (KBr) ($\nu_{max}$ cm$^{-1}$): 3351 (OH), 3220 (NH), 1593 (C=N); LCMS (m/z, %): 375 ($M+H^+$, 100); Anal. Calcd for $C_{21}H_{18}N_4O_3$: C, 67.37; H, 4.85; N, 14.96%; found: C, 67.44; H, 4.92; N, 14.90%.

4-(5-(4-chlorophenyl)-1-phenyl-4,5-dihydro-1H-pyrazol-3-ylamino)phenol (**5e**): Yield: 90%; solid. M.P.179-180 °C; $^1$H NMR (400 MHz, $CDCl_3$): $\delta$ 9.29 (s, 1H, -OH), 8.88 (s, 1H, Ar-NH), 7.56-6.65 (m, 13H, Ar-H), 3.89 (t, 1H, pyrazole-C-H), 2.14 (m, 1H, pyrazole-$CH_2$), 0.88 (m, 1H, pyrazole-$CH_2$); $^{13}$C NMR spectrum (100 MHz, $CDCl_3$): $\delta$ 147.5 (C-10), 143.6 (C-3), 142.6 (C-13), 140.2 (C-19), 133.7 (C-7), 131.6 (C-22), 129.8 (C-15, C-17), 127.3 (C-21, C-23), 126.8 (C-20, C-24), 121.9 (C-16), 117.2 (C-8, C-12),

### *In vitro* Anti-inflammatory activity

*In vitro* anti-inflammatory activity of the synthesized compounds **5a-j** was investigated against inhibition of Albumin Denaturation [17] and Membrane Stabilization test methods [18].

### (a) Inhibition of Albumin Denaturation

All the synthesized compounds **5a-j** were evaluated for their anti-inflammatory activity with respect to inhibition of Albumin Denaturation method. The reaction mixture consisting of test compounds at different concentrations and 1% aqueous solution of bovine albumin fraction. $p^H$ of the reaction mixture was adjusted using small amount of 1N HCl to 7. The samples were incubated at 37° C for 20 min and then heated at 57° C for 20 min. After cooling the samples, the turbidity was measured spectrophotometrically at 660 nm. The experiment was performed in triplicate. Percent inhibition of protein denaturation was calculated as follows.

Percentage inhibition=($Abs_{control}$–$Abs_{sample}$)X 100/ $Abs_{control}$

Denaturation of protein is a well documented cause of inflammation. Phenyl butazone and flufenamic acids (anti-inflammatory drugs) have shown a dose dependent ability to thermally induced protein denaturation.

### (b) Membrane Stabilization test

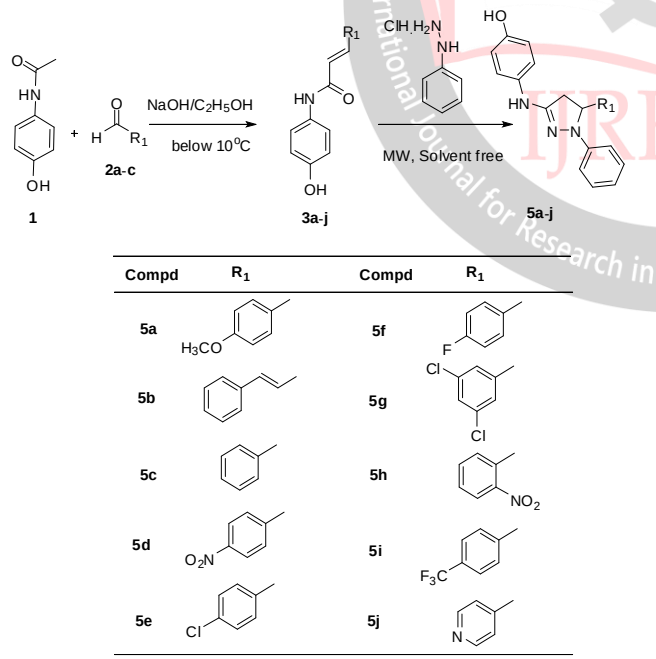
#### *Preparation of red Blood cells (RBCs) Suspension*

Fresh human blood (10 mL) was collected and transferred to the heparinized centrifuged tubes. The tubes were centrifuged at 3000 rpm for 10 min and were washed three times with equal volume of normal saline. The volume of the blood was measured and reconstituted as10% v/v suspension with saline.

#### *Heat Induced Hemolysis*

© 2018, IJREAM All Rights Reserved.

The reaction mixture (2 mL) consisting of 1mL of test drug solution and 1 mL of 10% RBCs suspension, instead of the drug only, saline was added to the control test tube [16]. Salicylic acid was taken as a standard drug. All the centrifuge tubes containing reaction mixture were incubated in a water bath at 56° C for 30 min. At the end of the incubation, the tubes were cooled under running tap water. The reaction mixture was centrifuged at 2500 rpm for 5 min and the absorbance of the supernatants was taken at 560 nm. The experiment was performed in triplicates. Per cent membrane stabilization activity was calculated by the formula.



Percentage inhibition= ($Abs_{control}$–$Abs_{sample}$) X 100/ $Abs_{control}$

***Statistical Analysis***

The anti-inflammatory activity were screened by Carregeenan rat paw Oedema, Cotton pellet (*in vivo*) and Albumin Denaturation , Membrane Stabilization (*in vitro*) was compared *versus* negative control group by one way Analysis of Variance (ANOVA) with Dunnets post-test a value of $p< 0.05$ was considered significant.

## III. RESULTS AND DISCUSSION

In this letter, we report an efficient and environmentally benign protocol for the synthesis of pyrazole derivatives (**5a-j**) by the reaction of chalcones (**3a-j**) (0.01 mol) with phenyl hydrazine hydrochloride (**4**) (0.01 mol) under solvent-free conditions at room temperature using microwave radiation at 490W (**Scheme 1**).

**Scheme 1. Synthesis of biologically active pyrazole derivatives**

The chemical structure of the title compounds **5a-j** were characterized by spectral data ($^1$H and $^{13}$C NMR, IR and LC-MS), elemental analysis and the results were presented in experimental section. The proton signals at 8.88-8.86 and 9.29-9.25 are due to Ar-NH and OH protons for the compound (**5a-j**). The $^1$H NMR spectra of the compounds (**5a-j**) gave signals due to Ar-H in the range of 8.29-6.56 ppm. The proton signals at 3.89 is due to C-H proton of pyrazole ring for the compounds (**5a-j**). The methylene protons of pyrazole ring gave two multiplets at $\delta$ 2.14 and $\delta$ 0.88 respectively for the compounds (**5a-j**). $^{13}$C NMR chemical shift for C-H and $CH_2$ carbon of pyrazole ring were observed at 38,6-37.3 and 51.0-45.2 for the compounds **5a-j.** IR absorptions in the regions 3363-3325, 3234-3216 and 1597-1585 $cm^{-1}$ were assigned to OH, NH and C=N stretching vibrations respectively for the compounds **5a-j**. In their mass spectra, $M^{+\cdot}$ ions were observed in the expected m/z values.

***In vitro anti inflammatory activity***

*In vitro* anti-inflammatory activity of the tested compounds (**5a-j**) were evaluated with Albumin denaturation method and Membrane test methods. Phenyl butazone, flufenamic acid and salicylic acid are used as standard reference drugs for the study. The experiment was performed in triplicate and the results were presented in **Table 1** and **Table 2**. The title compounds **(5a-j)** showed moderate to good anti-inflammatory activity ranging from 39-75 % (Albumin denaturation method) and 41-79% (Membrane test methods), where as flufenamic acid and starting compound exhibited 79% and 57% respectively in Albumin denaturation method and salicylic acid and starting compound exhibited 85% and 62% respectively in Membrane test method. Especially the compounds compounds **5d**, bearing with 4-nitrophenyl moiety; **5f**, incorporated with 4-fluorophenyl moiety and **5j**, bearing with pyridinyl group showed potent anti-inflammatory activity compared to other derivatives.

It was observed that the position of the substituent on terminal benzene ring of pyrazole moiety has profound effect on the activity. The para position on the terminal benzene ring is the favorable site for the higher potency. Evidently, the compound **5d** with $NO_2$ and **5f** with **F** at para position, exhibiting highest inhibitory activity in the two methods. The presence of pyridine as substituent also exhibits high inhibitory activity in the two methods when compared with standard drugs. The remaining compounds were found to have moderate to good activity.

**Table 1: *In vitro* Anti-inflammatory activity of the title compounds (5a-j) by Inhibition of Albumin Denaturation method**

| Compounds | Dose (mg/mL) | Mean OD | SD | %Inhibition |

## IV. CONCLUSION

In conclusion, we demonstrated here an efficient, environmentally benign protocol for the formation of *pyrazole derivatives* in high yields through an intermediate chalcone under solvent free condition in the presence of microwave irradiation at room temperature. *In vitro* anti-inflammatory screening results of **5a-j** showed that most of the derivatives exhibits good inhibitory activity in the two methods. **5d**, bearing with 4-nitrophenyl moiety; **5f**, incorporated with 4-fluorophenyl moiety and **5j**, bearing with pyridinyl group showed potent anti-inflammatory activity compared to other derivatives.

## ACKNOWLEDGMENTS

The authors acknowledge department of biochemistry, Sri Venkateswara University, Tirupathi, India, for providing biological activity. Also, the authors express their thanks to Hyderabad Central University for providing instrumentation facilities for recording the spectra.

## ABSTRACT

Microwave assisted easy, efficient, and environment friendly process has been devised for the synthesis of phosphonates within minutes *via* microwave-assisted Michaelis-Arbuzov reaction. The desired products were obtained in excellent yields and in high purity under solvent-free and catalyst-free conditions. The structure all the synthesized compounds was confirmed by spectral and CHN analysis. *in vitro* Antibacterial and antifungal activity of these compounds was also analyzed. Majority of the title compounds showed good inhibition towards bacteria and fungi.

## KEYWORDS

Microwave, Phosphonates, Michaelis-Arbuzov reaction, Antibacterial activity and antifungal activity.

## INTRODUCTION

Organophosphorus compounds particularly phosphonates have been played a key role in biologically active compounds [1]. Phosphonates feature tetrahedral phosphorus centersare structurally closely related to phosphorous acid [2]. Phosphonates and phosphonic acids are organophosphorus compounds containing C–PO(OH)$_2$ or C–PO(OR)$_2$ groups (where R = alkyl, aryl). Many commercially important phosphonates compounds includes glyphosate (1) (active molecule of herbicide "Roundup"), ethephon (2), a widely used plant growth regulator, tiludronate (3) as anti-inflammatory as well as anti-rheumatismal agent. Bisphosphonates are popular drugs for treatment of osteoporosis. In biology and medicinal chemistry, phosphonate groups are used as stable bioisoteres for phosphate, such as antiviral nucleotide analogue, Tenofovir, one of the cornerstones of anti-HIV therapy [3]. Many synthetic phosphonates are now widely used as herbicides [4], stimulants for the latex production of *Hevea brasiliensis* [5], pesticides [6], detergents [7], reagents for Wittig-Horner reactions [8], antibacterial [9], antiviral [10] and anti-tumor agents [11,12].

Phosphonates have traditionally been accessed through the Arbuzov reaction [13-16]; a double SN$^2$ process between an alkyl halide and a trialkylphosphite, and this remains the most commonly employed route today. However, due to the resistance of aryl groups to nucleophilic attack, the classic

Arbuzov reaction was essentially limited to the preparation of alkyl phosphonates. The synthesis of aryl phosphonates represents one early challenge. In this regard, transition-metal catalyzed Arbuzov reaction has gained remarkable success [17-21].

On the other hand, microwave-assisted organic synthesis has been given away to provide a number of advantages than the standard heating techniques such as clean reactions, improved reaction yields and shortened reaction times, easy work-ups and/or solvent free reaction conditions [22-25]. Keglevich *et al.* [26] also synthesized arylphosphonates by microwave-assisted Arbuzov reaction of triethylphosphite and aryl bromides in the presence of $NiCl_2$ as catalyst under solvent-free conditions.

As part of our research in the development of new methodologies for the synthesis of bioactive phosphonates, we synthesized a series of phenylphosphonate derivatives *via* Michaelis-Arbuzov reaction using microwave irradiation tech-nique under solvent free condition. All the synthesized compounds were characterized by various spectrophotometric methods and screened for their antibacterial and antifungal activities. Majority of the compounds showed good inhibition towards bacteria and fungi.

## EXPERIMENTAL

All the chemicals used in the present work were obtained from Sd. Fine Chem. Ltd., India; Qualigens, Mumbai and used after purifying them by following the established procedures.

**Characterization:** The reactions were carried out in a 100 mL round bottom flask holding condenser in nitrogen atmosphere. A magnetic agitator cum hot plate was used for stirring and heating the reaction mixtures. Rota evaporator was used for removing the solvent from the reaction mixture. All the chemicals were dehydrated before use by adopting the standard procedures and techniques. Rota evaporator was used for removing the solvent from the reaction mixture. Thin layer chromatography (TLC) on aluminium sheet of silica gel was used to check the development of the reaction and purity of the compounds by iodine as visualizing agent. All microwave-assisted irradiation experiments were conducted using single-mode microwave synthesis apparatus. The $^{31}P$ (161.9 MHz), $^{1}H$ (400 MHz) and $^{13}C$ (100 MHz) NMR spectra were recorded on Bruker AMX spectrometer. Chemical shifts were referenced to TMS ($^{1}H$ and $^{13}C$ NMR) and 85 % $H_3PO_4$ ($^{31}P$ NMR) and DMSO-$d_6$ was used to dissolve the samples. API 2000 Perkin-Elmer Mass spectrometer was used to record mass spectra. Bruker IFS 55 (Equinox) FTIR spectrometer in KBr was used to record IR spectra. Microanalytical data were obtained from University of Hyderabad, Hyderabad, India.

**Synthesis of 4-chloro-*N*-(substituted) benzenesulfonamide (3a-i):** To a stirred solution of 4-chlorobenzene-1-sulfonyl chloride (1) (0.2 mmol) and pyridin-3-amine (**2a**) (0.2 mmol) in dehydrated tetrahydrofuran (40 mL); triethylamine was added at 10 ºC with stirring for about 15 min. It was stirred further at ambient temperature for 4 h. TLC was used for monitoring the progress of the synthetic route and rota-evaporator on the way to eliminate the solvent to obtain crude product. By means of ethyl acetate- *n*-hexane (8:2) as eluent, the product was purified using column chromatography to afford 4-chloro-*N*-(pyridin-3-yl)benzenesulfonamide (**3a**). Similar experimental route was used to synthesize of left over compounds (**3b-i**).

**Conventional synthesis of phenylphosphonate derivatives (5a-i):** 4-Chloro-*N*-(substituted) benzenesulfonamide derivatives (**3a-i**) (0.01 mol) and trimethylphosphite (**4**) (0.02 mol) in THF were mixed together and stirred for 3-5 h at reflux temperature. TLC was used to check the progress of the process. After completion of the reaction, triethylamine hydrochloride salt was filtered off and the solvent was removed in a rota-evaporator. Finally column chromatography was used to get pure phenylphosphonate derivatives (**5a-i**) using ethyl acetate: *n*-hexane (6:4) as eluent.

**Microwave assisted synthesis of phosphonates (5a-i):** 4-Chloro-*N*-(substituted) benzenesulfonamide derivatives (**3a-i**) (0.01 mol) and trimethylphosphite (**4**) (0.02 mol) were mixed together and microwave radiated at 420 W under room temperature for about 12-30 min. TLC was used to check the progress of the reaction. After completion of the reaction, triethylamine hydrochloride salt was filtered off and the solvent was removed in a rota-evaporator. Finally, column chromatography was used to get pure phenylphosphonate derivatives (**5a-i**) by means of ethyl acetate:*n*-hexane (6:4) as eluent.

**Spectral data**

Dimethyl 4-(*N*-pyridin-3-ylsulfamoyl)phenylphosphonate (5a): Yield: 90 %; semi-solid. $^{31}P$ NMR spectrum (DMSO-$d_6$): δ 18.5 ppm; $^{1}H$ NMR spectrum (400 MHz, DMSO-$d_6$): δ 10.35 (s, 1H, NH), 8.35-7.20 (m, 8H, Ar-H), 3.65 (s, 6H, $OCH_3$); $^{13}C$ NMR spectrum (100 MHz, DMSO-$d_6$): δ 145.1 (C-1′), 141.5 (C-2), 141.2 (C-5), 138.8 (C-4′), 137.5 (C-2′), 131.4 (C-4, C-6), 126.8 (C-3, C-7), 124.7 (C-5′), 122.8 (C-6′), 52.5 (C-10, C-12); IR (KBr, $\nu_{max}$, $cm^{-1}$): 3269 (NH), 1468 (P-car), 1332,1183 ($SO_2$), 1225 (P=O), 1018 (P-O-C aliph.), 905 (S-N). LC-MS (*m/z*, %): 343 ($M+H^+$,100); Anal. calcd (found) % for $C_{13}H_{15}N_2O_5PS$: C, 45.61 (45.69); H, 4.42 (4.48); N, 8.18 (8.12).

**Dimethyl 4-(*N*-thiazol-2-ylsulfamoyl)phenylphosphonate (5b):** Yield: 89 %; semi-solid. $^{31}P$ NMR spectrum (DMSO-$d_6$): δ 20.2 ppm; $^{1}H$ NMR spectrum (400 MHz, DMSO-$d_6$): δ 11.94 (s, 1H, NH), 8.36-6.70 (m, 6H, Ar-H), 3.65 (s, 6H, $OCH_3$); $^{13}C$ NMR spectrum (100 MHz, DMSO-$d_6$): δ 171.7 (C-2′), 141.5 (C-2), 141.2 (C-5), 137.0 (C-4′), 131.4 (C-4, C-6), 126.8 (C-3, C-7), 112.1 (C-5′), 52.5 (C-10, C-12). IR (KBr, $\nu_{max}$, $cm^{-1}$): 3283 (NH), 1479 (P-car), 1338, 1186 ($SO_2$), 1228 (P=O), 1018 (P-O-C aliph.), 907 (S-N); LC-MS (*m/z*, %): 349 ($M+H^+$, 100). Anal. calcd. (found) % for $C_{11}H_{13}N_2O_5PS_2$: C, 37.93 (37.99); H, 3.76 (3.82); N, 8.04 (8.00).

**Dimethyl 4-(*N*-(1-methyl-2,6-dioxo-1,2,3,6-tetrahydropyrimidin-4-yl)sulfamoyl)phenylphosphonate (5c):** Yield: 87 %; semi-solid. $^{31}P$ NMR spectrum (DMSO-$d_6$): δ 23.4 ppm; $^{1}H$ NMR spectrum (400 MHz, DMSO-$d_6$): δ 11.36 (s, 1H, urea-NH), 8.35 (d, 2H, Ar-H), 7.88 (d, 2H, Ar-H), 4.35 (d, 2H, ethylene-H), 3.69 (s, 6H, $OCH_3$), 3.24 (s, 3H, N-$CH_3$), 2.13 (s, 1H, NH); $^{13}C$ NMR spectrum (100 MHz, DMSO-$d_6$): δ 163.2 (C-2′), 142.9 (C-2), 142.1 (C-5), 162.3 (C-6′), 161.7 (C-4′), 131.4 (C-4, C-6), 126.8 (C-3, C-7), 75.5 (C-7'), 52.5 (C-10, C-12), 28.0 (C-8′). IR (KBr, $\nu_{max}$, $cm^{-1}$): 3345, 3284 (NH), 1469 (P-car), 1338, 1181 ($SO_2$), 1232 (P=O), 1021 (P-O-C aliph.), 908 (S-N); LC-MS (*m/z*, %): 390 ($M+H^+$,100); Anal. calcd. (found) % for $C_{13}H_{16}N_3O_7PS$: C, 40.11 (40.19); H, 4.14 (4.18); N, 10.79 (10.85).

**Dimethyl 4-(*N*-thiomorpholinosulfamoyl)phenylphosphonate (5d):** Yield: 93 %; semi-solid. $^{31}$P NMR spectrum (DMSO-$d_6$): δ 22.7 ppm; $^{1}$H NMR spectrum (400 MHz, DMSO-$d_6$): δ 8.35 (d, 2H, Ar-H), 8.08 (d, 2H, Ar-H), 3.69 (s, 6H, $OCH_3$), 3.58 (t, 4H, methylene-H), 2.46 (t, 4H, methylene-H); $^{13}$C NMR spectrum (100 MHz, DMSO-$d_6$): δ 142.9 (C-2), 142.1 (C-5), 131.4 (C-4, C-6), 126.8 (C-3, C-7),52.5 (C-10, C-12), 49.3 (C-2′, C-6′), 26.9 (C-3′, C-5′). IR (KBr, $\nu_{max}$, cm$^{-1}$): 1464 (P-car), 1335, 1186 ($SO_2$), 1221 (P=O), 1018 (P-O-C aliph), 903 (S-N); LC-MS (*m/z*, %): 352 (M+H$^+$, 100). Anal. calcd. (found) % for $C_{12}H_{18}NO_5PS_2$: C, 41.02 (41.09); H, 5.16 (5.10); N, 3.99 (4.05).

**Dimethyl 4-(4-Methylpiperazin-1-ylsulfonyl)phenylphosphonate (5e):** Yield: 90 %; semi-solid. $^{31}$P NMR spectrum (DMSO-$d_6$): δ 23.2 ppm; $^{1}$H NMR spectrum (400 MHz, DMSO-$d_6$): δ 8.35 (d, 2H, Ar-H), 8.08 (d, 2H, Ar-H), 3.69 (s, 6H, $OCH_3$), 3.12 (t, 4H, methylene-H), 2.48 (t, 4H, methylene-H), 2.15 (s, 3H, N-$CH_3$); $^{13}$C NMR spectrum (100 MHz, DMSO-$d_6$): δ 142.9 (C-2), 142.1 (C-5), 131.4 (C-4, C-6), 126.8 (C-3, C-7), 53.7 (C-3′, C-5′), 52.5 (C-10, C-12), 46.0 (C-2′, C-6′), 45.5 (C-7′). IR (KBr, $\nu_{max}$, cm$^{-1}$): 1466 (P-car), 1332, 1183 ($SO_2$), 1226 (P=O), 1018 (P-O-C aliph.), 905 (S-N); LC-MS (*m/z*, %): 349 (M+H$^+$, 100). Anal. calcd. (found) % for $C_{18}H_{18}NO_5PS$: C, 55.24 (55.28); H, 4.64 (4.59); N, 3.58 (3.63).

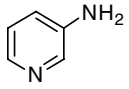
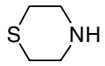
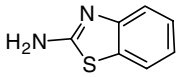
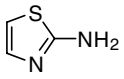
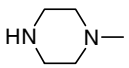
**Antibacterial and antifungal assays:** Antimicrobial activity of title compounds was tested by agar disc-diffusion method [27-29]. Sterile filter paper discs (6 mm diameter) moistened with the test compound solution in DMSO of specific concentrations 50 µg and 100 µg/disc were carefully placed on the agar culture plates that had been previously inoculated separately with the microorganisms. The plates were incubated at 37 ºC and the diameter of growth inhibition zones was measured after 24 h in case of bacteria and after 48 h in case of fungi. Penicillin was used as a reference antibacterial agent. Gresiofulvin was used as a reference antifungal agent. The test compounds, penicillin and gresiofulvin were dissolved in DMSO at concentrations of 50 and 100 µg/mL. Zone of inhibition is the area on an agar plate where growth of any microorganism is prevented by an antibiotic usually placed on the agar surface. If the test organism is susceptible to the antibiotic, the microorganisms will not grow.

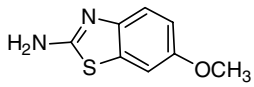


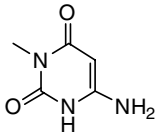


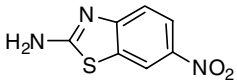


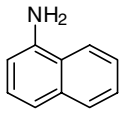








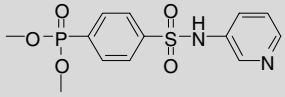


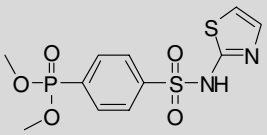


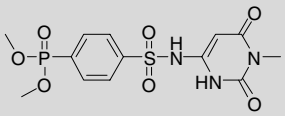
**Minimum inhibitory concentration:** Minimum inhibitory concentration (MIC) was evaluated using micro-broth-dilution method. MIC was determined by taking the minimum concentration at which there were observed no visually detectable bacteria/fungal growth. Specifically, 0.1 mL of standardized inoculum ($1.2 \times 10^7$ c.f.u/mL) was added to each test tube. The tubes were incubated aerobically at 37 ºC for 24 h for bacterial activity and 48-72 h for fungal activity. Control was maintained for each test sample. The lowest concentration (highest dilution) of test compound that produced no visible signs of microbial growth (no turbidity) when compared with the control tubes were regarded as MICs.

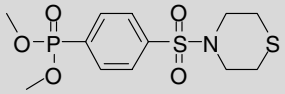
## RESULTS AND DISCUSSION

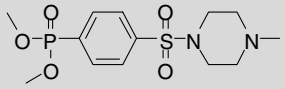
Synthesis of substituted phenylphosphonates (**5a-i**) was accomplished by reacting 4-chloro-*N*-(substituted) benzenesulfonamide derivatives (0.01 mmol) (**3a-i**) (which were synthesized by the reaction of 4-chlorobenzene-1-sulfonyl chloride (**1**) (0.2 mmol) and various amines (**2a-i**) (0.2 mmol) in THF in presence of triethylamine as base with trimethylphosphite (**4**) (0.02 mmol) using conventional and microwave irradiation techniques (**Scheme-I**) in high yields (73-95 %) in short period of time (12-30 min) under solvent free conditions (Table-1).

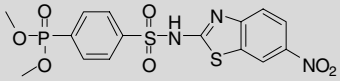


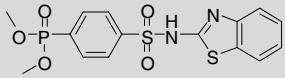


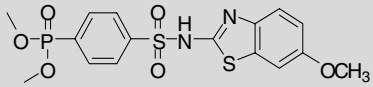


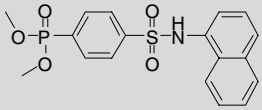












The structures of all the synthesized compounds were confirmed by NMR ($^{31}$P, $^{1}$H, $^{13}$C), IR, mass and CHN analysis. $^{31}$P

NMR signals appeared in the region δ 24.3-18.5 ppm for all the compounds (**5a-i**). $^{1}$H NMR spectra of the compounds (**5a-i**) gave signals for aromatic protons in the range of 8.58-6.70 ppm. The methyl protons of P-O-$CH_3$ showed singlet in the region δ 3.69-3.65 ppm for the compounds (**5a-i**). In $^{13}$C NMR spectra of compounds (**5a-i**), P-O-$CH_3$ was resonated at δ 52.5 ppm for the compounds (**5a-i**). In IR spectra, the bands in the region 1479-1461, 1235-1215 and 1024-1012 $cm^{-1}$ for P-car, P=O and P-O-C aliph. stretching frequencies. In mass spectra of the compounds, molecular ions were found in the accepted *m/z* values.

**Antibacterial activity:** All the synthesized compounds were assayed for their antibacterial activity against the growth of two Gram positive bacteria namely *Staphylococcus aureus*, *Bacillus subtilis* and two Gram negative bacteria such as *Escherichia coli*, *K. pneumoniae* at two different concentrations 50 and 100 µg/mL by agar well diffusion method. The standard drug, penicillin was used as reference for the comparison of the antibacterial activity. The diameter of zone of inhibition (mm) are represented in Table-1. Some analogues of this series were found to equipotent with the standard drug while some of them have comparable potency.

Especially, compound **5f**, bearing with 6-nitrobenzothiazolyl moiety and compound **5b** bearing with thiazol-2-yl group and compound **5c** incorporated with 1-methyl-2,6-dioxo-1,2,3,6-tetrahydropyrimidin-4-yl moiety were found to be most potent among all the title compounds. Zone of inhibition (ZOI) of compound **5f** is in the range 7.2-15.3 mm against Gram positive bacteria and 8.1-14.2 mm against Gram negative bacteria. The compound **5b** exhibited ZOI in the range 6.8-14.9 mm against Gram positive bacteria and 7.9-14.1 mm against Gram negative bacteria. The compound **5c** exhibited ZOI in the range 7.1-14.3 mm against Gram positive bacteria and 7.7-13.6 mm against Gram negative bacteria.The standard drug exhibited ZOI in the range 7.4-16.2 mm and 8.7-15.3 mm, respectively against Gram positive and Gram negative bacteria. The remaining compound exhibited modest activity. The results are shown in Table-2.

**Antifungal activity:** Two pathogenic fungi such as *Curvularia lunata* and *Aspergillus niger* were used to study the antifungal activity of synthesized compounds at two different concentrations 50 and 100 µg/mL using poison plate technique. Standard fungicide, gresiofulvinwas used for the comparison of antifungal activity. All the compounds showed moderate to good antifungal activity.

Especially, compounds **5c** bearing with 1-methyl-2,6-dioxo-1,2,3,6-tetrahydropyrimidin-4-yl moiety and **5f**, bearing with 6-nitrobenzothiazolyl moiety, **5d** bearing with thiomorpholine group were found to be most potent among all the title compounds. Zone of inhibition (ZOI) was found in the range 9.9-20.3 mm

for **5c**, 8.9-18.7 mm for **5f** and 8.6-18.0 for compound **5d** against the fungal strains where as the standard drug exhibited ZOI in the range 10.2-21.2 mm. The remaining compound exhibited moderate activity against all fungal strains. The results are presented in Table-2.

Minimum inhibitory concentration (MIC) was evaluated using micro-broth-dilution method [21]. The compounds **5f**, **5b** and **5c** exhibited the lower MIC values in the range of 15-45 µg/mL against bacteria and compounds **5c**, **5f** and **5d** showed lower MIC values in the range of 15-30 µg/mL against fungal strains (Table-3).

## Conclusion

In outline, we have demonstrated the synthesis of substituted phenylphosphonates (**5a-i**) by the reactions of 4-chloro-*N*-(substituted)benzene sulfonamide derivatives (**3a-i**) with trimethylphosphite under solvent free condition using microwave irradiation. Mild, non-hazardous and environment friendly reaction conditions, excellent yield in short reaction time are major advantages of this technique. The compounds **5f**, **5c** and **5b** showed promising antibacterial activity when compared with the remaining title compounds and were closer to standard drug. The compounds **5c**, **5f** and **5d** showed potent antifungal activity against the two tested fungal strains when compared with the remaining compounds. The remaining compounds exhibited reasonable activity against both bacterial and fungal strains.

## ACKNOWLEDGEMENTS

The authors thanks to Department of Biochemistry, S.V. University, Tirupati, India for providing biological assay results and Hyderabad Central University, Hyderabad, India for providing the spectral data.

## ABSTRACT

In the present report, an expeditious green synthetic approach was developed for the synthesis of α-aminophosphonates **5(a-j)** in good yields through one-pot three component reaction (Kabachnik-Fields reaction) in solvent-free conditions under microwave irradiation. The newly synthesized compounds were characterized by IR, NMR ($^{1}$H, $^{13}$C and $^{31}$P), mass and C, H, N analysis. The synthesized compounds were screened for their anti-inflammatory activity using rat paw edema method. Most of the compounds from the series showed significant ($p < 0.05$) anti-inflammatory activity.

## KEYWORDS

α-Aminophosphonates, Microwave irradiation, Sulphadiazine, Antimicrobial activity.

## INTRODUCTION

The area of drug discovery and drug development has experienced significant advances with the introduction of combinatorial chemistry approaches. This innovative technology of producing libraries of structurally related compounds is particularly beneficial in the step of lead optimization. Lead optimization involves structural modifications of a "lead" compound that has demonstrated desired biological or pharmacological activities and/or reduce unwanted side effects.

During the past few years, cyclooxygenases (COX-1 and COX-2) have been introduced as novel targets for anti-inflammatory and cancer treatment [1]. Currently, there is an increasing body of evidence stating that targeting COX enzymes, especially COX-2 isoform, is an effective approach for the prevention or treatment of inflammation and various types of cancers. Nimesulide is a relatively COX-2 selective, non-steroidal anti-inflammatory drug (NSAID) with analgesic and antipyretic properties. But continuous use of nimesulide can cause diarrhea, vomiting, skin rash, dizziness and bitterness in mouth. Hence there is a need for developing superior anti-inflammatory with better safety profile.

The α-aminophosphonates, structural analogues of natural amino acids have received wide attention in medicinal, bioorganic and organic chemistry. They are reported to possess antitumor [2], anti-inflammatory [3] and antibiotic [4] activities.

Their potential as good enzyme inhibitors [5], herbicides [6], peptide mimetics [7], fungicides [8], insecticides [9] plant growth regulators [10] *etc*. is also well documented. The assortment of possibilities of practical use of α-aminophosphonates has stimulated considerable interest toward α-aminophosphonate chemistry. Various synthetic protocols have been described for the synthesis of α-aminophosphonates. The nucleophilic addition of phosphites to imines (Kabachnik-Fields reaction) represents a convenient route for their preparation. A variety of Brønsted acid [11] or Lewis acids like $ZnCl_2$ [12], $BF_3$-$Et_2O$ [13], $CdI_2$/benzene [14], $CdI_2$/microwave [15]. One-pot syntheses of α-aminophosphonates have been carried out in organic solvents using lanthanide triflate [16], $InCl_3$ [17], $ZrCl_4$ [18], $In(OTf)_3/MgSO_4$ [19], $GaI_3$ [20], $BiCl_3$ [21], $Cu(OTf)_2$ [22], $SbCl_3/Al_2O_3$ [23]. Moreover, water [24] and ionic liquid [25] turned to be a kind of promising medium for such three component syntheses of α-aminophosphonates. Solvent-free transformations of phosphite to α-aminophosphonates could be accomplished in the presence of $LiClO_4$_$Et_2O$ [26,27], TFA [28], $LiClO_4$ [29], metal triflate [30], $Na_2CaP_2O_7$ [31], $ZrOCl_2{\cdot}8H_2O$, $ZrO(ClO_4)_2{\cdot}6H_2O$ [32] and TsCl [33].

Although, these approaches are satisfactory for three component, one-pot synthesis of α-aminophosphonates, nevertheless the utilization of toxic solvents, undesirable reaction conditions, expensive reagents, lengthened reaction times, costly catalysts and formation of side products limit the exercise of these approaches. The development of a simple and inexpensive procedure for one-pot synthesis of α-aminophosphonates is needed. Further, in recent years microwave irradiation [34-36] technique was playing a prominent role to promote one-pot synthesis of α-aminophosphonates and provide a number of advantages over the standard heating techniques such as improved reaction yield, shorten the reaction time and easy work-up procedure. For the most part, microwave assisted solvent-free reaction provides an opportunity to work with open vessels thus avoiding the development of high pressure and provide a possibility of up scaling the reaction on a preparative scale and helps the induction of the reaction under dry conditions. Overview of literature and to overcome the former drawbacks, we familiarized to explore the preparation of novel α-aminophosphonates under conventional as well as microwave assisted methods using solvent-free conditions.

## EXPERIMENTAL

All the chemicals are procured from Sigma-Aldrich, Merck and Lancaster were used as such without further purification. All solvents used for spectroscopic and other physical studies were reagent grade and were further purified employing the reported methods. The melting points were determined in open capillary tubes on a Guna Digital melting point apparatus and are uncorrected. IR spectra ($\nu_{max}$, $cm^{-1}$) were recorded as KBr pellets using Perkin-Elmer spectrophotometer at APL Research centre, Hyderabad. The $^1H$ NMR, $^{13}C$ NMR and $^{31}P$ NMR spectra were recorded on Bruker AMX 300 MHz NMR spectrometer operating at 300 MHz for $^1H$ NMR, 75.4 MHz for $^{13}C$ NMR and 161.9 MHz for $^{31}P$ NMR. All compounds were dissolved in DMSO-$d_6$ and chemical shifts were referenced to TMS ($^1H$ NMR and $^{13}C$ NMR) and 85 % $H_3PO_4$ ($^{31}P$ NMR) and mass spectra were recorded on API 2000 Perkin-Elmer PE-SCIEX Mass spectrometer. Micro-analytical data were obtained from University of Hyderabad, Hyderabad, India.

**Preparation of *N*-(4-amino-2-phenoxy phenyl)methanesulfonamide (2):** In the first step, to a mixture of nimesulide (5 g, 16.2 mmol) and tin (3.13 g) was added conc. HCl (20 mL) and the mixture was heated on a water bath at 90 °C for 3 h. After the completion of the reaction, the mixture was poured into ice water and the solid separated was filtered. After basification the crude product obtained was purified by re-crystallization from methanol and chloroform mixture to give the desired product as light brown solid; mp 198 °C; IR (KBr, $\nu_{max}$, $cm^{-1}$): 3412, 1572, 1487, 1215 and 1154; $^1H$ NMR (200 MHz, DMSO-$d_6$) δ 9.2 (s, 1H), 7.4 (m, 2H), 7.3 (d, *J* 8.6 Hz, 1H), 7.2 (m, 2H), 6.8 (d, *J* 8.6 Hz, 1H), 6.5 (s, 1H), 3.5 (br s, 2H), 3.1 (s, 3H); Mass (*m/z*) 279.1 ($M^+$, 100 %); Elemental analysis found C, 56.25; H, 5.07; N, 10.26; $C_{13}H_{14}N_2O_3S$ requires C, 56.10; H, 5.07; N, 10.06 [37].

### Procedure for the synthesis of a-aminophosphonates 5a-j

**Conventional method:** A mixture of N-(4-amino-2-phenoxy phenyl)methanesulfonamide (**2**, 0.005 mol) in ethanol, diethylphosphite (**3**, 0.005 mol) and 3-nitrobenzaldehyde (**4a**, 0.005 mol) were taken in flat-bottomed flask and stirred the reaction mixture vigorously at 40 °C for 4 h. The reaction progress was monitored by TLC on silica gel using ethyl acetate-hexane (7:3 v/v). After completion of the reaction, the solvent was removed under reduced pressure to get the crude product. The resulting crude product was purified by column chromatography on silica gel (100-200 mesh) using ethyl acetate-hexane (1:1) as eluent to afford pure diethyl (4-fluorophenyl)(4-(methylsulfonamido)-3-phenoxyphenylamino)methylphosphonate (**5a**). The other compounds **5b-j** were prepared by adapting to the above described procedure.

**Microwave irradiation method:** A mixture of N-(4-amino-2-phenoxy phenyl)methanesulfonamide (**2**, 0.005 mol), diethylphosphite (**3**, 0.005 mol) and 3-nitrobenzaldehyde (**4a**, 0.005 mol) were taken in flat-bottomed flask and irradiated with microwave radiations using catalyst systems (CATA-4R) at 490 Watts. The reaction mixture was heated successively twice for 2-3 min period each time followed by a 1 min cooling interval between irradiations. This method was intended to avoid continuous overheating of reactants. The reaction mixtures were kept under stirring to maintain the homogeneity of the irradiating field throughout the reaction. By monitoring with TLC, the reaction was stopped after 3-6 min. The obtained crude products were recrystallized from ethyl acetate to afford pure **5a-j** as solids with 80.9-90.6 % yield.

### Physical, analytical and spectral data for the compounds (5a-j)

**Diethyl (4-fluorophenyl)(4-(methylsulfonamido)-3-phenoxyphenylamino)methylphosphonate (5a):** Yield: 91 %; semi solid. $^{31}P$ NMR spectrum (DMSO-$d_6$): δ 18.5 ppm; $^1H$ NMR spectrum (400 MHz, DMSO-$d_6$): δ 8.41 (s, 1H, $SO_2$-**NH**), 7.66-7.21 (m, 9H, Ar-H), 6.53 (d, 1H, Ar-H), 6.48 (d, *J* = 6.8 Hz, 1H, Ar-H), 6.33 (s, 1H, Ar-H), 5.32 (s, 1H, C-NH), 4.54 (d, 1H, P-CH), 3.86 (m, 4H, O-**$CH_2$**$CH_3$), 2.89 (s, 3H, $SO_2$**$CH_3$**), 1.25 (t, 6H, O-$CH_2$**$CH_3$**); $^{13}C$ NMR spectrum (100

MHz, DMSO-$d_6$): δ 161.9, 157.8, 141.5, 136.5, 132.8, 129.7, 127.6, 122.5, 121.5, 119.9, 118.3, 114.3, 113.6, 101.9, 64.4, 55.8, 37.9, 16.5; IR (KBr, $\nu_{max}$, $cm^{-1}$): 3407 (-NH), 3296 (NH), 1227 (P=O); LCMS (*m/z*, %): 523 ($M+H^+$, 100); Anal. calcd. for $C_{24}H_{28}N_2O_6PSF$: C, 55.17; H, 5.40; N, 5.36 %; found: C, 55.54; H, 5.38; N, 5.42 %.

**Diethyl (4-(methylsulfonamido)-3-phenoxyphenylamino)(3-nitrophenyl)methylphosphonate (5b):** Yield: 91 %; semi solid. $^{31}P$ NMR spectrum (DMSO-$d_6$): δ 17.2 ppm; $^1H$ NMR spectrum (400 MHz, DMSO-$d_6$): δ 8.52 (s, 1H, $SO_2$-**NH**), 8.18-7.23 (m, 9H, Ar-H), 6.53 (d, 1H, Ar-H), 6.48 (d, *J* = 6.8 Hz, 1H, Ar-H), 6.33 (s, 1H, Ar-H), 5.31 (s, 1H, C-NH), 4.53 (d, 1H, P-CH), 3.86 (m, 4H, O-$CH_2CH_3$), 2.89 (s, 3H, $SO_2$**$CH_3$**), 1.24 (t, 6H, O-$CH_2CH_3$); $^{13}C$ NMR spectrum (100 MHz, DMSO-$d_6$): δ 157.8, 148.5, 141.5, 139.3, 136.5, 134.5, 130.4, 127.6, 122.6, 122.5, 121.5, 122.1, 119.9, 118.3, 113.6, 101.9, 64.4, 55.9, 37.9, 16.6; IR (KBr, $\nu_{max}$, $cm^{-1}$): 3399 (NH), 3285 (NH), 1227 (P=O); LCMS (*m/z*, %): 550 ($M+H^+$, 100); Anal. calcd. for $C_{24}H_{28}N_3O_8PS$: C, 52.45; H, 5.14; N, 7.65 %; found: C, 52.52; H, 5.20; N, 7.62 %.

**Diethyl (4-chloro-3-nitrophenyl)(4-(methylsulfonamido)-3-phenoxyphenylamino)methylphosphonate (5c):** Yield: 90 %; semi solid. $^{31}P$ NMR spectrum (DMSO-$d_6$): δ 17.7 ppm; $^1H$ NMR spectrum (400 MHz, DMSO-$d_6$): δ 8.53 (s, 1H, $SO_2$-**NH**), 7.81-7.23 (m, 8H, Ar-H), 6.53 (d, 1H, Ar-H), 6.48 (d, *J* = 6.8 Hz, 1H, Ar-H), 6.33 (s, 1H, Ar-H), 5.32 (s, 1H, C-NH), 4.55 (d, 1H, P-CH), 3.86 (m, 4H, O-$CH_2CH_3$), 2.89 (s, 3H, $SO_2$**$CH_3$**), 1.23 (t, 6H, O-$CH_2CH_3$); $^{13}C$ NMR spectrum (100 MHz, DMSO-$d_6$): δ 157.8, 148.2, 141.5, 137.6, 136.5, 134.7, 131.5, 127.6, 124.1, 123.4, 122.5, 121.5, 119.9, 118.3, 113.6, 101.9, 64.4, 55.7, 37.9, 16.4; IR (KBr, $\nu_{max}$, $cm^{-1}$): 3399 (NH), 3285 (NH), 1227 (P=O); LCMS (*m/z*, %): 584 ($M+H^+$, 100), 586 (M+1, 26.6 %), 586 (M+2, 36.8 %); Anal. calcd. for $C_{24}H_{27}N_3O_8PSCl$: C, 49.36; H, 4.66; N, 7.20 %; found: C, 49.42; H, 4.58; N, 7.24 %.

**Diethyl(4-hydroxy-3-nitrophenyl)(4-(methylsulfonamido)-3-phenoxyphenylamino)methylphosphonate (5d):** Yield: 87 %; semi solid. $^{31}P$ NMR spectrum (DMSO-$d_6$): δ 18.1 ppm; $^1H$ NMR spectrum (400 MHz, DMSO-$d_6$): δ 10.12 (s, 1H, -OH), 8.50 (s, 1H, $SO_2$-**NH**), 7.85-7.20 (m, 8H, Ar-H), 6.52 (d, 1H, Ar-H), 6.43 (d, *J* = 6.8 Hz, 1H, Ar-H), 6.35 (s, 1H, Ar-H), 5.30 (s, 1H, C-NH), 4.53 (d, 1H, P-CH), 3.85 (m, 4H, O-$CH_2CH_3$), 2.87 (s, 3H, $SO_2$**$CH_3$**), 1.23 (t, 6H, O-$CH_2CH_3$); $^{13}C$ NMR spectrum (100 MHz, DMSO-$d_6$): δ 157.8, 156.2, 141.5, 138.4, 136.5, 135.8, 130.7 127.6,, 123.5, 122.5, 122.1, 121.5, 119.9, 118.3, 113.6, 101.9, 64.4, 55.6, 37.7, 16.4; IR (KBr, $\nu_{max}$, $cm^{-1}$): 3399 (NH), 3285 (NH), 1227 (P=O); LCMS (*m/z*, %): 566 ($M+H^+$, 100); Anal. calcd. for $C_{24}H_{28}N_3O_9PS$: C, 50.97; H, 4.99; N, 7.43 %; found: C, 50.92; H, 4.95; N, 7.48 %.

**Diethyl (3-bromo-4-fluorophenyl)(4-(methylsulfonamido)-3-phenoxyphenylamino)methylphosphonate (5e):** Yield: 92 %; semi solid. $^{31}P$ NMR spectrum (DMSO-$d_6$): δ 17.9 ppm; $^1H$ NMR spectrum (400 MHz, DMSO-$d_6$): δ 8.52 (s, 1H, $SO_2$-**NH**), 7.65-7.21 (m, 8H, Ar-H), 6.53 (d, 1H, Ar-H), 6.48 (d, *J* = 6.8 Hz, 1H, Ar-H), 6.33 (s, 1H, Ar-H), 5.31 (s, 1H, C-NH), 4.51 (d, 1H, P-CH), 3.86 (m, 4H, O-$CH_2CH_3$), 2.88 (s, 3H, $SO_2$**$CH_3$**), 1.22 (t, 6H, O-$CH_2CH_3$); $^{13}C$ NMR spectrum (100 MHz, DMSO-$d_6$): δ 166.3, 157.8, 141.5, 136.5, 134.6, 132.5, 128.4, 127.6, 122.5, 121.5, 119.9, 119.2, 118.3, 113.6, 110.7, 101.9, 64.4, 55.7, 37.9, 16.5; IR (KBr, $\nu_{max}$, $cm^{-1}$): 3399 (NH), 3285 (NH), 1227 (P=O); LCMS (*m/z*, %): 601 ($M+H^+$, 100), 599 (M-2, 96.7 %), 602 (M+1, 26.9 %); Anal. calcd. for $C_{24}H_{27}N_2O_6PSBrF$: C, 47.93; H, 4.53; N, 4.66 %; found: C, 47.89; H, 4.57; N, 4.62 %.

**Diethyl (4-chlorophenyl)(4-(methylsulfonamido)-3-phenoxyphenylamino)methylphosphonate (5f):** Yield: 90 %; semi solid. $^{31}P$ NMR spectrum (DMSO-$d_6$): δ 17.6 ppm; $^1H$ NMR spectrum (400 MHz, DMSO-$d_6$): δ 8.51 (s, 1H, $SO_2$-**NH**), 7.66-7.21 (m, 9H, Ar-H), 6.53 (d, 1H, Ar-H), 6.48 (d, *J* = 6.8 Hz, 1H, Ar-H), 6.33 (s, 1H, Ar-H), 5.33 (s, 1H, C-NH), 4.54 (d, 1H, P-CH), 3.86 (m, 4H, O-$CH_2CH_3$), 2.87 (s, 3H, $SO_2$**$CH_3$**), 1.23 (t, 6H, O-$CH_2CH_3$); $^{13}C$ NMR spectrum (100 MHz, DMSO-$d_6$): δ 157.8, 141.5, 136.5, 135.1, 134.2, 129.9, 129.4, 127.6, 122.5, 121.5, 119.9, 118.3, 113.6, 101.9, 64.4, 55.7, 37.6, 16.4; IR (KBr, $\nu_{max}$, $cm^{-1}$): 3399 (NH), 3285 (NH), 1227 (P=O); LCMS (*m/z*, %): 539 ($M+H^+$, 100), 541 (M+2, 38); Anal. calcd. for $C_{24}H_{28}N_2O_6PSCl$: C, 53.48; H, 5.24; N, 5.20 %; found: C, 53.52; H, 5.20; N, 5.15 %.

**Diethyl (2,4-dichlorophenyl)(4-(methylsulfonamido)-3-phenoxyphenylamino)methylphosphonate (5g):** Yield: 91 %; semi solid. $^{31}P$ NMR spectrum (DMSO-$d_6$): δ 18.4 ppm; $^1H$ NMR spectrum (400 MHz, DMSO-$d_6$): δ 8.54 (s, 1H, $SO_2$-**NH**), 7.75-7.23 (m, 8H, Ar-H), 6.53 (d, 1H, Ar-H), 6.48 (d, *J* = 6.8 Hz, 1H, Ar-H), 6.33 (s, 1H, Ar-H), 5.33 (s, 1H, C-NH), 4.56 (d, 1H, P-CH), 3.86 (m, 4H, O-$CH_2CH_3$), 2.88 (s, 3H, $SO_2$**$CH_3$**), 1.24 (t, 6H, O-$CH_2CH_3$); $^{13}C$ NMR spectrum (100 MHz, DMSO-$d_6$): δ 157.8, 141.5, 140.6, 136.5, 134.7, 132.6, 131.3, 129.5, 128.4, 127.6, 125.3, 122.5, 121.5, 119.9, 118.3, 113.6, 101.9, 64.4, 56.1, 38.2, 16.8; IR (KBr, $\nu_{max}$, $cm^{-1}$): 3399 (NH), 3285 (NH), 1227 (P=O); LCMS (*m/z*, %): 573 ($M+H^+$, 100), 573 (M+2, 70); Anal. calcd. for $C_{24}H_{27}N_2O_6PSCl_2$: C, 50.27; H, 4.75; N, 4.89 %; found: C, 50.35; H, 4.84; N, 4.95 %.

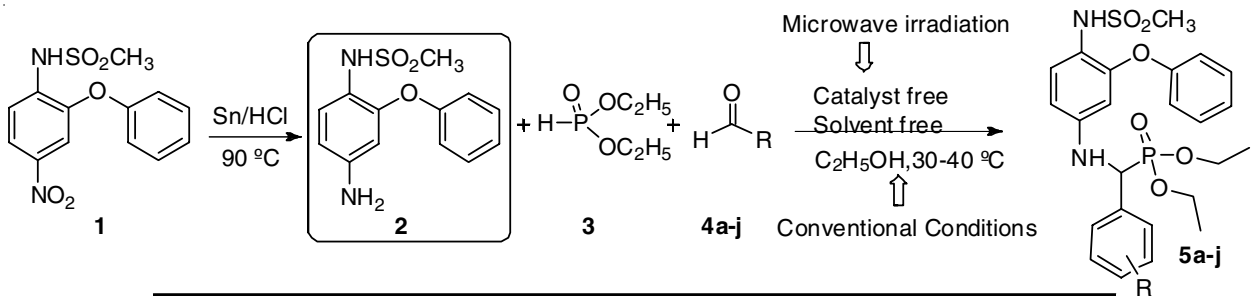
**Diethyl (2-hydroxyphenyl)(4-(methylsulfonamido)-3-phenoxyphenylamino)methylphosphonate (5h):** Yield: 87 %; semi solid. $^{31}P$ NMR spectrum (DMSO-$d_6$): δ 18.0 ppm; $^1H$ NMR spectrum (400 MHz, DMSO-$d_6$): δ 10.15 (s, 1H, -OH), 8.45 (s, 1H, $SO_2$-**NH**), 7.63-6.95 (m, 9H, Ar-H), 6.53 (d, 1H, Ar-H), 6.48 (d, *J* = 6.8 Hz, 1H, Ar-H), 6.33 (s, 1H, Ar-H), 5.29 (s, 1H, C-NH), 4.49 (d, 1H, P-CH), 3.87 (m, 4H, O-$CH_2CH_3$), 2.88 (s, 3H, $SO_2$**$CH_3$**), 1.22 (t, 6H, O-$CH_2CH_3$); $^{13}C$ NMR spectrum (100 MHz, DMSO-$d_6$): δ 158.4, 157.8, 141.5, 136.5, 129.5, 129.2, 127.6, 124.2, 122.7, 122.5, 121.5, 119.9, 118.4, 118.3, 113.6, 101.9, 64.4, 55.4, 37.7, 16.3; IR (KBr, $\nu_{max}$, $cm^{-1}$): 3399 (NH), 3285 (NH), 1227 (P=O); LCMS (*m/z*, %): 521 ($M+H^+$, 100); Anal. calcd. for $C_{24}H_{28}N_3O_8PS$: C, 55.38; H, 5.62; N, 5.38 %; found: C, 55.45; H, 5.70; N, 5.32 %.

**Diethyl (4-(methylsulfonamido)-3-phenoxyphenylamino)(thiophen-2-yl)methylphosphonate (5i):** Yield: 90 %; semi solid. $^{31}P$ NMR spectrum (DMSO-$d_6$): δ 16.8 ppm; $^1H$ NMR spectrum (400 MHz, DMSO-$d_6$): δ 8.52 (s, 1H, $SO_2$-**NH**), 7.66-6.92 (m, 8H, Ar-H), 6.53 (d, 1H, Ar-H), 6.48 (d, *J* = 6.8 Hz, 1H, Ar-H), 6.33 (s, 1H, Ar-H), 5.31 (s, 1H, C-NH), 4.50 (d, 1H, P-CH), 3.86 (m, 4H, O-$CH_2CH_3$), 2.89 (s, 3H, $SO_2$**$CH_3$**), 1.24 (t, 6H, O-$CH_2CH_3$); $^{13}C$ NMR spectrum (100

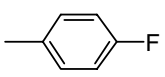
MHz, DMSO-$d_6$): δ 157.8, 141.5, 140.3, 136.5, 129.3, 128.3, 127.6, 126.3, 122.5, 121.5, 119.9, 118.3, 113.6, 101.9, 64.4, 55.8, 37.7, 16.4; IR (KBr, $\nu_{max}$, $cm^{-1}$): 3399 (NH), 3285 (NH), 1227 (P=O); LCMS (*m/z*, %): 511 ($M+H^+$, 100); Anal. calcd. for $C_{22}H_{27}N_2O_6PS_2$: C, 51.75; H, 5.33; N, 5.49 %; found: C, 51.82; H, 5.27; N, 5.56 %.

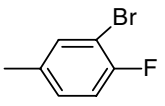
**Diethyl (4-(methylsulfonamido)-3-phenoxyphenyl-amino)(5-nitrothiophen-2-yl)methylphosphonate (5j):** Yield: 91 %; semi solid. $^{31}P$ NMR spectrum (DMSO-$d_6$): δ 17.1 ppm; $^1H$ NMR spectrum (400 MHz, DMSO-$d_6$): δ 8.53 (s, 1H, $SO_2$-**NH**), 7.95-6.96 (m, 7H, Ar-H), 6.53 (d, 1H, Ar-H), 6.48 (d, *J* = 6.8 Hz, 1H, Ar-H), 6.33 (s, 1H, Ar-H), 5.33 (s, 1H, C-NH), 4.54 (d, 1H, P-CH), 3.86 (m, 4H, O-$CH_2CH_3$), 2.86 (s, 3H, $SO_2$**$CH_3$**), 1.22 (t, 6H, O-$CH_2CH_3$); $^{13}C$ NMR spectrum (100 MHz, DMSO-$d_6$): δ 157.8, 152.1, 149.9, 141.5, 136.5, 129.3, 128.4, 127.6, 122.5, 121.5, 119.9, 118.3, 113.6, 101.9, 64.4, 55.8, 37.8, 16.5; IR (KBr, $\nu_{max}$, $cm^{-1}$): 3399 (NH), 3285 (NH), 1227 (P=O); LCMS (*m/z*, %): 556 ($M+H^+$, 100); Anal. calcd. for $C_{22}H_{26}N_3O_8PS_2$: C, 47.56; H, 4.72; N, 7.56 %; found: C, 47.52; H, 4.78; N, 7.62 %.

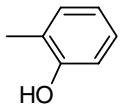
**Anti-inflammatory activity:** Anti-inflammatory activity was determined by carrageenan induced paw edema method. A either sex of rats weighing 150-200 g were divided into 6 groups (n = 6) and they were fasted with free access to water at least 16 h. Group-I received 1 % sodium CMC (negative control), Group-II received diclofenac sodium and nimesulide at a dose of 40 mg/kg (positive control) and Group-III to VI were given the compounds **5a-j** (40 mg/kg). All the compounds **5a-j** were given in oral route. After 30 min, 0.1 mL of 1 % carrageenan suspension in normal saline was injected into the subplantar region of the left hind paw of each rat to induce edema. The edema volumes of the injected paw measured with the help of plethysmograph at the interval of 1, 2, 3 and 4 h. The difference between the paw volumes of treated animals were compared with that of the control group and the mean edema volume was calculated. Percentage inhibition was calculated as per the formula,

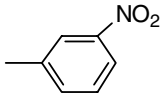


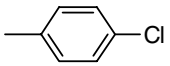
$$\text{Inhibition } (\%) = \left( \frac{V_o - V_t}{V_o} \right) \times 100$$

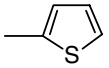


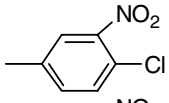


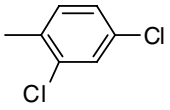


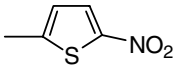


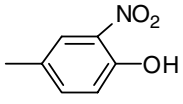












where $V_o$ = volume of the paw control at time t, $V_t$ = volume of the paw of drug treated at time t.

## RESULTS AND DISCUSSION

A series of α-aminophosphonates (**5a-j**) were conveniently synthesized by equimolar quantities of *N*-(4-amino-2-phenoxy phenyl)methanesulfonamide (**2**) which is previously prepared from nimesulide (**1**, 0.005 mol) on reduction, diethylphosphite (**3**, 0.005 mol) and various aldehydes (**4a-j**) (0.005 mol) through Kabachinic-Field reaction under conventional and microwave irradiation methods using neat reaction conditions was depicted in **Scheme-I**. The physical data of the title compounds are given in Table-1.

The chemical structure of the title compounds **5a-j** are supported by spectral data ($^{31}P$, $^1H$ and $^{13}C$ NMR, IR and LC-MS), elemental analysis and the results are presented in Experimental section. $^{31}P$ NMR signals were observed in the region 18.5-16.8 ppm [38] for all the compounds **5a-j**. The $^1H$ NMR spectra gave signals due to Ar-H in the range of δ 8.18-6.33 ppm. The proton signals in the range of 8.53-8.41, 5.32-5.30 and 4.55-4.53 ppm were due to $SO_2$-NH, C-NH and P-CH respectively. The methylene protons of P-O-$\underline{CH_2}CH_3$ gave a multiplet and methyl protons of P-O-$CH_2\underline{CH_3}$ resonated as a

triplet in the region δ 3.86-3.84 and δ 1.25-1.22 respectively. $^{13}$C NMR chemical shift for P-CH was observed in the region 56.1-55.4 ppm. IR absorptions in the regions 3399-3380, 3285-3256 and 1227-1220 cm$^{-1}$ were assigned to $SO_2$-NH, NH and P=O stretching vibrations respectively for the compounds **5a-j**. In their mass spectra, $M^{+\cdot}$ ions were observed in the expected *m/z* values.

**Anti-inflammatory activity:** In order to identify the potential anti-inflammatory agents among the newly synthesized compounds was evaluated for their *in vivo* anti-inflammatory activity using carrageenan-induced paw edema method [39] in rats. Considering the fact that carrageenan-induced paw edema assay is a biphasic event involving the release of histamine and serotonin as the mediators of inflammation in the first phase which normally lasts for about 2 h after the carrageenan injection followed by the second phase which generally operates between 2 and 4 h after the carrageenan injection and involves prostaglandins as the mediators for the inflammation, thus any anti-inflammatory activity in the second phase of this biphasic event can be attributed to the inhibition of prostaglandin synthesis.

The results shown in Table-2 revealed that most of the compounds showed significant anti-inflammatory activity 3 h and 4 h after carrageenan injection with as many as 5 compounds showing more than 80 % inhibition after 3 h (as compared to the reference drugs 88.34 and 85.88 %) and 7 compounds showing more than 80 % inhibition after 4 h (as compared to the references drug 91.57 and 88.20 %). The compounds **5d** (R = 4-F), 5e (R = 3-Br, 4-F), **5g** (R = 3,4-Cl), **5f** (R = 4-Cl) and **5b** (R = 3-$NO_2$, 4-Cl) showed remarkable anti-inflammatory activity ranging from 87.73 to 84.04 % comparable to the reference drug diclofenac sodium (88.34 %) and nimesulide (85.88 %) 3 h after carrageenan injection. The compounds **5j** (R = 5-nitrothiophen-2-yl), **5a** (R = 3-$NO_2$), **5i** (R = 5-nitrothiophen-2-yl), **5c** (R = 3-$NO_2$, 4-OH) and **5h** (R = 4-OH) showed appreciable anti-inflammatory activity ranging from 79.75 to 74.84 % 3 h after carrageenan injection. After 4 h of carrageenan injection, the compounds **5d** (R = 4-F), **5e** (R = 3-Br, 4-F), **5g** (R = 3,4-Cl), **5f** (R = 4-Cl), **5b** (R = 3-$NO_2$, 4-Cl), **5a** (R = 3-$NO_2$) and **5j** (5-nitrothiophen-2-yl) showed anti-inflammatory activity ranging from 91.01 to 80.33 % inhibition comparable to diclofenac sodium (91.57 %) and nimesulide (88.20 %). The remaining compounds showed anti-inflammatory activity ranging from 78.08 to 75.84 % inhibition 4 h after carrageenan injection. It is difficult to draw a correlation between the anti-inflammatory activity and the substituents present on the aromatic rings in 1 or 2 as the anti-inflammatory activity seems to be independent of the nature of substituents. The excellent anti-inflammatory inhibition exhibited by these compounds, 4 h after carrageenan injection suggested that these compounds do not get easily metabolized in the body.

## Conclusion

In conclusion, a new series of α-aminophosphonates has been prepared and fully assigned by analytical and spectral data. The present investigation showed significant anti-inflammatory action to all compound of the series when compared against vehicle treated control. The results were found to be equipotent with diclofenac. The anti-inflammatory effect was found to be most significant at 3 and 4 h. Overall looking at duration of action and percent inhibition, the sustained and momentous action was reported with **5d**, **5e**, **5g**, **5f**, **5b**, **5a** and **5j**. Hence the present series could be developed as a novel class of anti-inflammatory agents.

## IJPRONLINE

**International Journal of Pharmaceutical Research (IJPR)** an International Journal of Pharmaceutical Research **(ISSN -0975-2366)** (An official publication of Association of Indian pharmacist-AIP) is established in the year 2009. People from various avenues of pharmacy profession, who have come together in a single platform to redefine the structure of pharmacy profession in the country, where it is seen only as an industry oriented profession. IJPR is peer reviewed online journal which is also available in print version. The motto behind the journal is to help students, researchers and scientist worldwide to benefit from the high quality peer reviewed articles and to their high performing works in the entire arena of pharmaceutical science.

IJPR is dedicated to protect personal information and will make every reasonable effort to handle collected information appropriately. All information collected, as well as related requests, will be handled carefully and efficiently as possible in accordance with IJPR standards for integrity and objectivity.

## Editorial……

It is heartening to note that our journal is able to sustain the enthusiasm and covering various facets of knowledge. It is our hope that IJMER would continue to live up to its fullest expectations savoring the thoughts of the intellectuals associated with its functioning .Our progress is steady and we are in a position now to receive evaluate and publish as many articles as we can. The response from the academicians and scholars is excellent and we are proud to acknowledge this stimulating aspect.

The writers with their rich research experience in the academic fields are contributing excellently and making IJMER march to progress as envisaged. The interdisciplinary topics bring in a spirit of immense participation enabling us to understand the relations in the growing competitive world. Our endeavour will be to keep IJMER as a perfect tool in making all its participants to work to unity with their thoughts and action.

The Editor thanks one and all for their input towards the growth of the **Knowledge Based Society**. All of us together are making continues efforts to make our predictions true in making IJMER, a Journal of Repute

# SIMULATION STUDY OF ADVANCED INVERTING AMPLIFIER FOR LOW POWER BIOMEDICAL APPLICATIONS

**Sarah Khwaja**
Bachelor of Engineering
Jamia Millia Islamia, India

**Abstract**
In this paper, Simulation study of Advanced Inverting Amplifier for Low Power Biomedical Applications using 45 nm technology node is proposed using Cascode Operational transconductance amplifier .The proposed structure uses carbon nanotube field effect transistor. It is observed that the proposed Amplifier is also consuming low power of 188 µW. There is no need of negative feedback and feedback resistor. Further the proposed Amplifier consumes very low power and simple circuitry. Furthermore, the proposed advanced inverting amplifier is electronically tunable. It can be used for Low Power Biomedical Applications due to low power , low voltage and low amplitude of signal.

**Index Terms**— CMOS, CNTFET, COTA, Power consumption, Inverting Amplifier

## I. INTRODUCTION

Cascode Operational transconductance amplifier (COTA) is a new class of O.T.A. It has improved gain (due to Band output resistance) and bandwidth due to reduced Miller capacitance [5]. In order to ensure further improvement in Cascode COTA performance, Carbon Nanotube Field Effect Transistors (CNTFETs) based Circuits that promise to deliver much better performance than existing CMOS based Cascode Operational transconductance amplifiers is proposed [6]. CNTFET technology can easily club with the bulk CMOS technology on a single chip and utilizes the same infrastructure at 45 nm [7].

## II. DESIGN OF ADVANCED INVERTING AMPLIFIER:-

The amplifiers designed using operational amplifier haves serious limitations. Negative Feedback used in operational amplifier based Inverting Amplifier, an external Feedback Resistor is required. This feedback connection between the output and the inverting input terminal forces the differential input voltage towards zero. This closed-loop inverting amplifier uses negative feedback to accurately control the overall gain of the amplifier, but at a cost in the reduction of the amplifiers gain. But in proposed Cascode Operational transconductance amplifier based Advanced Inverting Amplifier, there is no need of negative feedback and feedback resistor. Further the proposed Amplifier consumes very low power and simple circuitry. Furthermore, the proposed advanced inverting amplifier is electronically tunable [1-4].

Figure 1.Multi wall CNTs

The R-C band stop filter is similar to a band pass filter in which the shunt arm is replaced by the series arm and the series arm is replaced by the shunt one.

Flexibility and tunability are the big advantages of OTAs. The output current io of the ideal COTA can be expressed by equation (1)

$$io = gm\ (vp - vn)$$

Where gm is the transconductance, vp and vn are positive and negative input terminals respectively. The ideal OTA has infinite output resistance. All of io flows in the external capacitive load and none flows in the OTA's own output resistance .Towards increasing the OTA output resistance, the current mirrors are cascoded. Cascode amplifier configuration improves gain due to Band output resistance and bandwidth due to reduced Miller capacitance.

## III.PROPOSED COTA BASED ADVANCED INVERTING AMPLIFIER

The Cascode Operational transconductance amplifier (COTA) circuit is used to design inverting amplifier. The proposed inverting amplifier is simulated using 0.9 V at 45 nm.

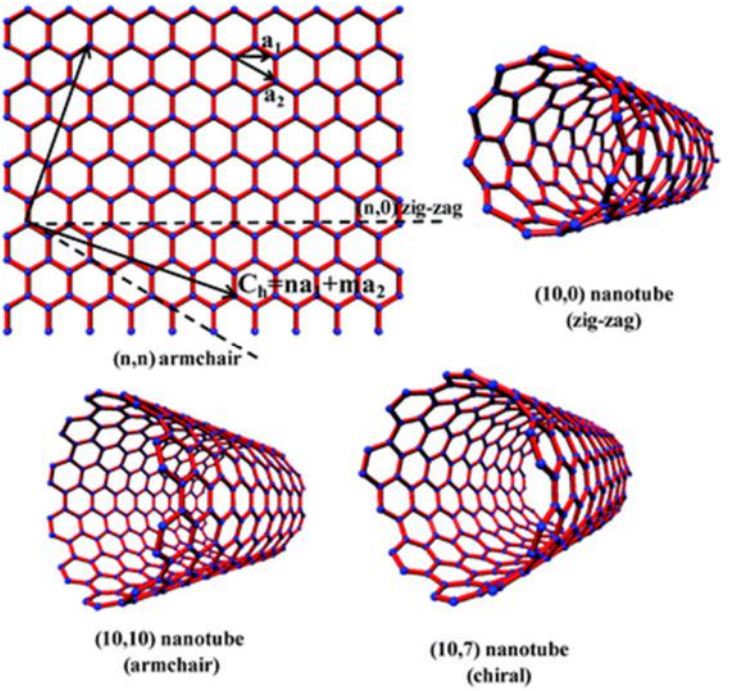

Figure 2. Different configurations of Single wall CNT

The carbon nanotubes exist in two forms: (i) Single wall carbon nanotube (SWCNT) and (ii) multiwall carbon nanotube as shown in Figure 1(a). SWCNT are actually tubes of graphite that are normally capped at the ends. They can be visualized as a layer of graphite rolled into a seamless cylinder [8-9]. Their diameter is around 1nm and length a few microns. They are superior to MWCNT, however, are costlier. MWCNT appear like a coaxial assembly of SWCNTs, like a coaxial cable. They diameter of MWCNT ranges from 5-50 nm and the inter layer spacing is 3.4Å. They are easy to produce in large quantity. However, the structure is complex and the structural imperfections may diminish their unique properties [10]. The wrapping of graphite sheets in SWCNT can be represented by a pair of indices (n, m), called as the chirality vector or roll-up vector, as shown in Figure 1(b). There are three types of SWCNTs based on the chiral vector and chiral angle (θ).

Figure 3. shows the schematics of one of the important application of CNT, that is, carbon nanotube field effect transistor (CNTFET). In a CNTFET, the channel is made up of parallel combination of SWCNTs. The source and drain regions are highly doped regions and the CNT channel is undoped. The important advantages of CNTFET include 1D ballistic transport of charge carriers, high mobility, large drive current and very low power consumption [11].

Nanotube diameter and chiral angles are given as [12-22]

$$d_t = \frac{\sqrt{3}a_{c-c}\sqrt{m^2 + mn + n^2}}{\pi}$$

$$\theta = \tan^{-1}\frac{\sqrt{3}n}{2m + n}$$

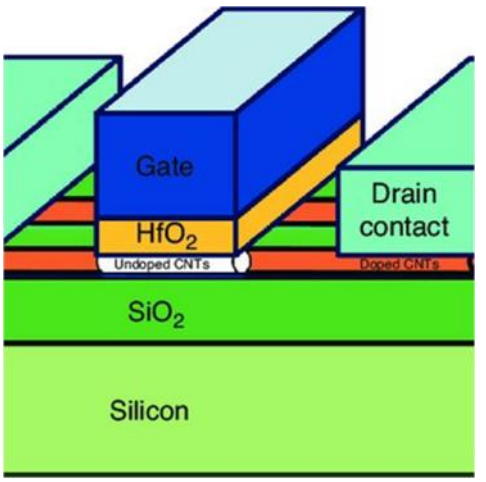

Figure 3. Schematic of a CNTFET

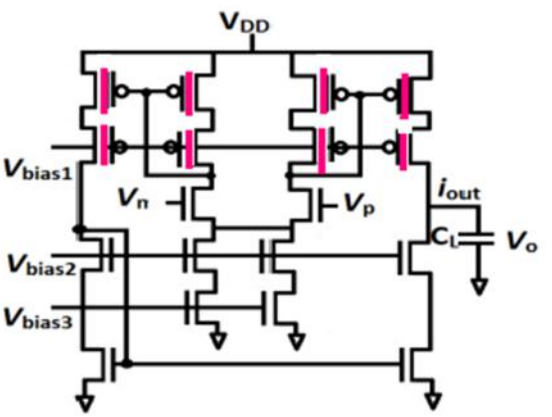

Figure 4. COTA [9]

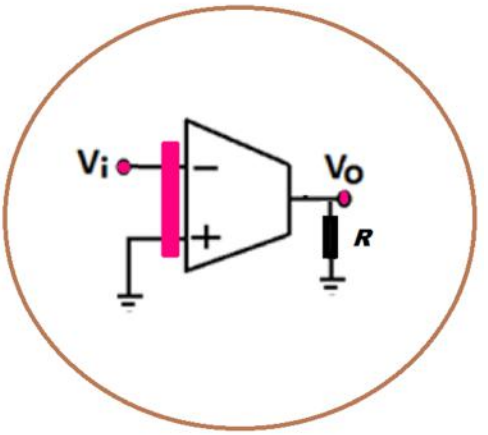

Figure 5. Advanced inverting amplifier

In inverting amplifier the output is exactly 180 degree out of phase with respect to input (i.e. if you apply a positive voltage, output will be negative). Output is an inverted (in terms of phase) amplified version of input. It is shown from the frequency response characteristics of Inverting Amplifier that the amplification can be performed successfully over the designed range with a reasonable accuracy.

It is observed that the proposed Amplifier is also consuming low power of 188 µW. It can be used for Low Power Biomedical Applications due to low power , low voltage and low amplitude of signal.

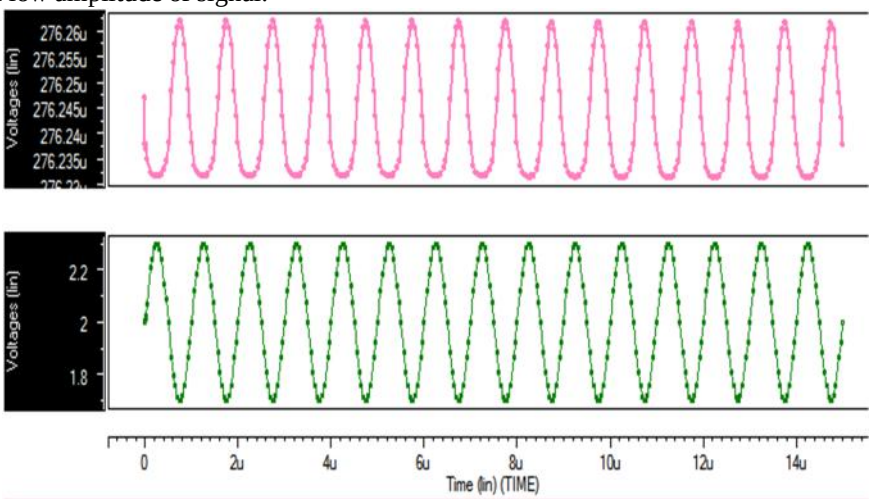

Figure 6. Frequency response of Proposed Inverting amplifier

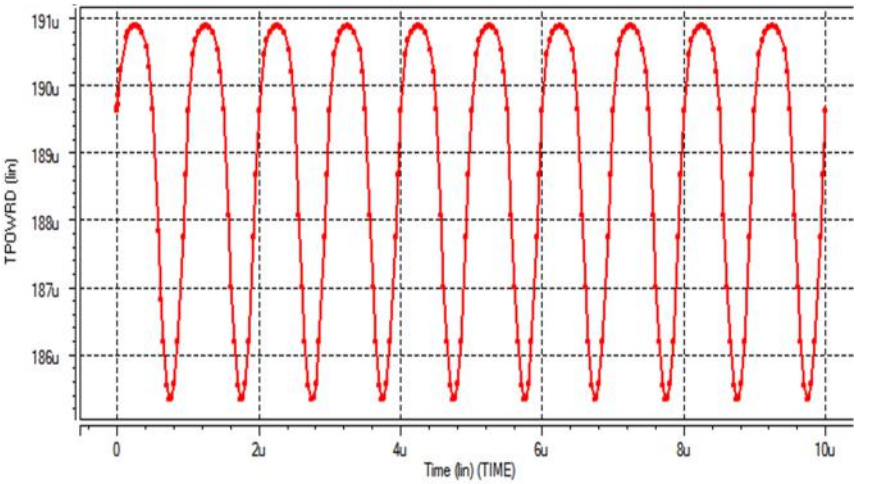

Figure 7. Average Power of Proposed Inverting amplifier

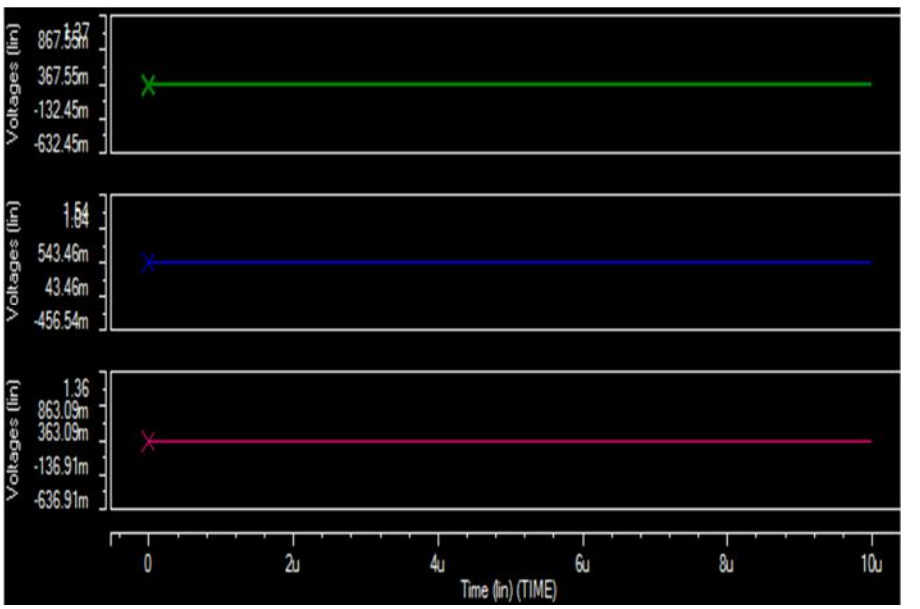

Figure 8. Biasing Voltages used in Proposed Inverting amplifier

## IV. CONCLUSION

In this work, Simulation study of Advanced Inverting Amplifier for Low Power Biomedical Applications is proposed. The proposed structure uses carbon nanotube field effect transistor. The proposed Amplifier is also consuming low power of 188 µW. It can be used for Low Power Biomedical Applications.

# ROLE OF VOLUNTARY ORGANIZATIONS IN COMMUNITY MOBILIZATION

**Sonali Boro**
Chandraprabha Saikiani Centre for Women Studies
Tezpur University, Tezpur

## Abstract

Emergences of a force, called voluntary organization, in urban and rural area have contributed towards structural change of the society where they are pertinent. The prime motive of these organizations is helping the society for uplifting the standard of life. These organizations are also expected to be the communication bridge between government and citizens. Community mobilization is a process which helps in monitoring good governance though local group intervention. The study is based on the role of voluntary organization in community mobilization; this will attempt to study the nature and functioning of voluntary organizations e.g. NGOs. Further the study will be carried on the responses of community particularly, women of Assam. In this context, the study analyses the impact of voluntary organizations in rural development.The study has been carried out in Ambikapur, Sadiya under Tinsukia District of Assam. In the study, what was the role of a single voluntary organization in community mobilization was analyzed through observation method. Survey data and project documentation were used as source of the study. In the study it was found that the organization was partially successful in motivating the community women towards upliftment of life. The sustainability of community organization is uncertain for future generations due to lacking of financial support, resource management etc. This study will attempts to analyses the following questions. Therefore change is needed in the structure of the community organization.

- How voluntary organization build rapport with the community people special women groups
- The Role of voluntary organization in increasing participation of the women group in community building
- Sustainability of organization in long run.

**Key words:** Voluntary Organization, Community mobilization, Assam, Women groups

## Introduction:

In recent times, response to the need of the society and to fulfill the demands arising out of population changes, several groups or group of individuals are voluntarily forming organizations with a definite goal. These organizations are also known as non-governmental organization. These are popularly called so, because they are free from governmental control in their functioning. It is also argued that this 'third sector' fights for the enlargement of people's choices as well as encourage 'people friendly' grassroots movement (Biswajit Ghosh, 2012). With the spirit of voluntarism and innovative intervention attempts to develop the society into next level through alleviation of poverty, hunger and diseases. These organizations' credibility is their friendly attitudes towards common people, disadvantaged groups and environments. These organizations are also means of communication between service provider and common people as their work primarily based on grass root level even in remote areas. In the implementation of the participatory democracy, these voluntary organizations played a significant role in mobilizing people toward the value of equity. Only these organizations can contextualized the issues of common masses on various aspects of life. As these organizations work on ground level they can make intimate contact with the common people. To address the issues like health, social or environmental, people engaged themselves together and make an effort for the welfare of a community is understood as community mobilization. It facilitates change by empowering individual community member ( Somnath Chattopadhyay, Udai Pareek, 1984 )

The year 2001 was declared as International Year of Volunteers (IYV) by 52$^{nd}$ session of UN General Assembly. This year was announced as IYV to recognize the work done in the past in the field of human rights, community development by the group of individuals voluntarily. These Voluntary Organizations/ Non-Governmental Organizations played a significant role in developmental arena during the 19$^{th}$ centuries. In India, Gandhian philosophy promotes volunteerism in social welfare actions. Prior to independence also there was a tradition of voluntary actions in India (Abdul Rashid Khan, 2006). After independence, with the emergence of NGOs, perception on development was changed. To enable the people to participate in economic growth programmes, initiated by government for community development efforts in rural areas. National government and Aid agencies approached NGOs to assist in the

implementation of community development welfare programmes. On the basis of origin and activity content, Indian NGOs are typologied as developmental, environmental, philanthropic, vocational, training, research advocacy or emergency aid ( Michael M. Cernea, 1997).

The study has been carried out in Ambikakur, Sadiya under Tinsukia District. Ambikapur is 45km far away from Sadiya town centre. There are various communities like Deori, Moran, Kachari tribe inhabit. The major sources of income for the people of the region are mainly farming, poultry farming, weaving. The study area is outskirt of Tinsukia District, only single public transport travel from Sadiya to Ambikapur. No single public amenities are there to fulfill the basic needs of the people. In 2006 a NGO intervened the study area to mobilize the community people. The NGO is North-East Affected Area Development Society (NEADS) which was founded in 1985 by a group of young enterprising people of Jorhat, led and guided by Mr. Girin Chetia (Present Director cum Chief Functionary) at the village of Dhekiakhowa. Their dream was to work together for greater impact at the grassroot developmental stage to reduce disaster risks, poverty and social exclusion. Girin Chetia, being a developmental activist, who was associated earlier and experienced for a number of years with National Institute for bank Management (NIBM), Peoples Institute for Development and Training (PIDT), Society For Rural Urban & Tribal Initiative (SRUTI) and Oxfam India Trust, together with his volunteers group felt the need to establish a social organization which will work in the affected areas for socially excluded families and marginalized communities for their holistic capacity development across the region. NEADS is one of Assam's oldest and pioneer Non-Government Organization in the field of development. As a registered organization under Societies Registration Act 1860, NEADS began to work since the year 1987. During the early years, the organization started its intervention in the geographically remote and vulnerable pockets of the district in the field of awareness generation and capacity building on livelihood opportunities, mobilization of affected communities to participate in decisions which affect their lives and strengthening traditional flood coping mechanism among the peoples of Brahmaputra plains to mitigate miseries of recurrent flood. Since 1998 onwards, NEADS began to look beyond from its existing based area of Jorhat and expanded the remit to support development work in other districts of Upper Assam, and also responded to humanitarian crisis caused by

emergency flood many a times since its inception. The organization currently have its programmatic intervention in five districts of Upper Assam region and which has impacted the lives of many individuals, groups and communities, by rendering services in the aspects of social and economic development. Today, with its presence in more than five hundred villages of vulnerable pockets, NEADS is working in the thematic focus on Disaster Risk Reduction and Humanitarian Response, Water, Sanitation & Hygiene (WASH), Vulnerable Livelihood, Education and Children, Gender Justice & Development in its intervention in its operational areas.

**Methodology:**

This study is a qualitative descriptive case study of a NGOs called *NEADS*. The study attempted to explain the functioning of an eight year project lead by *NEADS*. The study is based on both primary and secondary sources; the secondary data were collected from project reports, annual reports of the NGO (NEADS). The primary information was collected from the field visit in the surrounding areas of Ambikapur, Sadiya Block Division. Qualitative data were collected from observation method, personal interviews and focussed group discussion with the community people, NGO workers. Analytical method was used in interpreting the results. Among the all respondent female respondents are more than the male.

**Limitation of the study:**

There are certain limitations during the study, time constraint is one of among them. On the other hand, targeted population of the NGO intervention is about 8347, so it is impossible to visit door to door to collect information from all the community member. Further transportation and communication is one of the biggest bottleneck while visiting the fields.

**Discussion:**

*NEADS* intervened the study area of Ambikapur, Kukuramora, and Ghurmora which stands on a grassy plain, nearly surrounded by forested foothills of Himalayan mountains, on the right bank of the main stream of the Brahmaputra river. The widest point of any river all over the world at the point of creation of mighty river Brahmaputra with the joining of three rivers namely—Siang, Dibang and Lohit river. It has been the strategic importance for controlling trade with the hills and for checking

armed intrusions by the hill tribes on the plains during Ahom and succeeding British rule in the area. Great Assam earthquake of 1950 destroyed the old Sadiya town, changed its topography beyond recognition and repair and contributed to today its being one of the most deprived areas of Assam and its communities most vulnerable. The organization targeted 28 villages of Sadiya Subdivision. The total numbers of targeted household were 1868 and total targeted population is 8,347. Their project targeted tenure is 10 year and it was sponsored by Action Aid, which is an international non-governmental organization fighting against poverty and injustice worldwide. This worldwide organization work in around 45 countries with local partner organization, communities and individual groups. ActionAid was founded as a charity in 1972, and throughout the history they have innovated and evolved approach to better address the structural drivers of poverty and injustice. In the 1990s, they adopted a human rights based approach to development, which we continue to apply. In 2003, they established theActionAid International Federation, comprising members in every region of the world, and headquartered in South Africa.

The Core Programme Thrust Areas of the *Neads* in the study areas were :

**Education and Child Development:**

The prime objective of the organization in the study area was to promote primary education and child development for all the children age group 3-14 years. As there was no single school established by the government and community groups. The organization initiated to establish primary school through community participation for the growth and foundation of the children. The organization focused on community involvement in education so that they can identify local education issues and able to develop strategies to resolve barrier that impede access and retention and compromise quality(Jane P. Preston, 2013). Secondly the organization focused on teachers training exposure because training of the teachers plays an important role in an education. Rightful training only can guide the students toward evolution and advancement in potentiality, caliber, skill of the children ( Wafula Lorna, 2012 ). Quality education drive is another pertinent initiative taken by the organization which targeted qualitative growth of children. Under the education system by following traditional education system of India e.g. Pathsala, promoted production and innovation for self-reliance. For demonstration and mobilizing the community people for education of the children the organization

established a model school in the study area, where teaching is not limited only curriculum, their education system extended towards value education, knowledge of nutrition supplement, health, grooming of behaviour. It Initiated training and support for extracurricular learning, set up Joyful Learning Centre, libraries for Children in villages. Provided Training to educated youth to become JLCC volunteer facilitators. Created an opportunities for children to expedite in other parts of Assam. Initiated learning exchange programme between JLCC members, organized sports and cultural events for children, promoted Child Parliament.

**Food Security and Livelihood:**

**U**nder this trust area organization tried to bridge the gap between citizen and government on various issues like land, labour and agriculture. Therefore, community was mobilized to survey land and other resources in the study area. To tackle the slow production of the agricultural product and storage of seeds (grain) for rapid cultivation, the organization trained the community for seed preservation and established a community grain bank, where more than hundred samples of rice grain were preserved. Traditionally women of the North East India are the key participant in the labour force of the agricultural sector. More than 80% works in the paddy field are done by the women alone. So the organization felt the need to promote women producers group in the study area and also formed women agriculture producer group. For the demonstration and to motivate community towards production process a model farm was created at community centre. Bamboo plantation and nursery was also developing at the community centre. On the other hand poultry farming was encouraged to mobilize women towards economic empowerment, also goat farming unit were created among the women group.

**Community Health:**

To keep people healthy, the organization had initiated certain health promotion and disease prevention programmes. They try to empower community people by engaging them in certain programmes where community people are taught to choose healthy behaviour and make changes that reduce the risk of developing chronic disease and other morbidities. Community member are encouraged to explore at their own pace, health exhibits and information presented in a highly visible, easily

accessible, interactive learning environment (Anita Chandra, Joie D. Acosta, Katherine Grace Carman, Tamara Dubowitz, Laura Leviton, Laurie T. Martin, Carolyn Miller, Christopher Nelson, Tracy Orleans, Margaret Tait, Matthew D. Trujillo, Vivian L. Towe, Douglas Yeung and Alonzo L. Plough, 20016). The organization arranged health camps by qualified doctors, nurses and paramedics and community health worker to help the community to get healthcare free of cost. A drive of malaria prevention with homeopathy was also taken by the organization. World Health Organization stated that homoeopathy is the second most used medical system internationally which is a nontoxic form of alternative medicine and can be combined with classical treatment methods for avoiding the risk of adverse effects. Innumerous scientific researchers have been carried out to sustain homoeopathy as a complete scientific system to combat antagonism. Establishment of classical homeopathic drugs for malaria can prove as a next generation therapy, as homeopathy doesn't give any scope of resistance. The most important and significant aspect of homeopathic medicines is that they are developed after direct proving on human beings and not on animals. Each homeopathic medicine is therefore more akin to human nature and human system ( Rajan, Aswathy and Ravichandran, Ramanibai and Bagai, Upma, 2017 ).

**Promoting Community Based Institution / Peoples Organization:**

One of the most overlooked forms of violence in today's society is violence against women. Violence against women in the north eastern state of Assam has become a cause for severe concern as like all over India, women in Assam too have been facing violence in the domestic and public spheres. Assam registered second-highest number of incidents of crime against women in the entire country. According to the NCRB report of 2012, Assam tops the rate of cognizable crimes against women in India in 2012 at 89.54%. This high incidence of crime against women is a matter of great concern. The data available with the National Crime Records Bureau (NCRB) shows that most of the cases are related to kidnapping, rape and cases of domestic violence under section 498 (A) of the Indian Penal Code (IPC). Despite various legal provisions in the state to protect women against domestic abuse, women are still victims of domestic violence, dowry, rape, kidnapping and other forms of atrocities, both physical and mental. To promote gender justice in the study area the organization executed certain programmes like leadership training, legal aid training, training on functioning of local bodies. For the maintenance

of balance and check on functioning of governmental policies, implementation of the act, certain platform were formed such as *Sanmilita Nari Adhikar Surksha Mancha*. This forum has established a network of communities based women volunteers working for a gender just society and work in a collective approach to prevent violence through counseling support, community sensitization and mobilization ( Adittya Vatta, B. N. Borthakur, 2017 ). Women of the study area were also encouraged to participate in political process. They were trained on values and rights of their life.

**Policy implication:**

The organization successfully implemented the project in the study area. The project implication helps community people to take part in micro decision making process in local bodies and Panchayats. Even the local administration of the sub –division seeks help from this community people and various forums of the women. By establishing educational institution and community learning centre, it helps to promote education and awareness among community people. As there was no school in the study area, children were denied the fundamental rights e.g. right to education. After the establishment of school by the organization, initially enrolment number was quite depressing but later slowly number increased to a reasonable extent. There were around 65 students in 2016 (Adittya Vatta, B. N. Borthakur, 2017). Community learning centre and school established by the organization helped to enhance knowledge of craft and other skill. It also helped children in expressing the creativity by using waste material and other easily available resources. The initiative of the organization helped in promoting amusing environment of the study area, it helped in abolishing intoxication among young generation. Dropout rate among the children was also decreasing slowly in the study area. The children were trained to communicate with each other without hesitation through intra-personal communication method, which considerably developed their personality and attitude toward each other. Four centrally located Joyful Learning Community Centres were created and it was run by the children and community themselves. Trained JLCC students have started teaching younger children, this initiative of the organization helped children in participation and accomplishment of JLCC in larger platforms. It also enhanced confidence and brought changes in attitude of JLCC children, public speaking and

communication skill amongst JLCC students also improved through this initiatives.

The organization had successfully formed women forums in grass root level. These forums were committed to achieve gender equality by standing against gender based violence, and tried to create a gender sensitive society. These forums helped in maintaining balance in terms of work and power relation between men and women by participating and representing equally in decision making process. These forum provided counseling and support to the women who are victimized in both public and private sphere. Women forum tried to solve cased based on gender violence by their own at first, if the case is much critical then only they seek legal intervention. Several trafficked victim women were rescued from railway station, bus stoppage by these women forum. To support those rescued women a self-help group was created and they were given training on different skills like weaving, tailoring, embroidery etc. Even women of these forums equally participated in production process and market. Women Forum has been able to bring changes in the area like bus service started to Ambikapur with pressure from Mahila Mancha, assurance by SDO to improve road condition, PHC functioning, short term hostel started for girl students at Chapakhowa, Sadiya. Twenty one women's agriculture producer groups were engaged in regular farming. Their profit – started from capital Rs.1, 82,210/- to capital – 2, 50,692/- till 2013. Twenty community grain banks were formed. This idea of grain bank became popular among community people later. The starting stock was 296.44 quintal paddy. Apparently it increased to 1520.20 quintal stock. Demonstration of possibility of agriculture in sandy soil was successful. Community Centre land was developed as a forest despite of sandy soil. Family kitchen gardens became a regular feature in every household.

The organization in the study area helps community to keep monitoring on the functioning of the Public Health Centre to promote healthy life. They are also mobilized by the organization to check on regularization of Public Distribution system to assure food security of the community people. 25117 people received job card under National Rural Employment Guarantee Act (NREGA) which provides a legal Guarantee of 100 days of wage employment in a financial year. Regular monitoring of MGNREGA by community was materializedby the intervention of the organization. Regular participation of community in Gram Sabha ensured

after the mobilization through various discussion and participatory activities.

**Conclusion:**

The voluntary organizations are considered to be part of the alternative development paradigm. Voluntary organization established itself as a medium for the delivery of economic and social development. It also promoted the very notion of participation and democracy in order to improve civil society (S. Abbar Zaidi, 1999). In contrast to government, the caricature of voluntary organization has been extremely laudatory,where they are viewed by many official agencies and members of the public as more ancient and cost-effective service providers than governments, giving better value-for-money, especially in reaching poor people'(Edwards and Hulme, 1996). This voluntary organization, NEADS in the study area have influenced the lives of the community people through their humanitarian aid, development projects and advocacy campaigns. This organization has dramatically increased the ability of the people in terms of growth and development. It resulting in higher level of involvement of the people at almost all the sphere e.g. Panchayats, community decision, land resources etc (Gina Oramae Lewis, 2016). But the sustainability of the project of this organization cannot be overstated. There are certain factors affecting it's sustainability. The challenges faced by NEADS pose peculiar issues of concern for all concerned stakeholders on how to remain operational for the foreseeable future (Lynda Khamisi Shivairo, Susan Were, 2017). The factors affecting the organization in smooth functioning are:

Border area conflict: as the study area is situated in the border of Assam and Arunachal, time to time conflict between people of both the state take place which imbalances the peace among the people. Smuggling of drugs and women is the prominent issues but the state failed to address those issues.

Rapid Climate Variation: The study area is very prone to flood, every year flood submerge all the resources and livelihoods of the people. It creates distress and makes people's life in very precarious condition.

Lack of political will: as the region is isolated from mainstream and far away from major towns, the absence of political will for the prosperity of the region as well as the people is apparent. Lack of political

awareness among the people is also one of the reasons behind negligence of the power holders.

Geographic isolation and Remote landscape: geographically also the study area is isolated and remote by nature. For the smooth functioning and suitability of the organization need skillful community workers, due to its remoteness many worker refuse to work and monitoring from far away is not possible all the time.

Subsequently the project run by the NEADS in the study area is stagnant in present days; along with the other factors above mentioned, resource generation is also a significant challenge for the organization. Supports from funding agency are also very limited to run the project efficiently. More or the less this organization is unable to generate strong leaders among the community people to sustain the project run by the organization. The focus was more on the project mode which led catastrophe to the organization. Still there are many gaps in mobilization of community toward self, sustainable and subsistent life. Project sustainability is a challenging endeavour because it can only be determined long after the completion of the project by which time there are no resources to allocate for any further review or remedial action if need be (Okoth, A., 2016).

Acknowledgement: This paper and research would not be possible without unstinted support of the Organization NEADS, North-East Affected Area Development Society (NEADS) which was founded in 1985 by a group of young enterprising people of Jorhat, led and guided by Mr. Girin Chetia (Present Director cum Chief Functionary) at the village of Dhekiakhowa. I would like to take this opportunity to express my profound gratitude and deep regard to the Organization as well as Tirtha Prasad Saikia, Programme Manager cum Assistant Directorfor his exemplary support, valuable feedback and constant encouragement throughout the duration of the study. His valuable suggestions were of immense help throughout my study. His perceptive criticism kept me working to make this study in a much better way. Working with him was an extremely knowledgeable experience for me.

# వ్యవహారిక భాషోద్యమ ఊతం - గిడుగు 'బాలకవి శరణ్యం'

**డా. గోపవరం పద్మప్రియ**
అసిస్టెంట్ ప్రొఫెసర్ (తెలుగు)
డి.కె.ప్రభుత్వ స్వయం ప్రతిపత్తి
మహిళా కళాశాల, నెల్లూరు

ఈనాడు మనం అనుభవిస్తున్నసాంఘీక, సాహిత్య స్వేచ్ఛ వెనుక మనమూహించలేనంత ఉద్యమ నేపథ్యం కన్పిస్తుంది .సాంఘీక దురాచారాల నిర్మూలనకు ,స్త్రీవికాసం కొరకు రాజా రామ్మోహన్ రాయ్, కందుకూరి వీరేశలింగం లాంటివారు ఎంత పోరాటం చేయవలసి వచ్చిందో ,అంతే పోరాటాన్ని మాట్లాడే భాష ,రాసే భాష ఒకే విధంగా ఉండడానికీ చేయాల్సి వచ్చింది .ఈనాడు వ్యవాహారిక భాషోద్యమం గురించి ప్రస్తావిస్తే నేటి తరానికి హాస్యాస్పదంగానే ఉంటుంది . కాలమిచ్చిన తీర్పు వల్ల నేడు కొన్ని వందల పేజీలు మనం మాట్లాడే భాషలోనే అచ్చవుతు ప్రజల మధ్యకు వస్తున్నాయి .

కాని పూర్వం మాట్లాడే భాష వేరుగా , రాసే భాష వేరుగా చెలామణి అవుతూ వచ్చింది.అయితే ఈ భేదం పట్ల పూర్వం మనకంత నిరసన భావం కూడా లేదు .భారతదేశం లో సార్వత్రిక విద్యా విధానం అమలు లోకి వచ్చిన తర్వాత పరిస్థితుల్లో మార్పులొచ్చాయి .1852సంII లో మద్రాసు ,బొంబాయి, కలకత్తాల్లో విశ్వ విద్యాలయాలు ఏర్పాటు చేశారు.వాటిలో చదువుకొన్నవారు దేశంలో విద్యావ్యాప్తికి కృషి చేస్తారని తలచారు. అయితే ఆంగ్లం లో చదువుకోవడం వల్ల దేసభాషల అభివృద్ధికి వీరు తగిననత కృషి చేయలేదనే చెప్పవచ్చు.1901లోగవర్నర్ జనరల్ గా ఉన్న లార్డ్ కర్జన్ సిమ్లాలో ఒక సమావేశం ఏర్పాటు చేసి ప్రాథమిక స్థాయి నుంచి విశ్వవిద్యాలయ స్థాయి వరకు పరిష్కరించవలసిన సమస్యల గురించి చర్చించి 150 తీర్మానాలను చేశారు. దానిలో భాగంగా మాతృభాషలో వ్యాసరచనలను నిర్బంధపాఠ్యాంశంగా ప్రవేశపెట్టాలని అలాగే ఇంగ్లీషు లోని పుస్తకాలను ప్రాంతీయ భాషల్లోకి అనువదించేటప్పుడు వారికి శిక్షణ కల్పించాలనినిర్ణయించారు ఇలాంటి తరుణంలో1906 సంవత్సరంలో J.A ఏట్స్ గంజాం ,విశాఖ ,గోదావరి జిల్లాలకు పరీక్షా అధికారిగా నియమించబడ్డాడు ఇతనికి తెలుగు బాగా ఒంట బట్టింది .ఆయన మన పుస్తకాల్లో ఉన్న తెలుగుకి, ఆ పుస్తకాలను బోధించే అధ్యాపకులు మాట్లాడే తెలుగు మధ్య భేదాన్ని గుర్తించి ఆయన ఆశ్చర్యపోయారు.ఈ విషయం గురించి కళాశాల అధ్యక్షులైన టి. శ్రీనివాస అయ్యంగారు ని ఈ విషయమై ప్రస్తావించగా విజయనగరం లో ఉన్న గురజాడ పల్లాకిమిడి లోని గిడుగు రామ్మూర్తి పంతులు తనకంటే బాగా చెప్పగలరని సూచించాడు. ఏట్స్ వాళ్ళిద్దరిని సంప్రదించి చర్చించి ఈ వ్యవహారిక,గ్రాంధిక భాషా బేధాల వ్యత్యాసాన్ని తగ్గించడానికి ఉపాధ్యాయ వార్షిక సమావేశాలు ఏర్పాటు చేసి గిడుగు చేత ఉపన్యాసాలిప్పించాడు. ఇది పండితులందరికీ కంట్లో కారం అయింది. ఈ సమయంలోనే స్కూల్ ఫైనల్ పరీక్ష F.A స్థానంలో ఇంటర్మీడియట్ వచ్చింది. అప్పుడు విద్యార్థులు ఎంచుకోవలసిన అనువాద అంశాలు,

వ్యాసాలకు సంబంధించి రగడ మొదలైంది. ఆ సమయంలో P.T శ్రీనివాసయ్యంగారు Language Life and Deathఅనే పుస్తకాన్ని ప్రచురించారు. ఈ విధమైన పరిస్థితులు నెలకొని ఉండడంతో వ్యవహారిక భాషకు నిరసనగా ఒక ఉద్యమాన్ని లేవదీశారు.

ఈ గడబిడను గమనించి మద్రాసువిశ్వవిద్యాలయం 1911లో సెప్టంబరు 8న ఒక సంఘాన్నిఏర్పాటు చేసింది.ఇందులో 9 మందిసభ్యులు ఉంటారు. ఉంటారు ఇందులో లో నలుగురు గ్రాంథిక వాదులు, నలుగురు వ్యవహారిక భాష వాదులు ,ఒకరు తటస్థులు. వీరు అనేక సభలు సమావేశాలు జరిపిన తరువాత గిడుగు రామ్మూర్తి పంతులుఏ Memorandum of Modern Telugu;గురజాడ Decent పత్రం పుణ్యాన శిష్ట వ్యవహారిక భాషలోనే రచనలు సాగించాలనే నిర్ణయానికి వచ్చారు. కానీ గ్రాంథిక వాదులు వ్యవహారిక వాదాన్ని ఎదుర్కోడానికి ఆంధ్ర సాహిత్య పరిషత్తు ఏర్పాటు చేశారు. శిష్ట వ్యవహారికాన్ని గ్రామ్యంమని ఊరూరాసభలు జరిపి సంతకాలు సేకరిస్తూ వచ్చారు. మొట్టమొదట బోధనారంగంలో గ్రాంథికం ఏలుబడి చెల్లుతూ వచ్చింది. క్రమంగా ఉత్తరోత్తరా వచన రచనల్లో వ్యవహారిక భాషా ప్రాచుర్యం పెరుగుతూ వచ్చింది .క్రమక్రమంగా కాల ప్రవాహంలోఅన్ని రంగాల్లోనూ వ్యవహారిక భాష వేళ్ళూనుకుంది దీనికి ప్రధాన కారకులు గిడుగు, గురజాడలు. గిడుగు సిద్ధాంతవాది అయితే గురజాడ ఆచరణ వాది. గిడుగు భాషా సంస్కరణకు, కందుకూరి సంఘ సంస్కరణకు తన సాహిత్యం లో ప్రతిఫలింప చేసి ఆధునిక వైతాళికుడు అయ్యాడు. గురజాడ సహాయంతో సహాయంతో గిడుగురామ్మూర్తి పంతులు భాషా సంస్కరణకు తన జీవితాన్ని ధారపోసాడు.పూర్వరచనలన్నీ శిష్టవ్యవహారికం లోనేసాగినాయని, మధ్యలోనే భాష కృతకంగా మారిపోయిందని భావించిన గిడుగు రామ్మూర్తి పంతులు ఆ విషయాన్ని నిరూపించడానికి వ్యవహారిక భాషను పునఃప్రతిష్ట చేయడానికి కినాలుగు మార్గాలను అనుసరించారు.

1. భాషా తత్త్వాన్నివివరిస్తూ ప్రపంచంలోని ఇతర భాషావాఙ్మయమంతాలౌకిక భాషలోనే సాగిందని అలాగే తెలుగు భాషలో కూడా ఆయాకవులు ఆనాటి శిష్టవ్యవహారికాన్ని కావ్యాల్లో ప్రయోగిస్తూ వచ్చారని కాల పరిణామంలో మధ్యలో తెలుగు పరిస్థితి మారిందని ఇతని అభిప్రాయం. ఆ విషయాన్ని ఉదాహరణ పూర్వకంగా నిరూపించారు

2. తాళపత్ర గ్రంథాల్లోనూ, గ్రంధ పరిష్కారాల్లోనూ లౌకికభాష స్థానంలో గ్రాంథిక భాషను చేర్చారని భావించి లక్ష్య సహితంగా నిరూపించారు.

3. గ్రాంథిక భాషను నిర్వచించడం, స్వరూపాన్ని నిరూపించడం కష్టమని తేల్చి చెప్పారు. భాషా స్వరూపాన్ని వర్ణించే వ్యాకరణ గ్రంథాలే పరస్పర విరుద్ధ భావాల్ని వ్యక్తం చేస్తున్నాయి. ఒక వ్యాకరణం ఒక పదాన్ని గ్రామ్యంగా పేర్కొంటే మరొక వ్యాకర్త దాన్ని గ్రామ్యం కాదంటారు. వారికి వారే ఏది తప్పో ఏది ఒప్పో సమగ్రంగా చెప్పలేకపోతున్నారు. గ్రాంథిక భాషలో మాత్రమే రాసిన గ్రంథం మచ్చుకి ఒక్కటి కూడాఉండదని గిడుగు అభిప్రాయం ఇది ఇతని మూడో మార్గం.

4. ప్రాచీన కవులు అన్నీకావ్యాల్ని సమగ్రంగా పరిశీలించక పోవడం వల్ల వ్యాకరణ కర్తలు,నిఘంటు కారులు ,పండితులు తప్పుగా భావించి లక్షణ విరుద్ధమని,గ్రామ్యాలని నిందించిన రూపాలు వందలకొద్దీ కావ్యాల్లో కలవని నిరూపించారు . వ్యాకరణం ప్రయోగ మూలం కావడంవల్ల కవి ప్రయోగం లక్షణం కంటే బలవత్తర మైనది. కవులు ప్రయోగించిన రూపాలు ఆ లక్షణంతో సమన్వయం కాకపోతే ఆ లక్షణమే అసమగ్రమవుతుంది ,అంతే కాని ఆ కవి ప్రయోగాలు నింద్యాలు, గ్రామ్యాలు కావని అలాంటి ప్రయోగాలు వందల కొద్ది కావ్యాల్లో కలవని చూపించడం నాలుగోమార్గం. అందుకే "ఆర్యవ్యవహారంబుల దృష్టంబు గ్రాహ్యంబు" (బా.వ్యా-సం.ప 23) అంటారు బాలవ్యాకరణం లో చినయసూరి.

ఈనాలుగు మార్గాలను ఉదాహరణ సహితంగా నిరూపించడానికి గిడుగు రామ్మూర్తిపంతులుగారు 4 గ్రంథాలు రాశారు.

1.వ్యాసావళి

2.గద్యచింతామణి

3.ఆంధ్రపండిత భిషక్కుల భాషాభేషజం

4.బాలకవిశరణ్యం

ప్రస్తుత వ్యాసం నాలుగో మార్గాన్ని నిరూపించే బాలకవిశరణ్యాన్నిచర్చించడం ప్రధాన లక్ష్యం వ్యాకరణాల్లో ఇలాంటి పరిస్థితి నెలకొనడానికి ప్రధాన కారణం ఆ మూలాగ్రం వాఙ్మయాన్ని చదవక పోవడమే కారణం అంటాడు. ప్రధానంగా ఈ గ్రంథంలోబాల వ్యాకరణ సూత్రాలు చెప్పిన రూపాలను తీసుకొని వాటిని ని సాధు నిరూపణ చేయడానికి పూనుకున్నాడు .సాహిత్యంలో ఉపయోగించిన శబ్దాలను అసాధువులని చెప్పడం తప్పని ఇతని అభిప్రాయం. జనవ్యవహారంలో లేని దానిని కవి ప్రయోగించడు కొన్ని గ్రంథాలను ప్రమాణాలుగా తీసుకుని ఇవి సాధువులు , అసాధువులని, నిందాలని పేర్కొనడం తగదని ఇతని అభిప్రాయం.

వాఙ్మయమంటెల్లజూచినవారలెవరు?
బాస యెల్లను బండితల్పాపుకొనిరి?
సాహసముగాది పెద్దల సభ్యభాష
తప్పుతప్పనిదూరుట?తగనికవులు
పల్కులును దప్పులంటయు వాసిగనుక--

అని నిరసనవ్యక్తంచేశాడు.అలాగే .....

లోకయాత్ర కొరకు లౌకికభాషలు
పుట్టి ప్రజలనోట నొందియుండు
జీవలోకమందు జీవింపుభాషలు

జనుల తలపుదెలుపు సాధనములు

లోక వ్యవహారంలో ప్రజల భావాల్ని తెలిపేది భాషని ,కాళ్లు చేతులు అవి ఎలా తమ పనులు చేస్తాయో అలాగే భాష ఉచ్వాస ,నిశ్వాస కరణ ప్రయత్నాల ద్వారా తన విధిని నిర్వర్తిస్తుందని ,ఈ శబ్ద సిద్ధిని తెలపడానికి శాస్త్రాలు సరిపోవని అభిప్రాయపడుతూ ,పరిమితమైన శబ్ద జాలానికి కాక లోక భాషకు ప్రక్రియను ఏర్పరచినవారే గొప్పవారని వివరించారు.

లోకమందుభాషలలోన నున్న
సిద్ధి శబ్దాల పరిపాటి చిత్తగించి
మేరమీరక ప్రక్రియలేరుపరచి
వ్యాకృతికి ద్రోవచూపినవారి గనుడు

దీన్నిబట్టి చూస్తే అసలు భాషకు వ్యాకరణం ఏర్పరచడం కష్టమనే అభిప్రాయం మనకు కలుగుతుంది. వ్యాకరణ వేత్తలు చెప్పిందే వేదం కాదనేది గిడుగు అభిప్రాయం .ఇక్కడ ఒక ఉదాహరణను పరిశీలిద్దాం.
"కూతు శబ్దముప్రాథమైక వచనంబునకు రువర్ణంబగు"(బా.వ్యా-ఆ.ప 8) "కూతురు-కూతులు- కూతురులు – కూతుళ్ళు-కూతురిని ఇత్యాది రూపంబులు గ్రామ్యంబులని యేరుంగునది " అనే సూత్రం ప్రకారం కూతురు మాత్రమే సరి అయిన రూపమని,గ్రాహ్యమని అర్థం . మరి శిష్టవ్యవహారంలో ఉన్న కూతురిని- కూతురికి - కూతుళ్ళూ మొదలైన రూపాలన్నీ గ్రామ్యాలైయిపోయాయని, అవి రాయడానికి తగినవి కాదని పండితులు వాటిని బహిష్కరించారు. అందువల్ల పూర్వపు గ్రంథాలను అచ్చు వేసేటప్పుడు, పరిష్కరించేటప్పుడు ఆ వ్యవహారిక భాషా పదాల స్థానంలోఈ రూపాన్ని చేర్చారు. వ్యాఖ్యానాల్లో, టీకల్లో కూతురు ,కూతురిని అని ఉన్న చోట్ల అంతా ఆ కవులకు అపఖ్యాతి కలుగుతుందని లేక గ్రామ్యాలనో వాటిని దిద్ది వేశారు. అయితే జీవాద్భాష ఒకరు దిద్దితే అక్కడే ఆగేది కాదు. సాక్షాత్తు చిన్నయ్యసూరే తాను రాసిన హిందూ ధర్మ శాస్త్ర గ్రంథం లో కూతుండ్రు అని రాశాడు. ఇది తప్పని గాని ఒప్పని గాని తన లక్షణగ్రంథంలో చెప్పలేదు. తను రాసినశబ్దాన్నే తాను గ్రహించలేదు కాబట్టి ఏది తప్పు, ఏది ఒప్పని మనంనిర్ణయించలేమంటాడు.

ఇక్కడ మనం చెప్పదలచేదేమిటంటే ఏవ్యాకరణమూ ప్రమాణమూకాదు అలాగనీ నిరాదరణీయమూ కాదు. పాణిని అష్టాధ్యాయిలోనే కాత్యాయనుడు 10 వేలకుపైగా తప్పులుదిద్దాడు. అలాగే బహుజనపల్లి సీతారామాచార్యులు మొ. వారు బాలవ్యాకరణం లో వదిలిన అనేక విషయాల్ని ప్రస్తావించారు. ఇక్కడ మనం చిన్నయ సూరిని తప్పుపట్టలేము, ఆయన గ్రందమే వేడమని చెప్పలేదు. శిస్తుల ప్రయోగాల నుండి శేషమును తెలుసుకోవాలని చెప్పాడు. అంతేగాక లక్షణ విరుద్ధమైన దానిని పెద్దలు వాడితే దానిని యదా ప్రకారంగానే గ్రహించాలన్నాడు. ఇది తెలియని మనము ఇవి మాత్రమే ప్రయోగార్హాలని , ఇవి గ్రామ్యాలని, నింద్యాలని చెప్పడం , అవి ప్రయోగానికి అనర్హాలని చెప్పుకోవడం మన పండితుల తప్పని నిరూపించాడు. ఈ

అంతరం వల్లనే శిష్ట వ్యవహారిక భాషని, గ్రాంధికభాషని రెండు విభాగాలైంది. ఒకప్పటి శిష్టవ్యవహారికమే నేడు గ్రాంధికమని మన గిడుగు వారల అభిప్రాయం.

నన్నయ్య 'ప్రవాహినీ దేశ్య' అన్నారు.భాష నిరంతరం మారుతూ ఉంటుంది. ప్రాచీనులు వాడిన ఆనాటి వ్యవహారిక భాషను ఆ ప్రక్రియలతో సహా అనుసరించడం సరికాదంటాడు.

ఏరు పారునట్లు పారుచునుండును
దేశ భాష తెరుగు తెలియుటరది
మారుచుండు గాని మారుపు గనరాదు
లోటు చూచి కనుడు లోని గుట్టు
మనమే కానలేము మనము మారెడుచొప్పు
భాసయొక్కటే కాదు బ్రహ్మండ
మెల్ల మారుచుండు తెరున్గా లొక్కో
ఎప్పుదేద్ది కలదో యప్పతికడే నిత్య
మదియ మనకు సేవ్యమగుట యొప్పు.

భాషకేకాదు బ్రహ్మాండానికీ మార్పు సహజమనీ ఎప్పుడు దేనిని వ్యవహరిస్తామో అదే నిత్యమని దానినే మనం అనుసరించాలని చెప్పి వ్యవహారిక భాషోద్యమాన్ని నడిపిన కారణాన ఈనాడు మనం ఆ ఫలాలను అనుభవిస్తున్నాము. ప్రతీ రంగంలోనూ వ్యవహారిక భాష మాత్రమే ప్రయోగించ బడుతుంది. ఇంకా సాహిత్యమైతే ప్రాంతీయతనూ ఆదరిస్తుంది. మాండలిక సాహిత్య సృష్టికి ఊపిరి వ్యవహారిక భాషోద్యమమని చెప్పవచ్చు. ఈనాడు వ్యవహారక భాష ప్రయోగం కోసం కూడా ఇంత ఉద్యమం జరిగిందా అన్న స్థాయిలో వ్యవహారిక భాష వేయిచెరుగులా తెలుగు నేల నలుమూలలా విస్తరించింది. దీనికి కారణమైన గిడుగు రామ్మూర్తి పంతులు గారికి , గురజాడ గారికి ఆంధ్రజాతి ఋణపడ్డది. ఈ ఘనులను ఇలా స్మరించుకోవడం చంద్రునికో నూలుపోగులాంటిది.

## Introduction:

Education has been considered as a prime part of human life for growing intellectual and physical since ancient age, which guides person going in noble way. In ancient times, children were admitted to Gurukula in childhood and grammar, Sanskrit, Veda, vedanga, logic, Upanishads, Poetics, etc were being taught to children in Gurukula by teacher. Hiuen Tsang who had come to the court of Pulikeshi II, famous king of Baadami Chalukya dynasty quoted regarding Childhood and education in Si.yu.ki. of his literary work that Boys were admitted to Gurukula in their age of 5 years old ,which was also refered by Dr. M.Chidanadamurthy(1). Education would be started after Upanayana, Education was a prime part of Social growth in ancient days. Ghatikasthanas, Bramhapuris, Mathas, Agraharas were centers of education, which were being run in form of institutions. The above four institutions were supporting and together conducting educational activities. Kings, Queens, Mahamandaleshwaras, Mahasamanthas, Mahamathyas, Mahapradanas, Mahajanas and rich merchants had converted common villages as Agraharas', in which Tempels, Mathas were built, regarding this Testimonies of charity were found. Aim of this present Article is to study the Bramapuris and Agraharas in inscriptions during the reign of Chalukya Jayasimha II.

## Objectives of Study:

1. To study the Bramapuris and Agraharas in inscriptions during the reign of Chalukya Jayasimha II.
2. To analyze the education system during the period of Chalukya Jayasimha II.

## Research Methodology:

Research methodology is descriptive and analytical data is based on Primary and secondary. For this study data and information has been collected

with the help of Fieldwork, Volumes of inscriptions, Books, Magazines, Newspapers, Research Journals.

**Agraharas:**

The Name Agrahara is refered in many inscriptions of Jayasimha II of Chalukya. Dr.M.Chindanandamurthy defines that AGRA means best; AHARA means country or place (2). Agraharas were the places or villages which were assigned to Scholar Brahmins to hold their Educational and Religious function as gift. In this village, not only Brahmins were staying and other caste People were also there, but All Revenue of the village was going to Brahmins (3), means that Brahmins were enjoying revenue of treasury against service provided by them. So Establishing of Agraharas were considered as work of religious and sacred (4). Agraharas had grown as part of village or city or separately. Dr.Shantha Kumari Quoted that since Gurukulas were part of Agraharas, Scholars who were studying in Gurukulas would be Mahajanas, because of this Agraharas had developed well (5).

Concept of Agrahara were there during reign of Kadamba in Karnataka, when Mayuravarma visited the Kanchi for Ashwamedhayaga, Kanchi was a Agrahara and Ghatikasthana. Mayuravarma had gifted 12 Agraharas including Thalagunda and Possession of land to Brahamins who were welcomed from Ahhichathra of Uttar Pradesh (6). Dr. D.M. Nagaraju quoted the reference of Dr.Shantha Kumari that Thagarathe, Shivamoga District, Karnataka is an most ancient Agrahara (7). Thus developing Agraharas had developed as Prime centers during Badami Chalukya reign.

Inscription of ladakhan temple at Ihole quotes that there were 500 Mahajans headed by Binnama Somayaji.

Agraharas were not only a religious centers and also social workshop centers and had independent political administration. Mahapradhanadandanayaka or Samanthadipathi of the state had control over this village and were imposing and collecting tax, the collected tax was being spent for charity and development of Agraharas, Usually Mahajanas were rulers of these Agraharas.

Agraharas were cultured wealth centers. Agrharas were categorized as Agrahara, Piriya Agrahara, Kiriya Agrahara, Maha Agrahara, Anadi Agrahara, Parameshwara Datti Agrahara, Uttama Agrahara, Sri rama Datti Agrahara and etc on the basis of their importance (8).

Inscription of Guddada bevina halli Haverri District, Ranibennur taluk, (Period was destroyed) During reign of Chalukya Jayasimha II shows that Kundaraja, Mahamandaleshwara of Chalukya Jayasimha II had control over Banavasi 12000, 18 Agraharas, Santhalige1000 and was nightmare and

Sathigana Chatta to Cholas and as per this inscription, Kundaraja had control over 18 Agraharas, but more information has not been found in this inscription regarding them.

Salur inscription which is in ShikaripuraTaluk, ,Shivamoga Dist and belongs to A.D. 1017 refers that Saliur was a prominent Agrahara (10) and Manevergade Kethamalla Karanikapramukas gifted kannasoge to found tank for Salur people for charity of Banavasi Puravadishvara Srimath Kudmarasa who was son of Srimad Irivabedanga .

Inscription of Belur of Bijapur district, Badami taluk dated to A.D.1021, Dec 24 refers that During reign of Jayasimha II, Perur was an Agrahara, Akkadevi sister of Jayasimha II was ruling Kisukadu70 and converted Perur as Agrahara in the memory of elder brother Tribuvana Malla Vikramaditya (11) and started Thri Purusha School and gifted 500 Mathras land, 50 houses, flower garden for food and accomodation for 500 hundred students at Perur. Manneyachatta gifted this charity.

Rona inscription of reign jayasimha II of Dharwad District, Rona Taluk and AD 1022, December 25 refers that Rona was a prominent Agrahara. In the inception of this inscription, Description of Rona was found. Sri Sankimayya son of Aythaverma who was Scholar of Maha Agrahara of Rona made moolasthana at Rona and his elder brother founded 12 Brahmins choultary and gifted land, garden and oil mills for these. Maniyara of Rona dug wells in Arave and Aythavarma, Rudramaya, Dachimaya sons of Machimaya handed over gifted land by their father to 104 Brahmins (12).

Telgi inscription which belongs to AD.1032 at Kodalura Shankara Narayana Sannidi quotes about telagi agrahara inside the Bikkiga 70 (13). In this inscription, refered that Kannamaya who was head of Telgi Agrahara gifted a Matharu paddy field to Karigoda of bikkagana Kere. Mahasampadhipathi, Puravareshwara, Bramha Kshatriya, Madura Vamshodbhava Srimadalayya was ruling Banavasi 12000, Santhalige 1000 During reign of Jayasimahadeva II in the era of 959 on Saturday, Summer Solstice.

Kuppaguddee was open battle field to Mandalika Kunkunda. He killed many warrior and became an angel and his son, Mahasamathadhipathi Jayasimha Deva built Aleshwara Temple in the memory of his father at Agrahara, Kuppagudde and gifted Paddy field, garden for deity, worship, light of God. It has been refered in the inscription of AD.1033, Shivamoga, Sorabataluk (14).

Inscription of A.D.1042 Which is in Achapura, Sagarataluk, Shivamoga District, quotes regarding an Agrahara (15). Gonarasa who was younger brother of Bijjarasa who was Mahamandaleshwara of Jayasimha II was ruling Santhalige 1000 division as mahasamantha. Andasura founded an Agrahara, where also built temple and erected god idols of Shouryamarthanda and

Goneshwara and worshiped foot of Kriyashakthi Pandit who was disciple of Kalamukha Thapodhanagranya Vadirudra Panditha in the era of 964 on chitrabanusumvtsara, Vaishakashudha Akshayathrithiya on Sunday, Solitiece and assigned Goneshwar math and Shouryamarthanda temple, for which he gifted garden ,land for education and saints.

The above Inscriptions conclude that Agaharas were developed well during the reign of Jayasimha II. These Agraharas had local governments. Mahajanas who were head of these Agraharas were giving Charity and were striving for over all development of Agraharas over crossing their limit of power, because of Agraharas were wealthy.

During this time, Agriculture activities, building tanks and business were going under the Mahajanas of Agrahara (16), hence Agraharas had developed as centers of Education, religious, economic and cultuaral activities.

**Bramhapuris:**

Bramhapuris were the places where Brahmins were living. these may be called as Bramhapuri or Bramhanapura. Bramhapuris were part of Agraharas as street of Agraharasand were adjacent to temples. Numbers of Bramhapuris were very less compared to Agraharas, most probably Brahmins were not wishing to live separately, because Mahajans of Agraharas were brahmins. Brahmins were research scholar and had got skill in veda, vedanga, logic, poetics and many more things,which concludes from above discussion, but Brahmins who were living in Bramhapuris were common community and were living as part in the Agrahara and village .They also engaged in studying of veda, vedanga and other studies and were executing as Mahajanas. Establishment of Bramhapuri was as important as Agraharas at that time, hence it was known equal to that of building a temple, Supportably formation Bramhapuris were sacred, in which Accommodations were being provided for eligible Brahmins.

Pura Inscription which belongs to the reign of Jagadekamalla, Jayasimha II in A.D.1018. October 27, Koppala District, Kustagi, taluk quotes of Bramhapuri and during reign of Jagadekamalla, his mahasamanthadhipathi (17). In this inscription during reign of Jagadekamalla, Mahaprachandadandanayaka (name was destroyed ) was ruling Kelawadi 300. In the light of Monday eclipse, gifted 5 mathras paddy field to Kondayavari Ayyanayya head of Belvanage Agraahara in front of the village at temple of God Pampastanavirupaksha , it is also refered as gift for Jannayyabhatta, Chamundayya shanangi and Brahmins, Mulastana devaru, bramhadevaru, Kalidevaru. clearly mentioned in this inscription that how much gift had been given for each one. As per inscription, 5mathras paddy field to Jannayya Bhatta, 150 mathras to chamundayya shanangi including 12 Brahamins and bramhapuri, 3 mathras for mulastana god, 48 mathras to Kalideva, 12 mathras to

Bramhadeva, this inscription refers that charity was gifted for alivate to problems.

Brmhapuris had developed support of religious activities within the environment of tempels (18). Bramhapuris were part of Agraharas or street of Agraharas or village. Brahmapuri was the street, where Brahmins were living. Brahmins of bramhapuri were highly educated and were also scholar as Maha Brahmins of Agrahara, in matter of education, bramhapuris had not shown any speciality, formation of Bramhapuris was not only Brahminsstaying there, there lived common people and also were engaged in religious and educational activities at that time. Hence Brahmins of Bramhapuris were part of education, preaching education and daily meditation. When observing these particulars, Bramhapuris were alternative for Agraharas and had developed as part of these and were centers of cultural, religious activities.

**Conclusion:**

The above discussion concludes that During the reign of Jayasimha II, Agraharas and Bramhapuris were religious and educational activitiy centers and most number of Agraharas had developed ,but number of Bramhapuris were very less. Because urban towns and cities were very less in the medieval and ancient age. Bramhapuris were part of Agrahara, village or urban areas. The People believed that establishment of agraharas and Bramhapuris and giving charity was sacred. Kings and queens, Mahamandaleshwaras, Mahasamanthas, rich merchants, were assisting to manage fiancé to Agraharas and Bramhapuris, intention of this assistance was to advertise education and brahamins also were given charity to bramhapuris and Agraharas. During this time, Agriculture activities, building tanks, business were going under the Mahajanas, hence Agraharas had devolped as centers of Education, religious, economic and cultuaral. Bramhapuris were alternative for Agraharas and had developed as part of these and were centers of cultural, religious activities.

# INTERLINKAGE BETWEEN GEOGRAPHY EDUCATION WITH ECO AND SUSTAINABLE TOURISM

**Dr. Seema Agnihotri**
Amity Institute of Education
Amity University, Uttar Pradesh

## Abstract

Geography as a discipline evolved to understand the complex inter-relationship between man and environment. While passing through its various phases of development, various branches as per the transformations originated and expanded the horizon of Geographical inquiry. One amongst them is the tourism Geography which is providing information about the ways, mode and repercussions of expanding tourism at the world level. Due to technological advancement, urbanization, globalization and preference for materialistic life are causing the population at the world level to explore the areas as tourists per their convenience. This exploration has not only given the tourism as recognition of Industry, but also caused its proliferations in different branches. Along with that this world wide surge of tourists all over the world has placed tremendous pressure on the available resources of the chosen destinations. The balance between the nature and man got disrupted due to overriding of commercial interests on the delicacies of natural component.

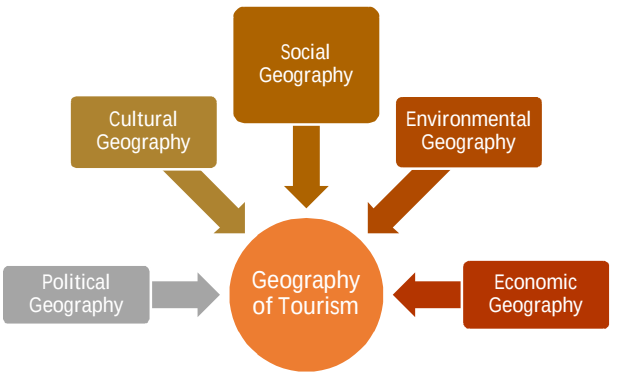
With the above mentioned background, this paper attempts to explore the role of geography education as a mediator to develop sensitivity about the prevailing issue at the school level,i.e how does including topics related with eco-tourism at the school level would cause the children to take a lead and further as an adult to use the tourist places not only as a leisure pursuit,but as an active participant in boosting the economy.

The methodology of this paper would be based on the reviewing of the second hand material available for the topic as well using them for the analytical purpose also.

**Key Words**: Geography Education, Eco tourism, Sustainable Tourism

## Introduction:

### 1.1 What is Geography?



Man since evolution expressed keen desire to know about different places of the Earth. The transformation from hunter gatherer to regular production of crops, from cave dwellers to living in ultra modern equipped facilities lead homes, evolving different modes of transports on the basis of the distance and reaching to the extent of conceptualization of human being as a 'Global citizen' are benchmarks of human civilization, which probably would not have been possible if human beings confined to the native place only. After settling down the basic necessities of life, always interest has been shown to the places away from home, sometime to find peace, sometime for leisure and sometime simply to know unknown. All these mentioned conduct and attribute has been attempted formally by the discipline of Geography. Geography as the

word indicates is the 'description about Earth'. This description mainly focuses on studying the interaction of men with the nature i.e how does man through his interaction understood the available physical realities followed by informing about the kind of adjustments and changes one has made over the surface. It might be the reason that geographers starting using the word 'spatial' as an 'essential modifier in framing their questions and forming their concepts. The word spatial comes ,of course from 'space', ***and to geographers it always carries the idea of the way things are distributed, the way movements occur, and the way processes operate over the whole or a part of the surface of the earth*** .'( Gettis,et;el ,Human geography, p.6)[1]

Geography as a spatial science is replete with details of explorers who played very significant role in developing understanding about the places. Here the contribution of Ritter and Humboldt, etc. are noteworthy who travelled extensively and threw light on the flora, fauna and human features of those visited places. Humboldt visited Bavaria, Austria, Switzerland and Italy to observe the nature closely.[2] Later on during the age of discovery; the expeditions of Columbus, Vasco De Gama have broadened the horizon of human understanding about different places of the Earth.

**1.2 Geography of Tourism**

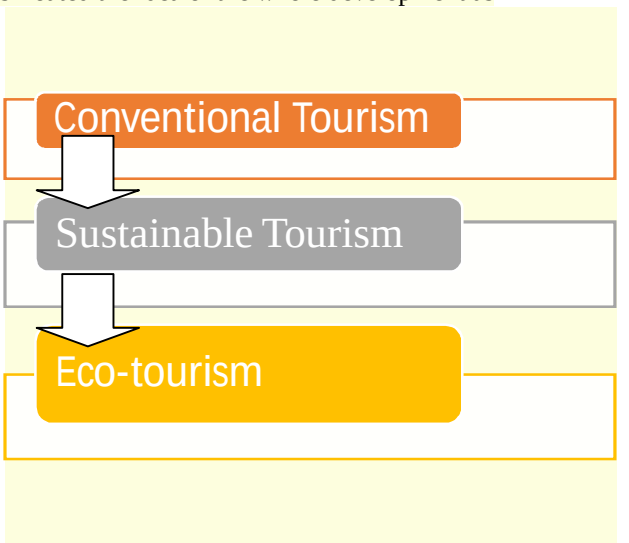
While keeping its major thrust on understanding the relation between man and nature in the spatial term, geography as a subject known for its two major bifurcations – physical and human. The former put its major thrust on understanding the physical aspects through geomorphology, climatology, oceanography etc. whereas the latter laid its emphasis on human behavior correspondence to all these physical phenomena through its numerous branches like Agriculture geography, economic geography, Social Geography, political geography, Urban geography, cultural geography etc. In the continuation of all these, an emergence of a new branch i.e of 'Geography of Tourism' was quite noteworthy. The geography of Tourism by itself is not a new idea. In fact, it might be taken as the applied part of all the major branches of human geography as given below-

The literature in this regard shows its origin around 1920 when intensively the impact of tourism on the economic activities was studied. The tourism Geography provides information about the ways, mode and repercussions of expanding tourism at the world

level. In this context, if one look at the nature of the geography of tourism, then it attempts to describe the whole journey of human movements in a precise form. For the spatial investigators, different terminologies are available like travelers, explorers in general and geographers in particular. Prior proceeding further, one may be curious to know that how does tourist different from the travelers, explorers and geographers? These differences have been very aptly described by Nelson Velvet in his book ' An Introduction to the Geography of Tourism as ' ***the explorers were recognized to be individuals who traveled to places that had not previously been extensively visited or documented by other from their society. Likewise, travelers were considered to be those who traveled for a specific purpose, such as business enterprises or official government functions.' [3](P.26).*** As far as the definition of geographer is concerned, he/she according to dictionary.com defined as ' ***a person who specializes in geographical research, delineation and study.*** (https://www.dictionary.com/browse/geographer)[4] On the other hand, the word 'tourist' ,based on the definition of United Nations World Tourism Organization (UNWTO) is '***a person who travels to and stays in a place outside of his or her usual environment for not more than one consecutive year for leisure, business, or other purposes***.' Or ' ***individuals who did not travel for any purpose other than the experience of travel itself and the pleasure they derived from that experience***. ( from Nelson,V ibid.)[3]

The tourism has been recognized as a fully fledged industry where countries are working hard to generate revenue by satisfying the need of the tourists across different regions. Geographers study the spatial expressions of tourism as a human activity, focusing on both tourist generating and tourist –receiving areas as well as the link between. The core components geography of tourism according to Boniface and Cooper are:[5]

First, **the countries of origin of tourists, or generating areas** – these areas represent the homes of the tourists, where the journeys begin and end. The key issues to examine in tourist generating areas are the features which stimulate demand for tourism and will include the geographical location of an area as well as its socio-economic and demographic characteristics. These areas represent the main tourist markets in the world and naturally enough, the major marketing functions of the tourist industry are found here



Second, **the tourist destinations themselves**- These areas attract tourist to stay temporarily and will have features which may not be found in the generating areas. The tourist industry located in this area will comprise the accommodation, retailing and service functions, entertainment and recreation. ( The Geography of Travel and Tourism, P.4)

Finally, **the routes travelled between these two sets of location** ( Leiper,1979). These two types of areas are a key element in the system as their efficiency and characteristics shape the size and direction of tourist flows. Such routes represent the location of the main transportation components of the tourist industry.

Proceeding further, while abiding the core definition of tourist given by Nelson V as 'individuals who did not travel for any purpose other than the experience of travel itself and the pleasure they derived from that experience' (ibid) it has been seen these individuals have grown exponentially due to technological advancement, urbanization,

globalization and preference for materialistic life. All these are causing the population at the world level to explore the areas as tourists as per their convenience. According to the estimate of United Nations World Tourism Organization, there were 25 million tourists estimated worldwide in 1950 which increased to 1.4 billion 68 years later. (https://ourworldindata.org/tourism)[6] . In India, according to tourism report '***Over 10 million foreign tourists arrived in India in 2017 compared to 8.89 million in 2016, representing a growth of 15.6%. Domestic tourist visits to all states and union territories numbered 1,036.35 million in 2012, an increase of 16.5% from 2011***.' (https://en.wikipedia.org/wiki/Tourism_in_India)[7] This surge at the national as well as at the international level if bringing economic benefits to the subjected countries ( generating employment, personal development, social development) , is creating serious environmental problems also. The excessive numbers of tourists' visits put tremendous pressure on the available resources. The superseding commercial interest normally creates resource crisis to the local people and degrade the quality of the environment. The article on 'Environmental impact on Tourism, summarizes the overall impact of tourism on environment as ' ***Negative impacts from tourism occur when the level of visitor use is greater than the environment's ability to cope with this use within the acceptable limits of change. Uncontrolled conventional tourism poses potential threats to many natural areas around the world. It can put enormous pressure on an area and lead to impacts such as soil erosion, increased pollution, discharges into the sea, natural habitat loss, increased pressure on endangered species and heightened vulnerability to forest fires. It often puts strain on water resources, and it can force local populations to compete for the use of critical resources***.' (https://www.gdrc.org/uem/eco-tour/envi/one.html )[8]

Overall influence is so much intensive, that as allied part of tourism ,the concept of eco-tourism and 'sustainable tourism' have evolved which mainly intends to sensitize the visitors as well as the host to treat this endeavor with responsibility and awareness. Bran (2000) has floated the idea of the whole development as

## 2. Methodology of the Paper

The methodology of this paper is largely based on deliberations emanating from reviewing the literature in this regard. The main books referred for this paper are related with human geography like sixth edition of 'Human Geography, Landscape of Human Activities by Getis,G,f,2001, 'An introduction to the Geography of Tourism' by Nelson,V(2013), 'The Geography of Travel and Tourism', second edition by Bonifice,G, B,Cooper,C,(1996). The online papers like 'Impact of tourism on Indian culture' presented fourth International conference on language, society and culture in Asian Context by S.,P.P (2016), 'Ecotourism in Developing Countries: A Critical Analysis of the Promise, the Reality and the Future' by O,Magio,K,V,V,M et al. 'EMERGING ENVIRONMENTAL ISSUES WITH THE DEVELOPMENT OF TOURISM INDUSTRY IN INDIA: A STUDY' by Rajamani,A and Rizal,P (2014), 'Ecotourism as a viable alternative for economic development of Romanian rural communities' Andre,R,D,Gogonea,M,R(2014) in 'Bulletin UASVAM (Agriculture), 'Geography of Tourism' by Hall,C.M, ' World Geography of Travel and Tourism' by Lew,A,Hall ,M et.el (2008), 'Relationship between Geography-Tourism and Tourism's Effects According to High School Students' by Koca,N (2018) etc. were referred. Along with all these geography textbooks at the secondary level ( from VI to XII) were also consulted to review the status of geography education and assessing the scope of inserting geography of tourism in such a manner so that children after receiving this exposure could incline towards ecotourism and sustainable tourism in the future.

**3. Edelson, Pitts** et.al in their project on 'Road Map for the Geography Education in the 21st century ' assert the need of Geography education as '***K–12 geography education is critical preparation for civic life and careers in the 21st century. It also is essential for postsecondary study in a wide range of fields, from marketing and environmental science, to international affairs and civil engineering.***

***Everyone in modern society faces personal decisions that require geographic reasoning. These decisions, such as where to live and how to travel from place to place, can have an enormous impact on one's life Education in Promoting Eco and Sustainable tourism[8]***

Now with due cognizance of geography education as a viable tool for preparing the people as tourist with dual sense of responsibility and personal satisfaction, there is a need to revamp the geography education as per the state of the art practices. t is quite paradoxical also that on the one hand geography has been recognized as a spatial science with taking cognizance of all spatial movements, on the other hand it has not been successful in transacting its core spirit amongst its readers. Geography of tourism by accommodating all the main branches of human geography is equipped to tourists to evolve themselves in an eco friendly manner. This preparedness needs to be percolate down to the school level so that children as a future citizen of the country as well of the globe could come out with best practices.

The reviewed literature in this regard clearly manifests the negligence of this important branch of geography in the education at different levels. In the geography textbooks, the bifurcation of physical and human aspects is accepted, but their implications on tourism have not been addressed properly. With the above mentioned

background, this paper attempts to explore the role of geography education as a mediator to develop sensitivity about the prevailing issue at the school level,i.e how does including topics related with eco-tourism at the school level would cause the children to take a lead and further as an adult to use the tourist places not only as a leisure pursuit, but as an active participant in boosting the economy.

In order to understand it, following are being given the textbook topics of geography textbooks, offered at the secondary level, means grades VI to XII prescribed by NCERT ( National Council of Educational Research and Training)

Source: http://ncert.nic.in/ebooks.html, downloaded on 14th September 2019[9]

The above mentioned syllabus of geography based on NCERT textbooks, framed on the basis of National Curriculum framework 2005. The review of the whole syllabus clearly shows that there is a lot of scope to insert the significance of different places of the earth from the tourist perspective along with developing awareness to emerge as eco-friendly tourist. Further, it also shows the apathetic behavior of the curriculum planners of geography to mould the subject as per the contemporary requirements of the society. Comparison of the content of these textbooks with the textbooks written two decades back reveals the shrinkage of spatial information lying about the other places of the world. Earlier, there used to be topics like 'our neighboring countries',' Europe', 'Australia' etc. in the textbooks which were helpful in developing understanding about the places other than the native ones, The topics like 'Resources', 'Our Environment', 'Life in Tropical Region','Life in the Temperate Region', 'Lifeline of Indian Economy', 'Occupation' ,'Ocean' etc. keep a vast scope to be moulded from the tourist perspective. This may not only revive the status of geography, but also train the children to develop sensitivity about the tourist places. In order to develop sustainable tourism along with eco-tourism, the geography education should try to revamp itself in the following manner.

1.The **basic notions of geography** should be cleared with varied examples of places.( The basic notions as given by Gettis,G.F in their sixth edition of the book ' Human Geography' are

1. Places have location, direction, and distance with respect to other places
2. A place may be large or small; scale is important.
3. A place has both physical structure and cultural content
4. The characteristics of places develop and change over time
5. The elements of places interrelate with other places
6. The content of places is rationally structured
7. Places may be generalized into regions of similarities and differences' (P.7) ibid[1])

2. Children should be sensitized about the usage of places through application of simulation, role play, stories and observation as core methods of teaching geography.

3. Children can be assigned tasks like to submit report after their visit to any place as a tourist with the Parents, focusing on mentioning the eco-friendly activities they have done in the subjected place.
4. Workshops, panel discussions, poster making competitions related with spreading the message of eco-tourism can be held frequently in the school.
5. Children living in the popular tourist places with the help of the geography teachers can take initiatives in generating awareness amongst the community members and visiting tourists to have usage of resources in a responsible manner.
6. Through the basic skills of geography like mapping, visuals, tables and graphing, children can be prepared to evolve as eco-friendly tourist later on their life.

**Conclusion**

This paper mainly attempted to explore the role of geography education in spreading the sensitivity for the sustainable tourism and eco tourism due to its emphasis on spatial movement and study of places as the key features. The paper by citing the offered topics in the geography textbooks at the secondary level tried to draw the attention about the potential of those topics to be converted hugely to promote eco-tourism. The paper concludes by giving the recommendations to the curriculum planners to revamp the geography curriculum by inserting some concerns of the geography of tourism also.

# IMPORTANCE OF WOMEN EMPOWERMENT IN THE PRESENT INDIAN SOCIETY: A STUDY

**Amit Kumar Mondal**
Teacher of Education
Magrahat College, West Bengal

**Sima Nandy**
Teacher of Education
Bidhan Chandra College, West Bengal

**Abstract:**

In the present era, Women's are playing the leading role for improving Indian society. The growth of women education in rural areas is quiet slow due to large number of women's in our country are illiterate, they are very weak, backward, exploited and many more. Yet in India, 7.5% women are educated of the world's total population. So it is observed that if their quality of life along with education is improving, the maternal mortality rate is declining and literacy rate increasing gradually. In this time education is the most important factor for women empowerment, welfare and prosperity. So, education is a key to unlock the golden moment of women empowerment in India. It brings to retrenchment in inequalities and enhances to participate everywhere i.e. doctor, pilot, teacher, lawyer, political leader etc. Government has facilitated for women in every sector and many constitutional laws are providing for equalization and equal right for women. Therefore, this research paper discusses the importance of Women Empowerment in the present Indian society as well as some suggestions to improve the changes that need to be considered for women empowerment and economic development.

**Keywords**: Women education, Women empowerment.

**Introduction**:

"Educate one man, you educate one person, but educate a woman you educate a whole civilization." Mahatma Gandhi.
Education is the most important factors in our society and it is the basic requirement for every citizen. It helps the individual to reduce inequality and play a central role in human development that impacts the overall social and economic development. Higher level of literacy and education leads to better attainment of health, nutritional status, economic growth, population control, empowerment of the weaker sections and community as a whole. There has always been gender discrimination toward the development of women. They do not have their rights and neither is considered independent to take any decision. In order to provide equal status in the society, women need to be empowered. Educating women uplifts their life as well as the quality and entire family also[23]. The term "empowerment" has been used widely by the government, NGOs, academics, donor agencies and women activists since in the early 1980s. In

India empowerment is not limited to any organization but it is an expansion of education, health care, training, social area, political area, sports, IIT, IT sector etc. However, the concept of empowerment has broadened to include the growing concerns of the women's movement for gender equality and social justice. It develops the capability and strength to influence the direction of social change. Recently women empowerment has been recognized as a central issue and it is determine the women status in our society. Abolition of gender discrimination in society and participation of women in decision making process at all levels is the mark of women empowerment. On this realization, a number of policies, programs, project and action research has been taken to ensure empowerment of women in India. Empowerment of women leads to benefit not only to the individual woman but also to the families and community.

**Concept of women empowerment:** The idea of 'empowerment' comes from the theory of social change. Empowerment differs on predominantly aggregative and integrative theory of democracy. Women empowerment also enrich social enhancement of all women in our society. So it may be stated that women's empowerment is defined as the process in which their spiritual, political, social and economic status is raised. The empowerment of women is about dealing with the legacy of apartheid and the transformation of society, particularly of power relations between women, men, institutions and laws[17]. The National Policy on Education (1986) has emphasized the promotion of women's education in all areas of learning and thus eliminates any sex based stereo typing with the guarantee of equality before the law.

**Objective of the Study:** The objective of the present study is to find out the importance of education towards women empowerment in modern Indian society.

**Methodology:** The present study is based on the review of information collected from secondary sources and some information has also collected through online media.

**Review of Literature**: Sen, Gita and Grown, Caren (1987) illustrated that, women's empowerment prove the transformation of the society, help to enhance the civil order, property and inheritance rights, and control over women's bodies and labour. Women empowerment also helps in skill training, leadership on the side and democratic process, dailogue, participation in policy and decision-making, and techniques for conflict resolution. It enriches to develop the leadership qualities, entrepreneurship, and exposure to the outside world[22]. Sushama (1998) described, women empowerment help to participate social, political and economic spheres of in life[36]. Rajput Pam and Tiwari (2001) described the psychological empowerment is the most important aspect of every women life. It is a process, which make increase their motivation, self-interest and morale[26]. Srivstavand Mira Shivaa (2001) mentioned that women empowerment is significant in every sector and social empowerment also the part of empowerment[34]. Kapur, Promilla (2001) discussed women's empowerment could be considered as a process to gain power [20]. Chauhan & Bansal (2002) mentioned the various dimensions of 'women empowerment'. According to them, empowerment means giving legal and moral power to an individual in all spheres of life[8]. Dutta (2002) mentioned that women's are still considered as the 'woe of society' and this is the reason why various policies and programmes fail to achieve the best results in the present day scenario[11]. K. Murugaiah (2002) observed about women's work and empowerment enhances women's income that helps to build the power of women in the society[24]. Parvathy & Kartikeyan

(2002) explained the importance of education in the modern age. Proper training and guidance also helps to achieve the empowerment[25]. Shrivastava (2002) discussed about the various policies and plans for the development of women in India. Women's status and conditions have changed to a great extent in the post-independence period[31]. Suguna (2002) mentioned women empowerment is a phenomenon of the nineties[35]. Bose (2004) discussed how far women empowering go in actually[7]. Bhowmik (2005) said that the tribal women's participation has seen in almost all the fields. But there are limited positions and authorities in the society. So they overcome the unbalanced and incomprehensive situation by empowerment [6]. Ahmad (2008) said that women empowerment means not only greater external control but also growing inner capability as greater self-confidence and inner transformation of one's consciousness [1]. Akhtar (2008) described the empowerment of women is an important issue in India as well as in the world [2]. Azad (2008) mentioned that women have been dominated by males. They have been marginalized in both, the socio-economic sphere and the political mainstream. The role of self-help groups (SHGs) is very important for empowerment of women, because it involves equality participation, decision making process and access to opportunity. [3]. Elliot (2008) described the economic empowerment also enhance the women power in our society and it uplifts social mobility and socialization. This empower also generate to improve of income and it fight against poverty[12]. Jha, Nishikant (2008) described the women empowerment is a worldwide problem in the present day scenario. Government provides many schemes for empowering the women's [18]. Sanyal Tapati (2008) illustrated the inequalities among the rural-urban females[28]. Singh Prasad Thakur (2008) observed that development processes have increased the male dominance over women and increased their deprivation [37]. Vinay (2008) discussed in his paper women empowerment and development in Global Scenario in India. He has suggested the socio-economic and political empowerment also anxious to every woman, but still a large section of women in the developing countries are far away from the developmental process [32]. Chiranjeevulu and Krishna Murty (2011) described education is most important to women. It provided with better health care facilities so on [9]. Duflo (2011) discussed women's empowerment and economic development is the collaborative part in society [10].Ranganathan and Rao (2011) described that women's empowerment is the method of enabling an individual to think, behave; take action and control work in an autonomous way. Empowerment can create social transformation by providing a social environment in which one can take decisions and make choices either individually or collectively[27]. Bhattacharjee (2015) said that education is an important aspect of women and it is one of the most powerful tools to change the position of women in the society as well as uplift the family[4]. Singh, Khushboo (2016) concluded that the impact of literacy and education on empowerment of women as well as the suggestion to improve the changes that need to be considered for women empowerment and economic development[33]. Khatri Rita (2016) described that the impact of literacy and education on empowerment of women as well as the suggestion to improve the changes that need to be considered for women empowerment and economic development [21].

**Historical Perspective of women empowerment in India:** The history of Indian women can be divided into three periods i.e. Ancient, Medieval and Modern. An

ancient India had free access to education. They were expected to participate in Vedic sacrifices and utter mantras. We got some references of such learned ladies i.e. Visvavara, Lopamudra, Apala, Urvasi, Ghosa, Sulabha, Lilabati, Maitreyi, Saswati, Kshana, Gargi and others. Maitreyi, the celebrated wife of the most learned philosopher of ancient India, Yajnavalka, used to hold discussion on abstruse philosophical questions with her husband. In the Vedic period, women had access to education in India and gradually lost this right.

However, in the British period there was revival of interest in women's education in India. During this period, various socio religious movements led by eminent persons like Raja Ram Mohan Roy, Ishwar Chandra Vidyasagar emphasized on women's education in India. Jyotiba Phule, Periyar and Baba Saheb Ambedkar were those leaders of the lower castes in India who took various initiatives to make education available to the women in India. Later, the country got independence in 1947 and the government has taken various initiatives to provide education to all Indian women. Durgabai Deshmukh committee (1959) plays the vital role in women education. Hansa Mehta Committee (1962), M. Bhaktvatsalam Committee to look into the causes of public support particularly in rural area for girls' education and public Corporation. Kothari commission (1964-66) has provided three forms of education for women empowering and also in 1986, the policy has been recommended "operation black board". On the other hand, to develop the primary education and to achieve the aim of universalization of primary education up to age level 6-14 years, some schemes of programs has been operated i.e. District Primary Education Programme (DPEP), Sarva Shiksha Abhiyan (SSA), National Literacy Mission (NLM), Right to Education Act(REA) 2009, Knowledge Commission(KC) etc. In present day Central Govt. and State Govt. has also introduced Integrated Child Development Services (ICDS) project. These projects are maintenances by women teacher. Women's education in India plays a very important role in the overall development of the country. It not only helps in the development of half of the human resources, but in improving the quality of life at home and outside [23].

**Right of Children to Free and Compulsory Education:** The Right of Children to Free and Compulsory Education Act or Right to Education Act (RTE) is an Act of the Parliament of India enacted on 4 August 2009, which describes the modalities of the importance of free and compulsory education for children between the age of 6 to 14 years in India under Article 21A of the Indian Constitution. It is enforced in 2010 by the Indian Government.

'Free education' means that no child, other than a child who has been admitted by his or her parents to a school which is not supported by the appropriate Government, shall be liable to pay any kind of fee or charges or expenses which may prevent him or her from pursuing and completing elementary education[15,42].

**Sukanya Samriddhi Yojana (SSY):** The SSY account is meant to provide a small deposit investment for the girl children under 10years or less as an initiative under "Beti Bachao Beti Padhao" campaign. The main focused on securing a bright future of the girl child in India by facilitating the parents of a girl child in building a found for the proper education and a carefree marriage expenses of their child. A Sukanya Samriddhi Account can be opened any time after the birth of a girl till she turns 10. A minimum

deposit of Rs 1,000 and maximum of Rs 1.5 lakh can be deposited in the scheme throughout the financial year. This account can be open any post office or authorized bank [49].

**Beti Bachao Beti Padhao:** Beti Bachao Beti Padhao (BBBP) scheme was started on January 22, 2015 as a joint initiative of the Ministry of Women and Child Development, Ministry of Health and Family Welfare and Ministry of Human Resource Development under coordinated and convergent efforts to empower the girl child. First, it was initiated in 100 districts with low girl child sex ratio. The main aim of Beti Bachao Beti Padhao (BBBP) scheme was to stope gender discrimination of children and abolish the practice of sex determination. To ensure the survival and protection of girl and also to ensure higher participation of girls in education and other areas. According to Prime Minister Narendra Modi said that, "our mantra should be: son and daughter are equal" [52, 53].

**Janani Shishu Suraksha Karyakram:** Government of India has introduced an awareness scheme of Janani Shishu Suraksha Karyakram (JSSK) on 1st June, 2011. The main aim of this scheme is to provide free maternal and neonatal services in all public health institutions in order to encourage institutional deliveries and thereby reduce infant and maternal mortality. The initiative stipulates free drugs, diagnostics, blood and diet, besides free transport from home to institution between facilities in case of referral and drop back home. These scheme is estimated to benefit more than 12 million pregnant women who access Government health facilities for their delivery. It is an initiative those who still choose to deliver at their homes to opt for institutional deliveries. All the States and UTs have implementation of this scheme [43].

**Mahila Shakti Kendra Scheme:** The Government of India has approved a new scheme namely, "Mahila Shakti Kendra Scheme" (MSKS) on 2017-18 to empower rural women through community participation and to create an environment in which they realize their full potential. The scheme would be operational at multiple levels. The national level and State level structures will offer technical assistance to the respective governments on matters concerning women, whereas the District and Block level centers will extended assistance to this scheme and provided a foothold to similar schemes. The main objective of the scheme is framed for the empowerment of women who belong to the rural community. These women will be proved with the essential impetus to establish smaller business unit. Over and above, the scheme is intended to create awareness of the roles to be played by these women [44].

**Kanyashree Prakalpa:** The Kanyashree Prakalpa has designed Department of Women Development and Social Welfare, Government of West Bengal. The United Nations has awarded the West Bengal Government the first place for Public Service for its 'Kanyashree' scheme. A conditional cash transfer scheme with the aim of improving the status and well-being of the girl child in West Bengal by incentivizing schooling of all teenage girl and delaying their marriages until the age of 18, the legal age of marriage. This scheme will be implemented henceforth in all the districts of the State. The main characteristic of these scheme are to preventing trafficking and exploitation of the girl child, Reducing the incidence the drop outs, especially amongst and consequently increasing the median age of first birth. Discouraging early marriage of

girls to ensure compliance with the legal provisions pertaining to the minimum age at marriage and eradicating undernutrition and mal-nutrition of the girl child [45].

**Sabooj Sathi Bicycle Distribution Scheme:** Sabooj Sathi Bicycle Distribution Scheme was initiated by the West Bengal Government. Hon'ble Finance Minister, announced in his Budget Speech of 2015-16, distribution of bi-cycles to estimated 40 lakh students of class ix to xii studying in Govt. aided School and Madrashas. The main objectives of the scheme are empower the students, especially the girls and reduce drop outs in higher education, to encourage students to take up higher studies and to increase attention in school and also to promote environmental-friendly[50,51].

**Rajiv Gandhi Scheme for empowerment of Adolescent Girls-Sabla (RGSEAG):** Rajiv Gandhi Scheme for empowerment of adolescent Girls-Sabla is an initiative launched on 1st April, 2011. The scheme was introduced Ministry of women and child Development in India. It is a pilot programme in 200 districts. The main aims of this scheme to facilitate self-development and empowerment of young girl, to improve their nutrition, nourishment and health status, to improve their home skills, life skills and vocational skills education[54,55].

**Indira Gandhi Matritva Sahyog Yojana (IGMSY):** Indira Gandhi Matritva Sahyog Yojana is a maternity benefit program run by the government of India. The scheme was launched in 2010 as Indira Gandhi Matritva Sahyog Yojana (IGMSY). It was renamed as Matritva Sahyog Yojana in 2014 and again as Pradhan Mantri Matru Vandana Yojana (PMMVY) in 2017. The scheme was implemented by the Ministry of women and child Development in India. The main aims of these scheme was to promoting appropriate practice, care and institutional service utilization during pregnancy, delivery and lactation. Encouraging the women to follow (optimal) nutrition and feeding practices, including early and exclusive breastfeeding for the first six months; and also the providing cash incentives for improved health and nutrition to pregnant, lactating mothers [44].

**Self-help group:** It is a financial mediates peer-controlled, informal association. This is usually composed of 10–20 local women or men. These groups are started by governmental organizations (GO) that generally have broad anti-poverty agendas. Self-help groups are seen as instruments for goals including empowering women, developing leadership abilities among poor and the needy people, increasing school enrolments and improving nutrition and the use of birth control.

Self-help group have been able to mobilize small savings either on weekly or monthly basis from persons who were not expected to have any savings. They have been able to effectively recycle the resources generated among the members for meeting the emergent credit needs of members of the group. And also groups member's financial security as primary focus and other common interest of members such as area development, awareness, motivation, leadership, training and associating in others social intermediation programmes for the benefit of the entire community. In the aforesaid scheme, the central focus was on the women empowerments[13, 46].

**Barriers of women empowerment:**

**Violence:** Violence is the prime factor which opposes women's empowerment. Physical, emotional, mental torture and agony were the deep rooted problems in the

society from ancient to till date which are responsible for decline in female sex ratio as well as a barrier for education.

**Gender inequality:** It is the vital problem in present time. For empowering women, gender equality is the most important entity.

**Family restrictions**: Illiterate guardians are not willing to send their female children to the educational institute. Because, they think women are only saved into their home.

**Early marriages:** Early marriages are another obstacle in society. It was common throughout history. Today, child marriage is still fairly widespread, particularly in developing countries, such as parts of Africa, South Asia, Southeast Asia, West Asia, Latin America and Oceania. The countries with the highest observed rates of early marriages below the age of 18 are Niger, Chad, Mali, Bangladesh, Guinea, etc. [56]

**Trafficking:** Women trafficking is another problem in our own society in present era. Women and girls are usually trafficked for the purpose of sexual an economically exploitation, particularly prostitution and pornography, forced labour including, commercial, agriculture and domestic work. Women trafficking are a criminal phenomenon that violates basic human right. In the recent decades it has emerged problem and requiring new solutions for its [57].

**Women empowerment in education:** It can be described the impact of education towards women empowerment in this era. Education helps women to known the society as well as world, come out from the darkness of illiteracy to the light of education. It helps a woman to know, responds to challenges in their life, raise their voice of exploitation, dowry, and early marriage etc.[30.] Recently, women education has upgraded from informal to formal by teaching them how to manage business organizations, school, college, hospital and every academic sector etc. Acquisition of formal education ensures effective and efficient contribution of these women to the management of different sectors of the society. The formal education is mainly to empower both male and female gender in order to contribute greatly and equally to the advancement of the society. Women education involves the systematic means of equipping women with skills, abilities and experiences through formal education for personal as well as professional growth and thus development of the society. Women empowerment is now becoming a global issue in India. Indian constitution has been recommended some important article for develop the women empowerment and growing the equality[38].

In 1986, The National Policy on Education (NPE) was formulated and in 1992 revised policy has provided a separate and protected space for women's empowerment through the Mahila Samakhya Programme. This educational programme aimed at promoting women's education for equality.

Education also brings a reduction in inequalities and improving their status within the family. To bring more girls, especially from marginalized families of SC, ST, OBC and minority are now involved in school, college, work place etc. Govt. is provided mainstream education for their uplift and essential things are also provided for them. Some examples are i.e. free book, uniform, boarding and lodging, clothing, mid-day meal, scholarships, free circles, kanyashree and so on[5].

In 2009, the Government of India (GOI) has passed the 'Right of Children to Free and Compulsory Education Act' (RTE), which guarantees every Indian child from 6 to 14 have the right to enrolled and to complete eight years of elementary schooling[15]. The

upward trend in the access of girls to education, at all levels is has reflected across the GOI's enrollment statistics between 2013-2014, the enrollment of girls as a percentage of total enrollment in primary education has increased from 43.8 percent to 48.2 percent, while the enrollment of girls as a percentage of total enrollment in upper primary education increased from 40.9 to 48.6 percent (ASER 2015). In India, 7.5% women are educated of the world's total population. India ranks 113 of 135 on the 'World Economic Forum's Gender Gap Index'.

A Census chart has given below to describe the literacy rate about last 7 years[39]. The age group of 5 and above has mentioned in Census 1951, 1961, 1971 and also the age group of 7 and above described 1981, 1991, 2001 and 2011 Census. In these years, the literacy rate has given below:

Table: 1-Literacy Rate in India about last 7 years.

| Year of Census | Males | Females | Male and Female gap in the literacy rate |
|---|---|---|---|
| 1951 | 27.16 | 8.86 | 18.30 |
| 1961 | 40.40 | 15.35 | 25.05 |
| 1971 | 45.96 | 21.97 | 23.98 |
| 1981 | 56.38 | 29.76 | 26.62 |
| 1991 | 64.13 | 39.29 | 24.84 |
| 2001 | 75.26 | 53.67 | 21.59 |
| 2011 | 82.14 | 65.46 | 16.68 |

Sources: Census of India[16].

Table: 2-Gender Gap Rate: Census 1991-2011.

| Year | 1991 | 2001 | 2011 |
|---|---|---|---|
| India | 24.85 | 21.59 | 16.68 |
| Non EAG states | 21.14 | 17.72 | 13.34 |
| EAG states | 30.32 | 26.89 | 20.97 |

Sources: Census of India [16].

This table is shown that how the Gender Gap Rate changed from 1991 to 2011.
Literacy rate among the total population of the last 2 Census report given below:
Table: 3-Literacy Rate in India of Total Populations: Census of 2001-2011.

| Literacy Rate | Total Populations | Males | Females |
|---|---|---|---|
| 2001 | 560753179 | 336571822 | 224181357 |
| 2011 | 778454120 | 444203762 | 334250358 |
| Increased in 2011in compare with 2001 | 21770094 | 107631940 | 110069001 |

Sources: "Figures at a Glance"[40]

Table: 4-Literacy Trends in India of EAG (Empowered Action Group) states:

| Year | 1991 | | | 2001 | | | 2011 | | |
|---|---|---|---|---|---|---|---|---|---|
| | P | M | F | P | M | F | P | M | F |
| India | 52.21 | 64.13 | 39.29 | 64.83 | 75.26 | 53.67 | 74.04 | 82.14 | 65.46 |
| Non EAG states | 60.09 | 70.34 | 49.20 | 70.64 | 79.25 | 61.53 | 78.24 | 84.76 | 71.42 |
| EAG states | 41.65 | 56.00 | 25.68 | 57.22 | 70.09 | 43.21 | 68.86 | 78.96 | 57.99 |

Sources: Census of India[16].

According to the 2011 Census of India, the literacy rate amongst the female age group of 7 years was 65.46 percent, as compared to 82.14 percent of the comparable male population. This shows a 16.68 percent gap in male to female literacy rates, down from the 21.59 percent gap recorded in the 2001 census. Later, an Empowered Action Group has developed the category of non EAG states and EAG states of female are improving. As a result, women literacy rate has increased 2437,061 in 2011 [21].

India has worked in a multipronged way through Sarva Shiksha Abhiyan (SSA), the Education for all campaign, to enhance the access and retention of girls in school. The programme ensuring that there is a school available at every kilometer of each inhabited area, by giving free textbooks to all girls up to class 8, separate toilets for girls, recruitment of 50 percent female teachers, gender-sensitive textbooks and so on.

India has been successful in acquired gender parity in school and college education. Even in technical and professional education such as law, medical, IT, engineering, management etc., the presentation of women is significantly increasing. Today every fourth worker in India is a women and one-third of all certified medical researchers, banking sector, IT workers and chartered accountants are women. So women are now empowering power both in private and public life firmly. In political area 46 percent women are panchayat members and 1.3 million women in positions of power in Indian society. According to UNICEF, maternal mortality rate reduced from 212 deaths per 100000 live births in 2007 to 167 deaths in 2013. Financial inclusion has also increased tremendously and last five year 53 percent of women have saving bank account.

In addition, two focused interventions especially for girls the National Programme for Education of Girls at elementary Level and the Kasturba Gandhi Balika Vidyalaya have been launched to reach out to girls from extremely marginalized social groups, girls from lower castes, and families living below the poverty line.

In addition, the following schemes and policies demonstrate the Indian Government's commitment to promoting education access, quality, and the necessity of targeting girl's education.

Government of India launched a scheme in 2008. This is Incentive to Girls for Secondary Education. It has the objective to reduce dropouts and promote the enrollment of the girl child belonging mainly to Scheduled Caste and Scheduled Tribes (SC/ST) communities.

**Conclusion:** There is a positive relationship between education and woman empowerment. In present day the issue of women empowerment has been facing certain serious challenges, which are outcome of some certain evil norms and attitude such as child labor, child marriage, illiteracy, superstition, partial attitude of the parents, female feticides, etc. and in such a situation women empowerment is an urgent necessity for every society. In order to promote women's empowerment, it is necessary to create an environment that will allow women to participate in educational programs and share the benefits. The educational and other policies for women empowerment should be implemented in reality for empowering women in the world. The evils of poverty, unemployment and inequality cannot be eradicated by man alone. Equal and active participation of women is obligatory. Unless women are educated, they will not be able to understand about their rights and their importance. So it is conclude that women empowerment through education is now an important facet in this era. It means education has not only educated a person but also helps to frame the society or civilization for further needs.

**Abstract:**

Banking sector is the basic instrument for the economic growth of a country. A strong banking sector plays a vital role of the flourishing economy. Failure of the banking sector adversely impacts various other sectors. This study is an attempt to analyze the number of bank branches, Deposits, Investments and loans and advances of the scheduled commercial banks before and after the global financial crisis. Secondary data was collected for the period from 2000 – 2018 from RBI website. Regression using dummy variable is applied for analytical purpose. From the study it is concluded that the banks took the practice of 'ever greening', where fresh loans were given to some promoters to enable them to pay off their interest effectively pushed the recognition of these loans as non-performing to a later date, but did not address the root causes of their unprofitability which affect their regular banking business of deposits, loans and advances and investment in growth aspect.

**Key Words:** Global Financial Crisis, Commercial banks

## Introduction:

The Banking system of the country is the base of the economy and economic development of the country. It is the most leading part of the financial sector of the country as it is responsible for more than 70% of the funds flowing through the financial sector in the country. In India, banks are not doing terribly well. They have lent unwisely. As a result, many loans have "become overdue" and a number of borrowers are not in a position to pay back their debt. This has made many a loan a non-performing asset (NPA). When borrowers are in default or in arrears on scheduled payments of principal or interest for specified period, usually 90 days, the loan is classified as NPA. All banks around the world have some NPAs but, if they become too large, banks can collapse. If the banks are big enough, this can cause the meltdown of the entire financial system.

According to CARE Ratings, India had the fifth highest NPA ratio in the world, ranking only after Greece, Italy, Portugal and Ireland. India's NPA ratio stands at 9.85%, while major economies such as Britain, the US; Japan and Germany have ratios less than 2%. According to the latest Financial Stability Report of the Reserve Bank of

India (RBI), the NPA ratio is set to deteriorate to 12.2% by March 2019, which would put India in fourth position, overtaking Ireland. As per the RBI, 11 public sector banks are under the prompt corrective action category, which means that the poor quality of balance sheets has to be addressed immediately to avoid potential meltdown.

**Review of Literature**

**1. Mittal (2017)** tried to compare the performance of public sector banks with that of private sector banks in India for the period 2005 to 2016. The major objective of the study was to measure the health of the banking industry with respect to the size of non-performing assets. To analyze the growth of non-performing assets, different ratios were used. The study found that the extent of non-performing assets was comparatively more in public sector banks.
**2. Adwani (2018)** tried to compare the productivity of employees of top public and private sector banks for the year 2016-17. The study evaluated different ratios for these banks to analyze the efficiency of employees. It was observed that for Indian banks, public sector banks had higher business per employee but poor profit per employee as compared to private sector banks.
**3. Sharma and Sharma (2018)** analyzed the financial performance of three selected Indian commercial banks, namely, Punjab National Bank, Canara Bank and State Bank of India; for the period 2016-17. Using financial ratio analysis, the study concluded that State Bank of India dominates the banking scenario, and has outperformed Punjab National Bank and Canara Bank for majority of the indicators.

**Need and Objectives of the study:**

In the recent years, the entire banking sector has been plagued by issues of rising bad loans and bank failures. Non-performing assets is increasing in the banking industry and has become a serious threat to the banks' existence and survival. Rising debts, non-repayment issues, and loan defaulters have become an area of major concern; which is now the prime focus of the policy makers and the government.

There have been major transitions and transformations in the banking history. Banks have shifted from traditional methods of banking to new domains as technology based banking and digital banking. Large numbers of studies have been undertaken on the subject of bank performance in India. Still, continuous measurement and evaluation of bank performance is imperative. Against this background, the study attempts to review, measure and analyze the performance of Scheduled Commercial Bank Groups in India before and after global crisis. The objectives of the study are:

1. To compare the number of branches of scheduled commercial banks before and after global financial crisis
2. To compare the Deposits of the scheduled commercial banks before and after global financial crisis.
3. To compare the Investments of the scheduled commercial banks before and after global financial crisis.

4. To compare the Loans and Advances of the scheduled commercial banks before and global financial crisis.

**Hypothesis formulated:**

H1: The number of branches of scheduled commercial banks differs significantly before and after global financial crisis.
H2: The Deposits of the scheduled commercial banks differs significantly before and after global financial crisis.
H3: The investment of the scheduled commercial banks differs significantly before and after global financial crisis.
H4: The loans and advance of the scheduled commercial banks differs significantly before and after global financial crisis.

**Research Methodology:**

The present study adopts an analytical and descriptive research design. The data was collected from RBI website and its various series of publications. The data was collected from the year 2000 to 2018.

**Tools used for the study:**

The financial tools used for the study are the number of branches of the scheduled commercial banks, Deposits of the scheduled commercial banks, Investments of the scheduled commercial banks and Loans and Advances of the scheduled commercial banks. Multiple Regression with dummy variables in excel is used to analyze before and after global financial crisis.

**Analysis and Interpretation:**

**a) Hypothesis Testing:**

$H_0$: The number of branches of the scheduled commercial banks does not differ significantly before and after global financial crisis.
$H_1$: The number of branches of the scheduled commercial banks differs significantly before and after global financial crisis.

| Dummy variables | 41178.136 | 8769.385 | .751 | 4.696 | .000 |

a. Dependent Variable: No. of Branches

A multiple linear regression was calculated to predict number of branches of the scheduled commercial banks before and after global financial crisis. A significant regression equation was found ($F(2, 18) = 22.049$, $p > 0.000$), with an $R^2$ of 0.565.

At 5% level of significance t test shows the probabilistic significance as 0.001 which is greater than 0.05 (prescribed). Hence the hypothesis is accepted and it may be concluded that there is a significant difference because of the effort taken by government for financial inclusion programme to reach the people.

**b) Hypothesis Testing:**

H0: The deposits of the scheduled commercial bank do not differ significantly before and after global financial crisis.

H1: The deposits of the scheduled commercial banks differ significantly before and after global financial crisis.

| Year | Deposits | Dummy Variables | Year | Deposits | Dummy Variables |

a. Dependent Variable: Deposits

A multiple linear regression was calculated to predict the deposits of the scheduled commercial banks before and after global financial crisis. A significant regression equation was found (F (2, 16) = 144.9868, p> 0.001), with an $R^2$ of 0.947708. At 5% level of significance t test shows the probabilistic significance as 0.482 which is greater than 0.05 (prescribed). Hence the hypothesis is accepted and it may be concluded that significance exist because of more deposit mobilization after crisis in order to protect their funds by investors.

**c) Hypothesis Testing:**

H0: The Investments of the scheduled commercial banks does not differ significantly before and after global financial crisis.

H1: The investments of the scheduled commercial banks differ significantly before and after global financial crisis.

| Year | Investments | Dummy variables | Year | Investments | Dummy Variables |
|---|---|---|---|---|---|
| 1999-00 | 4138.71 | 0 | 2010-11 | 19236.33 | 1 |

| | Dummy variables 2 | 18440.775 | 3406.594 | .796 | 5.413 | .000 |

a. Dependent Variable: Investments

A multiple linear regression was calculated to predict the Investments of the scheduled commercial banks before and after global financial crisis. A significant regression equation was found (F (2, 16) = 150.705, p > 0.000), with an $R^2$ of 0.949592.

At 5% level of significance t test shows the probabilistic significance as 0.001 which is greater than 0.05 (prescribed). Hence the hypothesis is accepted and it may be concluded that t significance exist because banks park their surplus funds in the investment.

**d) Hypothesis Testing:**

H0: The loans and advances of the scheduled commercial banks do not differ significantly before and after global financial crisis.

H1: The loans and advances of the scheduled commercial banks differ significantly before and after the global financial crisis.

| Year | Loans and Advances | Dummy Variables | Year | Loans and Advances | Dummy Variables |

| 2006-07 | 19812.35 | 0 | 2017-18 | 87460.00 | 1 |
| 2007-08 | 24769.36 | 1 | | | |
| 2008-09 | 29999.24 | 1 | | | |
| 2009-10 | 34967.20 | 1 | | | |

**Model Summary**

| Model | R | $R^2$ | Adjusted $R^2$ | Std. Error of the Estimate | Change Statistics | | | | |
|---|---|---|---|---|---|---|---|---|---|
| | | | | | $R^2$ Change | F Change | df 1 | df2 | Sig. |
| 1 | .821[a] | .673 | .654 | 17279.69858 | .673 | 35.032 | 1 | 17 | .000 |

a. Predictors: (Constant), Dummy variables 3

**Coefficients[a]**

| Model | | Unstandardized Coefficients | | Standardized Coefficients | t | Sig. |
|---|---|---|---|---|---|---|
| | | B | Std. Error | Beta | | |
| 1 | (Constant) | 9846.438 | 6109.296 | | 1.612 | .125 |
| | Dummy variables 3 | 47523.051 | 8029.188 | .821 | 5.919 | .000 |

a. Dependent Variable: Loans and Advances

A multiple linear regression was calculated to find the Loans and Advances of the scheduled commercial banks before and after global financial crisis. A significant regression equation was found (F (2, 15)=176.83, p> 0.000), with an $R^2$ of 0.9567.

At 5% level of significance t test shows the probabilistic significance as 0.001 which is greater than 0.05 (prescribed). Hence the hypothesis is accepted and it may be concluded that significance exist because of lesser than the expected growth after crisis.

**Findings:**

1. At 5% level of significance t test shows the probabilistic significance as 0.532 which is greater than 0.05 (prescribed). Hence the hypothesis is accepted and it may be concluded that the number of branches of the scheduled commercial banks differ significantly before and after global financial crisis. The number of branches has increased up to the year 2016 and there was a gradual decline after 2017. This is due to initiatives taken by the Government to develop digital banking system. Another point is that banks expansion has attained saturation period in recent period.
2. At 5% level of significance t test shows the probabilistic significance as 0.482 which is greater than 0.05 (prescribed). Hence the hypothesis is accepted and it may be concluded that the Deposits of the scheduled commercial banks differ significantly before and after the global financial crisis. This is because of tightening financial conditions due to low deposit growth and the initiatives taken by the bank in accelerating the rate of economic growth and disposable income, holds the key to higher deposit mobilization.

3. At 5% level of significance t test shows the probabilistic significance as 0.482 which is greater than 0.05 (prescribed). Hence the hypothesis is accepted and it may be concluded that the Investments of the scheduled commercial banks differ significantly before and after the global financial crisis. The difference in interest rate for investments plays a major role for the investors. There was a decline in investments during 2003-2008 but due to reforms in interest rates the investment pattern gradually grows in recent years.
4. At 5% level of significance t test shows the probabilistic significance as 0.482 which is greater than 0.05 (prescribed). Hence the hypothesis is accepted and it may be concluded that the Loans and Advances of the scheduled commercial banks differ significantly before and after the global financial crisis. The loans and advances initially show a decline after the crisis and there was a gradual improvement due to the steps taken by RBI in improving the economy.

**Conclusion:**

The experience gained by banks across various countries post recent global financial crisis has given another opportunity to the banking sector to review and renew its approach towards factors decisive to its extant working and future sustenance. A lot of loans currently classified as NPAs originated in the mid 2000s at a time when the economy was booming and business outlook was very positive. Large corporations were granted loans for projects based on extrapolation of their recent growth and performance. With loans being available more easily than before, corporations grew highly leveraged, implying that most financing was through External Commercial

Borrowings rather than internal promoter equity. But as economic growth stagnated following the global financial crisis of 2008, they repayment capability of these corporations decreased. This contributed to what is known as India's Twin Balance sheet problem, where both the banking sector (that gives loans) and the corporate sector (that takes and has to repay these loans) have come under financial stress. When the project for which the loan was taken started underperforming, borrowers lost their capability of paying back the bank. The banks at this time took the practice of 'ever greening', where fresh loans were given to some promoters to enable them to pay off their interest effectively pushed the recognition of these loans as non-performing to a later date, but did not address the root causes of their unprofitability which affect their regular banking business of deposits, loans and advances and investment in growth aspect.

1. Dr.V.Sornaganesh and Thangarani (2014) In September 2008 Global Financial Crisis has put more pressure for this industry because of funding interlink ages among NBFCs, mutual funds and commercial banks. The ripple effect of the turmoil in American and European markets led to liquidity issues and heavy redemption pressure on the mutual funds in India, as several investors, especially institutional investors, started pulling out their investments in liquid and money market mutual funds. RBIs measures help the financial system strong and resilience during crisis.

# योगदर्शने अष्टाङ्गयोगकला

दर्शना राय
विद्यावारिधिः (सांख्ययोगविभागः)
दूरवाणी

(**विषयसारांशः** – योगशास्त्रस्य विषयो भवति मुक्तिः। कैवल्यं वा समाधिः। योगशास्त्रे उक्तम् - 'योगश्चित्तवृत्तिनिरोधः' योगः समाधिः अर्थात् समाधिलाभायास्माकं किमपि कर्तव्यम्। तत्तु भवति अष्टाङ्ग(अष्ट+अङ्ग)योगस्य क्रियाणां पालनम्।)

प्रकृतधर्मः साधनसापेक्षः। धर्मस्य मूलं साधना, अतः धर्मः न तु केवलं वितर्कः, विचारः, आलोचना, मतभेदा इति। अपि तु यत्र शास्त्राणां युक्तिविचारस्य समाप्तिः, ततः धर्मस्य सूचना भवति। निरपेक्षः, परमसत्यस्य साक्षादुपलब्धिश्च एवं जीवनस्य प्रात्यहिककर्मणामन्तरे ईश्वरीयभावस्य प्रकाशनमेव धर्मः। मानवात्मनः ब्रह्मस्वरूपस्योपलब्धिः, आध्यात्मिकचरित्रसंघटनम्, आध्यात्मिकसत्ये प्रतिष्ठापनञ्च जीवनधर्मस्योद्देश्यम्।

**योगः –** संस्कृतभाषा अत्र धर्मानुष्ठानिककार्ये परिलक्ष्यते। शारीरिकस्य नैतिककार्यप्रणालीनाञ्च प्रतिपालनं योगशास्त्रस्य सर्वप्रथमा शिक्षा। हिरण्यगर्भः योगस्य प्रथम उपदेष्टा इति। तद्योगमाश्रित्यैव महर्षिपतञ्जलिना प्रणीतं पातञ्जलयोगदर्शनम् अथवा योगसूत्रम्। महर्षिपतञ्जलिः शेषनागस्य अवतारो वर्तते। युजिर् योगे इत्यस्माद्धातोः घञ् प्रत्यये योगशब्दो निष्पन्नः। चिन्तनं मानवानां धर्मः। यदा मानवः विविधचिन्तनेभ्यो विमुक्तो भवति तदा विमुक्तचिन्तनस्य मानवस्य मनो लयावस्थां प्राप्नोति, सैवावस्था योगनाम्ना प्रत्याख्याता। योगशास्त्रं मुख्यतः दैहिकं, मानसिकं, आध्यात्मिकविज्ञानप्रबोधकञ्च भवति।

योगशास्त्रस्य विषयः शास्त्रभेदेन सम्प्रदायभेदेन च बहुप्रकारकः भवति। तन्त्रे उक्तम् – शिवशक्त्योः मेलनमेव योग इति। इतोऽपि योगस्य सप्तदश स्वरूपाणि दृश्यन्ते। योगस्य अष्टौ अङ्गानि सन्ति। यथा - 'यमनियमासनप्राणायामप्रत्याहारधारणाध्यानसमाधयोऽष्टावङ्गानि' –योगसूत्रम् 2.29

पुनः अष्टावङ्गानि द्विविधानि। यथा - 1) बहिरङ्गम् – यमः, नियमः, आसनम्, प्राणायामः, प्रत्याहारः।

2) अन्तरङ्गम् – धारणा, ध्यानम्, समाधिः।

**यमः –** 'अहिंसासत्यास्तेयब्रह्मचर्यापरिग्रहा यमाः' योगसूत्रम् 2.30

अर्थात् अहिंसा, सत्यम्, अस्तेयम्, ब्रह्मचर्यम्, अपरिग्रहः इत्यादयः पञ्च यमाः। यो 'महाव्रतः' इति नाम्ना अभिधीयते।

अहिंसा – अहिंसा शब्दस्य अर्थः प्रेम इति। जीवहत्या न करणीया, अपरस्य हानिः न करणीया, अपरस्मै कष्टं न दातव्यम्। अहिंसा शब्दो भवति कायिकः वाचिकः मानसिकश्च।

मानसिकाहिंसा – आत्मवत्सर्वभूतेषु अर्थात् सर्वभूते(प्राणिसमूहः) एक एव आत्मा इति चिन्तनीयम्। कस्मै अपि कदापि मानसिककष्टं न देयम्।

वाचिकाहिंसा – कदापि कठोरवचनं न वक्तव्यम्। अर्थात् कटुवचनद्वारा यस्य कस्यापि हृदयोपरि कष्टं न देयम्। सर्वदा मधुरं, प्रियं, हितकारि, आनन्ददायकं, उत्साहवर्धकञ्च वचनं वक्तव्यम्।

कायिकाहिंसा – शस्त्रेण कोऽपि कदापि न पीडितव्यः। शारीरिकनिर्यातनं न करणीयम्। सुखभोगलाभार्थं जीवहत्या न करणीया। जीवहत्या महापापम् इति चिन्तनीयम्। "अहिंसा-प्रतिष्ठायां तत् सन्निधौ वैरत्यागः"

सत्यम् – सत्यवचनम् इत्युक्ते सिद्धवाणी। सत्यपालनेन साधकस्य अन्तः एकः आध्यात्मिकशक्तिः जागरिता भवति। साधकस्य मनः दर्पण इव भवति अतः लोभः, क्रोधः, मोहः, रागः, दोषः, भयम्, मिथ्याभाषणम्, मिथ्याचरणं सर्वं वर्जनीयम्। शास्त्रे उक्तम् –

सत्यं ब्रूयात् प्रियं ब्रूयात् मा ब्रूयात् सत्यमप्रियम्।

प्रियञ्च नानृतं ब्रूयात् एष धर्मः सनातनः।।

अर्थात् सत्यं वाक्यं वक्तव्यं परन्तु शब्दः प्रियः मधुरश्च भवेत्, परन्तु प्रियम् असत्यभाषणं न वक्तव्यम्। यथा नेत्रहीनं जनं कदापि अन्धं न वदेत्। तत्तु सत्यम् इति सर्वे जानन्ति परन्तु तत् अप्रियम्। इति हेतोः अन्धजनः सुरदासः इति नाम्ना आह्वातव्यः। महर्षिवाल्मीकिः रामस्य आचरणविषये उवाच – 'रामो द्विर्न भाषते' अर्थात् श्रीरामचन्द्रः कदापि असत्यभाषणं न कृतवान्। शास्त्रे उक्तम्- 'सत्यमेव जयते नानृतम्'। सत्यकर्मणार्थं साधकजनः मानवाय एकं राजपथं कृतवान् – 'महाजनो येन गतः स पन्थाः' अर्थात् महत्पुरुषस्य पन्थाः तस्य आचरणं च सर्वश्रेष्ठं तथा योग्यम्। अतः मनुष्यस्य अपि तथैव करणीयम्। तत्तु कर्तव्यं तथा धर्मः।

अस्तेयः – स्तेयशब्दस्य अर्थो भवति चौरकार्यम् अर्थात् अस्तेयः नाम अचौर्यकार्यम्। अतः अपरस्य वस्तुनि लोभः मोहः क्रोधश्च न करणीयः। अपरस्य किमपि वस्तु अनत्तवा न हरणीयम्।

ब्रह्मचर्यम् – सनातनधर्मस्य श्रेष्ठः शिष्टाचारः ब्रह्मचर्याश्रमः। (ब्रह्म+चर्य) ब्रह्मचर्य इत्युक्तौ निवासः। अर्थात् ब्रह्मचर्यशब्दस्य अर्थः विचरणं, नारीस्मरणं, नारीचर्चा, सौन्दर्याकर्षणं, भोगविलासः, ऐकान्तिकमेलनं, मैथुनादिब्रह्मचर्यस्य वैशिष्ट्यं नास्ति। एतद् भवति बौद्धिकब्रह्मचर्यम्। अश्लीलगीतश्रवणं गायनञ्च, अश्लील-उपहासः सौन्दर्यस्य स्तुतिः निन्दायाश्च वर्जनं भवति वाचिकब्रह्मचर्यम्। अनन्तरं नारीस्पर्शः आलिङ्गनं, चुम्बनं, रोगावस्थादि शारीरिकब्रह्मचर्ये न भवति।

अपरिग्रहः – शब्दस्पर्शरूपरसगन्धादिसम्बद्धं किमपि भोगवस्तु न स्वीकरणीयम् इति अपरिग्रहः तथा स्वल्पे तुष्टिः इति।

**नियमः** – 'शौचसन्तोषतपःस्वाध्यायेश्वरप्रणिधानानि नियमाः' (योगसूत्रम्.2.32) अर्थात् शौचम्, सन्तोषः, तपः, स्वाध्यायः, ईश्वरप्रणिधानम् एते पञ्च नियमा भवन्ति।

1. शौचम् – शौचं द्विविधं यथा – बाह्यम् आभ्यन्तरञ्च। गोमुत्रं, त्रिफला, रीठा, सुगन्धिवस्तु स्वीकृत्य स्नानादिकार्यं भवति बाह्यशौचता। अनन्तरं मनसि अहंता, ममता, रागः, द्वेषः, ईर्ष्या, भयम्, कामः, क्रोधादि भवति आभ्यन्तरशौचता।
2. सन्तोषः – सुख-दुःखम्, लाभ-क्षतिः, यश-अपयशः, सिद्धि-असिद्धिः, अनुकुलता-प्रतिकुलता सदा-सर्वदा सन्तुष्टः प्रसन्नचित्तो वा भवति चेत् सन्तोषो भवति। येन केनचित् सह दुर्व्यवहारः परित्यक्तव्यः।
3. तपः – मन-इन्द्रियादि-संयमेन धर्मपालनार्थं कष्टसहनेन व्रताद्यनुष्ठानकरणं भवति तपः। बुभुक्षातृष्णाशीतोष्णादीनां सहनं तथा एकादशी-अमावस्या-पूर्णिमासु व्रतादिपालनं भवति तपः।

4. स्वाध्यायः – कल्याणप्रदशास्त्राणाम् अध्ययनं इष्टदेवमुद्दिश्य मन्त्रजपादिकरणम् ओङ्कारगायत्रीमन्त्रादिपठनं वेदोपनिषद्गीतापुराणादीनामध्ययनं भवति स्वाध्यायः।

5. ईश्वरप्रणिधानम् – अस्माकं जीवने सर्वकर्म(बुद्धि-वाणी-शरीरद्वारा सृष्टम्) ईश्वरस्योपरि समर्पणीयम्। प्रणिधानशब्दः भक्तिविशेषः, तस्य अर्थो भवति अर्पणम्। अर्थात् कर्म-कर्मफलं सर्वम् ईश्वरस्य चरणकमले अर्पितं भवति ईश्वरप्रणिधानम्।

**आसनम् –** पातञ्जलयोगसूत्रे उक्तम् - 'स्थिरसुखमासनम्' (योगसूत्रम्.2.46) अर्थात् सुखपूर्वकं स्थिररूपेण बहुकालपर्यन्तम् उपवेशनं भवति आसनम्। 84 लक्षम् आसनानि सन्ति। किन्तु केवलं 33 आसनसमूहः मुख्यरूपेण चिन्तितः योगिभिः। योगासनं हठयोगस्य एकं महत्त्वपूर्णम् अङ्गम्। योगासनं मानवानां कृते अधुना बहु उपयोगि भवति। शारीरिकमानसिकाध्यात्मिकस्वास्थ्यलाभाय योगासनं सरलं साधनम्। नियतरूपेण प्रतिदिनं योगासनस्य अभ्यासेन अस्माकं मनः एकाग्रं भवति। शरीरं सम्यक् भवति धैर्यता स्फूर्तिः साहसश्च आगच्छति। यथा – सूर्यनमस्कारः, पद्मासनं, सिद्धासनं, भेकासनं, वज्रासनं, नटराजासनं, हलासनं, धनुरासनं, नौकासनं, सर्वाङ्गासनं, शीर्षासनम् इत्यादयः।

**प्राणायामः –** 'तस्मिन् सति श्वासप्रश्वासगतिविच्छेदः प्राणायामः' (योगसूत्रम्.2.49) अर्थात् आसनान्तरं श्वासवायोः अन्तः प्रेषणम् एवं अन्तस्थवायोः बहिःप्रदेशे निष्कासनं भवति 'श्वासप्रश्वासः' तथैव प्राणशब्दः भवति वायुः, आयामः इत्युक्तौ नियन्त्रणम्। अर्थात् श्वासवायोः नियन्त्रणं भवति प्राणायामः। प्राणायामः त्रिविधः यथा – पूरकः, रेचकः कुम्भकश्च। पूरको भवति श्वासवायोः बहिः प्रदेशात् अन्तः प्रेषणम्। रेचको भवति अन्तस्थश्वासवायोः बहिः प्रदेशे निष्कासनम्। कुम्भको भवति पूरके गृहीतम् अन्तःस्थितवायोः उदरभागे स्थापनम्।

प्राणायामद्वारा मस्तिष्कं जागरितं भवति। तस्य विकारः दूरीभूतो भवति। इतोऽपि पिट्टुइटारि ग्रन्थिः विकसितो भवति। योगसाधकजनानां कृते प्राणायामः प्रयोजनीयः। प्राणायामद्वारा तेषां व्यक्तित्वं निर्मितं भवति।

**प्रत्याहारः -** 'स्वविषयासंप्रयोगे चित्तस्वरूपानुकार इवेन्द्रियाणां प्रत्याहारः' (योगसूत्रम्.2.54) प्रति+आहारः = प्रत्याहारः(भोजनस्य अन्ते) शब्दस्पर्शरूपरसगन्धाः एते इन्द्रियाणां भोजनानि सन्ति। यदा इन्द्रियेण साकं मनसः मेलनं भवति तदा विषयेण सह एकीभूतानन्तरं विषयज्ञानं न भवति।

**धारणा –** 'देशबन्धश्चित्तस्य धारणा' (योगसूत्रम्.3.1) अर्थात् धारणा भवति धारणम्। यदा मनसि किमपि वस्तु धारयितुं योग्यता भवति एवञ्च किञ्चित् समयपर्यन्तं तत् स्थिररूपेण स्थापनं क्रियते तदा धारणा भवति। धारणा भवति मनसः विकसितः शक्तिः। धारणाशक्तिं विना योगशक्तिः न भवति। धारणाशब्दस्यार्थो भवति संयमः। संयमशब्दस्यार्थो भवति वस्तुविशेषज्ञानम्। अतः धारणा या मनसः विचरणस्थानं सीमितं निश्चितञ्च करोति।

# SABARIMALA TEMPLE CASE : A THOUGHTFUL INTROSPECTION

**Akash Chatterjee**
Semister III Student
Amity University
India

Given below are some thoughtful insights which may be analysed in the present Sabarimala Temple Case

## MAINTAINABILITY OF THE PETITION –

Article 32 of the Constitution of Vindhu lays down that ;
*32. Remedies for enforcement of rights conferred by this Part*
*(1) The right to move the Supreme Court by appropriate proceedings for the enforcement of the rights conferred by this Part is guaranteed*
*(2) The Supreme Court shall have power to issue directions or orders or writs, including writs in the nature of habeas corpus, mandamus, prohibition, quo warranto and certiorari, whichever may be appropriate, for the enforcement of any of the rights conferred by this Part*
*(3) Without prejudice to the powers conferred on the Supreme Court by clause ( 1 ) and ( 2 ), Parliament may by law empower any other court to exercise within the local limits of its jurisdiction all or any of the powers exercisable by the Supreme Court under clause ( 2 )*
*(4) The right guaranteed by this article shall not be suspended except as otherwise provided for by this Constitution*

A Public Interest Litigation can be filed, called PIL for the enforcement of fundamental rights that have been denied or breached. This is indeed the greatest weapon of judicial activism and a direct means of enforcing social equality as well, however it has its own limitations at the same time. It is imperative that the petitioner has suffered any particular damage, in order to file a PIL. Article 25 of the Constitution guarantees to all persons the freedom of conscience, and the right freely to profess, practise and propagate religion. This is however subject to public order, morality and health, and to the other provisions of Part III of the Constitution. In this case, the PIL can only be filed under Article 32 as violation of fundamental rights, if the petitioner's own rights have been violated in the temple. The filing of petition is flawed as it urges upon the Court to decide a matter that can be decided and managed by the religious sect or denomination exclusively. By interfering with the religious rights of a community the Court cannot judge a case where the petitioner does not ascribe to the faith being dealt with and questioned. This is a question of faith more than an issue of Equality, because if women claim equality to enter the temple, the temple and the sect thereof will also claim the protection given to them under Article 25. The issue cannot be adjudicated on the basis of Article 14 because it cannot be applied ;
Two conditions are required to apply Article 14;
• The classification must be founded on an intelligible differentia; and

• It must have a rational nexus with the object sought to be achieved by the impugned law.

In this case the differentia needs to be analysed from the point of view of the class of people following the rituals at Sabarimala temple and women who seek equality. Since the right of women to enter the temple is in dissonance with the religious freedom of the sect , the court needs to review the religious practice, which would be a breach of the fundamental religious right of the sect. A judicial review of the practices at the Sabarimala temple is not possible by the Court as the Constitution has already granted that degree of freedom to the sects. Second of all, the question of equality of women in entering and worshipping in the Sabarimala temple cannot be considered. This is because the demand placed in front of the Honourable Court can be fulfilled only at the cost of the nature of the deity. In order to enter the temple to worship, the faith and respect in the decorum of the temple and the respective nature of the deity needs to be preserved. Ironically that would be desecrated the moment they deny the nature of the deity and enter. Hence this petition is not only ambiguous but also attempts to strike at the group autonomy and collective conscience o0f a group involved in practising their respective religious freedom. Secondly , the petition has been filed by non believers and non followers of the sect being put to question. In this case Article 14 cannot be applied, and the PIL cannot be considered. As religion as a fundamental right is protected by the Constitution itself, Courts normally do not delve into the intricacies of religious affairs, as that would be unconstitutional. It can only act if an aggrieved person from that sect petitions or brings a complain.

Another matter which assumes importance is that whether the petitioners can at all file this petition or not ? A famous case in this regard needs to be taken into consideration:

*Hans Muller of Nurenburg v. Superintendent, Presidency Jail, Calcutta & Ors*[1]

In this case, Court held that a person can impugn a particular law under Article 32 only if he is aggrieved by it.

Hence it becomes imperative that petitioners have suffered, which is clearly not the case here. Secondly as the petitioners are non believers of the faith, hence the Court cannot adjudge a case at the cost of harming the faith of any sect, and if women want to worship and they claim faith in the deity or the temple, then that needs to be followed strictly according to the prescribed rules of worship, not by altering the modus operandi of worship completely.

In a pluralistic society if religious freedom and unique religious practices are brought under the lens of scrutiny of rationality or judicial review, a serious harm would be inflicted upon the faith and the constitutional right to defend it. Where diversities need to be respected by giving them respective freedom, such a step would harm communal harmony. By encouraging such PILs, minority communities and their freedom to profess religion would be seriously hampered, at the same time the degree of autonomy with which the religious affairs of a sect is managed will be compromised, all leading to a socio cultural dissent. In this way the incorporative state would soon give

[1] (1955) 1 SCR 1284 : AIR 1955 SC 367.

way to rigid rational judgements obliterating age old traditions. Not every religious aspect can be perfected by rational thinking of this century, certain things are best left to faith, and certain observances are simply the product of faith and should not be challenged for grater harmony.

**THE QUESTION OF DISCRIMINATION -**

Article 26 of the Constitution of India states that:

Freedom to manage religious affairs Subject to public order, morality and health, every religious denomination or any section thereof shall have the right
(a) to establish and maintain institutions for religious and charitable purposes;
(b) to manage its own affairs in matters of religion;
(c) to own and acquire movable and immovable property; and
(d) to administer such property in accordance with law

In the present case, Sabarimala temple and its devotees can defend their own customary practice by the power bestowed upon them by the Constitution itself. Followers and the worshippers of Sabarimala temple constitute a distinct sect by virtue of belonging to a common deity, a common name for their sect, a common place for worship and hence it is in their best interest to determine, practice and propagate their distict faith. Before debating on the practice being discriminatory or not, the Constitutional protection that the devotees at Sabarimala get, needs to be taken into consideration.

In the famous case of
*S.P. Mittal Etc*. **v.** *Union of India And Others*[2],
*The Honourable Supreme Court held in this case that in case of a religious denomination, there are two prerequisites for such a qualification, one being a set of rituals and the other being common organisation as designated by a common name in this regard. Sabarimala devotees do conform to these necessary preconditions and hence need to be recognised as a denomination. In this regard the exclusionary practice has to be understood as an essential condition or a discipline pertaining to the deity presiding over the temple of Sabarimala- LORD AYAPPA. The deity in this temple is in the form of a Naishtik Brahmachari- which means a state of being a perennial celibate. Celibacy is a vow to abstain from marital relationships and remaining in one's own penance to achieve spiritual upliftment and emancipation. Yajnavalkya Smriti* explains this form;
**a naishtika brahmachari is one who undertakes a vow to remain a celibate till his death**.
In addition to this, there is a requirement of the person being seated in position and an extreme degree of control over the senses, called – ""*vijitendriya*". It also involves sense control over, eyes, ears, mouth (and tongue), nose, skin, hands, legs, reproductive organ

[2] **(1982) 1983 AIR, 1 1983 SCR (1) 729**

and excretory organ and mind. Hence it is expected that such a person would completely abstain from coming into contact with women of the reproductive age.It is a regulation to keep the person away from any source conducive to procreation.

The second aspect to be taken into consideration is the deity bestowed with human like qualities, the combination of mundane characteristics with a sense of divinity being involved. Agama Shastras elucidate on the importance of temples and the associated deities in them. Deities are and possess a distinct character of their own, and when a temple they are subjected to conditions as are human beings subjected to. In the case of *Sri Adi Visheshwara of Kashi Vishwanath Temple, Varanasi, vs State of UP*[3], it was held that :

Deities can own property with their interests vested in them, and priests would simply have the role of managing the estates owned. The rulings in Court indicate the intention of Courts to recognise deities as persons or rather "legal persons "as stated under Article 21 of the Indian Constitution. There have been circumstances where deities have been involved into legal battles thereby affirming their existence as persons. In this sense the deity has the right under Article 14 to have its fundamental rights properly preserved. Being a Naishtik Brahmacharya, it is his fundamental requirement to abstain from women of the prescribed age group, hence the regulation prohibiting the entry of women of a certain age is not discriminatory but rather an exercise of a right by the deity.

The situation must be viewed keeping in mind not just some fabricated feminist issues but the considerations of a pluralist society that keeps different religions together in a framework of society. It is a question of faith and the perspective matters the most in this case, while at the same time issues of social importance need to be adjudged at the same time. In this particular instance, the question of discrimination is void ab initio as it is a matter of personal right of the devotee and of the section therein devoted at the same time. While not allowing women of a particular age group might seem discriminating, but it needs to be judged from the circumstantial point of view. Indian Constitution has awarded each section propagating their religion, the freedom to do that. Indian state is incorporative of distinct individualities; it respects religious sects and practices maintaining a non interfering secular ground.

Speaking of discrimination, Article 15 provides;

*Prohibition of discrimination on grounds of religion, race, caste, sex or place of birth*

*(1) The State shall not discriminate against any citizen on grounds only of religion, race, caste, sex, and place of birth or any of them*

*(2) No citizen shall, on grounds only of religion, race, caste, sex, place of birth or any of them, be subject to any disability, liability, restriction or condition with regard to*

*(a) Access to shops, public restaurants, hotels and palaces of public entertainment; or*

*(b) The use of wells, tanks, bathing Ghats, roads and places of public resort maintained wholly or partly out of State funds or dedicated to the use of the general public*

*(3) Nothing in this article shall prevent the State from making any special provision for women and children*

[3] [1997 (4) SCC 606

*(4) Nothing in this article or in clause (2) of Article 29 shall prevent the State from making any special provision for the advancement of any socially and educationally backward classes of citizens or for the Scheduled Castes and the Scheduled Tribes*

In the sub clause (1), the grounds are explicitly specified. And the case of Sabarimala does not fit in with any of these grounds mentioned. The selective prohibition is hence not amounting to discrimination, rather conformity with a custom of antiquity and a mark of reverence to the presiding deity at the temple. If women as a class were prohibited from participation, it would amount to social discrimination. However, this is not so in the present case. Girls below 10 years, and women after 50 years can freely enter this Temple, and offer worship. The classification of women between the ages of 10 to 50 years, and men of the same age group, has a reasonable nexus with the object sought to be achieved, which is to preserve the identity and manifestation of the Lord as a 'Naishtik Brahmachari'. This prohibition can in no stretch of imagination be considered to be derogatory to women, as it is but for the sake of the deity to be worshipped. A deity is the sole essence in a temple . IT needs to be understood that the concept of GOD is a western influence, while Hinduism specifies 33 types of Gods and at the same time allows for devotion at an individual level in any condition. People can practice and meditate in at their own liberty but a temple is a place of practising spiritual advancement. A temple seeks to fulfil a spiritual purpose and hence the entire *Agama Shastras* delineate on the modus operandi of worship and the subsequent construction of temples. When viewing a temple, the focus is on the deity, towards whom a devotee's prayers are addressed to. The deity is a manifestation of the spiritual enigma that a devotee seeks op obtain as a result of his systematic prayers, a deity is a guide or a revelation that simplifies the object of devotion. It is a way in which a person can focus the objective of his meditation. In situations where a devotee observes penance, hardships, it is again the deity that will show him the purpose he is striving towards. It is a simplification of a complexity beyond discretion, an idol serves as a symbol, a motif or an image representing the abstract conception of the omnipresent god. The idol worship focussing on the deity of a temple constitutes an essential element of religion of Hinduism.

In this sense,

*" With the growth of anthropomorphism came the increased use of images and the construction of temples for daily services. Icons were known to the ancient people of the lower Indus Valley, and stray allusions to images have been traced in some Vedic texts. But the first undoubted historical reference to image worship by an Aryan tribe occurs in a passage of Curtius, who states that an image of Heracles was carried in front of the Paurava army as it advanced against Alexander. Patanjali refers to the exhibition and sale of images of Siva, Skanda, and Visakha by the Mauryas who rose to power at the end our period. Temples of a primitive kind are mentioned already in the Satapatha Brahmana, but these were not meant for iconic worship. In the epic, however, we have clear references to temples sacred to deities."*[4]

[4] R.C Majumdar, An Advanced History of India,3rd edition

Hence history bears sufficient testimony to the fact of a residing deity and connected idolatry. Apart from this , there is a significant case confirming the importance of deity ;

*Tilkayat Shri Govindlalji Maharaj etc. v. State of Rajasthan & Ors.*[5],
A cutting emphasis was laid on the types of rituals to be performed when Lord Krishna was worshipped in the form of a child. This shows that religion does not merely lay down a code of ethical rules for its followers to accept, but also includes rituals and observances, ceremonies and modes of worship which are regarded as integral parts of the religion. Worship and devotion cannot emanate out of nowhere, they need a material manifestation and that is precisely provided by the associatyed rites and rituals. These rituals are organised on the basis of the deity to be worshipped and therein lies the importance of the nature of a deity. In this case, Sabarimala temple's associated rituals are centred on the nature of the presiding deity, who is a celibate. At the same time it is his nature that needs a complete abstinence from women. The perspective is protection and preservation of the deity and his rights as embodied by Article 21 and Article 14 of the Constitution, not the women and their entrance in the temple.

Worship is comprised of two cardinal aspects, one being the worshipper and the other being the worshipped. In this case both of them have the right to protect their interests and which they are doing by exercising the selective prohibition. Hence the said practice does not amount to discrimination.

## RIGHT OF THE TEMPLE AUTHORITY

The Government of India is considered a parliamentary democracy. The country consists of 29 states and accommodates various religious, racial, traditional and linguistic groups and their values and customs. As such the culture is a melting pot of diversities in which each individual wants to conform to one's own belief system. Sharing such a belief system by a group of people gives rise to a collective conscience. It is again implied that there are more than one such group with their own interests. Being a democracy , the Government is elected by the people and it caters to the needs of the people as well.In this situation , the fundamental objective of the Constitution would be to secure individual rights of the people. Since people are different, hence matters concerning them need to be judged from their respective point of views.Article 26 states that ;

*Freedom of conscience and free profession, practice and propagation of religion*
*(1) Subject to public order, morality and health and to the other provisions of this Part, all persons are equally entitled to freedom of conscience and the right freely to profess, practise and propagate religion*
*(2) Nothing in this article shall affect the operation of any existing law or prevent the State from making any law*

[5] (1964) 1 SCR 561 at 582 : AIR 1963 SC 1638

*(a) regulating or restricting any economic, financial, political or other secular activity which may be associated with religious practice;*
*(b) providing for social welfare and reform or the throwing open of Hindu religious institutions of a public character to all classes and sections of Hindus Explanation I The wearing and carrying of kirpans shall be deemed to be included in the profession of the Sikh religion Explanation II In sub clause (b) of clause reference to Hindus shall be construed as including a reference to persons professing the Sikh, Jaina or Buddhist religion, and the reference to Hindu religious institutions shall be construed accordingly*

The practice of restricting women of a particular age group from the temple of Sabarimala, serves to protect the dignity of the deity . Religion is deeply connected with beliefs and is intricately woven with the character of a deity who is being worshipped. In the case of the deity, his being a Naishtik Brahmacharya restricts him from the presence of women. That he does not or will not come in contact with women is a matter of faith that many believe in . As people worship the deity , the sacrosanct force is the nature of the deity and that cannot be breached. Allowing women to enter would be desecrating the divinity and the nature of deity, subsequently a sacrilege meted out to the worshippers at Sabarimala temple, as it needs to be analysed how important it is to maintain this selective ban for the collective conscience of the group following the religion and the deity's nature thereof. In this sense , the non allowance of women forms an essential practice because the deity being a celibate abstains from women of the procreative age. It is not because of some biological phenomenon of menstruation that makes them impure, it is rather a requirement of the deity for the sake of preserving its nature and celibacy. The practice forms a part of the religious rights of the sect of people worshipping inside Sabarimala and a continuation of this ban would be important in the light of the faith that they keep in the shrine, thereby directly relating it with Articles 25 and 26 of the Constitution. In order to prove that the exclusion is indeed a part of religious affairs, certain case laws need to be considered.

In subsequent rulings , Indian judiciary has upheld religious rights of the people of the country in accordance with Article 25 and Article 26 of the Indian Constitution. In the case of *John Vallamattom v. Union of India*[6]*;*
It was held that any religious practice integral to any religion would be protected, as considered sacred by belief. In the case of *Dara Singh v. Union of India*[7] *;*
The State would not unnecessarily interfere in the religious matters of any particular religion. In the case of Sabarimala, interference of a State is not only unnecessary but also unconstitutional as it seeks to alter an age old practice integral to the belief system of devotees and it implies State interfering and attempting to alter such customs as may be disrespectful to not only the deity and the sect worshipping at Sabarimala temple but

[6] AIR 200 SC 2902
[7] (2011) 2 SCC 490

at the same time to the sect who believe in the deity . This interference would mean a breach of Article 25 and 26 of the devotees and that would be unconstitutional.

With respect to customs, these are practices which have been followed since antiquity and often they become an integral part of a religious practice. These customs define ways of rituals and other practices surrounding worship. In the case of
*Krishna Singh v. Mathura Ahir*[8]*;*
The Court refused to interfere with a particular custom and refused to alter it in its judgement.
Thus case serves as an essential precedent for our present case. The custom of women of a particular age not entering the Harimala temple is not simply old but it is integral to the nature of the Deity and the faith in celibacy of the devotees. In the famous case of
Acharya Jagdhishwaranand Avdhut v. Commissioner of Police, Calcutta[9] :
The court refused to alter or prevent the practice of a special kind of dance that was an integral customary practice of the religion and formed a part of the faith as well.

One important aspect that needs to be brought under the lens is that of the Constitutional morality. The Constitution serves to protect all the communities by granting them basic freedoms in their respective ambits of religious activities. A community is protected to ensure its continuance; hence the belief systems of a community are subsequently protected as well. In the case of ;
*Ratilal Panachand Gandhi v. The State of Bombay & Ors ;*
It was held that all essential practices in the pursuance of the religion would also amount to be a part of the religion itself.
The practise of celibacy and austerity is the unique characteristic of the deity in the Sabarimala Temple. Hindu deities have both physical and philosophical form. The same deity is capable of having different physical and spiritual forms or manifestations. Worship of each of these forms is unique. In this case the form of deity is celibate, requiring complete abstinence from women and hence it is essential to regulate the entry of women as an important practice followed in the religion and course of worship. The main idea to be considered here in this case is that of the “Essentiality Test”. By means of this test , any practice or ritual or custom needs to be weighed as whether it is essential for the furtherance of the religion or continuation of worship or is it fundamental to its tenets. The Constitution has its own principle of morality in religious matters. It cannot apply rationality or morality to adjudge any ritual. On the other hand it needs to preserve such rituals as part of the religious rights of communities following it. The court is not the competent authority to determine the cardinality of a custom towards the religious sect, but it can only consider opinions centring around it. The thing will speak for itself just the way a custom of antiquity will speak the fact that it has been followed over a long period of time. The command and authority of a custom will help the Court determine its essentiality and need to remain unchanged. In this way it is evident that there are certain customs that need to b followed as being essential. In

[8] AIR 1980 SC707
[9] AIR 1984 SC 512

the same way the exclusion of women falls under such a religious practice as it will preserve the nature of the deity and thereby sustain the faith of the sect.

Since it is an important practice , hence it becomes a right of the sect to practice it as well. In this sense the aspect of Constitution needs to be judged as well. Equality and non-discrimination are certainly one aspect of Constitutional Morality. However, the concept of equality and non-discrimination in matters of religion cannot be viewed in isolation. Holding a concept of Equality alone for consideration would be an injustice to all those religious specifications that would get obliterated by morality from a non believer and non follower's point of view. At this juncture of argument it needs to be clarified that, Article 15 does not apply in this case, as the category of temples have been explicitly avoided in it, thereby hinting at the increased autonomy of religious affairs and their management. Further the article provides for the ground of 'sex' but in the case of Sabarimala temple , women as a sex are not banned from the temple, rather only a selective age group is , in conformity with the nature of the deity. In this case , to safeguard the religious customs, temple authorities can exercise this ban. It would definitely be included in the scope of power bestowed upon by the Article 25 and Article 26 of Constitution of India. In the case of *Bira Kishore Devi v.* State *of Orissa*[10]*;*
Administration of a temple is solely the responsibility of the temple authorities .
This brings us to the matter of administration of Sabarimala Temple; in this case the prohibition of women is in consonance with the customary traditions of the place,and since it is essential and important , it needs to be sustained at the same time. This impliedly becomes the sole responsibility of the temple authorities to perform.Hence the temple authorities can practice this prohibition, as it is an essential practice being followed. With the faith of a large group coalescing on the nature of the devotee, when the sect believes in Lord Ayappa as being a Naishtik Brahmachari, and they perform penances towards attaining spiritual emancipation from the enigmatic manifestation of Lord in his temple abode, it seems quite important for the authority to take all steps to maintain the decorum of the worship, and in this case the entry of women of the said age group directly clashes with the interests of the material form of the deity, and it becomes all the more a duty for the authorities to practice the regulation of prohibition.

## DENOMINATIONAL CHARACTER OF THE TEMPLE

The temple of Sabarimala has a denominational character as its followers have a common deity to be worshipped; they have common ritualistic observances and practices as well. The temple derives its denominational character by virtue of its organisation, and unique style of worship specific to this particular place. There are clear attributes that there exists identifiable features. These are in conformity with the accepted features and are as follows;
• Ceremonial law relating to the construction of Temples;
• Installation of Idols therein;

[10] AIR 1964 SC 1501

• Place of consecration of the principle deity;
• Where the other Devatas are to be installed;
• Conduct of worship of the deities;
• Where the worshippers are to stand for worship;
• Purificatory ceremonies and their mode and manner of performance;
• Who are entitled to enter for worship; where they are entitled to stand and worship; and, how the worship is to be conducted.

Keeping the accepted features of a denomination in mind, the devotees at Sabarimala do constitute a religious denomination, and are entitled to mange their own affairs as guaranteed by Article 26 of the Constitution. The devotees are expected to follow a 41-day austerity period called as 'Vritham' prior to the pilgrimage. This Vritham period unifies devotees into one common sect, persuing the penances to appease Lord Ayappa.They are expected to bath twice in a day and visit the local temples regularly only wearing plain black coloured traditional clothing. It is also believed that in order to achieve the purpose of the pilgrimage one has to take a hike through the traditional mountainous forest path which runs up to 61 kilometers. This journey is undertaken by the devotees together. They become unified as a sect . This sect is that of Lord Ayappa – with unique rites and rituals common to them.

In the following cases, it has been observed that the courts have defined religious denominations in a unified way , *Sardar Syedna Taher Saifuddin Saheb v. State of Bombay*[11], *Raja Bira Kishore Deb v. State of Orissa*[12], *Shastri Yagnapurushadiji and others v. Muldas Bhundardas Vaishya and another*[13]

The presence of a multiplicity of religions and religious practices makes it a Herculean task to determine the essential tenets of a religion and those parts of a religious practice which would be indispensable. Hence Judiciary has in he course of subsequent rulings established how the significance of certain religious practices need to be determined in the ligh of the religion being taken under consideration. In the famous case of ;

*Commissioner., Hindu Religious Endowments, Madras v. Sri Lakshmindra Thirtha Swamiar of Sri Shirur Mutt*[14],

The Supreme Court formulated the 'essentiality test' when defining religion. Certain aspects of a religion were to be identified as being central or cardinal to the practice and accordingly given importance. Hence the Courts need to take into account the perspectives and the people involved in a particular practice .Another case ;

*Sri Venkataramana Devaruand Others v.The State of Mysore and Ors*[15],held that ;

[11] [1962] Suppl. 2 SCR 496
[12] (1964) 7 SCR 32
[13] (1966) 3 SCR 242 : AIR 1966 SC 1119
[14] 1954 AIR 282, 1954 SCR 1005
[15] 1958 AIR 255, 1958 SCR 895

Although the restriction on a particular caste as a whole had been relaxed, but they were still prohibited to enter during certain special ceremonies as directed by the board thet manages the temple. In this case it has to be noted down that the Court had placed special emphasis on the Board managing the affairs of the temple and had recognised the customs of the temple to get an important consideration. In yet another case , *Durgah Committee, Ajmer v. Syed Hussain Ali*[16]*;*
It was held that no new religious right can be bestowed and given the protection of Article 25 . Only those rights which are present and covered under Article 25 can be given protection. Administration of one's religious affairs comes well under the ambit of Article 25 and the devotees at Sabarimala temple enjoy that right. Allowing women of the prescribed age group to enter the premises of the temple would amount to a breach of the right bestowed upon by the constititution.

The Constitution is not a fountainhead of morality that screens every possible aspect under the modern liberal lenses and reject anything that creates a dissonance with it. On the contrary Courts need to preside over an entire subcontinent divided by unique traditions, customs, belief and faiths, united by the Constitution. As the guardian of the Constitution, it acts as the legal protector of the people, a guarantee that each individual would be protected along with his interests.

Courts are expected to judiciously determine fundamental questions on the basis of the Constitution. Framed as a constitutional question, not allowing menstruating women to enter Sabarimala temple presents a conflict and a clash between the scope and extent of an individual's right to pray and a community's right to manage its own affairs of religion. It is a clash of competing autonomous aspects where judges must balance the claims made on the basis of what the Constitution demands. Treating a regulation of prohibition simply as unconstitutional and discriminatory may appear prima facie but myopic and constricted in judgement at the same time.

With regards to the unconstitutionality of the exclusion of Women, certain issues are to be considered, this is not an argument against the Courts interfering in religious practices on the touchstone of equality and non-discrimination. Quite the opposite: when marginalised groups within cultures or religions challenge oppressive norms or practices, more often than not, they will *need* an external authority, a protector who will guarantee the continuation of their religious practices and this role has to be taken up by the courts. In the case of *Riju Prasad v State of Assam,*it was held that ;
The provisions of protection of customs under Articles 25 and 26, are immune from challenges meted out by the part III of the Constitution.This ruling is significant in the sense that it seeks to uphold the group consensus that is created in a collective mass of people bound by their own common religious practices. Secondly this shows the true role of Judiciary as guaranteeing every individuality a chance to preserve itself in the fabric of the pluralistic society.

This establishes an important case law in this case. The custom of women not being allowed to enter cannot be seen as unconstitutional , rather it has to

[16] 1961 AIR 1402, 1962 SCR (1) 383

be conceived as a right granted to the deity under the Constitution. The Temple is a place of practising the rituals that are associated with devotion and the deity. In this sense a temple is definitely bound by certain rules and codes that need to be followed. The prohibition on the entry is such a kind of rule, that needs to be followed. Its the right perspective by which the situation is to be analysed. The question that has importance in this case is of guarding the nature of Sabarimala temple from an outer intervention that essentially questions faith from the eyes of a non believer.

Article 26 of the Indian Constitution secures the right of a religious institution to manage its own affairs, and the exclusion of women entails an essential practice.

Further, according to Article 25(1) ;
*Subject to public order, morality and health and to the other provisions of this Part, all persons are equally entitled to freedom of conscience and the right freely to profess, practise and propagate religion*

So in order to respect the nature of the presiding deity, a particular rule has been brought into practice. The aspect of discrimination is nullified by the fact that women in this case are not barred as a class or as a basis of their gender. Women below 10 and above 50 are gladly accepted into the temple. The distinction is quite pin pointed at a particular age group of women . So this does not amount to any unconstitutional discrimination. It was held in the case *Sri Venkatramana Devaru v. State of Mysore and others*[17]*;*
The temple cannot completely restrict a particular class of people,but can restrict entry of a section in certain rituals.

Article 25 is subject to Part III of the Constitution but Article 26 is subjected to only three conditions –public order , morality and health.As a result of which , the fundamental rights of the religious denomination are not subjected to Articles 14 or 15 of the Constitution. Furher , the practice of not allowing women into the premises of the temple is a managerial step by the temple committiees, as it is for the sake of preservation of the nature of the deity. Faith is deeply connected with reverence and this reverence is invoked by the nature of the deity inside the temple.Now the nature of the deity calls for abstenance from women. If in this case women are allowed to enter, it will not simply breach the freedom of religion enjoyed by the sect but at the same time amount to desecrating Varnappan deity and the decorum of the Harimala Temple at the same time. If the faith is insulted, it would hit at the entire community and duisrupt the group autonomy at the same time. It would therein be unconstitutional to breach the basic religious rights of a community. The freedom to profess their religion is covered under Article 26 and this is a constitutional safeguard to preserve the faith. In the land of diversities, the constitution has a greater duty to protect minority faiths not just from majority but also from floodgates of modern thought process. Any liberal ideology or modern thought cannot breach the pillars of faith which binds devotees by the threads of devotion , With religion being a right, faith and the belief that people bestow upon faith is also a right that they are entitled to enjoy, and if

[17] (1958) SCR 895 : 1958 AIR 55

thus faith of the minority section is humiliated then it would be the duty of the court to reinstate it .

Article 25.2(b) cannot be interpreted to mean that customs and practices sacred of a place can be easily overridden. Furthermore the claim of preventing the said section of people do not amount to discrimination, nor does Article 25.2(b) apply as women as a caste or sex have not been banned. It's just the women of reproductive age, symbolic of procreation who are banned and that too because the nature of the deity calls for to do so, and that it forms a part of the custom and belief that has been followed since time immemorial and command respect and allegiance as a matter of antiquity.

# A CRITIQUE OF VICTORIAN MORALITY: A STUDY WITH REFERENCE TO GEORGE ELIOT'S LIFE AND WORKS

**Dr. Jayanta Mukherjee**
Associate Professor and Head
Department of English,
Belda College,Belda
West Bengal, India

**Abstract**

This paper is a critique of Victorian morality with reference to the life and works of George Eliot. George Eliot's primary interest in analysing a character from its moral perspective has provided her art of characterisation with a new height. She firmly believes that a human character is not cut in marble but it evolves as time passes. A chronological study of her novels reveals that almost all her major characters have not only evolved from egoism and moral blindness to strict morality and vision but they have questioned the double standards and hypocrisy of Puritan Morality of Victorian era.. In other words, the characters who are receptive to this positive growth have emerged as the leading figures in her novels.. Unlike her Victorian predecessors like Dickens and Thackeray, George Eliot's interest in analysing a character from moral and psychological perspectives has provided her art of characterisation with depth and endurance. The following chapters are devoted to discuss the literary craftsmanship and ingenuity of this great Victorian novelist.

**Key Words**:Character, Hypocrisy, Moral, Positive, Growth

## Introduction :

Born and brought up in an orthodox Christian family and influenced by her evangelist aunt Mrs. Elizabeth Evans, George Eliot used to attend churches in her youth . However, in her later years she became an intellectual lady and in course of time she lost faith in orthodox Christianity. It was only under her elite father's influence that she began to attend the church again. But eventually, she questioned the Christian concept of God, heaven and hell, and in the immortality of human soul. It was because George Eliot was a rationalist, she did not want to adhere herself to the irrational Christian concept. Instead she kept herself in touch with the development of the latest scientific, religious and philosophical thought of the age. Basil Willey, a celebrated critic, observes that there was no novelist like George Eliot who has epitomised the entire century in her novels beginning from the standpoint of `evangelical Christianity ' and ending to " religion of Humanity"

George Eliot, true to the consciousness of the century, had the instinct to tolerate the ordinary while admiring the ideal, to cling to the old while accepting the new and

retaining the core of tradition while criticising their forms. Sober conservative zeal and reforming impulse a"e the leading motive of her life; her lifelong quest was to achieve a synthesis between these two opposites, to harmonise the static and dynamic principles, tradition and enlightenment, the head and the heart. It is this tension which forms the basis of all her novels. George Eliot, before taking up novels as an expression of her creativity, immersed herself deeply in philosophical reflections; and the works which influenced her most were Charles Bray's *Philosophy of Necessity*, Spinoza's *Ethics*, and *Tractatus Theologico-politicus*, David Strauss's *Leben Jesu* and Feuerbach's *Das Wesen Des Christenthums (The Essence of Christianity).* Eventually she translated the books of David Strauss and Feue[r]bach into English for the common people. Though the works, referred to here, helped in shaping her *life* and thought, paradoxically enough, she never fully followed any of the ideas emanated from these works.

So, before Marian Evans adopted the pseudonym 'George Eliot' in 1857, she was already an experienced, and exceptionally well-read writer. She had made a modest living as an editor of the 'Westminster Review' and she was established as the companion of a married man, one of the most gifted intellectuals of the day, George Henry Lewes. After the acclaim accorded to *Adam Bede* in 1859, George Eliot, the intensely moral novelist, steadily eclipsed the immoral and Godless Miss Evans. In a sense that eclipse sprang from the very nature of her fiction.

Quite interestingly though an unconventional woman, she upheld conventions in her works. Her liaison with a married man seems scarcely to have touched the treatment of sexuality and marriage in her fiction. G.H. Lewes, the thinker, the immediate inspirer and first critic of her novels, may have been of cardinal importance to her development as a writer, but the nature of their relationship is never reflected in the norms of conduct accepted by the characters.

Even Maggie Tulliver, the heroine who springs most directly from the novelist's own roots, when steps beyond narrow moral conventions, her freedom is not celebrated, it becomes tragically awkward. This is not to argue that George Eliot rejoiced conventions in her books because she allowed fiction to represent her own unease with unconventionality, but to suggest that in seeking to establish a new basis for moral action she was first determined not to offend her readers by touching raw nerves. She became a major naturalistic novelist because she was able to present so impressive and observant a picture of ordinary, and often conventional, man and woman. She is a great moral novelist because she ought to explain and give substance to a personal morality which can function without a supernatural fiat.

Her single-minded devotion was to explore a view of life that would give modern man a sense of purpose, dignity and ethical direction. She wrote to Clifford Allbutt:

The inspiring principle which alone gives me courage to write is that of so presenting our human life as to help my readers in getting a clearer conception and a more active

admiration of those vital elements which bind men together and give a higher worthiness to their existence. (*George Eliot's Letters*, ed. by Gordon Haight,OUP,1976.Bk.IV p.472)

The 'vital elements' of which Eliot speaks here are natural and humane rather than divine. This is made perfectly clear by a letter to Mrs. Posonby in which Eliot asserts that her novels have the conclusion that " fellowship between man and man, which has been the principle of development — social and moral — is not dependent on the conception of what is not man; and that the idea of God, so far as it has been a highly spiritual influence, is the idea of a goodness entirely humane". *(George Eliot's Letters*, ed. by Gordon Haight,OUP,1976.Bk.IV p.198.)

As to George Eliot's mode of writing Leslie Stephen is of the opinion that the novelist tries to permeate her works with an ethical impulse. Two general ideas are pervasive in her view; first, stress on sympathy and secondly, an emphasis on intuition as the method of making moral judgements. She believes in the fact that men's deeds determine them as much as men determine their deeds. If we yield to temptation and sin, suffering and nemesis are sure to follow us. We have to reap the consequences of our own actions. Her characters suffer because they violate some moral codes and yield to temptation sometimes consciously and often unconsciously. Hetty Sorrel in *Adam Bede,* Maggie Tulliver in *The Mill on the Floss,* Romola in *Romola,* Lydgate and Dorothea in *Middlemarch, and* Gwendolen in *Daniel Deronda* suffer for this reason. However, it is difficult to point out George Eliot's moral views within the categories of any standard philosophical notion. She insists on the fact that there cannot be any particular law to ascertain morality. Any moral judgement must be made in the light of the complex context of any event. Mora! behaviour needs, as George Eliot thinks, a kind of impartiality, an ability to observe nobility and goodness in man and woman and to ignore their selfish desires . George Eliot does not like the dominance of self to the exclusion of the moral fibre of life. Her passionate conviction is that man's sense of immorality lies in the mode of his self-love. Unless there is a concomitant ability to excel in compassion for others, there can be no escape from the fetters of the self, however powerful the mind is.

As to George Eliot's mode of writing, Leslie Stephen is of the opinion that the novelist tries to permeate her works with an ethical impulse. Two general ideas are pervasive in her view: first, stress on sympathy and secondly, an emphasis on intuition as the method of making moral judgments. She believes in the fact that men's deeds determine them as much as men determine their deeds. If we yield to temptation and sin, suffering and nemesis are sure to follow us. We have to reap the consequences of our own action. Her characters suffer because they violate some moral codes and yield to temptation sometimes consciously and often unconsciously. Hetty Sorrel in *Adam Bede,* Maggie Tulliver in *The Mill on the Floss,* Lydgate & Dorothea in *Middlemarch* and Gwendolen in *Daniel Deronda* suffer for this reason.

Eliot's plots rely heavily on the moral struggle between altruism and egoism. *Middlemarch* plays out this ethical debate clearly. "We are all of us born in moral stupidity, taking the world as an udder to feed our supreme selves,''(Eliot, *Middlemarch* 208) says the narrator, but she also says "Dorothea had early begun to emerge from that stupidity" (Eliot, *Middlemarch* 208). Rosamond, on the other hand, "had been little used to imagining other people's states of mind except as material cut into shape by her own wishes" (Eliot, *Middlemarch* 208). She is, George Eliot writes, "Entirely occupied not exactly with Tertius Lydgate as he was in himself but with his relation to her" (Eliot, *Middlemarch* 208). But it is a struggle for even Dorothea to enter fully into Casaubon's point of view, to "conceive that he had and equivalent center of self, whence the lights and shadows must always fall with a difference" (Eliot, *Middlemarch* 208), and much of the novel depicts her progress in the capacity of sympathy and altruism.

Because ethical judgments require sympathy and compassion, in George Eliot's view only real-life situations (such as novels can depict) can teach us about ethics. Neither general rules nor rational arguments are sufficient. A letter of July 5, 1859, often-quoted, makes, the argument clear:

If art does not enlarge men's sympathies, it does nothing morally. I have had heart cutting experience that opinions are a poor cement between human souls, and only effected ardently long to produce by my writings is that those who read them should better able to imagine and to fill the pains and joys of those who differ from themselves in everything but the broad fact of being struggling erring, human creatures. (*George Eliot's Letters,* ed. by Gordon Haight,OUP,1976.Bk.IV p. 72)

"Self-interested desires'* (Eliot, *Middlemarch* 175) are something to be fought against and conquered in Eliot's novel. "I know nobody as troublesome as self' (.*Middlemarch* 502), the narrator declares in *Middlemarch.* Her novels present some characters who are unable to move out of self-absorption and others who learn painful lessons as a result of trying to struggle towards a less egocentric world view. Barbra Hardy sees the characters as part of a complex pattern within the novels. This patterning highlights themes for the reader and gives shape to the novels. "Two formal features which are most conspicuous are antithesis, or contrast, on the one hand, and correspondence, or resemblance, on the other" (Hardy, Barbara. *The Novels of George Eliot: A Study in Form*, Pg.108) As readers we are invited to see this pattern in many ways, and whereas in earlier novels the correspondence between characters may be fairly obvious and straight forward (Hetty versus Dinah in *Adam Bede),* this becomes more complex and sophisticated later. Thus in *Middlemarch* there are fruitful parallels between Dorothea and Lydgate and between Dorothea and Rosamond.

In the section of *The Mill on the Floss* entitled 'The Great Temptation', Eliot presents us with a very difficult moral dilemma. Maggie must choose between her love for Stephen Guest and her sense of duty to her cousin Lucy Deane and to her admirer Philip Wakem. Eliot creates here a compelling sense of the powerful almost overwhelming mutual

attraction between Maggie and Stephen. We are told that it is like opium and their feeling has the solemnity belonging to all deep human passion. Stephen tries to persuade Maggie that their mutual love is natural and by the discovery of it they have been saved from a mistake. He points out that a mere out-ward faithfulness to their previous lovers would be nothing but a sham. Moreover, the reader is acutely aware, that these tender scenes provide an opportunity for Maggie to taste real joy in an otherwise bleak life.

However, Maggie's own judgment is unflinchingly on the side of renunciation. Maggie tells Stephen: "Many things are difficult and dark to me; but one thing I see quite clearly-that I must not and cannot seek my own happiness by sacrificing others" (Eliot, *The Mill* 472). Once Maggie has temporarily abandoned her principled position by allowing herself to drift off with Stephen in the boat, she is severe in judgment on herself:" the irrevocable wrong that must blot her life had been committed: she had brought sorrow into the lives that were knit up with hers by trust and love" (Eliot, *The Mill* 473). She is absolutely right but she suffers acutely for her mistake afterwards.

*Daniel Deronda* provides us with the fascinating Gwendolyn Harleth. In chapter 4, the narrator, with delicately judged irony informs us: "Always she was the princess in exile, who in the time of famine was to have her breakfast-rollmade of the finest-bolted flour from the seven thin ears of wheat" (Eliot, *Daniel* 102).Gwendolen's luxurious self-absorption allows herself to glide over early difficulties with more ease than most; even by the end of the novel she still has the implicit impression which had accompanied her from childhood that whatever surrounded her was somehow specially for her. This impression is so strong that she fails to understand until the last possible moment that Daniel Deronda, the man whom she idolizes, is in fact going to marry someone else. Up to this point, Gwendolen has not really considered the lives of others except in so far as they have affected her personally; the revelation of Daniel's quite separate agenda comes as something of a shock to her.

Blind egoism gives rise to self-deception in the characters and this is removed through self-discovery. Daniel Cottom points out: "It is the presumption of self-discovery through self- sacrifice that constitutes the running argument of all of Eliot's writing" (Cottom, Daniel. *Social Figures: George Eliot, Social History and Literary Representation.* Pg.162). *Adam Bede* provides good examples of people seeing why they want to see rather than reality. Hetty sees Arthur, and Adam sees Hetty exclusively as answer to their own yearning. Thus Adam persists in attributing imaginary virtues to Hetty, he created the mind he believed in out of his own, which was" large, unselfish, tender," (Eliot, Adam, 56). despite all evidence to the contrary. His determined ability to believe in his own subjective fantasy of Hetty is illustrated particularly well by the incident in which he realizes that Hetty is the owner of a rather expensive locket which contains two locks of hair - Hetty's and some hair of a much lighter colour. He correctly fears the worst: "there was something in Hetty's life unknown to him; that while he had been rocking himself in the hope that she would come to love him, she was already loving another" ( Eliot, Adam, 173). However, Adam's mind goes on to weave for

himself an ingenious web of probabilities in this situation. He decides that because she is so found of finery she has bought it herself. He has problem with her obvious discomfort at his seeing the locket but explains this away to his complete satisfaction by her acceptance that it was wrong for her to spend her money on it, and she knew that Adam disapproved finery. This, moreover, is a proof she cared about what be liked and disliked. He decides that the locket must contain a bit of her father's or mother's hair, who had died when she was child, and she would naturally put a bit of her own along with it. He moves himself from anxious suspicion to complacent self- satisfaction in on time at all.

In her magnum opus, *Middlemarch* (1872) the novelist observes ' we are all of us born in moral stupidity, taking the World as an udder to feed our supreme selves'* (Eliot, *Middlemarch* 173) This novel, written on a vast panorama and having the scope of Tolstoy's *War and Peace,* mainly centres around the moral growth of two impractical visionaries.

Dorothea Brooke, unlike Maggie Tulliver, appears to be a bold and mature woman as she displays the ability to withstand the criticisms of her individual choice and decision. However, Dorothea's decision to accept happy conjugal life and motherhood has put a question mark on woman's intellectual abilities and her sphere of activities. Lydgate's predicament is the result of his being of man of a weak moral fibre. He decides to marry Rosamond only being attracted by her outer beauty who ultimately brings his downfall. A feminist scholar observes 'Dorothea represents a woman's desperate attempt to establish an identity for herself, to create a space for her self-expression. Her muted plea to make life good for anything is the cry of an entire generation of women seeking some form of identity. Eliot shows her entrapped in a male-dominated society desperately trying to seek opportunities to realize her latent qualities'. (Choudhury Sheila Lahiri, (2002), *The Reclining Ariadane ; A Gender Reading of George Eliot's Middlemarch, Pg 115)* Though George Eliot's last novel *Daniel Deronda* (1876), dwells on the 'Jews question', the central attraction of the novel lies in the moral upgradation of the heroine Gwendolen Harleth and the moral enlargement of the hero Daniel Deronda.

*Middlemarch* also provides many examples of self-deception and because of the way in which the narrator moves from a particular example to generalization; we are all invited to see ourselves as part of the fellowship of illusion. Eliot refers to the few imaginative weeks called courtship in this novel and this is a recurrent idea in her writing. Gwendolen, in *Daniel Deronda* is walking amid delusion on her wedding day and Maggie feels that she and Stephen are enveloped in an enchanted world whilst they are on the river in the *Mill on the Floss.* Despite the fact that her sister Celia points out to Dorothea her error with regard to Sir James Chettam and says: "you always see what nobody else sees; it is impossible to satisfy you; yet you never see what is quite plain" (Eliot, *Middlemarch* 208), Dorothea goes on to perceive Casaubon, too, in her own self-created image. Thus when she looks into his mind, she sees there a vague labyrinthine extension which she herself had created. Lydgate does exactly the same. Despite his experience with Laure, Lydgate repeats his previous error and constructs

Rosamond as he wants her to be rather than what she is. His suppositions are entirely rose-tinted; something which is betrayed by the language used when he saw Rosamond as a creature who would bring him the sweet furtherance of satisfaction and beautiful life. Lydgate extends his optimism to encompass the behavior of his future father-in-law, whom he imagines will provide useful sum in the form of a dowry, to make payment easy. Eliot tells us in this novel that we are all bom in moral stupidity. Both Dorothea and Lydgate emerge from that stupidity when they take responsibility for their partner, not as an idealized object, but as a being with their own center of self. This involves both in suffering and a voyage of self-discovery, which runs alongside the discoveries that they make about others.

However, it is difficult to point out George Eliot's moral views within the categories of any standard philosophical notion. She insists on the fact that there cannot be any particular law to as certain morality. Any moral judgment must be made in the light of the complex context of any event. Moral behavior needs, as George Eliot thinks, a kind of impartiality, an ability to observe goodness of others against selfish desires of some people. George Eliot does not like the dominance of self to the exclusion of the moral fiber of life. Her passionate conviction is that man's sense of immorality lies in the mode of his self-love. Unless there is a concomitant ability to excel in compassion for others, there can be no escape from the fetters of the self, however powerful the mind is. Unlike her Victorian predecessors like Dickens and Thackeray, George Eliot's interest in analyzing a character from moral perspectives has provided her art of characterization with depth and endurance.

Though the world has undergone a considerable progress and has become sensitive and liberal, true to admit, the puritan 'moral code' practised in Victorian era has not changed lock, stock and barrel. What was condemned in Eliot's time would be criticised in these days as well. The act of Maggie's elopment, Hetty's illicit sex, Rosamond's extra-marital affairs, Romola's unilateral decision to break the wedlock or Gwendolen's loyalty towards Deronda would be questioned in present society as well. So an act of morality or immorality has a universal dimension.Herein lies the relevance and acceptability of George Eliot's novels.

**Abstract**

Signs of 'deterritorialization' could be discerned from the Central government's notification, titled the Prevention of Cruelty to Animals Rules, 2017, stipulating that those who wish to sell cattle, may do so only after formally stating that the animals are not "brought to the market for sale, for slaughter," thus, effectively, prohibiting the sale of cow and buffaloes for slaughter. This move is perceived to be an indirect ban on consumption of beef as part of their diet, by a substantial segment of the society. Pertinently, this 'signifier' appears to be 'atmospherizing' the politico-religious ideology of 'Hindutva', that runs counter to the 'secular' fabric of the country. A series of violent incidents that spiralled out as an offshoot of the imposition of the cattle-ban in many states, signify the process of deterritorialization that seems to have been triggered through an attempt to control what one should consume as food. The absence of pluralism and polyvocality after the coming to power of the present ruling Government, since 2014 in India, and cow slaughter-ban, in particular, is deliberated upon.

**Introduction**

After the World War II, with the emergence of new ideas, theories, material practices and novel technologies facilitating the speed and intensity with which the ideas and practices permeated the national imaginary, across national boundaries promoting the sense of 'the global' undermining the deeply engrained notions of community tied to a sovereign and demarcated territory containing relatively homogenous populations (Appadurai, 2006; Albrow, 1997; Beck, 2005). The ideologies dominating the world today are no longer exclusively articulations of the national imaginary but reconfigured ideational systems that constitute early-stage translations of the dawning global imaginary (Steger, 2009). In the wake of globalisation in the 1990s, the world was expected to move towards the global imaginary surpassing the national imaginary. Deterritorialization, considered a central feature of globalization, implies the growing presence of social forms of contact and involvement which go beyond the limits of a specific territory (Giddens 1990), taking us closer to the external generating closeness in distance and a relative distancing from what is close (I Marti, 2006). "Deterritorialization, whether of Hindus, Sikhs, Palestinians or Ukranians, is now at the core of a variety of global fundamentalisms, including Islamic and Hindu fundamentalism. …the problems of cultural reproduction for Hindus abroad has become tied to the politics of Hindu fundamentalism at home". (Appadurai and Breckenridge, as cited in the book The Social Theory, continuity and confrontation, Garner, Hancock, 2014).

Talking about fundamentalism in India, there are a lot of incidents happening around, especially the ones that are affecting the day to day lives of people. Coercive behaviours, with the power of politics and dominant social ideology, people in a democratic country have been dictated to change their long-standing practices in an undemocratic way, in the name of morality. Religionists and humans more generally have the cognitive tendency of anthropomorphism, overgeneralization, essentialism … binary thinking, hierarchical thinking, linear-causal thinking, and tendency to divide the social or intellectual world into communities of good/right us and bad/wrong them. The most significant cognitive tendency being confirmation bias, where we notice and remember what confirms our established beliefs and to overlook or forget what contradicts them. (De Cruz & De Smedt 2007, Smith, 2010). One such sites of suppression that has been felt recently is the control over food culture. Food is an important aspect of culture and every food culture we have now, has a deep rooted history/reason for being the way it is. Our very existence is determined by 'what we eat and how we eat'.

The Central government's notification in 2017, titled the Prevention of Cruelty to Animals Rules, stipulates that those who wish to sell cattle like bulls, cows, buffaloes and camels, may do so only after formally stating that the animals are not "brought to the market for slaughter". This effectively, prohibits the sale of cow and buffaloes for slaughter. This move is perceived to be an indirect ban on consumption of beef as part of their diet by a substantial segment of the society. Pertinently, this 'signifier' appears to be 'atmospherizing' the politico-religious ideology of 'Hindutva', that runs counter to the 'secular' fabric of the country. A series of violent incidents that spiralled out as an offshoot of the imposition of the cattle-ban in many states, signify the process of deterritorialization that seems to have been triggered through an attempt to control what one should consume as food. There is an attempt to deterritorialize the beef consuming sections of the society, thus laying the foundation to an ultimate exclusion. The arbitrariness with which the notification was issued, has given power to many fundamentalists to take law into their own hands to enforce the ban, adding to the deleterious impact of the rule. A section of the society appears to have been emboldened by the legal backing given to what was, hitherto, a part of the non-justiciable Directive Principles of State Policy. As a result, there have been mob-violence, cow-vigilantism and murderous lynchings, all in the name of cow-protection. The line of flight, the resistance of the system, reterritorialization, in places like Hyderabad and Kerala, is assigned a negative value and condemned in the name of sacredness and prevention of cruelty to animals.

Beginning with a detailed preface to the historical information on beef consumption in Indian food culture, the study aims to throw light on communities consuming beef as their main source of protein, then and now, and the circumstances that led to the promotion of vegetarianism and 'sacredness' of the cow. It also examines the right of every community to enjoy freedom of choice of food under the Constitution of India, which may find negation in the implementation of beef-ban.

**History of Beef eating, Beef ban and right to food**

Hindu and sanskritic elements are emphasized as the contribution of India to the world History. And, the presence and role of other religious and linguistic cultures, such

as Buddhism, Jainism or even Islam, as it evolved in India, in the construction Indian civilization is generally not recognized. (Thapar, Romila, 2004). The eating of beef has always been in the civilization that emerged in this part of the world. And beef eating was reserved for specific occasions, such as rituals or when welcoming a guest or a person of high status. The economic value of the cow enhanced its veneration. This may have contributed to the later attitude of regarding the cow as sacred and inviolable. Eventually, it became a matter of status to refrain from eating beef and the prohibition was strengthened by various religious sanctions (Thapar, Romila, 2004).

In 1955, Congress had banned cow slaughter in 24 states across the country. By June 2017, 18 Indian states had banned the slaughter of cattle. "The main attempt to sanctify cow in the name of Hindutva is to disenfranchise Muslims. Other than the beef-eating Muslims and Christians, the lower caste Hindus are also the target of Hindutva's hate brigade. Attacks of this has been going on since Hindutva began in 1923. In 2002, five lower-caste Hindus were lynched in a north Indian town, for skinning a cow". (Doniger, wendy, 2017). According to the father of the Indian constitution, BR Ambedkar, the principle of untouchability initially emerged as a practice to ban the consumption of eating beef and the Brahmans found it convenient to say that those who ate beef were untouchables, rendering Islam and Christianity alien and communal by Hindu fundamentalists.

"The right to food", according to the UN special rapporteur (2001), "is the right to have regular, permanent and unobstructed access to quantitatively and qualitatively adequate and sufficient food corresponding to the cultural traditions of the people to which the consumer belongs, and which ensures a physical and mental, individual and collective, fulfilling and dignified life free from anxiety". Article 21 of the Indian Constitution states that Right to life is not mere existence like an animal, but the right to live with dignity. Adding to this, the preamble to the Indian constitution states that "we, the people of India, having solemnly resolved to constitute India into a sovereign socialist, *secular*, democratic republic and to secure to all its citizens.

Currently 72 communities in Kerala prefer beef to the expensive mutton. Not all of them come under the socio-cultural construct of 'untouchables'. And, it is a myth that Muslim rulers introduced beef eating in India. The number of Indians eating beef and buffalo meat went up from 7.51 crore in 1999-2000 to 8.35 crore in 2011-12, according to the National Sample Survey Office (NSSO).

**Hypothesis**

The Central government's notification in 2017, titled the Prevention of Cruelty to Animals Rules has triggered lynching of the beef eating sections of the society.

**Methodology**

A triangulation study of the incidents of violence in Haryana and Uttar Pradesh (UP), before and after the announcement of cow slaughter ban, has been attempted, through the analysis of media reports published from time to time.

A quantitative analysis of the number of news reports on mob lynching and violence in the most read English daily 'Hindustan Times' in UP, Lucknow edition and Dainik Jagran is done.

News reports of the most read English daily 'Hindustan Times' in Haryana, Chandigarh edition and Dainik Bhaskar were also surveyed for the study.

The Key words used for the search in the Newspaper archives are Beef ban, cow slaughter, cow slaughter ban, cow vigilante, Gau Rakshak, cattle thieves, cattle trader, cattle smuggler.

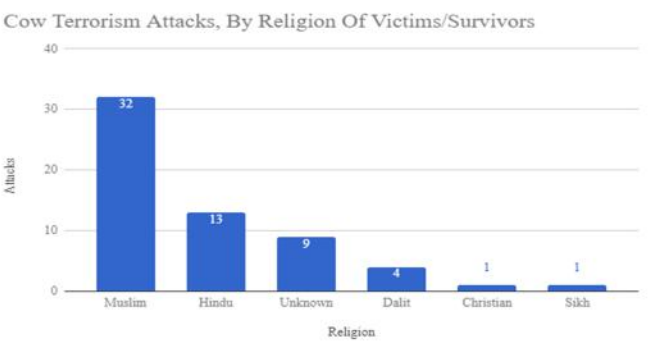
The nature of the titles of the news stories related to cow protection and mob lynching were also analysed.

**Area of Focus**

In 2015, Uttar Pradesh, a Muslim man Akhlaq was lynched, when suspected of storing "beef" at his home. This state has the highest number of Muslims eating buffalo meat, 1.73 crore, followed by West Bengal, 1.5 crore and Assam, 57 lakh. In terms of percentage, the Muslim beef/buffalo eating population is highest in Meghalaya (94 per cent) followed by Lakshadweep, 78 per cent and Sikkim, 72 per cent. U.P. and Maharashtra have this figure around 47 per cent.

Uttar Pradesh and Haryana are among the few states that has witnessed more number of mob lynching in the country. Therefore, the reported cases of mob lynching in the name of cow, in these two states are chosen for the study.

**Data Collection**



**Secondary Data**

The secondary data forms the basic understanding for the hypothesis formulation for this study. Between 2010 and December 2017, 3% of the total attacks related to cow vigilantism happened between 2010 and 2014.

| | 2010 to 2014 | Jun 2014 to Dec 2017 |
|---|---|---|
| Attack related to cow vigilantism | 3 % | 97% |
| Murders | -Nil- | 28 |

*Courtesy: (IndiaSpend, a data journalism initiative)*

In 24 attacks, as per media reports, the attackers were mobs or groups of people belonging to Hindu groups, such as the Vishwa Hindu Parishad, Bajrang Dal and local Gau Rakshak Samitis. Between 2010 and 2017, Muslims were the target in 51% of the violence.

There were 28 murders in 63 incidents, of which 86% of the people murdered were Muslims.

| | |
|---|---|
| No. of incidents | 19 |
| Total no. of people killed | 28 |
| Muslims murdered | 86% |
| Hindus murdered | 14% |

Cow Vigilante activities were reported from 19 Indian states. Uttar Pradesh and Haryana lead the list. One incident was reported from the North-East (Assam).

**Findings and Discussions**

Arrests, violence and murders reported in Hindustan Times, Chandigarh edition and Lucknow edition, UP.

| Year | Arrests | Violence | Murder | News Items |
|---|---|---|---|---|
| 2011 - 14 | 40 | 12 | 1 | 67 |
| 2014 – 17 | 92 | 92 | 9 | 127 |

**2011 – 14: Murders: 1**
Muslims – Nil-
Others - Nil-
Cow Vigilante - 1

**2014 – 17: Murders: 9**
Muslims murdered - 7
Others - 2
Cow Vigilante - Nil

**News Items include:**

- Banning of Beef and pork festival in JNU
- Muslim Men arrested for killing Cow Volunteer
- A senior judge said the "cow should be declared a national animal and people who slaughter cows should be sentenced to life in prison".
- "Condemn the brutal mob-attack on the woman, who exposed illegal cow slaughter. This violent attack today in Bengaluru is another proof law & order breakdown under @cmofkarnataka Sh. @Siddaramaiah," he tweeted.
- 'Will break hands and legs of those who disrespect, kill cows': BJP MLA
- Noose for cow killers, vows Chhattisgarh CM
- Stray cattle menace, ill maintained cow shelters and cattle on road leading to fatal accidents.
- Dadri lynching accused dies in jail, villagers drape coffin in tricolour, refuse to cremate body.

**Conclusion**

The number of news items and the violence related to Cow protection has increased many folds in the period between 2014 and 2017. The media reports show a clear difference in the kind of news that appeared on media, before and after attempts

made by the ruling parties of those states, to protect cows. The open remarks instigating violence in the name of cow, in communally sensitive areas has increased and could also have led to the communal imbalance in those states. The Muslims and Dalits were the most affected sections, in the cow vigilante acts. This situation definitely is an attempt to deterritorialize the population that consumes beef and is involved in businesses dealing with Cow.

## Abstract

The main idea of this is to give the proper description of Human Resource Enablement (HRE) inside of a organization's culture as a contemporary evolving trend in Human Resource Management. Employee enablement gives employees the ability to continue performing high-level job functions, while employee engagement ensures your team is dedicated to the company vision and overall goals. When Organization move beyond Employee Engagement to Employee Enablement, it empower employees with training, development and the skills & competencies to make smart decisions. This paper tries to conceptualize the employee enablement & recognize the strategies and benefits in scaling organization.

**Keywords:** Human Resource Enablement, Human Resource Management, Employee Enablement, Employee Engagement, training, development.

## Introduction

Employee Enablement refers to the process that involves taking the employees in an organization above the existing stage. They are hence empowered in advanced manner beyond the current engagement stage. During the empowered procedures, the employees are therefore provided with the right operation tools as well as appealing circumstances (Hewitt, 2012). The provision of this conducive environment translates to the delivery of quality output. In every business enterprise, it is critically ideal for every employee to enhance productivity. Therefore, the management is at the verge of higher expectations in terms of not only productivity but also good performance.

While executing their duties, the employees tend to be careful and considerate and work hard to avoid any form of inconvenience. Execution of duties and responsibilities becomes a very significant consideration in any company. The human resource department, therefor, needs to undoubtedly equip itself with the necessary etiquettes which tend to be passed to the employees. Nevertheless, several prerequisites are connected to employee enablement (Mazzei, 2014). Not only engagement but also

empowerment becomes vital aspects of strengthening employee enablement. Without the conjunction of these two factors, the employees in any organization tend to deliver very poor quality results. Employee survey ensures that managing body enables the employee to portray the required characteristics and qualities.

Proper survey over the behaviors of employees calls for a well-managed business enterprise. Under this dimension, Employee enablement relates to giving the right duties to employees to make them perform to their best. Creating and issuing them with a supportive working environment enhances the productivity. The right tools, equipment, funds, training as well as a unity from coworkers create a strong bond in the working environment. Some of the barriers that can hinder proper working should be eliminated. Red tape, as well as procedure restrictions can adversely affect the normal functioning of the business.

Skills are very important for every employee. It is very hard to compare the performance of an enterprise with skilled labor and without. A very significant variation exists between the two there by defining the importance of skills to employees. Skills are always acquired through careful training. For the effectiveness of any training, it is always good for the employees to be equipped with oncoming skills as the occupation demand. Some skills are outdated and they may be little help because of the advancing technology. The human resource department is also mandated to provide enough tools to enable continuous working conditions.

**Review of Literature**

This part of the research gives the relevant literature related to employee enablement. It, therefore, gives a discussion of the above mentioned objectives. Employee Enablement has got many issues concerned with it which are strongly supported by various literatures. Strategies that enhance employee enablement tend to be highly considered. Employee enablement also harbors numerous benefits as well as some connected ideas. This portion, therefor, discusses the relevant literature based on the study objectives.

According to several types of research, inferences have been reached at that many organizations have numerous workers with low results provided. This is because the firms lack the necessary tools and equipment which conform to the type of service. Proper information to the employees also ensures that they perform the intended tasks to the maximum. Good information enables the employees to have authority as well as the capability to make clear decisions (Vergara,2017). Employees enablement formulas enable the workers to give out a good performance. The first formula, therefore, calls for higher performance which accrues from enablement plus engagement (Enablement Engagement= High Performance).

Employee engagement, therefore, enables the employees to be committed so that they can effectively achieve the set objectives as well as the goals. On the other hand, enablement enables the employees to perform the duties of the company perfectly. This means that engagement is concerned with commitment while enablement deals with the ability to perform. The well-known mistake done by many organizations is that they tend to place more concern on engagement than enablement. This is very risky as the two aspects are equally important and they greatly influence the performance. The

results are always severe frustrations to the employees. These employees are always committed to deliver, but they are hindered due to lack of enablement.
When these challenges arise, most of the employees tend to seek for enablement as an effort to solve the challenge. In the case of enablement failure, they may equalize the level of engagement to the enablement level so tht they can work on an equal basis (Larso,2015).
Additionally, some of them may decide to abandon the organization and migrate to where they can be properly be enabled. The second formula of employee enablement tends to incorporate the aspect of empowerment whereby

**Empowerment** + **Engagement** + **Enablement** = **High Performance**

In this case, empowerment provides employees with the autonomy of decision making during the undertaking of their duties. This means that employees can come to decisions on lower level which helps in easier solving of problems as well as affecting their performances. Additionally, every employee can be accountable for anything which can accrue from the decisions made. The results of empowerment are higher productivity by the employees and inherent services to customers. The employees are also willing to change with time as technology and management changes.

**Objectives of the Study**

1. To study the conceptual framework of Employee Enablement
2. To determine the strategies that lead to successful employee enablement
3. To determine various benefits associated with employee enablement
4. To identify the ideas involved in employee enablement

**Methodology**

Generally, literature review summarizes research spread over a specific timeline about a particular topic and identifies main themes and issues. Moreover, it gives you new insights from the existing literature which has not been revealed earlier. Carrying this thought forward our review gives the developments and trends in the area of employee enablement which will help organizations to improve their employees' productivity and motivation. Finally, future research directions are given at the last for potential researchers.

**Data Collection**

Our study has taken only academic journal articles to review. Firstly, we searched the following databases with these keywords employee enablement, employee engagement, human resource management,training and development.

1. JSTOR
2. Management & Organization Studies: A SAGE Full Text Collection
3. PsycINFO
4. Science Direct
5. Scopus

We selected all the papers containing any of the above mentioned keywords in the

entire text. This gave us a total of 50 papers out of which we selected papers belonging to timeline and further filtered them by reading their titles, abstracts and keywords which reduced our number of papers to 27. For reassuring that papers are relevant for our review we read and analysed the introduction section of them and finally we get 18 papers.

## DISCUSSION

### Strategies for Successful Employee Enablement:

Not only Permana but also Larso (2015) stated that the Creation of a transparent culture in the organization is very important aspect. This strategy enables the business to manage and enhance employee enablement. Transparency is an ideal contributor to the decisions made by the employees. This means that the company is quite aware of the kind of employees they have. On the other hand, employees are clearly keen and aware of their roles. The employees also understand the reason as to why they perform various tasks. Therefore, transparency leads to provision of context which drives every employee to give out efficient outcomes. The context also makes them be more focussed as it gives a proper picture of the organization's motives.

Activities such as assisting employees to understand the business initiatives enhance transparency. Additionally, understanding the company goals and performance data enhances equality and employees become objective oriented (A kanno, 2015). They feel honored by the management, and they make sure they perform their tasks to the maximum. Respectable feedback mechanisms can also lead to a good performance by the employees. Efficient self-corrections aid in enhancing the transparency culture of the business organization. Therefore, transparency is a very critical strategy in the company.

According to Radda (2015), listening culture also defines a very important strategy that enhances employee enablement. Most of the companies geared towards effecting employee enablement tend to build a listening culture. The human resource department identifies whatever every employee needs so that they can improve and perform their tasks to their level best. This calls for every employee to have his or her ear rooted to the ground. They hence take note on every issue highlighted by the management and address it using the right actions. The company, therefore, creates forums where employees can comfortably voice their concerns and opinions regarding the company's desires. This boosts engagement and employees feel not only empowered but also trusted.

Providing immediate learning avenues is also another vital aspect. Currently, many fast paced working places calls for employee's enablement. The world is highly advancing in terms of technology. Therefore, flexibility in a workplace is becoming very important. This, therefore, demands the organizations to enhance business mobility for the betterment of not only the customers but also the company itself. Employees should, therefore, be equipped with the right information so that thay can give it to the customers as required by the management (Permana,2015). In case the companies need to affect employees enablement, immediate learning should be given consideration. Therefore, the firm will have to leverage mobility power.

Considering not only the learning but also development directives portrays an important aspect. Most of the forward thinking companies have advanced in this formality. Nevertheless, in case the management requires to assemble and have a good breed of employees, initiatives must be given the necessary target. They need to be hyper-personalized so that the right employees can be cultivated. The focus hence translates to continuous learning and curative adoptions. These two aspects are in line with the requirements of the employees. A quite comprehensive as well as streamlined dissemination of knowledge plays a significant role. Disbursement of training items leads to acceptable retention of knowledge.

Analysis of enablement measures is also an important strategy. According to recent studies, most of the firms tend to be updated to the current affairs. They, therefore, access their initiatives which are synched to development. Regardless of the location that the employees might be, the management ensures that information reaches them at the right time. Collaboration is also vital and shapes the knowledge economy. Currently, it is apparent to come across proactive learning platforms which are aimed at getting rid of performance barriers. This guarantees the organization of the better placement of people whi can have an ideal succession. This, therefore, calls for proper diagnostics which are in line with mind context.

Typically, several such activities always go beyond the existing subject that is meant for motivation. This, therefore, takes into account the overall achievement parameters as well as those factors which cause the influence. The creation of a conducive environment calls for assurance to the employees that the right skills will be passed to them. This will definitely translate into proper responsibilities (Vergara,2017). Not only training but also development initiatives cannot be seen as a single time event. It is hardly an event where most employees attend in the circumstances where they are onboarding or swiping duties. In the current era of employee enablement, it is very ideal to place training on the first bench. Training should, therefore, be a continuous process because companies goals are rapidly evolving.

It is therefore very important to ensure that employees' skills are up to the present. The skills should, therefore, be tuned with not only the advancement but also the changing working demands. Assisting every employee to obtain business clarity on the struggles present make them strong and bound. Additionally, some of the recognition programs aids in the creation of enabling employees who are bound to succeed.

**Benefits of Employee Enablement**

It is very critical for any business organization to uphold employee enablement. It is always the wish of every firm to make huge profits margins at every end of the financial year. For this to happen, it, therefore means that every aspect of the business must be looked at in a special way (Luan, 2014). It all starts with the machinery or rather the tools that enhance maximum production. For the employees to perform well, this calls for their enablement through decent working tools alongside the apprehend skills. The human resource department has to understand the importance of employee enablement in that company.

Employee Enablement, therefore, ensures that employees are always on the right track.

This enables the company to get maximum benefits and therefore competing fully with the outside market. In most circumstances, employees tend to contribute more to the business rather than their advantage. This means that they can act as real brand advocates for the firms as well as boosting the productivity (Taylor, 2014). Once the company engages its employees, it, therefore, calls for the management to find means of committing them to the tasks. The company, therefore, tends to understand the nature of every employee and creates a personal profile for each one of them.

Employee Enablement ensures that employees understand even the internal affairs of the business. It is not only about the goals and targets to be met. They are even involved in decision making forums where they can contribute not only in the running but also the management of the company. The guidance, as well as the empowerment, is given to them learn and develop additional skills that highly boosts the firm. In the end, what matters is the output generated and the picture portrayed to the outside world. The company hardly tends to lower the standards of employees. They train them on the basis that they can be managers of business in the years to come. Therefore, enablement transforms employees to be superior in every chapter of business.

The technology is evolving and advancing at a very high magnitude. Machines and modern working tools have become obvious in many organizations. This, therefore, enables the employees to interact with these tools which even advances their know how. It is not ideal for specific personnel to operate the new machines. It calls for the training of everyone which promotes job swiping. Revenue is the prime factor in any organization. Therefore, managers do not hesitate to equip their employee's with all kinds of skills. Employee enablement therefore largely contributes to the firm's revenue thereby making the company grow on a large scale basis.

The overall turnover is very vital in the business organization. Therefore, many companies need employees equipped with modern skills. Without enablement, you can be very certain that the company can face challenge in terms of final revenue (Thompson, 2002). Employee enablement, therefore, allows the companies to record an efficient number of costs synched to the overall turnover. It also allows the company to maintain a good system involved with the records of company expenditure. Performance by the employees always makes the company expenditure. Performance by the employees always makes the company be proud of its laborers. Their enablement makes them perform to their level best without necessarily being supervised.

**Ideas Involved in Employee Enablement**

According to Singh (2015), it is very ideal to provide more than occupation to the employees. In the present days, it is very easier to lose high skilled employees in the company. This accelerated by the fact that they know of similar companies with modern and better management. This, therefore, calls for the firms to have ideas on how to maintain their trusted employees. The leaders are always requested to treat their juniors with respect because the foundation of the company is founded on these employees. It becomes a challenge for the employees to work at their best if the job itself is not enabling. The management bodies need to get various ideas that make not only the skills but also the abilities of employee utilized.

Conducting surveys in all business aspects is very important. Most of the developed countries have comprehensive management of employees, and this can be passed on to other less developed nations. Borrowing ideas as well as creating exchange programs are some of the terminologies that can assist companies to learn from one another (Berger, 2014). A company can have some terminologies which are absent from another company. Through exchanges, they can adopt each other's strategies thereby establishing a permanent partnerhip. It is not always about competition but rather the ideas that can be gotten from various organizations.

It is also ideal for the human resource department to establish a vivid vision that is applicable in the future. This means that the management should aim at making the employee understand even the internal forces of the comapany. The more frequently any leader communicates the affairs of the firms to his juniors, the more trust he gains. This means that the employee will be ready to contribute to the vision of the company. The human resource managers, therefore, need to deploy some e-learning modules which can pass the ideas to the long waiting employees.

The management should also put acros more information on the output rather than the inputs incorporated. This means that the company should not always focus on the period worked. The success of every business should hence be measured on the basis of outcomes rather than the inputs. The employees can work for any hours as long as it is in line with the agreement made. They can agree on some conditions such as overtime charges and these standards always maintain their relationship with the management (Schepers,2016). However, the output measurement approach shifts all the roles to the employees. This is because they get empowered to work in a manner which fits their requirements.

Another idea that has been circulating in the business world is about the need to hire proactive employees. Employees who are lively and willing to perform always changes the appearances of the company. The proactive nature can be identified during job iterviews because the interviewer can grasp some unique personalities (Rai, 2012). Attitude is also vital, and it determines how an employee perceives the duties and roles assigned to him or her. Any impression be it negative or appealing determines the kind of employee that you higher in your company. Leaders should also watch and follow whatever they promise to the employees. Studies reveal that most actions by the senior staffs have an impact on the employees. Therefore, they should always be positive.

## CONCLUSION

Employment formalities have diversified due to various complex backgrounds in the world of business. Globalization has greatly fueled the fierce competitions existing in current markets. There has been an advancing industry structure that calls for advancement in the ways tht companies are undertaking their daily tasks. For them to compete in fierce market, they need to employ strategies that ensure their continuity. Adoption of more flexible business strategies can boost the productivity of each company. However, employee enablement is a vital aspect that will make every plan to be successful. It is therefore advisable for the firms to equip their employees with skills which are alligned to advancing technology. All of these considerations will see the company being able to withstand the competition in the market while getting higher

revenues.

## ABSTRACT:

The risk has been and will remain one of the main problems of any pharmaceutical company during its activity, whether it is a financial activity, a production activity, a management activity or else. The risk is a matter which should not be neglected. Root cause analysis is a structured team process that assists in identifying underlying factors or causes of an adverse event. The Fishbone Diagram is a tool that helps identify, sort and display possible causes of a specific problem or quality characteristic. So this Cause and Effect Diagram referred to as the "Ishikawa diagram," and the "fishbone diagram," because the complete diagram resembles a fish skeleton. The diagram illustrates the main causes and sub causes leading to an effect. It is a more structured approach than some other tools available for brainstorming causes of a problem
(e.g., the Five Whys tool).

**Keywords:**Risk, Fishbone Diagram, Root Cause Analysis

## INTRODUCTION:

The Ishikawa diagram or Fishbone diagram is a graphic representation, which helps the processing and organization of ideas and conclusions to be formulated in case of problems and the identification of their causes, and it may be used in any type of activity.[1]This diagram also represents a tool that helps logical and systematic processing of the causes and sub causes of certain problems or of certain effects that related to a particular activity, regardless of its type.[2]Fishbone diagrams is also known as Ishikawa diagram, herringbone diagram, cause-and-effect diagram or Fishikawa. [3]

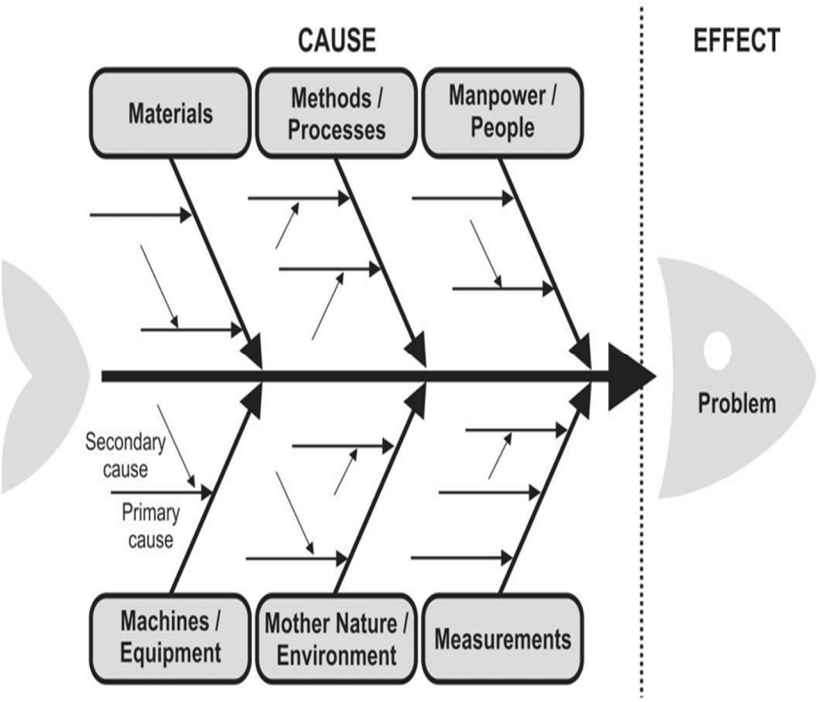
History of Fishbone diagram- Ishikawa diagrams were proposed by Kaoru Ishikawa in the 1960s,who pioneered quality management processes in the Kawasaki shipyards and in the process became one of the founding fathers of modern management. It was first used in the 1960s,and is considered one of the seven basic tools of quality management, along with the histogram, Paretochart, check sheet, control chart, flowchart and scatter diagram. It is known as a fishbone diagram because of its shape is similar to side view of a fish skeleton.[4]

Brassard and Ritter (1994, 23) assert that the CED "enables a team to focus on the content of the problem, not on the history of the problem or differing personal interests of team members." Andersen and Fagerhaug (2000, 14) write that the CED is "an easily applied tool used to analyze possible causes to a problem," while Wilson, Dell, and Anderson (1993, 195) call it a "highly visual technique which aids the process of defining the elements of a problem or event and determining how itprobably occurred."[5]

Causes are usually grouped into major categories to identify these sources of variation. The categories typically include:[6],[7]

Manpower/People: Anyone involved with the process
Methods/Processes: How the process is performed and the specific requirements for doing it, such as policies, procedures, rules, regulations and laws
Machines/Equipment: Any equipment, computers, tools, etc. required to accomplish the job
Materials: Raw materials, parts, pens, paper, etc. used to produce the final product
Measurements: Data generated from the process that are used to evaluate its quality
Mother Nature/Environment: The conditions, such as location, time, temperature, and culture in which the process operates[5]

**MATERIALS AND METHODS:**



In justifying the theoretical basis of this article I started from the theoretical presentation of the fishbone diagram, a presentation that is meant to indicate its meaning and its role in the management of a company.[8] In economic theory and practice there is a wealth of possibilities to address and analyze this theme, so my approach and analysis module complements and develops current and past studies that have addressed this subject.[9]
The materials used consist of a set of specialized works published in different books, various articles and online sources.[10]The methodology used in this article demonstrates its own vision in terms of describing the scientific approach and it is based in particular on a qualitative research that will help understand the topic approached and highlight the main issues addressed.[10]The basis of this article is a fundamental research - the activity developed mainly in order to acquire new knowledge about phenomena and processes, in formulating and verifying hypotheses, conceptual models and theories.[11]

**DESCRIPTION:**

**Appearance**

A generic Ishikawa diagrams have a box at the right hand side, where the effect to be examined is written. [12]The main body of the diagram is a horizontal line from which stem the general causes, represented as "bones". These are drawn towards the left-hand side of the paper and are each labeled with the causes to be investigated often brainstormed beforehand.[13]
These can be found using the 5 Whys technique. When the most probable causes have been identified, they are written in the box along with the original effect.[14]The more populated bones generally outline more influential factors, with the opposite applying to bones with "fewer branches". Further analysis of the diagram can be achieved with a

paretochart. [15]The fishbone concept can also be documented and analyzed through depiction in a matrix format.[16]

**COMMON CATEGORIES IN FISHBONE DIAGRAM**[17]

| **The M's** (Manufacturing industry) | **The P's** (In Marketing industry) | **The S's** (In Service Industry) |
|---|---|---|
| Machine(Equipment) | Plant /Place | Surroundings |
| Method(Process) | Promotion | Supplies |
| Man Power(People) | People | Systems |
| Material | Positioning Skills | |
| Mother Nature(Environment) | Procedures Safety | |
| Management (Policies) | Price | |
| Measurement(Inspection) | Product | |
| Maintenance | | |
| Marketing(Promotion) | | |

**GENERAL PROCEDURE**

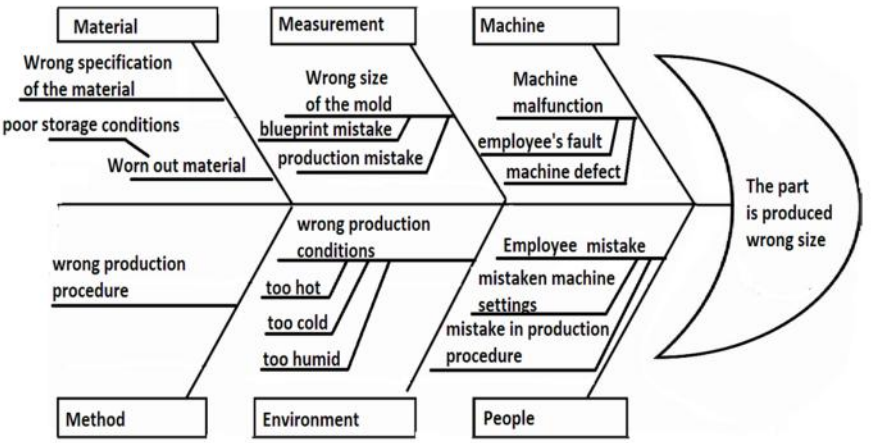
The cause-effect chart (the Fishbone Diagram) is a method for the analysis of complex problems that present several interrelated causes.

One of the key aspects of this technique is the use of cause-effect chart. Because of the way it looks, this diagram technique is also called Fishbone Diagram (or Ishikawa Diagram). [18]

The method uses a combination of visual representation (branches) and brainstorming techniques for obtaining the causes. For building a fishbone chart we use arrows or branches: [19]

- Primary branch: represents the effect;
- Major branch: corresponds to the major cause;
- Minor branch: corresponds to the causative and more detailed factors.

**STEPS:**



The steps in building a Fishbone diagram: [20]

I. The identification of the problem.
II. The description of the problem on the right side of the chart. This may be the problem itself or a symptom, but at this stage no one can know for sure.
III. We draw a horizontal line directed towards the box describing the problem. This arrow will serve as backbone. This is the starting point in identifying and grouping the major and minor causes.
IV. We identify potential causes are we group them into categories. The major categories are: people, processes, materials, equipment, environment, etc. The main categories are identified by means of the brainstorming technique, trying to list them all. During the graphic representation on the diagram we must take care to save enough space between categories in order to later add individual causes. Each of these major categories will be explored in detail.
V. We continue the brainstorming activity on the causes by means of the detailed analysis for each main category identified. We write the detailed cause on a slanting line connected to the main category.

- Basically, the Fishbone technique is a very successful technique in that it does not involve the use of statistical methods, the visual representation is simple, human-readable, it values a series of elements and causes that characterize a particular situation, it helps to identify some possible causes of variation and allows for the determination of the fundamental cause, it encourages the participation of the members of the group to problem solving, and last but not least it represents an easy and simple technique to find solutions for improvement.[21]
- Analyzing the stages of the Fishbone diagram we draw the conclusion that it can be easily applied to general issues that can arise in all branches of an organization. For example, it can be applied to solving problems such as the decrease of profit, the decrease of market shares, the loss of suppliers, the loss of contracts, etc.[22]
- The categories involved within a Fishbone diagram are: people involved in the process; methods of written policies, procedures, laws, rules applied throughout the

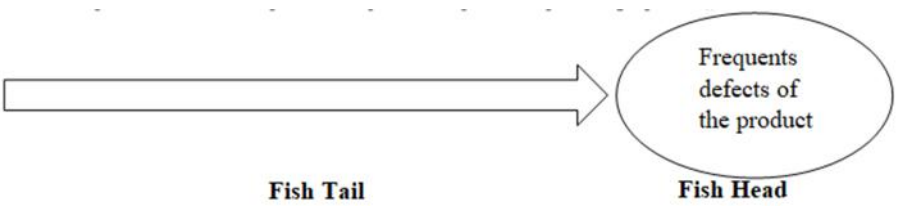
process; cars represented by equipment, computers; consumable materials; measuring data quality; the internal and external environment. [23]

**Example of Fishbone Diagram**[24]

**ADVANTAGES**[25]

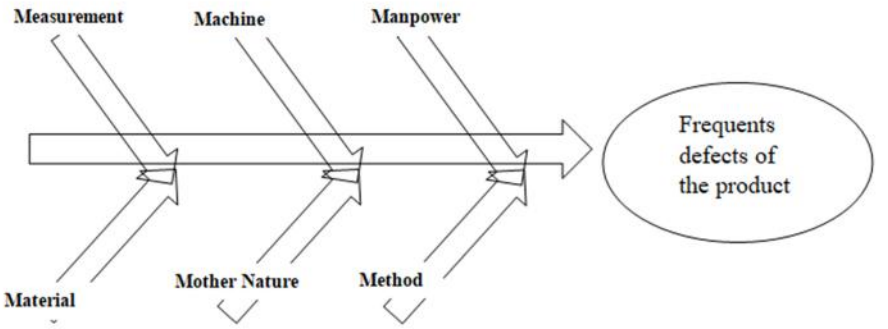
I. Helps to determine root causes.
II. Uses an orderly, easy-to-format.
III. By using a fishbone diagram, you are able to focus the group on the big picture as to possible causes or factors influencing the problem or need.
IV. Even after the need has been addressed, the fishbone diagram shows areas of weakness that once exposed can be rectified before causing more sustained difficulties.
V. Encourages group participation.
VI. Indicates possible causes of variation.
VII. Increases process knowledge.
VIII. Identifies areas for collecting data.

**DISADVANTAGES**[26]



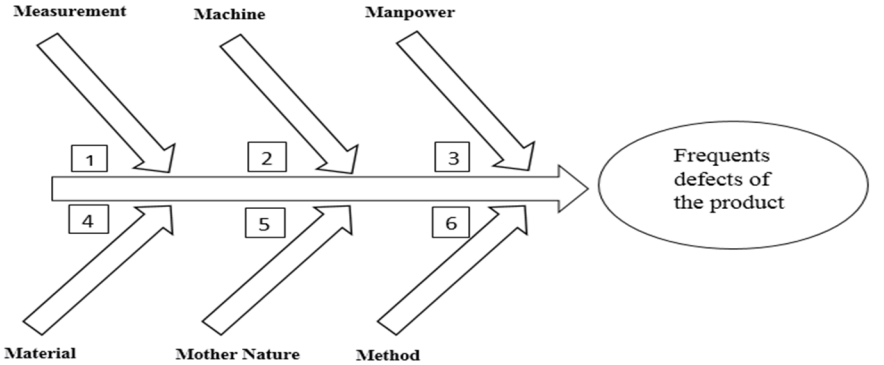
**I.** As a weakness, the simplicity of the fishbone diagram may make it difficult to represent the truly interrelated nature of problems and causes in some very complex situations.

**II.** Unless you have an extremely large space on which to draw and develop the fishbone diagram, you may find that you are not able to explore the cause and effect relationships in as much detail as you would like to.



## IDENTIFY THE CAUSES OF A PROBLEM USING:THE FISHBONE DIAGRAM

As mentioned above, the Fishbone diagram or cause-effect diagram is an analytical tool that helps identify the causes of a problem, namely the modification of a process or phenomenon.[27] It aims at presenting and identifying schematically the primary and secondary causes that have led to the appearance of symptoms. Subsequently, these causes are analyzed and removed. [28]



The starting point in drawing up this diagram is to identify the problem and the effect produced by this problem. [29]Thus, the problem will be the head of the fish, and the spine will be represented by the causes that have led to the problem.[30]
As an example, I took as a defect problem frequent in the process of producing a product.[31]

Once the problem has been identified, the main causes of the problem will be identified by discussing and analyzing the deficiencies of the work carried out. After identification, the identified causes will be inserted into the fish tail.[32]
Major cause category branches can be initially identified using the four Ms: material, methods, machines, and manpower, or more correctly, the four Ps: parts (raw materials), procedures, plant (equipment), and people. Categories can also be tailored depending on the problem.[33],[34]

After identifying the main causes that have led to a problem, we will identify the underlying causes of each major cause.[35] In this sense, brainstorming will be used. By using the brainstorming method during the process of identifying the causes of the problem, participants concentrate more easily and at the same time they are motivated, facilitating the assessment of possible causes according to their level of importance in the chart hierarchy. [36] , [37] , [38]

1. **Measurement :** Incorrect Parameters
   Not capable Measuring device
   Incorrect time interval of Measurements
2. **Machine:**Low Yield
   Maintenance
   Outdated
   Not Validated

3. **Manpower :**Low Number
   Unmotivated
   Poorly Trained
4. **Material :** Poor Quality
   Not Supply on Time
   Inappropriate
5. **Mother Nature :**Stress
   Toxicity
   Condition of work Unsuitable
6. **Methods :**Underperforming
   Inappropriate
   Complex

After the Fishbone diagram, we will analyze the main and secondary causes as well as the sub-cases, and in these analyzes we can use statistical, analytical methods, etc. [39] After discussions, opinions, suggestions, the company's management will make the decisions to resolve the problem they are confronted with.[40]

**DISCUSSION:**

- It indicates that the CED is an easy-to-use tool for developing and classifying root cause categories.[41], [42]
- It assumes the existence of enough knowledge to be able to isolate and identify probable root causes,but the identified causes may not be specific or reasonable.
- The CED has the potential to highlightinformation that is lacking or inadequate through thelack of identified causes in certain categories; however,it does not identify relationships between factors, hasno formal mechanism for selecting and evaluating rootcauses, and may be influenced by group bias.[43]
- The Fishbone diagram is used to identify, analyze, and classifypossible relationships among critical issues using a nonlinear structured method.[44]
- The Fishbone diagram does not have a mechanism for evaluating the integrity of the output, and may rely too heavily on subjective judgments of factor relationships.[45]
- If the selected root cause is trustworthy, it produces aclear managerial decision for an action. [46]Each analysistool has distinguishing characteristics that canpotentially affect group output. Therefore, reliabledecision making requires that managers have aworking knowledge of root cause analysis tools, theirProcesses, and their likely outcomes.[47]

**CONCLUSION:**

- The Fishbone technique is a simple technique by means of which the problem to be solved is written in the "fish head", and afterwards the causes are specified along the "fish bones" and they are divided into categories.[48]

- Alternatively, root cause analysis tools must also have the characteristics to promote collaboration,stimulate discussion, be readable or understandable, and have mechanisms for evaluating integrity.[49]
- The implications for management are that effectiveproblem solving requires the identification of specific and reasonable root causes. [50]
- Several methods exist for identifying root causes, but their effectiveness is dependent on the rigorous application of the group and the integrity of the selected root cause.[51]

# RE-READING OF KABIR'S TEACHINGS TO KNOW THEIR ESSENCE

**Dr. R.P. Gangwar**
C.M.P. College, Allahabad

Much have been made about Kaibr and his teachings. At the name of original text of Kabir, scholars from R.N. Tagore to Dr. Dharamveer tried to apropriate Kabir. Thus real Kabir was missing. What Winand M. Callewaert observed in the connection of Hundred poems of Kabir by Tagor will be proper to quote here. "The authenticity of these poems is very questionable; it appears that most of them were probably not composed by Kabir. This kabir is less caustic & more constantly ecstatic than the sharp eyed observer of socity who apears in older collections. This observation agrees with my theory of appropriation.[1] So many texts have been compiled on Kabir's Name that real Kabir & his teachings become very complicated task to reach final conclusion. So it is not easy to know exactly what actually Kabir wanted & what he was forced to want to say. He was antithesis to the Brahmnical order & their intelligencia . So he was not properly read & understood. Not only during Kabir's time even centuries after him, he was misinterpreted among scholars because intellectual means to be Dvij & their superiarity complexed mind. Some so called liberals among them overtly tried to esteblish Kabir but covertly they also damaged them.

As Winand M. callwaert observed: 'Kabir very soon was appropriated by imterseted parties (from the Gorakh panthis & Ramanandis in the 17th century to the Brahmans like Hazari P. Dvivedi or other social groups in 20th century) for their own ideological purpose or benifit.[2] Real Kabir & his teachings are to be searched and need scientific tempor & effort as Ambedkar did to know real Buddha & his teachings. Whatever Kabir said infavour of Bhakti, Sumiran, Jap of Nirgun Ram, Allah &against Maya, Jagat, Body, Mullah, Pandit, Outwardshows etc. could not be easily understood until unless one rises above the limitations of religious & Bhakti movement. Actualy it create contradictions in Kabir's teachings. It has wider socio economic & political prospects. So not so much easy his poetry as it outwardly looking simple & plain. Kabir points us to the idiomatic core of a language's history, where there is a ceaseless struggle between competing claims for nation in such terms as tradition, history and Community... The icon of Kabir in currency today has two dimensions. There is on the one hand the sceptic Kabir who negates everything, belongs to no one, and affirms no identity. On the other hand there is Kabir the dalit god who affirms everything by negating it.[3] Whatever such contradictions appeared & whatever such he said was forced by the medieval mind set of people. Nothing could be said or no body could interact with the medieval society without mixing religion, Atma, Parmatma, Ram, Govind, Allah, Swarg, Nark, Maya, Kaya in pure worldly subjects & problems. The contractors of religions misusing the faith, conscience of innocent people for their vested interests, material gains.

Had Kabir not born in the medieval society, he would have not used this genre , language to awaken the people. Actually he was humanist, rationist & revolationary thinker & activist. He tested the mythical, Puranic, blindfaith-ridden subjects on his

logic & reasoning.[4] Like Buddha he two taught to the people not to take things for granted. Unfortunately he was born in such age & society where it was fated to use old bottle for new wine & completely new bottle & new wine not acceptable to the people. So he used undesirably old symbols & imageries to express new & somewhat ultramodern revolutionary thought just to give message of humanity, dignity & brotherhood- the essence of social justice. That's why he insisted to remember Nirgun Rama[5] to recite Ramnam & Bhakti[6] & Sumiran[7], Like wise he remembered 'xkdy ukbd ohByk* & his soul-bride married with Raja Ramram, the groom etc & alerted people to short living world & body *;g llkj dkxn dh ifM;k* *foufl tk; dkxn dh ifM;k* *;g ru dkpk dEHk g] <cdk ykxk QfV x;k dN u vk;k gkFk* etc. This type poetry of Kabir confused or more proper to say critics of Kabir misused this poetry to confuse people with his teachings. Actually Kabir, if was not opposed to all this he was not happy also with these teachings. Whatever as such he said it had its specific context. Those who in depth worldly people & luxury loving oppressing classes exploited people for the entertainment of their these ambitions were targeted by these desperate teachings so that they may might awaken & proceed to leave bad habbits.

Otherwise Kabir believed in philosophy of work is worship & world where human being is born with *eu"k tUe nyHk vg *ghjk tue veky ;g*- He did not belive in outwardshows,[8] oral recitation of Rama & other world of swarg. He believed in diginity of labour & conduct. His Rama, Allah Khuda, kaya, kasi , Mathura, Dwarika etc. Lie in holy heart.[10] Unity of speech and deed unity in ¼dFkuh&dju½ & company of noble character people. His conduct should be reflected through his work, deed, speech & thinking.

He like a scientist believed in cause and effect relationship of a thing. That's why he argumentated with the pandits & Mullah Quzi & others. Where they failed to answer, Kabir alleged them & attacked vehemently[11]. He believed in unity of thought & action. He did what he taught. He believed in holy heart, noble conduct-the supreme deity decides one's fate here he used new wine in old bottle removing blindfaiths.

Real Kabir is not only in criticising pandey, Pandit, Mullah, Quzi, Yogi, Shaiva, Shakt etc. Actually he is yet to be known. He is true disciple of Satguru. He is hard working weaver. He is prodignity of labour. He believed & implemented in his life simple[12] living & heigh hinking.[13] He is very sweet natured fellow.[14] He is true socialist who believed in equalitarian distribution of means of livelihodd.[15] He is much worried about this world, family life & the poor people. Many 'Pads' of kabir depict the worst condition of peasants & their exploitation by the administration.[16] He is very much worried about education & hunger because old education & books are antihuman, against love & brotherhood, divide people on basis of caste, colour, creed, religion, gender etc. His comment on valueless reading & writing of his time, are more relevant even today.

^if<&2 d iRFkj Hk;k fyf[k&2 Hk;k tk bV@dg dchj l;kj dh yxh u ,dk NhVAA

That's why he attacked - ' iLrd nm ogk;*\ Those appropriated Kabir & his teachings according to their biased mentality & tried to prove Kabir to be pure Bhakt, individual saint isolated from real world, hundred percent Spiritual, every inch involved in affairs of Atma - Pramatame- maya, etc & who used only mystic lipstick- ^ykyh ej yky dh ftr n[kk frr yky@ykyh n[ku e x;h e Hkh gk x;h yky&are now exposed. They are unable to reach Kabir, We should go mto the processing making of the text (poetry), then we can reach to know the essence of his teachings.[17]

The essence of his teachings is problem of 'roti', poverty, misery Poverty breeds hatered, enmity & the contractors of society misused this weakness to misguide & divide the people. Kabir being sufferer of that misery- &^tn dk ekb tukfe;k dn u ik;k l[k*[18] So he reached to the conclusion that &^u dN n[kk Hkko Hk tu e] u dN n[kk ikFkh e@dg dchj luk Hkkb lrk tk n[kk lk jkVh eA[19] He dreamt a secular & democratic society & country providing social justice - right to equality, liberty, fraternity & pursuit of happiness for all without any discrimination . ^^ge okslh ok n'k d tgk tkfr oju dy ukfg** He was one of pioneers of social & religious freedom. He was extremely critical of gross inequalities and social injustices practised by both Hindus & Muslims. He was a great believer in the equality of mankind. For him like Mahatma Gandhi, Truth & God were synonymous.[20]

**Abstract:**
Thespesia populnea, otherwise known as Portia Tree, Eden Apple, Pacific Rosewood, or Indian Tulip Tree, belongs to the Malvaceae family. It was found all over the world on the coasts. It's a small tree or shrub with arborescence. Methanol extract of Thespesiapopulnea flowers with high antibacterial activity of flavonoids,alkaloids, tannins and anthroquione glycosides, steroids phenolic antioxidants. Antifungal activity has been shown by methanol extracts of the flower buds. The flowers ethanol extracts showed antihepatotoxic activity. The flowers produce a yellowish color that is water-soluble. Eichhornia Crassipes is a freely floating perennial aquatic plant native to tropical south America, also known as water hyacinth. It is considered the worlds most troubling aquatic weed, introduced as an ornamental plant in India in 1896. The plant also has delicate lilac flowers that can be used to produce dye.An effect arising between two or more agents entities, Factors, or substances that produces an effect greater than the sum of their Indi dual effects. It is opposite of antagonism. It had a synergistic effect on the item and they all began playing harder and working together much more effectively. In this study the selected two flowers extraction were mixed to get effective properties. By Mixing of water hyacinth flower extraction with Portia flowers extraction we can get another new color and increased values of presented properties.

**Key words:** Thespesia Populnea flower, Eichhornia Crassipes flower, Extraction dyes, Synergistic Effects.

## I. INTRODUCTION

### 1.1.Thespesia Populnea Flower

Thespesiapopulnea, otherwise known as Portia Tree, Eden Apple, Pacific Rosewood, or Indian Tulip Tree, belongs to the Malvaceae family. It was found

all over the world on the coasts. It's a small tree or shrub with arborescence. Methanol extract of Thespesiapopulnea flowers with high antibacterial activity of flavonoids,alkaloids, tannins and anthroquione glycosides, steroids phenolic antioxidants. Antifungal activity has been shown by methanol extracts of the flower buds. The flowers ethanol extracts showed antihepatotoxic activity. The flowers produce a yellowish color that is water-soluble.It is a small tree or shrub that at maturity reaches a height of about 10 m and a trunk diameter of up to 60 cm. It grows fast and its bole is short and often crooked. The leaves are thin, green bluish, and heart-shaped broadly. The flowers are bell-shaped, yellow, and occur alone. Fruits are capsules that are rounded.

The root is poisonous. Plants that are fully established are highly tolerant of drought, strong winds, and saline conditions. Such characteristics make it suitable for the control of coastal erosion. It is possible to eat raw or cook young leaves, flowers and buds of flowers. The fruits are consumed and stored. Unripe fruits are eaten as a vegetable, raw or fried.Anti-fungal activity has been shown by methanol extracts of the flower buds. The flower's ethanol extracts showed antihepatotoxic activity. The flowers produce a water-soluble yellowish color. The bark is a tannin source. It also yields a good cordage, fishing lines, coffee bags, and caulking ships thread. It is possible to use seed oil in lamps. Wood, berries, seeds, and all producing coloring leaves. Often producing gums are fruits, seeds and bark. The leaves are used as wrappers for food. For light building, flooring moulds, musical instruments, utensils, vessel bodies, boat construction, oil, etc., wood is highly valued.

### 1.1.1. Medicinal Use of Thespesia Populnea Flower

Portia tree is often used in traditional medicine, where a range of ailments are handled with bark, root, leaves, flowers and fruits. Plant parts of Portia tree, particularly bark, root, leaves, flowers, and fruits, are all used in traditional medicine against a wide variety of conditions such as pleurisy, cholera, colic, fevers, herpes, urinary tract problems, abdominal swelling, hair lice, swollen testicles, rheumatism, coughs, asthma, inflammation.The tree's leaves were made into a paste and applied to inflammation as a bandage. The oil produced by the leaves and castor oil is applied to the areas of pain and inflammation. The fruit's milky secretion is linked to skin diseases. The bark paste is applied to leucoderma and other skin infections externally. The bark prepared decoction is administered internally for toxic conditions, ascites and inflammations. The roots ' decoction is a good tonic for the body.

### 1.2. Eichhorni a Crassipes Flower

Eichhorniacrassipes, also known as water hyacinth, is a free floating perennial aquatic plant native to tropical South America. It is regarded as the most troublesome aquatic weed of the world ,which was introduced in India as an ornamental plant in 1896. It has complex root structure and rapid growth rate which result in dense interlocking mats of the weed on water surface. The weed grows best in warm water rich in macronutrients and most of our water bodies are in this condition. Thus it affects water transportation, fish production, hydroelectric projects, irrigation, potability of water, etc.

Water hyacinths are called "tristylous" and have three flower morphs. Because of the length of their pistil the flower morphs are named: long, medium and short. However, tristylous populations are limited to the native lowland water hyacinth range of South America; the M-morph prevails in the introduced range, the L-morph occurs occasionally and the S-morph is completely absent. This geographic distribution of floral morphs shows that founding events played a prominent role in the worldwide spread of the species. In order to use these weeds, extensive research is now being carried out. Phytoremediation is used to remove heavy metals from water. The farm was used as animal feed, fertilizer, manufacturing of handicrafts, paper boards, mushroom substrates, and solid condition. There are applications for all parts of the weed. The plant also has delicate lilac flowers that can be used to produce dye.

#### 1.2.1.Medicinal Use of Eichhornia Crassipes Flower

This plant has beautiful lilac flowers that can be used for extraction of dye. Anthocyanin isolated from the flower. The water hyacinth's pale purple flower contains just one delphinidin glycoside. Anthocyacin (water soluble vacuolar pigmets) may appear red, violet, blue or black depending on their PH. The antioxidant activity found in anthocyanin, the anti-inflammatory, anti-viralandanti-cancer effects. A number of conditions (including high blood pressure, colds and urinary tract injections) have long been treated with anthocyanin-rich substances in herbal medicine. Recent research suggests that anthocyanins can also help to identify major health issues, including disease and cancer. Although Hyacinth is not known for its hair care benefits, it provides that amazing fragrance of a fresh flower to the shampoos and conditioners.

### 1.3.Synergistic Effects

An effect arising between two or more agents entities, Factors, or substances that produces an effect greater than the sum of their Indi dual effects.

It is opposite of antagonism. It had a synergistic effect on the item and they all began playing harder and working together much more effectively.Synergistic effects are nonlinear cumulative effects of two active ingredients with similar or related outcomes of their different activities, or active ingredients with sequential or supplemental activities. For example, vitamin E is an antioxidant and vitamin C may help to recycle oxidized vitamin E into active vitamin E, thus, a synergisticeffect may be possible between the two.

The history of drug combinations can be traced back 1900 years to HuangdiNeijing. Nowadays, drug combinations have been widely used in biomedical research and clinical practice to treat disease. Traditional Chinese Medicines (TCM) and well-established treatments for AIDS, cancer, and infectious diseases are vivid examples. TCM combines different compounds to increase therapeutic effectiveness, while minimizing toxicity and side effects. A combination of at least three active antiretroviral medications known as the AIDS cocktail not only delays the progression of AIDS, helps rebuild and maintain the immune system, and reduces complications, but also helps prevent drug resistance. Current cancer treatment also relies heavily on such drug combinations as anthracyclines, platinum drugs, and taxanes.These impressive successful examples fully illustrate the benefits of drug combinations.

With increasing mortality rates of immune compromised patients affected by invasive fungal infections and emergent drug resistance, new therapeutic strategies and effective antifungal drugs with new mechanisms of action are urgently needed. Thus, in-depth analyses of known successful and unsuccessful drug combinations would yield a greater understanding of the patterns of synergistic drug combinations and, at the same time, accelerate the development of new drug combinations. Synergistic drug combinations are a promising strategy and tend to improve therapeutically relevant selectivity

## III.METHODOLOGY

### 3.1.Extraction of dyes from Thespesia Populnea and Eichhornia Crassipes

The flowers Thespesia Populnea and Eichhornia Crassipes were collected and washed with distilled water. They were shadow dried for 3 weeks and grinded into fine powders. The fine powders were collected and stored in sterile containers. The bioactive compounds were extracts using soxhlet apparatus. About 100ml of solvent (Water/ Methanol/ Ethanol) was used for 20gm of powder. Soxhlet extraction was carried out for 30mins. The extracts were collected and stored.

FLOWER POWDER SOXHLET EXTRACTION EXTRACTED DYE

### 3.2. Materials Required

Fabric – 100%Cotton
Extracted solution – 100ml
M:L:R – 1:5
Drying Temp.- 60ºC -70ºC
Time – 30 minutes
Curing Temp. .- 60ºC -70ºC

### 3.3. Finishing of extracts on fabrics

The fabric samples were treated separately using citric acid as cross linking agent separately. The fabric specimens are treated separately with the pigments collected using citric acid as cross linking agent tool. The extracts are added to the fabricbydipand dry-method.
The finished fabricsweretakenanddriedat100-120oCfor5minandcuredat180oCfor3min

## IV.RESULT

In this study the selected two flowers ThespesiaPopulnea and Eichhornia Crassipesextraction were mixed to get effective properties(Synergistic Effect) By Mixing flowers ThespesiaPopulnea and Eichhornia Crassipesextraction we can get another new color and increased values of presented properties.

THESPESIA POPULNEA DYED FABRIC

EICHHORNIA CRASSIPES DYED FABRIC

THESPESIA POPULNEA AND EICHHORNIA CRASSIPES DYED FABRIC (SYNEGISTIC EFFECT)

## V.CONCLUSION

The extracted color from above two flowers gives very good colour on fabrics. The main benefits is there very few amount of extracted dyes gives more color. This color finished fabric shows special properties like antibacterial, antifungal and also antioxidant. Dyeing properties were analyzed. The color fastness test shows good to average further studies can be done by changing the mordents to give different shades and colors. The main advantage in this synergistic effect is the properties were more effective then usual.

## ABSTRACT

This project is study about the "Customer Relationship Management in Stanson rubbers" was done under the auspicious company Stanson rubber products. The objective of the study was to find out the companies relation with the customers. The secondary objective includes the factors that induce the customers to purchase, their preference and the satisfaction level. Descriptive research design was adopted; Primary data is the data which is collected for the first for the sake of research study. Primary data used here is the questionnaire which is filled in by the customers and secondary data is the data which is collected already from the existing information and data. Sources of secondary data are the books, journals, existing reports and websites. The questionnaire was designed and the data was collected from 140 respondents. Statistical tools such as Chart, Percentage, ANOVA and Correlation analysis used. Major findings and suitable suggestion were also made. It is hoped that by a close study of the project will enable the company to understand the customer's preference, satisfaction level and the problems can also be resolved.

**Keywords:** CRM, Stanson rubber products, Satisfaction

## INTRODUCTION

CRM stands for Customer Relationship Management. (CRM) is perhaps the most important concept of modern marketing. Until recently, CRM has been defined narrowly as a customer data management activity. In its broader sense, CRM is the overall process of building and maintaining profitable customer relationship by delivering superior customer value and satisfaction. It deals with all aspects of acquiring, keeping and growing customers. The key to building lasting customer relationship is to create superior customer value and satisfaction. Organization can build customer relationships at many levels, depending on the nature of the target market. To build customer relationships, companies can add structural ties as well as financial and social benefits.

Successful CRM focuses on the profiling and understanding the needs and desires of the customers and is achieved by placing these needs at the heart of the

business by integrating them with the organizations strategy, people, and technology and business processes. CRM requires a synergistic integration of the strategy, people and technology of an organization. This integration leads to the creation of the service process that seek to develop an ongoing relationship with customers and results in creation of an exchange relationship that is mutually beneficial for both the organization and the customer. CRM must come from the top. It is an all-encompassing strategy, and no one department or call centre or Information Technology manager can drive the cross-functional process changes required. Thus, CRM is a Holistic approach. It is ideal from any organization's part of view that customers are the only assets.

## REVIEW OF LITERATURE:

According to **Peppers and Rogers (2011),** there is global tendency in customer relationship management that relates to the shift from transactional model towards the relationship model. In other words, Peppers and Rogers (2011) argue that satisfying customer needs as a result of on-time transaction is not sufficient today in order to ensure the long-term growth of the businesses.

**Ogunnaike Olaleke Oluseye (2014**) in his article "Customer Relationship Management Approach and Student Satisfaction in Higher Education Marketing" he found that the student's willingness to recommend to others increases when the student lifecycle in the university is well managed. It was also discovered that strong parent relationship management at the University enhances the student's willingness to recommend their Universities to others. He suggested that the recommended that Universities should adopt effective customer relationship management strategies to achieve student satisfaction.

## OBJECTIVES OF THE STUDY

- A study on customer relationship management in Stanson rubbers.
- To know about the socio- economic background of the respondents.
- To find out the satisfaction level of customers.

## HYPOTHESIS OF THE STUDY

- There is no significant difference between the satisfaction level of Stanson Rubber products.
- There is no significant difference between the satisfaction level of price and service in Stanson rubber products.

## NEED OF THE STUDY

- To understand the customers' expectations.
- To improve the overall customers satisfaction towards the products delivered.
- To understand the customers intention towards availing stanson products in future.

## RESEARCH METHODOLOGY

### RESEARCH DESIGN

This study employs both analytical and descriptive type of methodology. The study is conducted in two stages format, with a preliminary pilot study followed by the main study. The secondary data are collected from journals, magazines, publications, reports, books, dailies, periodicals, articles, research paper, websites, company publications, manuals and booklets. It is a plan of organizing framework for doing the study and collecting the data on the basis, the research design chosen for this study is descriptive.

### SAMPLING DESIGN

The primary data was collected among 140 respondents from Stanson Rubbers by random sampling method. The questionnaire was distributed to get the required data.

### SOURCES OF DATA

The study is based on the primary as well as secondary data. The study depends mainly on the primary data collected through a well framed and structured questionnaire to elicit the well-considers opinions of the respondents. The data collection for this study is both primary and secondary data.

### FRAMEWORK OF ANALYSIS

The selection of statistical tools was based upon the nature of data used and research objectives. The applied statistical analysis are percentage analysis, Karl Pearsons' Correlation and Analysis Of Variance.

## RESULTS AND DISCUSSIONS:

This section shows the analysis and interpretation of data used for the study.

**Table 1: Demographic profile of the respondents**

| Demographic profile | No. of respondents | Percentage |
|---|---|---|
| **Gender** | | |
| Male | 128 | 91 |
| Female | 12 | 9 |
| **Total** | **140** | **100** |
| **Age group** | | |
| 20-30 yrs | 4 | 3 |
| 31-40 yrs | 27 | 19 |
| 41-50 yrs | 71 | 51 |
| 51-60 yrs | 31 | 22 |
| Above 60 yrs | 7 | 5 |
| **Total** | **140** | **100** |

| **Educational qualification** | | |
|---|---|---|
| School | 8 | 6 |
| Graduate | 45 | 32 |
| Professional | 82 | 58 |
| Others | 5 | 4 |
| **Total** | **140** | **100** |

*Source Primary data

It is inferred that majority of the respondents (i.e) 91% are male and most of the respondents (i.e) 51% belong to the age group between 41-50 years and it is also inferred that most of the respondents ( i.e) 58% are professionals.

**Table 2: Opinion towards price**

| **Opinion** | **No. of respondents** | **Percentage** |
|---|---|---|
| Highly satisfied | 64 | 46 |
| Satisfied | 56 | 40 |
| Neither satisfied nor dissatisfied | 13 | 9 |
| Dissatisfied | 5 | 4 |
| Highly dissatisfied | 2 | 1 |
| **Total** | **140** | **100** |

The above table 2 portrays that 46% of the respondents are highly satisfied towards the price offered, 40% are satisfied, 9% are neither satisfied nor dissatisfied, 4% are dissatisfied and 1% are highly dissatisfied.It is inferred that majority of the respondents (i.e.) 46% are highly satisfied towards the price offered by the company.

**Table 3: Opinion towards service**

| **Opinion** | **No. of respondents** | **Percentage** |
|---|---|---|
| Highly satisfied | 42 | 30 |
| Satisfied | 58 | 42 |
| Neither satisfied nor dissatisfied | 34 | 24 |
| Dissatisfied | 4 | 3 |
| Highly dissatisfied | 2 | 1 |
| **Total** | **140** | **100** |

From the above table it is found that 30% of the respondents are highly satisfied with the service offered, 42% are satisfied, 24% are neither satisfied nor dissatisfied, 3% are dissatisfied, 1% are highly dissatisfied.It is inferred that majority of the respondents (i.e.) 42% are satisfied with the service offered by the company.

**Table 4: Satisfaction level of price and service- correlation**

| S.NO | Satisfaction level of price (X) | Satisfaction level of service (Y) | $X^2$ | $Y^2$ | XY |
|---|---|---|---|---|---|
| 1 | 64 | 42 | 4096 | 1764 | 2688 |
| 2 | 56 | 58 | 3136 | 3364 | 3248 |
| 3 | 13 | 34 | 169 | 1156 | 442 |
| 4 | 5 | 4 | 25 | 16 | 20 |
| 5 | 2 | 2 | 4 | 4 | 4 |
| **TOTAL** | **140** | **140** | **7430** | **6304** | **6402** |

Karl Pearsons formula:

$$r = \frac{n\sum xy - \sum x \sum y}{\sqrt{[n\sum x^2 - (\sum x)^2][\, n\sum y^2 - (\sum y)^2]}}$$

$$r = \frac{5(6402) - 140(140)}{\sqrt{[5(7430) - (140)^2][5(6304) - (140)^2]}}$$

$$r = \frac{12410}{14461.74}$$

$$r = 0.8581$$

$$r < 1$$

It is found that there is a perfect positive correlation. It is implied that satisfaction level of price and service are related.

**Table 5: Satisfaction level of stanson rubber products- One way Anova**

H0: There is no significance difference between the satisfaction level.

H1: There is significance difference between the satisfaction level.

$H_0$ is accepted
There is no significant difference between satisfaction level.

**SUGGESTIONS**

- Company should take necessary action towards the complaints of the customers.
- Company can improve the advertisement.

- Company can improve the customer awareness program.

## CONCLUSION

From this study it can be concluded that the customer relationship management in Company is satisfactory. The company is using various CRM practices like customization of the product, maintaining interaction with the customers regularly and providing good quality product etc. Customer relationship management has a certain impact on the profitability of the company. The study about the customer relationship will really have an impact on identifying the areas in which the management should be concentrated. From the overall study on the level of customers relationship with respect of Stanson rubbers, it is understood that majority of the customers are expecting customer awareness program to be conducted by the company. Most of the customers are satisfied with quality of the products produced. To improve the sales and services and effective advertising should be used and also the existing technology should be upgraded.

# INCLUSION OF VISUALLY IMPAIRED STUDENTS IN EXTRA-CURRICULAR ACTIVITIES & FUNCTIONAL SKILLS ACHIEVEMENT IN IED-SS

**Premalatha.T**
Assistant Professor
Department of Education
Avinashilingam Institute
Coimkbatore

## Abstract

Inclusive Education (IE) is a new approach towards educating the children with disability and learning difficulties with that of normal ones within the same roof . It brings all students together in one classroom and community, regardless of their strengths or weaknesses in any area, and seeks to maximize the potential of all students. It is one of the most effective ways in which to promote an inclusive and tolerant society. The overall objective of the study is to find out the Involvement of visually impaired students in Extra-Curricular activities and the Functional skills of visually impaired students in Inclusive set up in Coimbatore district and differences among them due to age, gender and nature. The present study revealed that there is no significant differences in Involvement of Extra-Curricular activities due to different age groups, gender and nature. The present study also reported that the totally blind children showed independency in achieving Functional skills.

## INTRODUCTION

Inclusive education has grown from the belief that education is a basic human right and that it provides the foundation for a more just society. All learners have a right to education, regardless of their individual characteristics or difficulties. Inclusive education initiatives often have a particular focus on those groups, which, in the past, have been excluded from educational opportunities. It is known that 73 million children of primary school age were out of school in 2010, down from a high of over 110 million out-of-school children in the mid-1990s, according to new estimates by the UNESCO Institute for Statistics (UIS). About Eighty percent of Indian population lives in rural areas without provision for special schools. It means, there are an estimated 8 million children out of school in India (MHRD 2009 statistics), many of whom are marginalised by dimensions such as poverty, gender, disability, and caste.

**Inclusive education** is when all students, regardless of any challenges they may have, are placed in age-appropriate general education classes that are in their own neighborhood schools to receive high-quality instruction, interventions, and supports that enable them to meet success in the core curriculum (Bui, Quirk, Almazan, & Valenti, 2010; Alquraini & Gut, 2012) Inclusive schools have a collaborative and respectful school culture where students with disabilities are presumed to be competent,

develop positive social relationships with peers, and are full participating members of the school community (Jelas & Ali, 2014; Lamichhane, 2017).

An **Extracurricular activity (ECA)** or **Extra academic activity** (**EAA**) is an activity, performed by students, that falls outside the realm of the normal curriculum of school, college or university education. Such activities are generally voluntary (as opposed to mandatory), social, philanthropic, and often involve others of the same age. Co-Curricular activities complement the curricular activities and groom the students in the art of living and working together. It also professes co-ordination, adjustment and speech fluency, extempore and debating skills among students. Students with visual impairments will need particular assistance to acquire co-curricular skills primarily through vision. **Functional skills** refer to the skills that students learn that provide them with the opportunity to work, play, socialize, and take care of personal needs to the highest level possible. Students with visual impairments will need particular assistance with those skills acquired primarily through vision.

**SIGNIFICANCE OF THE STUDY**

Extra-Curricular activities and Functional skills have been given important consideration keeping in mind their significance towards the performance in day to day tasks. Comparatively significant research has been conducted on involvement of Visually Impaired students in Extra-Curricular activities in relation to age, gender and nature and on achievement of Functional skills in relation to age, gender and nature of visually impaired students.

**OBJECTIVES**

1. To study the involvement of visually impaired students in Extra-Curricular activities in relation to their age in inclusive set up.
2. To study the involvement of visually impaired students in Extra-Curricular activities in relation to the gender in inclusive classroom.
3. To study the involvement of visually impaired students in Extra-Curricular activities in relation to nature in inclusive education.
4. To study the achievement of Functional skills by visually impaired students in relation to their age in inclusive set up.
5. To study the achievement of Functional skills by visually impaired students in relation to the gender in inclusive classroom.
6. To study the achievement of Functional skills by visually impaired students in relation to nature in inclusive education.

**SCOPE AND LIMITATIONS**

This research study the involvement of visually impaired students in Extra-Curricular activities and achievement of Functional Skills in Coimbatore district school students in relation to a few selected variables like age, gender and nature. The involvement in Extra-Curricular activities is measured by using checklist and questionnaire. The main purpose of the study is to find out whether there is differences in age, gender and nature. Based on the analysis and discussion of results implications are drawn. Due to practical constraints the sample size was limited to 40 students in Coimbatore district in Inclusive schools. However, it is felt that inspite of the above mentioned limitations the findings of the study can be generalized to a great extent , since care was taken to make every step in the procedure of the study as objective as possible.

## REVIEW OF THE RELATED LITERATURE

Rahaman, Muhammed Mahbubur (2011) viewed a phenomenological study to understand and describe the inclusive education practices for students with disabilities in secondary schools in Bangladesh. This study intends to answer the main research question: How do teachers in secondary schools in Bangladesh understand inclusion? The research used a phenomenological research design consisting of participant interviews and observations. An additional questionnaire was used to measure teacher attitudes and understanding of teaching strategies. A total of 12 interviews (two for each participant classroom teacher) and 12 observations (two of each participant) were conducted. Participants found that student-centric evidence-based teaching and learning strategies are more effective than their traditional lecture-based teaching and learning.

Mumthas, N. S.; Shamina, E. (2011) conducted a study involving teachers in USA it was found that only 29 percent of general educators felt that they had enough expertise or training in inclusion (Hobbs and Westling 2002). The present study is an attempt to find out whether the prospective teachers have adequate awareness on the concept of inclusive education through an Awareness Test on Inclusive Education (Mumthas & Shamina, 2010). A sample of 300 prospective teachers at secondary level from various teacher-training institutions of Malappuram and Calicut districts were selected for the study. It is found that prospective teachers do not have adequate Awareness on Inclusive Education and it does not differ significantly irrespective of their gender, locale of Institution and type of management of institution.The study suggests that adequate training programs on Inclusive Education should be given to prospective teachers for successful implementation of Inclusive Education.

A 2000 quantitative study found 58% of time spent in a self-contained classroom was classified as “non-instructional,” compared to 35% of the time in a general education classroom. The students with severe disabilities in general education classroom were also 13 times more likely than their typical peers to receive direct instruction during whole-class time, and 23 times more likely to receive one-on-one support. This challenges the common argument that students with disabilities cannot receive individualized instruction in a general education setting.

A study looking at the outcome of 11,000 students with all types of disabilities found that more time in a general education classroom correlated to less absences from school, fewer referrals for misbehavior, and more post-secondary education and employment options.

Erten,et al ( 2012 ) conducted a study on conceptual and methodological challenges of doing research in the field of inclusive education and revisit school effectiveness research literature to inform future research. First, we present the rationale for inclusive education and briefly review the evolution of special needs education. Then, we discuss limitations of current research on inclusive

education. Next, we present school- and classroom-level findings of school effectiveness research to highlight how it can influence the inclusive education research agenda. We conclude by presenting future directions for research.

## METHODOLOGY

" The survey is in briefly a method of analysis in scientific and orderly form for defined purpose of given social situation of problem or population" Herman,(2005).The method adopted in the study is survey method. " Survey research is an organized attempt to analyze interpret and report the present status of social institution group or area Whitney, F. L (2005)

## SELECTION OF TOOL

Tool is an important instrument to collect data. For collecting new, unknown data required for the study of any problem one may use various devices. For every type of research we need certain instrument to gather new facts or to explore new fields. In the present study the investigator selected "Checklist" and "Questionnaire" as the most important tool for collecting data.

## CONSTRUCTION OF TOOL

**Checklist:**

The checklist was prepared to find out the functional and social skills of visually impaired students. The checklist consists of 30 questions including social skills, emotional management skills, communication skills, verbal behaviour and response skills and personal care skills. The response from the students for the above skills will be evaluated and marked by the researcher for every student selected for the research study.

**Questionnaire :**

The Questionnaire was prepared by the investigator .It consists of 10 questions to test their involvement in Extra-Curricular activities . The response from the students will be evaluated and marked by the researcher for every student selected for the research study.

## PILOT STUDY:

A pilot study is a' small scale replica 'of the main study. It is the rehearsal of the main study. It covers the entire process of research preparation of a broad plan of the study, construction of tools, collection of data, processing and analysis of data and report writing. The selected tool was first used with Avinashilingam Girls higher Secondary school and C.S.I Girls Higher secondary school with 14 Visually impaired children to find the reliability of the tool. After the tool was found to be reliable, it was used to collect data from other students in the other school for final study.

## SELECTION OF THE AREA

The area selected for the purpose of the study was limited to Coimbatore district only. The example selected for the present study consists of 40 students in 5 schools implementing IED –SS programme in and around Coimbatore district.

**Distribution of sample for the present study:**

**TABLE- 1**

| S.NO | SCHOOLS | BOYS | GIRLS | TOTAL |
|---|---|---|---|---|
| 1 | Avinashilingam Girls Hr.Sec.School, Coimbatore | | 8 | 8 |
| 2 | Government Hr.Sec.School,Karamadai | 4 | 1 | 5 |
| 3 | CSI Boys Hr.Sec.School,Coimbatore | 16 | | 16 |
| 4 | CSI Girls Hr.Sec.School,Coimbatore | | 6 | 6 |
| 5 | St.Michael Hr.Sec.School,Coimbatore | 5 | 5 | |
| | TOTAL | 20 | 20 | 40 |

The above table reveals that there are 40 visually impaired students in IED-SS programme in Coimbatore district. Out of 40 students 20 are boys and 20 are girls.

## ANALYSIS AND INTERPRETATION OF THE DATA

The data after collection has to be processed and analyzed in accordance with the outline laid down for the purpose at the time of developing research plan.The term processing implies editing, coding, classification and tabulation of collected data so that they are manageable for analysis. The term analysis refers to the computation of certain measures along with searching for patterns relationships that existing among data groups ( Kothari, 1990 ).

Interpretation refers to the task of drawing inferences from the collected facts after an analytical or experimental study. Interpretation leads to the establishment of explanatory concepts that can serve as guide for future research studies; it opens new avenues of intellectual adventure and stimulates the quest for more knowledge - Kothari ( 2006 )

The percentage analysis of functional skills and social skill among visually impaired students was done by the investigator and corroborated under the following headings.

**AGE OF SELECTED STUDENTS**

The percentage analysis of selected students with regard to their age groups was calculated in the following table.

**TABLE - 2**

**AGE OF SELECTED STUDENTS**

| AGE | No. | Percent |
|---|---|---|
| 14-16 Years | 20 | 50.0 |
| 17-19 Years | 20 | 50.0 |
| Total | 40 | 100.0 |

From the above table it can be said that visually impaired children in the age groups of 14 – 16 yrs and 17 – 19 yrs are 50 %.

**GENDER OF SELECTED STUDENTS**

The percentage analysis of selected students with regard to their gender was calculated and presented in the following table.

**TABLE - 3**

**GENDER OF SELECTED STUDENTS**

| GENDER | No. | Percent |
|---|---|---|
| Boys | 26 | 65.0 |
| Girls | 14 | 35.0 |
| Total | 40 | 100.0 |

It can be said from the above table that majority of them (65 percentage) were visually impaired boys and 35 percentage were visually impaired girls.

**NATURE OF SELECTED STUDENTS**

The percentage analysis of selected students with regard to their nature was calculated and presented in the following table.

**TABLE- 4**

**NATURE OF SELECTED STUDENTS**

| NATURE | No. | Percent |
|---|---|---|
| Total blind | 13 | 32.5 |
| Low vision | 27 | 67.5 |
| Total | 40 | 100.0 |

From the above table it can be discussed that 67.5 percentages were low vision and 32.5 percentages of students were totally blind. Majority of the sample were low vision students.

**COMPARISON OF INVOLVEMENT OF VISUALLY IMPAIRED CHILDREN IN EXTRA-CURRICULAR ACTIVITIES BASED ON THEIR AGE**

The T-test was applied to find out whether there is significant difference among the group in the average extra curricular activities skill scores.

**TABLE-5**

**COMPARISON OF INVOLVEMENT OF VISUALLY IMPAIRED CHILDREN IN EXTRA-CURRICULAR ACTIVITIES BASED ON THEIR AGE**

| | | EXTRA-CURRICULAR ACTIVITIES | | | T | df | Sig | |
|---|---|---|---|---|---|---|---|---|
| | | Mean | S.D | No. | | | | |
| AGE | 14-16 Years | 7.80 | 1.79 | 20 | 0.000 | 38 | NS | |
| | 17-19 Years | 7.80 | 1.51 | 20 | | | | |
| TOTAL | | 7.80 | 1.64 | 40 | | | | |

NS- Not Significant

The above table shows that the calculated T - value 0.000 which is lesser than the table value of 2.024 at 5 % level of significance. Since the calculated value is lesser than the table value it is inferred that there is no significant difference among the age groups in the average scores. Hence the hypothesis is accepted.

**COMPARISON OF INVOLVEMENT OF VISUALLY IMPAIRED CHILDREN IN EXTRA-CURRICULAR ACTIVITIES BASED ON THEIR GENDER**

The T-test was applied to find out whether there is significant difference among the group in the average extra curricular activities skill scores.

**TABLE-6**

**COMPARISON OF INVOLVEMENT OF VISUALLY IMPAIRED CHILDREN IN EXTRA-CURRICULAR ACTIVITIES BASED ON THEIR GENDER**

| | | EXTRA-CURRICULAR ACTIVITIES | | | T | df | Sig |
|---|---|---|---|---|---|---|---|
| | | Mean | S.D | No. | | | |
| GENDER | Boys | 7.85 | 1.67 | 26 | 0 .240 | 38 | NS |
| | Girls | 7.71 | 1.64 | 14 | | | |
| TOTAL | | 7.80 | 1.64 | 40 | | | |

NS- Not Significant

The above table shows that the calculated T - value 0.240 which is lesser than the table value of 2.024 at 5 % level of significance. Since the calculated value is lesser than the table value it is inferred that there is no significant difference between boys and girls in the average scores.
Hence the hypothesis is accepted.

**COMPARISON OF INVOLVEMENT OF STUDENTS IN EXTRA-CURRICULAR ACTIVITIES BASED ON THEIR NATURE**

The T-test was applied to find out whether there is significant difference among the group in the average extra curricular activities skill scores.

**COMPARISON OF INVOLVEMENT OF STUDENTS IN EXTRA-CURRICULAR ACTIVITIES BASED ON THEIR NATURE**

**TABLE-7**

| | | EXTRA-CURRICULAR ACTIVITIES | | | T | df | Sig |
|---|---|---|---|---|---|---|---|
| | | Mean | S.D | No. | | | |
| NATURE | Total blind | 8.23 | 1.83 | 13 | 1.161 | 38 | NS |
| | Low vision | 7.59 | 1.53 | 27 | | | |
| TOTAL | | 7.80 | 1.64 | 40 | | | |

NS- Not Significant
The above table shows that the calculated T - value 1.161 which is lesser than the table value of 2.024 at 5 % level of significance. Since the calculated value is lesser than the table value it is inferred that there is no significant difference between totally blind and low vision children in the average scores. Hence the hypothesis is accepted.

**C0MPARISON OF FUNCTIONAL SKILLS OF VISUALLY IMPAIRED CHILDREN BASED ON THEIR AGE**

The T-test was applied to find out whether there is significant difference among the group in the average Functional skill scores.

**C0MPARISON OF FUNCTIONAL SKILLS OF VISUALLY IMPAIRED CHILDREN BASED ON THEIR AGE**

**TABLE- 8**

| | | FUNCTIONAL SKILLS | | | T | df | Sig |
|---|---|---|---|---|---|---|---|
| | | Mean | S.D | No. | | | |
| AGE | 14-16 Years | 16.40 | 1.73 | 20 | 0.000 | 38 | NS |
| | 17-19 Years | 16.40 | 2.62 | 20 | | | |
| TOTAL | | 16.40 | 2.19 | 40 | | | |

NS- Not Significant

The above table shows that the calculated T - value 0.000 which is lesser than the table value of 2.024 at 5 % level of significance. Since the calculated value is lesser than the table value it is inferred that there is no significant difference among the age groups in the average scores. Hence the hypothesis is accepted.

**COMPARISON OF FUNCTIONAL SKILLS OF VISUALLY IMPAIRED CHILDREN BASED ON THEIR GENDER**

The T-test was applied to find out whether there is significant difference among the group in the average Functional skill scores.

**COMPARISON OF FUNCTIONAL SKILLS OF VISUALLY IMPAIRED CHILDREN BASED ON THEIR GENDER**

**TABLE- 9**

| | | FUNCTIONAL SKILLS | | | T | df | Sig |
|---|---|---|---|---|---|---|---|
| | | Mean | S.D | No. | | | |
| GENDER | Boys | 16.50 | 2.40 | 26 | .389 | 38 | NS |
| | Girls | 16.21 | 1.81 | 14 | | | |
| TOTAL | | 16.40 | 2.19 | 40 | | | |

NS- Not Significant

The above table shows that the calculated T - value 0.389 which is lesser than the table value of 2.024 at 5 % level of significance. Since the calculated value is lesser than the

table value it is inferred that there is no significant difference between boys and girls in the average scores.
Hence the hypothesis is accepted.

## COMPARISON OF FUNCTIONAL SKILLS OF STUDENTS BASED ON THEIR NATURE

The T-test was applied to find out whether there is significant difference among the group in the average Functional skill scores tabulated and represented graphically in fig.7.

## COMPARISON OF FUNCTIONAL SKILLS OF STUDENTS BASED ON THEIR NATURE

**TABLE- 10**

| | | FUNCTIONAL SKILLS | | | T | df | Sig |
|---|---|---|---|---|---|---|---|
| | | Mean | S.D | No. | | | |
| NATURE | Total blind | 17.38 | 2.63 | 13 | 2.049 | 38 | * |
| | Low vision | 15.93 | 1.82 | 27 | | | |
| TOTAL | | 16.40 | 2.19 | 40 | | | |

* - Significant at 5% level
The above table shows that the calculated T - value 2.049 which is higher than the table value of 2.024 at 5 % level of significance. Since the calculated value is higher than the table value it is inferred that there is significant difference between totally blind and low vision children in the average scores. Hence the hypothesis is rejected. From the table it is inferred that totally blind showed independency in achieving Functional skills.

## SUMMARY AND CONCLUSIONS

The findings of the study are as follows

1. By viewing the background information of students, it was found that both visually impaired boys and visually impaired girls were in equal percentage. (20 %).
2. It was found that majority of them 65 % were visually impaired boys and 35 % were visually impaired girls.
3. Regarding the nature, 67.5 % students were low vision and 32.5 % of students were totally blind. Majority of the sample were low vision students.

4. The T-test was applied to find out whether there is significant difference among the group in the average Extra curricular activities skill scores. The calculated T - value 0.000 which is lesser than the table value of 2.024 at22.5 % level of significance. Since the calculated value is lesser than the table value it is inferred that there is no significant difference among the age groups in the average scores.
5. The T-test was applied to find out whether there is significant difference among the group in the average Extra curricular activities skill scores.The calculated T - value 0.240 which is lesser than the table value of 2.024 at 24.5 % level of significance. Since the calculated value is lesser than the table value it is inferred that there is no significant difference between boys and girls in the average scores.
6. The T-test was applied to find out whether there is significant difference among the group in the average Extra -curricular activities skill scores. The the calculated T - value 1.161 which is lesser than the table value of 2.024 at 5 % level of significance. Since the calculated value is lesser than the table value it is inferred that there is no significant difference between totally blind and low vision children in the average scores
7. The T-test was applied to find out whether there is significant difference among the group in the average Functional skill scores.The calculated T - value 0.000 which is lesser than the table value of 2.024 at 5 % level of significance. Since the calculated value is lesser than the table value it is inferred that there is no significant difference among the age groups in the average scores.

9. T - value 0.389 which is lesser than the table value of 2.024 at 5 % level of significance. Since the calculated value is lesser than the table value it is inferred that there is no significant difference between boys and girls in the average scores.
10. The T-test was applied to find out whether there is significant difference among the group in the average Functional skill scores. The calculated T - value 2.049 which is higher than the table value of 2.024 at 5 % level of significance. Since the calculated value is higher than the table value it is inferred that there is significant difference between totally blind and low vision children in the average scores. From the table it is inferred that totally blind showed independency in achieving Functional skills

## RECOMMENDATIONS

The research report's recommendations are outlined below, and presented thematically.

1. Efforts are necessary to provide the optimal learning experience for the visually impaired children in co curricular activities.
2. Provide in-service training to all mainstream teachers and primary education advisors on inclusive education.
3. To develop flexible curricula in accordance with individual needs of children, which will allow using different forms and methods of education.
4. The teaching should aim at the provision of sufficient experience for visually impaired children for optimum utilisation of their potentialities.

5. Provide right kind of learning materials and books for children with disabilities in Government schools
6. The teachers and parents should give more attention to tackle the problems faced by the visually impaired children in developing functional skills.

## CONCLUSION

Inclusive education has potential to benefit all students, their families and the whole community. Despite many barriers, inclusive education is gaining momentum everywhere. . The visually impaired children feel better in inclusive set up than in special school. A group with parent, teacher, society and student can bring anonymous change in inclusive education through co-operation. Parents and pupils have important contributions to make to shape the implementation of inclusion ( Lindsay , 2007 ). Inclusion is focused on presence, participation, and achievement. If everyone focus on this , the barriers in inclusive education will be eradicated which facilitate the visually impaired to excel academically and face challenges in all walks of life.

Imphal (Manipur)

**Abstract**

Parental role in child's education is pivotal. Without which the child's education will be incomplete in this modern world as child will remain more hours at home than at school. Most of supports for the children are coming from family mainly. But, many parents do not know, what will be actual care to be taken up for their children. The way of systematic parental care is also discussed minutely in the study. The same study tries to find out and compare the quality of parental care for their children between the parents of Government and private schools. The study also tries to find out the suggestive measures to improve the quality of parental care towards their children, which will make their children perfect citizens in future.

## INTRODUCTION:

Parental involvement is often seen as a cornerstone in a child's education. It can make a considerable difference to child's school life, both in academics success and in general enjoyment at school. Parental involvement is known to be linked with improved behaviour, regular attendance and positive attitudes. It provides a support network for children which is particularly important when they face academics hurdles or other challenges in life. As a results children whose parents stay involved are more likely to have more self esteem, be disciplined have more self-motivation and tend to achieve better grades and also creates ties and strengthens bonds with children.

It also leads to the building of stronger relationships within the school, leading to clearer communication between teachers and participate in school activities. They gain a clearer understanding of what is expected of their children at school and they learn from teachers how to work at home to enhance their children's education.

**REVIEW OF RELATED LITERATURES OF STUDY: (1) Ballen and Moles (1994**) in "school-family partnerships. Strong families, strong school's as a type of parental involvement in children's education. it is not necessary for parents to know all the answers, however, it is important to demonstrate their interest by providing a quiet, well-lit place for doing homework, encouraging children's effort, being available for questions and being willing to discuss material the child is learning. (2) **Carter and Wojtkiewicz (2000)** studied differences in parental involvement between sons and daughters. They discovered that when it pertains to discussions about school, parents were more involved with their daughters however, when it come to being involved with their schooling directly, parents were more involved in the education of their son. (3) **Grolnick and slawiaczek (1994)** conduct a study on "parents" involvement in children's schooling: A multidimensional conceptualization and motivational model" it viewed PI as parents dedication of resources to a child. Their model incorporates both developmental and educational aspects of PI and differentiates parents overall involvement with their child from their involvement in the child's education. (4) **Epstein (1995)** proposed types of involvement which include parents establishing a home environment that supports child as students, school-to-home and home-to-school communications about school programs and children's progress parents and guardians volunteering at school, taking part in decision making at school and school collaborating with communities to identify and integrate resources. Parents should take advantage of opportunities to become involved with school administration and policy development for example, attend school board meetings and joint the PTA (parents teachers association). (5) **Catsambis (2001)** explored the impact of parental involvement on the success of high school seniors. She found the parental involvement during the senior year does impact student's success but not as much as it did in earlier years. She also found that educational expectations and parental encouragement were the most effective type of parental involvement in affecting academic success.(6) **Powell et al, (2010)** conducted a study on parents – school relationships and children's academic and social outcomes in public school pre-kindergarten. They examined the correlation between parent-school relationship and the academic outcome in public school prekindergarten "They examined the correlation between parent-school relationship and the academic outcome s of 140 students attending a state funded preschool program. School readiness was assessed at the beginning and end of the school year via eleven items derived from a parent interview. (7) **Arnold et al., (2008)** Later conducted a study to further examine the relationship between PI and pre-literacy development. PI assessed through teachers' responses to ten items of the Parent-Teacher Involvement Questionnaire (Reid, Webster-Straton & Beauchaine, 2001). The result of the study revealed small to medium sizes. Higher PI was related to pre literacy skills. Moreover, a significant positive correlation was found between SES and PI. (8) **Khajehpour (2011)** conducted a study on "Relationship between emotional intelligence, parental involvement and academic performance of high school students." This study investigated the relationship between emotional intelligence , parental involvement and academic performance of 300 high school students in Tehran, Iran. The participation ranged in age between 15 and 18 years. Researcher in this study used an adapted questionnaire. Results showed that both emotional intelligence and parental involvement could predict academic achievement in

high school students. (9) **Chaudhary and Muni (1995)** in "role of parental support in child's need satisfaction and academic achievement", observed that parental support had positive effect on their children's academic performance. They study on the role of parental support in children's need for satisfaction and academics achievement. The sample consisted of fifty children from 7th grade to 9th grade of equal number of boys and girls. Family effectiveness and need satisfaction, inventory and academics marks were used as measures in this study. (10) **Kaur (1999)** conducted a research on " Problem of Primary education as perceived by parents in relation to their attitude towards primary education". The researcher found as to what the levels of income and education of the parents affect on the perceptions about the primary education. It was found that parents respond differently on their perceptions to the problems in primary education on public and government schools, attitude of different genders with the difference on income and educational levels of the parents. (11) **Suresh kumar N Vellymalay (2012)** conducted a study on, "Bridging school and parents, parental involvement in their child's education. The parents also show higher involvement when the school is cooperative in discussing their child. In addition, findings also indicate that parents are more involved in their child's education when the parents are kept informed about the meetings, activities and events that they have to attend. (12) **Sarkar A.K. (1986)** conducted a study on, "Correlates of children attitude towards their parents". the important finding were that attitudes scores were normally distributed, boys and girls with favourable and unfavourable attitude did not differ with respect to their personality and the third born children attitude towards their parents differed significantly. (13) **Devi and Mayuri (2003)** studied " the effects of family and school on the Academic Achievement of residential school". The study was conducted on residential school children studying in IX and X classes. The result indicated that girls were superior to boys. Family factors like parental aspirations and socio economic status significantly contributed to academic achievement. (14) **Pati and Acharya (2005) i**n their study "Out of School Learning and its Impact on the Achievement of the Pupils" analyzed that the pupils who learn from parents or guardians after the normal school instruction had done much better achievement in the exam than those learned in group coaching or tuition learned by them. The authors recommend the need of parents or guardians to teach their children if uneducated parents than coaching or tuition instead of self learning to give the required instruction lacking from the school instructions.

**CONCLUSION**:

It can be concluded that the topic of the present study was not conducted by anybody before as the proofs and evidences are given above. So, the work of the investigator is the new area study for the improvement of elementary education in connection with parental roles in terms of child's education.

**JUSTIFICATION OF THE STUDY:** Parent's involvement in their children's improve children's academic outcomes and create and also create a connection between the home and school. And those who participate along with their children are well informed to the many aspects of their child's day to day life. Parental involvement in education of their children's has been significantly linked with the quality of education and academic achievement of children. Parents involvement not only make them understand their needs to work to increase the competency and confidence of the children but also able to influence decision made in the school and develop closer ties to their communities and neighbours. The information obtained by completing this study will be beneficial to parents, students and educators. The findings of this research may also be beneficial to educational institutions. The results can be utilized to develop school programs associated with parental involvement in school activities and decision. These can be implemented to bridge the gap between home and school while improving student's academic achievement.

**DEFINITION OF KEY WORDS USED:**

a. **Parents**: One who gives birth to or nurture and raised a child.
b. **Jr high school:** Junior high school also known as intermediate school or middle high school is an educational stage which exists in some countries, providing education between primary school and secondary school. The concept regulation and classification of middle schools as well as the ages covered vary between and sometimes within countries.
c. **Elementary Education:** Elementary education also called primary education following preschool but before high school. It usually encompasses grades 1-8 and students learn basic skills in areas such as reading, writing and maths.
d. **Kshetrigao A/C:** Kshetrigao is a town in Imphal east district of Manipur. It is located 6km towards south from district head quarter Porompat, 7km from state capital Imphal
e. **Parental involvement**: participation by a child's father or mother in a child's learning processed both in and out of school.

**OBJETIVES OF THE STUDY:**

1. To find out overall awareness level of the parental involvement in their child's education.
2. To compare the awareness level of parental involvement between the higher and lower qualification of parents within Kshetrigao Assembly Constituency.
3. To compare the awareness level of between employed and unemployed parents within Kshetrigao Assembly Constituency.
4. To compare the awareness level of parental involvement between the parents of Govt. and private schools in Kshetrigao Assembly Constituency.
5. To find out suggestive measures for the improvement of parental education and child care.

**HYPOTHESIS OF THE STUDY:**

1. There is no significant level of overall awareness on parental involvement in their child's education.
2. There is no significant difference between the awareness level of parental involvement between the higher and lower qualification of parents within Kshetrigao Assembly Constituency.
3. There is no significant difference between employed and unemployed parents within Kshetrigao Assembly Constituency
4. There is no significant difference between the awareness level of parental involvement between the parents of Govt. and private schools in Kshetrigao Assembly Constituency.

**DELIMITATION:**

1. The study was confined to the parents residing within Kshetrigaon Assembly Constituency, Imphal East Manipur.
2. The study was confined to 80 parents whose children were studying in class I to VIII at Govt. and Private Schools within Kshetrigaon Assembly Constituency, Imphal East Manipur.
3. The study was confined only within the academic calendar-2019-2020.

**METHODOLOGY:** The Descriptive Survey Method was employed for the proposed study. The population was consisted of parents residing in Kshetrigao Assembly Constituency, Imphal east, Manipur, the children are reading in class I to VIII at Government and Private Schools in Kshetrigao Assembly Constituency.
The investigator selected 56 numbers of parents randomly, residing within Kshetrigao Assembly Constituency, Imphal East, Manipur, the children are reading in class I to VIII in government and private schools on the basis of purposive sampling.

The sample is shown in the following ways :

| Government School-28 | | | | Private School -28 | | | |
|---|---|---|---|---|---|---|---|
| Matriculate-14 | | Under Matriculate-14 | | Matriculate-14 | | Under Matriculate-14 | |
| Unemployed 07 | Employed 07 | Unemployed 07 | Employed 07 | Unemployed 07 | Employed 07 | Unemployed 07 | Employed 07 |

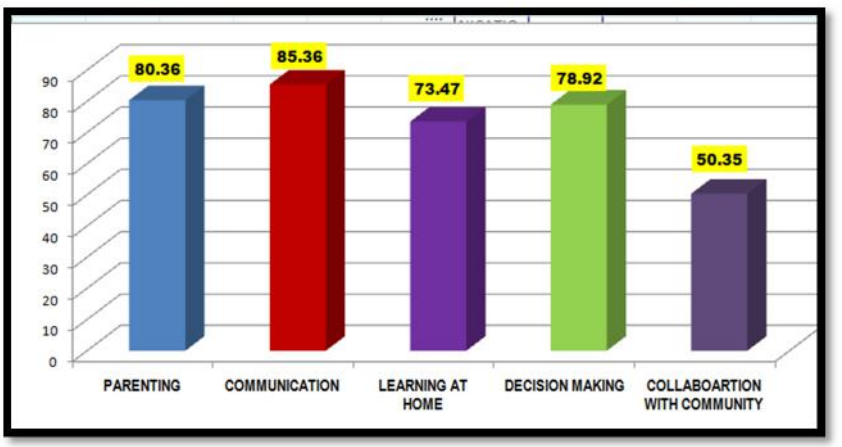
**TOOL USED:** Self developed questionnaire was used to collect the relevant data of the study. This consisted of 25 questions relating to different areas of parental involvement among the parents. The questionnaire composed the statement covering various aspects of parental involvement. The questionnaire contained 25 items under the six areas of parental involvement namely:

1. 5 (five) questions on parenting.
2. 5 (five) questions on communication: school to home, home to school.
3. 5 (five) questions on learning at home.
4. 5 (five) questions on decision making.
5. 5 (five) questions on collaboration with community.

**SCORING TECHNIQUES**: The scoring key of the questionnaire provided to the parents of four schools was in the form of 2 points scale (yes/no) under Thurnstone scale. Scale in which 1 mark was given for right responses, whereas the wrong answer will be awarded 0 mark.

**STATISTICAL TECHNIQUES:** For analyzing and interpreting the result of the study form the collected data, following statistical techniques were used:

1. Percentage
2. Graphical representation and
3. T-test



**ANALYSIS AND INTERPRETATION OF THE PRESENT STUDY:**

**OBJECTIVE-1: TO FIND OUT OVERALL AWARENESS LEVEL OF THE PARENTAL INVOLVEMENT IN THEIR CHILD'S EDUCATION:**

TABLE 1: Overall Awareness Level of the Parental Involvement in Their Child's Education.

| SL.NO. | Q.NO. | RIGHT RESPONSE | % | WRONG RE SPONSE | % |
|---|---|---|---|---|---|
| 1. | 01 | 56 | 100 | 00 | 00.00% |
| 2. | 02 | 36 | 64.28 | 20 | 35.72% |
| 3. | 03 | 54 | 96.43 | 02 | 03.57% |
| 4. | 04 | 25 | 44.64 | 31 | 55.36% |
| 5. | 05 | 54 | 96.43 | 02 | 03.57% |
| 6. | 06 | 54 | 96.43 | 02 | 03.57% |
| 7. | 07 | 53 | 94.64 | 03 | 05.36% |
| 8. | 08 | 41 | 73.21 | 15 | 26.79% |
| 9. | 09 | 44 | 78.57 | 12 | 21.43% |

| | | | | | |
|---|---|---|---|---|---|
| 10. | 10 | 47 | 83.93 | 09 | 16.07% |
| 11. | 11 | 46 | 82.14 | 10 | 17.86% |
| 12. | 12 | 34 | 60.71 | 22 | 39.29% |
| 13. | 13 | 30 | 53.57 | 26 | 46.43% |
| 14. | 14 | 44 | 78.57 | 12 | 21.43% |
| 15. | 15 | 52 | 92.86 | 04 | 07.14% |
| 16. | 16 | 54 | 96.43 | 02 | 03.57% |
| 17. | 17 | 45 | 80.36 | 11 | 19.64% |
| 18. | 18 | 48 | 85.71 | 08 | 14.29% |
| 19. | 19 | 35 | 62.50 | 21 | 37.50% |
| 20. | 20 | 39 | 69.64 | 17 | 30.36% |
| 21. | 21 | 29 | 51.79 | 27 | 48.21% |
| 22. | 22 | 40 | 71.43 | 16 | 28.57% |
| 23. | 23 | 19 | 33.93 | 37 | 66.07% |
| 24. | 24 | 18 | 32.14 | 38 | 67.86% |
| 25. | 25 | 35 | 62.50 | 21 | 37.40% |
| **OVERALL** | | **41.28** | **68.40%** | **31.60** | **14.72%** |

**CONCLUSION** : The overall awareness level of parental involvement in child's education of the parents within Kshetrigao assembly constituency comes out at the percentage of 68.40%. It is therefore, the first hypothesis that was constructed for testing that " There is no significant level of overall awareness on parental involvement in their child's education" is rejected as the level of awareness is very high at the level of 68.40%. However, improvement is required to be improved. And the highest parameter found in communication at the percentage of 85.36%. And lowest found in collaboration with community at 50.35%.

**OBJECTIVE-2: TO COMPARE THE AWARENESS LEVEL OF PARENTAL INVOLVEMENT BETWEEN THE HIGHER AND LOWER QUALIFICATION OF PARENTS WITHIN KSHETRIGAO ASSEMBLY CONSTITUENCY.**

TABLE 2: To compare the awareness level of parental involvement between the higher and lower level of parents within Kshetrigao assembly constituency.

| Sl. No | N | Qualification | Mean | SD | SED | t-test | Df |
|---|---|---|---|---|---|---|---|
| 1 | 28 | Higher | 19.86 | 2.53 | 0.58 | 2.50 | 54 |
| 2 | 28 | Lower | 16.28 | 2.22 | | | |

@ Remark - Significant

**INTERPRETATION:** From the above table no 2 it can be observe that the level of parental involvement in connection with the parents who have higher and lower qualification of junior high school /elementary education within Kshetrigao assembly constituency have the mean score 19.86 and 16.28 with standard deviation of 2.53 and 2.22 respectively .

The t-ratio of the two mean scores comes out to be 2.50 with a standard error of 0.58 which is greater than the level of significance at 0.01 therefore the second hypothesis of the study: "There is no significant difference between the awareness level of parental involvement between the parents, who are higher and lower qualification of schools in Kshetrigao Assembly Constituency" is rejected as there is significant difference between the level of parental involvement towards child's education among the higher and lower qualification within the Kshetrigao assembly constituency. It can be concluded that higher qualification parents of the children who are going at elementary schools are more involved than the lower qualification parents in terms of child's education.

**OBJECTIVE-3: TO COMPARE THE AWARENESS LEVEL OF PARENTAL INVOLVEMENT BETWEEN THE EMPLOYED AND UNEMPLOYED PARENTS OF GOVT. AND PRIVATE SCHOOLS IN KSHETRIGAO ASSEMBLY CONSTITUENCY.**

Table 3: To compare the awareness level between employed and unemployed parents within Kshetrigao Assembly Constituency.

| SL. NO. | N | JOB | MEAN | SD | SED | T-test | df |
|---|---|---|---|---|---|---|---|
| 1 | 28 | Employed | 18.36 | 2.48 | 0.78 | 2.65 | 54 |
| 2 | 28 | Unemployed | 17.78 | 3.41 | | | |

@ Remark- Significant

**INTERPRETATION:** From the above table no.3 it can be observed that of parental involvement in connection with the parents who are employed and unemployed of elementary education within Kshetrigao Assembly Constituency are found to have mean score of 18.36 and 17.78 with standard deviation of 2.48 and 3.41 respectively
The t-ratio of the two mean scores come out to be 2.65 with standard error of 0.78 which is greater than the level of significance at 0.01, Therefore the third hypothesis of the study that "there is no significant difference between employed and unemployed parents between Kshetrigao Assembly Constituency." is rejected as there is significant difference between the level of parental involvement towards child's education among the employed and unemployed parents within Kshetrigao Assembly Constituency.

It can be concluded that employed parents of elementary education are more involved than unemployed parents in terms of child's education.

**OBJECTIVE-4: TO COMPARE THE AWARENESS LEVEL OF BETWEEN THE PARENTS OF PRIVATE AND GOVT SCHOOLS WITHIN KSHETRIGAO ASSEMBLY CONSTITUENCY**

Table 4 : To compare the awareness level between the parents of Private and Govt. Schools in Kshetrigao Assembly Constituency .

| SL. NO. | N | Parents | Mean | SD | SED | t-test | df |
|---|---|---|---|---|---|---|---|
| 1 | 28 | Private | 18.36 | 2.48 | 0.65 | 1.80 | 54 |
| 2 | 28 | Govt. | 15.78 | 3.41 | | | |

@ Remark- Significant

**INTERPRETATION**: From the above table No.4 it can be observed that the level of parental involvement between the parents of private schools and Govt. schools of elementary education in Kshetrigao Assembly constituency are found to have mean score of 18.36 and 15.78 with standard deviation of 2.48 and 3.41 respectively.

The t-ratio of the two mean scores come out to be 1.80 with standard error of 0.65 which is greater than the level of significance at 0.01 therefore the fourth hypothesis of the study that "there is no significant difference between the awareness level of parental involvement between the parents of Govt. and private schools in Kshetrigao Assembly constituency "is rejected as there is significant difference between the level of parental involvement towards child's education among the parents of Govt. and private school within Kshetrigao Assembly Constituency.

It can be concluded that private school parents are more involved than Govt. school parents in terms of child's education.

**MAIN FINDING OF THE STUDY:**

1. The overall awareness level of parental involvement in child's education of the parents within Kshetrigao assembly constituency comes out at the percentage of 68.40%. It is therefore, the **first hypothesis** that was constructed for testing that "There is no significant level of overall awareness on parental involvement in their child's education" is rejected as the level of awareness is very high at the level of 68.40%.

2. Therefore the **second hypothesis** of the study: "There is no significant difference between the awareness level of parental involvement between the parents, who are higher and lower qualification of schools in Kshetrigao Assembly Constituency" is rejected as there is significant difference between the level of parental involvement towards child's education among the higher and lower qualification within the Kshetrigao assembly constituency.
   It can be concluded that higher qualification parents of the children who are going at elementary schools are more involved than the lower qualification parents in terms of child's education.

3. The **third hypothesis** of the study that "there is no significant difference between employed and unemployed parents between Kshetrigao Assembly Constituency." is rejected as there is significant difference between the level of parental involvement towards child's education among the employed and unemployed parents within Kshetrigao Assembly Constituency. It can be concluded that employed parents of elementary education are more involved than unemployed parents in terms of child's education.

4. The **fourth hypothesis** of the study that "there is no significant difference between the awareness level of parental involvement between the parents of Govt. and private schools in Kshetrigao Assembly constituency "is rejected as there is significant difference between the level of parental involvement towards child's education among the parents of Govt. and private school within Kshetrigao Assembly Constituency. It can be concluded that private school parents are more involved than Govt. school parents in terms of child's education.

**REMEDIAL MEASURES SUBJECT TO THE HYPOTHESIS OF THE STUDY:**

1. As far as the **first hypothesis** of the study, The overall awareness level of parental involvement in child's education of the parents within Kshetrigao assembly constituency comes out at the percentage of 68.40%., which is not high. Further improvement is required in the area of (1) Learning at Home (2) Collaborations with community.
2. As far as the **2nd hypothesis** of the study, it can be suggested that parents needs higher qualification, which is very useful in terms of child care and parenting in the modern age of technology. If parents are illiterate, they need the support from home tutor or tuition or coaching, so that their children will get benefit same like that of higher qualification.
3. As far as the **3rd hypothesis** of the study, it can be suggested that earning capacity is must to fulfil the needs of the children. From this we learnt that employed parents are more evolved than unemployed in connection with financial matter and knowledge. It is therefore, unemployed parents needs to improve their earning capacity.
4. As far as The **4th hypothesis** of the study concerned that Private schools are built around open communication between parents and administration, and they make it a priority to involve parents in the community. One of the accepted benefits of private schools is that they provide exceptional and challenging educational experience through extracurricular activities in the schools and also find dedication teachers in private school, while government school has less opportunity for the parents. Govt. schools need improvements upto the level of the private schools.

**OVERALL REMEDIAL MEASURES FOR FURTHER IMPROVEMENT:**

Parents play a vital role in the lives of their children. They are the ones who first teach their children on how to write and read. Parents are considered as role models to every child that, why they should have the potential to model positive attitudes and behaviours. All parents want their children to become successful, caring adults. Many parents involve in the process of imparting education to their children. The more the parents involve in the process of imparting education, the more the children excel in their academic career and to become productive and responsible members of society. The academic achievement of students may not only depend on the quality of schools and the teacher, rather on the extent of parent's involvement has a vital role to play in it. The parent has vital roles to play in the life of a child. Parental involvement is a catch-all term for many different activities including home, good parenting, helping homework, talking to teachers, attending school function through taking part in school governance. When schools, work together when families to support learning children tend to success not just in schools but throughout their lives, as the most accurate prediction of a students, achievement in school is not the income nor the social status but extent to which the student's parents is able to create a home environment that encourages learning and to express high expectations for their children's achievement and future careers.

Parental involvement in school has been linked with academic achievement as parental involvement has a powerful impact on the children's attainment. The impact of parental involvement arises from parental values and educational aspirations and that these are exhibited continuously through parental enthusiasm positive parenting style.

It has been concluded that parental involvement helps children to exhibit more positive attitudes, behaviour and a reduction in negative students behaviours such using drugs, violence and anti-social behaviours as parents involvement increase.

# PHENOMENOLOGICAL ASPECTS OF NOEMA & NOESIS: AN ANALYSIS

**Jayeeta Mazumder**
PhD Research Scholar
Department of Philosophy
University of North Bengal
Raja Rammuhan Pur
Darjeeling
West Bengal

**Abstract:**
'Noema- noesis' concept is one of the most prime concepts of Husserl's phenomenology. In *Ideas,* Husserl introduces the terms to understand the structure of consciousness. Intentional act always has an act of thinking and an object of thinking. So, noesis refers to act of thinking and noema refers to object of thinking. Every intentional act has a noetis content. This noetic content corresponds to noema. Noema is an act of meaning which directs towards intentional object. According to Lyotard, every intentional act has an 'I- pole' and an 'object- pole'. Here, 'I- pole' means 'noesis' and 'object- pole' means 'noema'. Husserl also refers to the noema as the sense or meaning of the act. This paper attempts to show how 'noema- noesis' plays an important character in determining the desired goal in phenomenology.

**Key words:** Noema, Noesis, Phenomenological, Consciousness, Intentional act.

German philosopher Edmund Husserl is known for his revolutionary phenomenological method. He wanted to establish philosophy as a certain science like any other sciences by means of his phenomenological method. There were many concepts in phenomenology that were proposed by Husserl. One of the most important concepts in Husserl's phenomenology is the concept of intentionality. In this concept, his purpose was to search the structure of consciousness first. Because, he thought consciousness was the essential element of the concept of intentionality. Brentano initially introduced the idea of intentionality in the history of philosophy. In his concept, he mainly focused on to analyse

and describe the essential characteristics of consciousness. In Husserl's concept, his attempt was to explore the nature of consciousness. According to this theory, a consciousness is always directed towards an object. It means a consciousness is a consciousness of something. In other words, we may be say that, without anything a consciousness is nothing. There are mainly two parts present in every conscious act, one is act of consciousness and another one is object of the conscious act. These two things make an act as intentional act. For Husserl, consciousness is intentional, that means 'openness to' or 'relation to'. Here the term 'relation' is establish between the 'the act' and the meaning of the act. Husserl introduced the concept of noesis to understand the structure of consciousness in his *Ideas*. Both the term 'noema' and 'noesis' came from the Greek words. He used the term 'noema' in relation to the term 'noesis' to determine the intentional nature of an object. For him, the act of thinking is noesis and object of thinking is noema. Noesis is the thought of an object which was real, but noema was not the real object. It was become 'content' after bracketing. It was because he maintained that if we wanted to reach transcendental subjectivity of pure ego then we had to bracket out the actual existence of the worldly object. So, we are not able to say anything about the content, whether it is real or unreal. It is not necessary to conceive about the existence of perceiving (or judging and so on) an object. The object becomes content here. Content is something that may be real or unreal. This can be compared in context of thinking about golden mountains. The example of golden temple is contextual here because as a phenomenologist our goal is to find out certain knowledge and here in the concept of intentionality, we try to uncover the characteristics of consciousness as well as the process of gaining complete or certain knowledge. Through this concept we do not justify the fact whether the object is real or unreal. Therefore the significance of intentionality concept is an analysis process by which we can acquire knowledge about something which appears in our consciousness. So, as a phenomenologist our research will be concentrated towards in content or noema. According to Lyotard, every intentional act has an 'I-pole' and an 'object-pole'. Here, 'I-pole' means 'noesis' and 'object-pole' means 'noema'.[1] Husserl also refers to the

[1] Lyotard, Jean. Franscois, *Phenomenology*, trans. Brian Beakley, SUNY Press, 1991, p55

noema as the sense or meaning of the act. Sometimes it appears that Husserl uses the terms interchangeably. When we bracket out the real object (noesis) via process of reduction, it converts into content (noema). This often may appear that Husserl's motive is to know about the content or noema rather than knowing the real object. But in reality, use of method of reduction utilizes to gather new knowledge seizing the old. Unlike Kant, Husserl never emphasizes that it is not possible to know the noesis or the real object completely; only thing we are able to know is appearance or phenomena of the object because they are immanent and exist in transcendental state. Husserl applied the term noesis in a broader sense than noema.

Husserl uses the term 'noesis' in broader sense rather than 'noema'. But, there is some controversy regarding the nature of the perceptual noema. According to Smith and McIntyre, the noema is an abstract object, where Sokolowski and Drummond maintain that, the noema is the object we perceive after experience. Husserl describes noesis as the process of cogitation, while noemata as cogitate. Cogitation means the act of consciousness, whereas noemata refers to cogitate or content or object after process of bracketing. According to Husserl, every intentional experience has two phases. These two are- noetic or real phase and noematic or non-real phase. Every noetic phase of consciousness always corresponds to a noematic phase of consciousness. Noesis is a process of reasoning ormeaning that refers to intentional object. According to him, noetic meaning of transcendent object is discoverable by reason, while the noematic meaning of immanent objects is discoverable by pure intuition. Noetic meaning is immanent. Thus, noesis and noema correspond respectively to experience and essence.In the *Investigations* and the *Ideas,* Husserl begins to use the term 'noesis' as 'intentional acts' or 'act- quality' and 'noema' as 'act- matter'.[2]

Husserl's analysis of noema and noesis has given rise to a controversial discussion concerning the nature of the phenomenological theory of meaning and the nature of the intentional object. Noesis is called as concretely complete intentive mental process. Husserl's interest in the noema comes through a consideration of the relation between individual experiential act and its acts of grasping a meaning and referring to an object. After the bracketing of existence of object, Husserl again thinks

[2] Internet Encyclopedia

about the nature of the intentional object. Then, in a meditating stage, he finds a relation between sense and reference which Frege has proposed in his famous article 'sense- reference' in 1891. But, Frege's interest is not in the actual reference but only in the act of referring and intending reference of the act. Husserl posits noema as a single complex entity which takes care both of what Frege includes under the term sense and referential function of the act. In this sense, Husserl does not simply restate Fregean conception in his own terms, but essentially rethinking the relation between the act of meaning and object intends. But, there is a lack of clarity regarding the nature of noema. Is an immanent entity of consciousness a part of an occurrent thought? Or whether it refers to an object beyond the thought? Or whether it is an abstract ideal meaning through which an object is given?[3]

As a matter of fact, when a common person intends to know about any object, he always tries to focus just on the object. When he tries to comprehend a known object again, he applies all the previous knowledge onto that which may cause error in that knowledge. But, after bracketing the object what we should focus is the noema. He acknowledges this kind of reflection is 'unnatural'. This reflection is different from our ordinary act of reflection. If these two reflections are same then no difference exists between phenomenological and semantic or conceptual analysis at all. For this, we have to apply the reduction to create a new kind of reflection, which is self- consciously 'unnatural'. As we know, our consciousness always directs towards an object. When, I think of a box, it is the real object (box), it is the real box that my thought is directed to. Similarly, when I think about a golden mountain, then I focus on an object which is not existent in reality. The noema is not the object towards which the act directs, rather it provides to connect my occurrent thought to the intend object. Through the act of noema we grasp the object; it is the route to the object. So, we may say that our perceptual act has a noetic- noematic constitutions, because our act has a noema.[4]

Husserl's concept of noema and noesis somehow seems like, it leads into Berkeley's idealism and Kant's realism, but the explanation what Husserl gave was quite different. Though, he followed Kant's transcendental idealism. But, there is difference between Kant's phenomena- noumena

[3] Dermot, Moran, *Introduction to Phenomenology,* Routledge. USA, 2000, pp 155-56
[4] Dermot, Moran, *Introduction to Phenomenology,* Routledge. USA, 2000, p157

and Hussserl's noema- noesis. For kant, we can attain the knowledge of phenomena (apperence), but knowledge of noumena (originality of an object) is beyond our thinking. We can only know the phenomena. On the other hand, Husserl said that, we recognize the relation between noema and noesis by the method of reduction. The process of reduction helps us to analyse and understand the nature of both these concept of phenomenology.

## Abstract

In the present work, total 48 species of trees belonging to 21 families of angiosperms have been reported from college campus. Present work is the result of intensive ethnobotanical explorations of herbaceous plants of New Arts commerce college campus Ahemednagar district made during the period from 2019 to 2020. In Ahemednagar district few workers have done ethnobotanical work on some selected and small parts of the district. Pradhan and Singh (1999) have worked out flora of the district. In the present study, ethnobotanical information is collected on 48 trees species belonging to 21 families of angiosperms have been reported from college campus. Out of the 48 trees species collected, Polypetalae have12 families and 30 species, Gamopetalae have04 families and 07 species. Apetalae have 01 families and 03 species, included Monocotyledone have 03 families and 08 species have been collected.

## INTRODUCTION

Tree is a perennial woody plant. It most often has many secondary branches supported clear of the ground on a single main stem or trunk with clear apical dominance. Compared with most other plants, trees are long-lived, some reaching several thousand years old and growing to up to 115 m.

Trees are an important component of the natural landscape because of their prevention of erosion and the provision of a weather-sheltered ecosystem in and under their foliage. They also play an important role in producing oxygen and reducing carbon dioxide in the atmosphere, as well as moderating ground temperatures. They are also elements in landscaping and agriculture, both for their aesthetic appeal and their orchard crops. Wood from trees is a building material, as well as a primary energy source in many developing countries. Trees also play a role in shade, food like fruits, wood, to control the air pollutions etc.

India has two biodiversity hotspots the Western Ghats and the Himalayas, having-vast variety of flora and fauna and ranks $10^{th}$ in the global biodiversity of flowering plants. It is a home for threatened and endemic species that have immense ecological and commercial value. A thorough investigation of our flora has become an urgent necessity not only because of the economic and ecological importance of biodiversity but also of accelerated genetic erosion occurring as consequence of destruction of the forest and other habitat Inventory is a continuous process of searching and re-examining the earlier Findings. Therefore the present research works to generate the detailed floristic data of exotic trees of Ahmednagar. The study was undertaken with the following aims-

Survey, collection and documentation of the trees of Ahemadnagar ,Identification and inventorisation of the trees, Utility aspect of trees of college campus,List of exotic trees.

These floristic data will be useful for students, researchers, forest officers and policy makers etc.

## MATERIAL AND METHODS

The Ahmednagar- city of (Maharashtra state) area was preliminary surveyed for its floristic diversity during the period of 2019-2020 During work regular field visits were made to collect and documentation all the angiosperms. The field data such as habit, habitat, flower colour and odour was recorded. All the collected specimens were identified carefully and were processed as per the conventional methods of drying, poisoning, mounting and labeling (Jain and Rao. 1977; Rao and Sharma. 1990]. The collected specimens were identified by referring to various floras, monographs and revisions. The list of plants and families are arranged primarily as per the classification given by Bcntham and Hooker. The nomenclature of plant has been adapted and updated applying ICON and referring to latest taxonomic literature. For each species, correct botanical name followed by basionym and important synonyms, if any. Wherever necessary to connect the name with T. Cooke's 'The *Flora of the Presidency of Bombay',* Pradhan S. G. & N. P. Singh. *'Flora of Ahmednagar District (Maharashtra/, V.* N. Naik. *'Flora of Maratlrwada,. E.* D. Sharma *A! 'Flora oj Maharashtra Stale'* etc. have been given.

Online nomenclatural database such as 'The International Plant Names Index (1PNI) (http:// www.ipni.org) and $W^3$ Tropicos' (http://wvvw. tropicos.org) published on the internet also used. The citation is followed by short diagnostic description. The information on the phenology, illustrations and a field note on its habitat, identity and any peculiarity are provided.

**Study Area :** . Ahmednagar city .

The present work is done during 2019-2020 in different parts of Ahemadnagar. Old experienced men and women were interviewed to know about the utility of plants growing in their localities. Herbarium specimens of the exotic plants prepared and identification was done following standard literature Cooke, (1967) Singh et al., (2000 and 2001), Cooke, (1958), Pradhan and Singh, (1999). Herbarium specimens are deposited in the New Arts Commerce and Science College in Botany Department herbarium Ahemadnagar ,

### ANNONACEAE

**Annona reticulata** L. Sp. 537.1753; Hook, f & Thorns, in Hook. f. Fl. Brit. India 1: 78. 1872.
**Nativity**- Caribbean & Central America
*Common Name:* Ramphal
Trees. Leaves oblong-lanceolate, minutely pellucid beneath, apex acute, Flowers greenish Yellow, Fruits syncarpous, yellowish-red, Seeds smooth, black.
***Fls. & Frts***. July-November
***Distrib:*** Cultivated for its fruits.
***Uses:*** ***Medicinal***
*Acidity and stomach disorders: One tea cup of leaf extract taken orally twice a day for 7 days.
***Edible:*** Ripe fruits are eaten.
***Annona squamosa* L**. Sp. PI. 537. 1753; Hook. F. & Thorns. In Hook f. Fl. Brit. India 1:78 1872.
**Nativity**- Tropical America & West Indies
***Common Name :*** Sitaphal
Trees, Leaves oblong -lanceolate, glaucous beneath, and pellucid- punctuate. Flowers green.
Fruits yellowish-green. Seeds brownish-black, polished, oblong, c 2.0 x 0.5 cm.
***Fls:*** March-August
**Frts:** April-December
***Uses:*** ***Medicinal***

1. *Skin disease: Leaf paste applied for treating ringworm & itch.
2. Tooth ache: Crushed leaves kept on tooth.
3. To expel lice: Leaves crushed in water and applied on hair.
4. Cuts and wounds: Leaf paste applied for treating cuts, injuries & for healing wounds.
5. Head ache: warm leaves kepts on fore head to treat headache.
6. Boils: Leaf paste with salt applied externally until cure.

*Edible:* Ripe fruits are eaten.
*Vet:* Swelling and Wounds. Leaf paste applied externally.

**BIXACEAE**

*Bixa orellana* L. Sp. PI. 512. 1753.
**Common Name:** Shendri
**Nativity**-Tropical America
Small, evergreen trees, Leaves ovate, acute or acuminate at apex, truncate or subcordate at base. Flowers white or pink, in terminal panicles. Capsules ovoid orsubglobose. clothed with long soft prickles. Seeds trigonous rounded a grooved on the back, pulp red.

**FIs & Frts:** July-Novenber
**Distrib.:** Planted as a avenue tree
**Uses:** Dystenlry: 20-40 ml decocation of leaves taken twice a day for two days.

**TILIACEAE**

***Muntingia calabura*** *L. Sp. PI. 509. 1753; Murthy in Sharma et al. Fl. India 3: 570. 1993; Kothari in Singh et al. Fl. Maharashtra St. Dicot. 1: 411. 2000.*
**Nativity**- Southern Mexico, Central America & Bolivia
***Common Name:*** *Singapore Cherry.*
*Small trees, branches spreading; densely villous, glandular-pubscent. Leaves distichous. Inflorescence sessile, supra-axillary.Petals 5, white, rarely pink. Berries red or yellow, pulp juicy, sweet.*
***FIs & Frts:*** *Throughout year.*
***Distrib:*** *Cultivated in gardens for its fruits.*
***Uses:***
1. *In Mexico the fruits are eaten and sold in markets.*
2. *Leaves are used for making tea.*
3. *Fruits are used in the preparations of jams & jelly.*
4. **In traditional medicine, its flowers can be used as antiseptic and to treat abdominal cramps.**

**RHAMNACEAE**

***Ziziphus mauritiana*** **Lam. Encycl. 3:319. 1789.**
**Common Name: Bor**
**Nativity**-Afghanistan
**Small trees or large shrubs, armed. Leaves ovate-elliptic with rounded ends, slightly oblique at base, glabrous above and white-tomentose beneath. Flowers greenish- yellow. Drupes globose, fleshy, yellow or orange when ripe.**
**FIs. & frts: September-October**
**Distrb.: Common in villages, road side.**
**Uses: Medicinal**
1. **Tonic: leaf paste made in to 1 gm pills taken one are two pills twice a day for 6 days.**
2. **Urinary disorder or blood in urine: One tea cup juice of its stem bark with one tea spoon** *Cuminum cyminum* **seeds and sugars taken orally twice a day for 7 days.**
3. **Painful menstruation : One tea cup juice of its fresh stem bark with 1 tea spoon chilli powder and 7** *Piper nigrum* **seeds powder taken orally once a day for three days at the time of means period.**

**Edible: Ripe fruits are eaten. Fruits are also used to made chutney.**

**Misc:** **Wood is used to making agricultural implements, furniture and house construction.**

**FABACEAE**

***Gliricidia sejrium*** *(Jacq.) Kunth. Ex Steud. Norn. Bot. (ed. 2) Walp. Repert. Syst. 1: 679. 1842; Sanjappa, Legums of India 182. 1991; Kothari in Singh at al. Fl Maharashtra St. Dicot. 1: 770. 2000.* ***Ribinia sepium*** *Jacq. Enum. PI. Carib. 28. 1760.* ***Gliricidia maculate*** *H. B. & K. Nov. Gen. et Sp. 6: 393. 1823.*

**Common Name:** *Giripushpa, Undirmari*

**Nativity**- Mexico

**Fls. & Frts.:** *February - June*

**Distrib:** *It planted also on barren lands as a pioneer plant.*

**Uses:** **Medicinal**

1. ***G. sepium*** *leaves are rich in protein and highly diesible, and low in fiber and tannins. There is evidence of improved animal production (both milk and meat) in large and small ruminants when* ***G.sepium*** *is used as supplement.*
2. *Crude extracts have been shown to have antifungal activity. Reported to be expectorant, sedative and supportive.*

Misc: *1. The* ***Gliricidia*** *has light brown sapwood and dark brown heart wood turning reddish brown on exposure to air. It is hard, coarse textured with an irregular grain, very durable and termite resistant. Wood is utilized for railway sleepers, farm implements, furniture, and house construction.*

***Caesulpinia pulcherrima*** L. S\v\, Obs. 166.1791; Baker in Hook. f. Fl. Brit. India 2: 255. 1878; Cooke, Fl. Pres. Bombay 1: 440. 1958 (Repr); Sanjappa, Legumes of India 13. 1991; Moorthy in Singh et al. Fl. Maharashtra St. Dicot. 1: 796. 2000. ***Poinciana pulcheirima*** L., Sp, PI. 380. 1750. Erect shrubs; branches often unarmed or with few weak prickles. Leaves bipinnate; pinnae 6-8 pairs, leaflets 8-12 pairs, oblong or obovale-oblong. Flowers in terminal racemes. Corolla yellow or red; petals orbicular. Stamens long exerted, Pods flat. thin. Seeds 8-10, smooth.

**Common Name:** Shankasur

**Nativity**-West Indies & Tropical America

**FIs. & Frts.**: Almost throughout year.

**Distrib:** Cultivated throughout in gardens and backyards and near temples.

**Uses:** **Medicinal**

1. Maroon medicine men in Suriname have long known some of the medicinal uses for *Caesalpinia* ***pulcherrima,*** which is known as ayoowiri.
2. 4 gms from the roots is also said to induce abortion in the first trimester of pregnancy.

***Cassia fistula*** L. Sp PI. 377.
1753.

**Common Name:** Bahava

**Nativity** -Tropical South America

*Trees 10 m tall. Leaflets 4-8 pairs, ovate, Flowers yellow, lax, drooping receraes. Pods indehiscent. Seeds numerous, embedded in dark coloured pulp.*

***Fls. & Frts.***: *April-October.*

***Distrib:*** *Occasional in forest edges & road sides.*

***Uses:*** ***Medicinal***

1. *Tonsils: Decoction of fruits for gargling twice a day for 3 days.*
2. *Abortifacienl : Fruit pulp with* Butea monosperma *flower,* Zingiber officinale *rhizome powder and jaggery taken in equal proportion to make it 50 gms, taken orally once a day for 3 days.*

3. *Hair fall. Paste of seeds with* terminalia chebula *fruit pulp and* Cassia tora *seeds taken in equal proportion applied externally once a day for 15-20 days.*

***Edible:*** *Curry is made by flowers.*
***Vet:*** *Removal of Placenta: Handful crushed stem bark powder given orally with warm water.*
*Misc.:* *Wood is used for making agricultural implements and house construction.*

***Cassia siamea*** *Lam Encycl. 1: 648. 1785.*
***Common Name:*** *Kasud.*
**Nativity** -Sri Lanka
*Trees bark grey Leaves abruptly pinnate: leaflets 8-12 pairs, ovate-elliptic or elliptic-oblong coriaceous. Flowers yellow. Pods brown, beaked, compressed, and broadly oblong.*
***Fls.& Frts.:*** *August-June.*
***Distrib:*** *Planted as an avenue tree.*
***Uses:*** ***Misc.***
*1. The wood used for house construction and agricultural implements.*

**Delonix regia** *(Hook.) Raf. Fl. Tell. 2: 92. 1836; Sanjappa, Legumes of India 27. 1991; Moorthy in Singh et al. Fl. Maharashtra St. Dicot. 1: 803. 2000.* Poinciana regia *Bojer ex Hook. f. in Curtis, Bot. Mag. 56: 5. t. 2884. 1829; Hook. f. Fl. Brit. India 2: 260. 1878; Cooke, Fl. Pres. Bombay 1: 442. 1958 (Repr).*
***Common Name-*** *Gulmohor*
**Nativity** -Tropical Africa
**Deciduous trees, Leaves bipinnale; pinnae 10-20 pairs; leaflets narrowly oblong, 6-35 pairs. Flowers 6-12 in axillary racemes. Petals redthe upper white blotches, clawed with crisped orbicular limbs. Stamens 10. filaments long, red in the upper half. Pods woody, dark brown.Seeds 10-50, dark brown; mottled.**
**Fls. & Frts.: February - November**
**Distrib: Cultivated for its ornamental value.**
**Uses: It is fast growing & develops an umbrella-shaped crown, making it a valuable shade.**
**Misc.: The wood is of little value, although it is durable and resistant to water, and has been used for making fences posts.**

***Peltophorum pterocarpum*** **(DC.) Baker ex Heyne, Nutt. PI. Ned. Ind. 2: 755. 1927; Sanjappa, legumes of India 33. 1991; Moorthy in Singh et al. Fl. Maharashtra St. Dicot. 1: 804. 2000.** *Ingapterocartai* **DC. Prodr. 2: 441. 1825.** *Teltophorum ferrugenium* **Benth. Fl. Austr. 2: 279. 1864; Bekerin Hook. f. Fl. Brit. India 2: 257. 1878.**
**Common Name: Sonmohor**
**Nativity** -Australia
**Evergreen trees ; young branches brown tomentose. Pinnae 9-15 pairs; leaflets 10-20 pairs. Flowers in rather dense terminal panicles shorter than the leaves. Petals bright yellow. Pots flat, red-brown, narrowly winged in both surfaces. Seeds 3-6 compressed brown.**
**Fls. & Frts.: September - March**
**Uses:**
1. **fodder: It is suitable for use as a fodder.**
2. **Fuel: The tree is used as fuel wood.**
3. ***Tannin & Dyesruff*: The bark of P. *pterocarpum* has been an important component of the bark or black 'Sogo' dye in Java, used for batik work.**
4. **Medicine ; In traditional, medicine it is used as an astringent to cure or relieve intestinal disorders after pain at childbirth, sprains, bruises and swelling or as a lotion for eye trouble, muscular pains and scores. It is also used for gargles and tooth powders**

**Misc.: 1. The wood has wide variety of uses, including cabinet-making.**

***Saraca asoca*** (Roxb.) Wild. In Bluema 15: 393. 1968; Sanjappa, Legumes of India 35. 1991; Moorthy in Singh et al. Fl. Maharashtra St. Dicot. 1: 793. 2000. ***Jonesia asoca*** *Roxb.* In Asiat. Res. 4: 365. 1795; Wight, Ic. t 206. 1839. ***Saraca indica*** *auct.* Non L. (1753); Baker in Hookf. Fl. Brit. India 2: 271. 1878; Cooke, Fl. Pres. Bombay 1:456. 1958 (Repr).

**Common Name:** Sithecha Ashok

**Nativity** -Tropical South America

Trees. Leaflets oblong-elliptic, 4-6 pairs. Flowers fragrant, numerous in dense axillary racemes, bracteoles 2, amplexicaule, coloured. Calyx segments 4. Stamens 7 or 8, much exerted; anthers purple. Pods black, tapering at both ends. Seeds 4-8, slightly compressed.

**FIs. & Frts.:** December - May

**Uses:** **Medicinal**

1. It is use in treatment of excessive uterine bleeding extensive in India.
2. The plant is used also in dysmenorrheal and for depression in women.
3. It is useful in menorrhagia (scant menses), dysmenorrheal (painful menses, menstrual cramps), depression, bleeding hemorrhoids, uterine fibroids.

**MIMOSACEAE**

*Acacia nilotica* (L.) Willd. Ex Del. ssp, Indica (Bth.) Brenan in Kew Bull. 12: 84. 1957*;* ***Mimosa nilotica*** L. Sp. PI. 521.

**Common Name:** Babhul.

**Nativity** -North Africa

Trees bark longitudinally cracked. Pinnate 4-7 Pairs; leaflets 10-25 Pairs, linear-oblong. Flowers yellow in globode heads. Pods green, flat, beaked, shortly stalked. Seeds 2-12 per pod.

**FIs. & Frts.**: More or less through out the year.

**Distrib:** Common in west lands and road sides.

**Uses:** **Medicinal**

1. Burned wounds: Stem bark burnt to ash and applied with coconut oil for healing wounds.
2. Spermatogenesis: Leaves bark and fruit taken in equal amount and extract prepare with cow milk and sugar taken 100 ml twice a day for 21 days.
3. Menorrhagia: 20-25 ml extract of the bark with 250 ml of cow milk taken once a day for 5 days.
4. Cooling agent: 20 ml of root extract taken with one glass of butter milk once a day for 7 days.

**Vet:** Stomach ache: 100 ml decoction made by 50 gm fresh stem bark and given orally twice a day to cattle.

**Misc:**

1. Wood is used to making agricultural implements, furniture and house construction also used as fuel

***Acacia longifolia*** *Willd. Sp. PI. 4: 1052. 1806; sanjappa, legumes of India 49. 1991; Londhe in Singh et al. Fl. Maharashtra St. Dicot. 1: 825. 2000.*

**Common Name:** *Australian babhul.*

**Nativity** -Australia

*Trees; phyllodes narrowly lanceolate, falcate; conspicuously 3-5 nerved. Flowers in axillary spikes shorter than phyilodes. Corolla bright yellow, twice as long as calyx. Pods twisted. Seeds black, polished, and covered by silvery funicle.*

**FIs. & Frts.:** *August - November*

**Distrib:** *Planted by social forestry department and also as avenue trees.*

**Uses:**

1. *Fooder.*

2. *Flowers rich in pollen, they are often used in fritters.*
3. **Acacia** *seeds are highly nutritious and contain approximately 26% protein, 26% available carbohydrate, 32% fiber and 9% fats. The fat content is higher than the most legumes.*

**Misc:** *Yellow dye prepared from flowers and green dye is obtained from seed pots. The extensive root system of this plant helps to prevent soil erosion.*

***Albizia lebbeck*** *(L.) Bnth. In Hook. London J. Bot. 3:87. 1844 p p.('lebbek') & in Trans. Linn. Soc. 30: 562. 1875 p.p; Mimosa lebbeck L. Sp. PI. 516. 1753.*

**Common Name:** *Shirish.*

**Nativity** - Tropical America

*Trees. Leaves abruptly pinnate; leaflets 4-9 pairs, lateral, elliptic-oblong, terminal ovate-oblong. Flowers white, fragrant. Pods, pale yellow. Seeds 4-12.*

**FIs. & Frts.:** *March-December.*

**Distrib:** *Common along roadside.*

**Uses:** **Medicinal**

1. *Snake bite: One tea cup extract prepared by handful stem bark. Three doses to be given after the interval of 30 minutes as an antidote to snake bite.*
2. *Cooling effect: Powder of tender leaves with rhizome powder of Curcuma longa taken in equal proportion and made in to pills. One or two pills taken twice for 15 days.*
3. Dog bite: 10-12 seeds soaked for half an hour in human milk and dried (this is done repeatedly for 10 times) then seeds are crushed small pills are prepared. 3 pills are taken once to treat dog bite.
4. "Cough: Root bark crushed & soaked in goat urine. 5 gm eaten with ***Piper belle*** leaf.
5. Jaundice: 50-60 ml of leaf juice with 250 ml rice flour 'roti' prepared & eaten once a day until cure. Or seeds paste applied over eye once a day for 15 days.

***Vet:***

1. *Joint pain & swelling in legs: One Liter extracts 100 gm stem bark given orally once a day until cure to cattle.
2. *Stomach ache: Leaves along with ***cassia auriculata*** leaves in equal proportion crushed together & given orally thrice a day for 3-4 days to cattle.

***Misc:*** Wood is used house construction & packing cages.

***Calliandra haematocephala Hasskacl,*** Retzia 1: 216. 1855; Naluurk Tijdschr. Ned.- Indie 10: 216. 1856.

***Common Name****:* Powder puff tree

**Nativity-** Tropical America

A shrub with brown bark. Leaves alternate, bipinnate, up to 14 cm long, pinnae paired. 10-11 cm long, leaflets opposite, more or less sessile, 4-8 pairs, 1.5-3 cm long, lanceolate, apex acute slightly curved on one side near the apex, coriaceous. Flowers in axillary heads, scarlet. Calyx campanulate toothed. Corolla funnel-shaped, deeply 5 cleft. Stamens indefinite, monadelphous at the base, filaments filiform, much exserted. Ovary stalked, many ovuled; style filiform, stigma minute, capitate. Pods strap shaped, slightly falcate, flat.

***Fls. & Frts.:*** November - April

***Distrib:*** Ornamental cultivation: grown in gardens and parks.

*Uses:* ***Medicinal***

1. Antibacterial study evaluated ethanolic extractable constituents of bark ***calliandra haematocephala*** against selected bacteria. Results showed varied antibacterial activity.
2. Gastro protective study of butanolic extract for gastro protective effect in acute gastric lesion induced by acidified alcohol showed a gastro protective effect with moderate control gastric lesion and inhibition of hemorrhage and necrotic aspects of tissue injury.

*Leucaenu leucocephala*
**Common Name :**
Subabhul
**Nativity**- Colombia
Tree, forked when shrubby and branching strongly after coppicing, with greyish bark and prominent lenticels Leaves bipinnate with 4-9pairs of pinnae, variable in length up to 35 cm, with a large gland at the base of the petiole; leaflets 11-22 pairs/pinna, acute. Flowers numerous, in globose heads with a diameter of 2-5cm, stamens (l0 per flower) and pistil 10 mm long, anthers pilose, dehiscing at dawn. Pod 14-26cm x 1.5-2 cm, pendant, brown at maturity. Seeds 18-22 per pod , 6-10 mm long, brown.

**FIs. & Frts.:** Throughout the year.
**Distrib:** Suitable as an ornamental and roadside landscaping species.
**Other Uses:**
1. Unripe pods and seeds of all subspecies have been used by the native inhabitants of Mexico and Central America as a food or medicine since ancient times. Very young shoots used as a food by villagers in Thailand. Highly valued as ruminant forage and as a fuel wood by subsistence and semi-commercial farmers throughout Southeast Asia and parts of central Asia and Africa.
2. Timber: *L. leucocephala* has hard wood, with pale yellow sapwood and light reddish-brown heartwood the wood is known to be medium density and dry without splitting or checking. It is strong, medium textured, close grained and easily workable for a wide variety of carpentry purposes.
3. Gums and resins: Gum arises from Leucaena stems under ill-defined conditions of injury and disease or from sterile hybrids, especially *leucocephala* x *L. esculenta.* The gum has been analyzed and found similar to gum arabic and of potential commercial value.
4. Tannin or dyestuff Red. brown and black dyes are extracted from the pods, leaves and bark.

***Pithecellobium dulce*** ***(Roxb.) Benth. In Hook London J. Bot 3: 199. 1844*** *(Pithecolobium);* ***Baker in Hook. f. Fl. Brit. India 2: 302. 1878; Cooke, Fl. Pres. **Common Name:** ***Wilayati Chinch***
**Nativity**- Mexico
**FIs. & Frts.:** ***January - June***
**Distrib:** ***Planted in garden and also naturalized.***
**Uses:**
1. ***The seed pods contain a sweet pulp that can be eaten raw or prepared as a smoothie.***
2. ***Wood is hard and lasting but because of irregular shape of bole and branches its use for rough carpentry works.***

***Prosopis julifera*** ***(Sw.) DC. Prodr. 2: 447. 1825; Sanjappa Legumes of India 72. 1991; Londhe in Singh et al. Fl. Maharashtra St. Dicot. 1: 824. 2000.*** Mimosa julifera ***Sw., Prodr. 85. 1788.***
***Common Name:*** ***Vilayati babhul***
**Nativity**- Mexico
***Scandent shrubs or small trees; branches zigzag. Leaves bipinnate; pinnae 2-4 pairs; leaflets 20 pairs. Flowers in dense axillary, peduncled spikes. Corolla pale yellowish, twice as long as calyx. Stamens exerted, anthers crested with deciduous gland. Seeds 10-20.***
**FIs. & Frts.:** ***August - June***
**Distrib:** ***Planted in garden and also naturalized.***
**Uses:**

1. *Mesquite pods are among the earliest known foods of prehistoric man in the new world. Today flour products made from the pods are still popular, although only sporadically prepared, mostly by Amerindians.*
2. *Pods are made into gruels, sometimes fermented to make a mesquite wine. The leaves can be used for forage.*

**Misc:** *The wood is used for parquet floors, furniture, and turnery- items, fencepost pilings, as a substrate for producing single-cell protein, but most of all for fuel.*

***Samanea saman*** *(Jacq.)* **Merr.** *in J. Wash. Acad. Sci. 6:46. 1916;Sanjappa, legumes of India 72.1991; Londhe in Singh et al. Fl. Maharashtra St. Dicot. 1:828. 2000.*
**Common Name:** *Parjanya Vriksha*
**Nativity-** Tropical America
*Unarmed trees. Leaves bipinnate; pinnae 4-6 pairs; leaflets 2-8 pairs. Flowers in long peduncled. globose heads.Corolla pale pink. Stamens long exerted filaments purple.*
*Seeds 6-10. embeded in brownish black, sweet pulp.*
**FIs. & Frts.:** *March-July.*
***Distrib:*** *Planted as avenue trees.*
**Uses:** **Medicinal**
*The root decoction is used in hot baths for stomach cancer in Venezuela Rain Tree is a traditional remedy for colds, diarrhea, headache, intestinal ailments and stomachache.*

**COMBRETACEAE**

***Temimtia catappa*** **L. Syst. Nat. ed. 2 : 674. 1767.**
***Common Name :*** **Deshi Badam**
**Nativity-** Tropical Asia

**Trees; branches in horizontal whorls. Leaves crowded at ends of branches obovate. Flowers sessile, in axillary spikes, white or yellowish-green. Fruits, ovoid or ellipsoid, usually reddish-green**

***Fls. & Frts.:*** **April-October.**
***Distrib.:*** **Avenue tree & cultivated for their fruits**
***Uses:*** ***Medicinal***
1. **Headache. Leaves dipped in edible oil heated over fire & applied externally.**

***Edible Use:*** **Fruits & seeds are edible**

***Terniinalia chebula*** **Retz. Obs. Bot. 5:31. 1788.**
***Common Name:*** **Hirda**
**Nativity-** Tropical Asia
**Trees, Leaves elliptic-ovate or elliptic-oblong. Flowers yellow, in simple or sparsely branched spikes, Drupes, elliptic or ovoid, 5-ribbed when dry.**
***Fls. & Frts.:*** **February-May.**
***Distrib:*** **Occasional in forests**
***Uses:*** ***Medicinal***
1. **Cough & asthma: One table spoon paste of fruits or stem bark taken with water twice a day until cure.**
2. ***Piles: Powder of its fruits with jaggery in equal proportion made in to 1 gm Pills taken one or 2 pills twice a day for 7 days.**
3. **Tooth ache: Fruit powder with *Emblica officinalis* fruit powder, 'crystal salt' and catechu, each in equal proportion prepared mixture used like tooth powder.**

4. ***Eye infection: Paste of fruit pulp with black salt one type of salt and butter milk applied externally daily night 7 days for eye infection.**
5. ***Hiccough: 40-60 ml decoction of fruit pulp with** *Ricinus communis* **roots.** Plumbago zeylanica **whole plant in equal proportion taken orally to check hiccough.**

**Edible Use:** **Seed cotyledons are eaten by children.**

**Vet:**

1. ***Tongue sores: 100 gm powder of fruits crushed given orally with water & powder of applied on tongue of cows.**
2. ***Expel foetus. Fruits or stem powder applied externally and put the fetus in.**

***Terminalla arjuna***

**Common Name :**

**Arjuna**

**Nativity-** Tropical Asia

**Tree up to 25 meter height; bark grey, smooth; leaves sub-opposite, 5-14 * 2-4.5 cm, oblong or elliptic oblong, glabrous, often in equilateral, margin often crenulate, apex obtuse or sub-acute, base rounded or sometimes cordate; petioles 0.5-1.2cm; glands usually two. Flowers small, white. Fruit 2.3-3.5 cm long, fibrous woody, glabrous with 5 hard wings, striated with numerous curved veins.**

**FIs. & Frts.:** **April - July**

**Distrib:** **Grows well along bank of streams, rivers, ravines, dry water courses.**

**Uses:** **Medicinal**

1. **The Arjuna was introduced into Ayurveda as a treatment for heart disease.**
2. **It is traditionally prepared as a milk decoction, arjuna in the treatment of wounds, hemorrhages and ulcers, applied topically as a powder.**

**MYRTACEAE**

***Callistemon citrinus*** **(Curits) Skeels in US Depl of Agric Bur PI. Ind. Bull. 282: 49. 1930; Kulkami in Singh et al. Fl. Maharashtra. St. Dicol. 2: 16. 2001.**

**Common Name: Bottle Brush**

**Nativity-**Australia

**Small trees. Leaves sessile, linear, sharp pointed, margins often revolute. Flowers sessile in axils of deciduous bract.Petals pink or red, deciduous. Stamens numerous; filaments red Capsules globose. Seeds numerous, minute, black.**

**Fls. & Frts.:** **September - February**

**Distrib:** **Planted in gardens.**

**Uses:** **The herbicide Mesotrione was developed as a synthetic analogue of leptospermone, a natural herbicide produced by the roots of** Callistemon cilrinus.

***Eucalyptus globules*** *LwiU.* **Rel. Voy. Rech. Perouse 1: 153, t. 13. 1799; Kulkarni in Singh et al. Fl. Maharashtra. St. Dicot. 2: 18. 2001.**

**Common Name: Nilgiri**

**Nativity-**Australia

**Trees, bark, flake off into long stripe. Leaves lanceolate. Flowers large 1-3 together on short peduncle.Calyx tube hard, bluish white, lid of calyx and corolla conical.**

**Fls. & Frts.:** **February - May**

**Distrib:** **Planted in gardens and avenue tree.**

**Uses:** **Medicinal**

1. **The oil is used as a flavoring agent in cold and cough medicines.**
2. **It is used in disinfectants, antiseptic liniments, ointments, toothpastes, and mouthwashes.**
3. **It is used by veterinarians for treating influenza in horses, distemper in dogs, and septicaemia in all animals**

***Psidiuni guajava*** **L. Sp. PL 470. 1753.**

**Common Name: Peru**

**Nativity-**Tropical America

**Shrubs, barks smooth peeling off. Leaves oblong-elliptic, pubescent on both sides. Flowers white, axillary, solitary. Berries oboid. pulpy.**

**Fls. & Frts.: November-June.**

**Distrib.: Planted for edible use.**

**Uses: Medicinal**

1. ***Diabetes: 40-60 ml decoction of handful leaves taken orally daily-early in the morning once to control the diabetes. (Or) 4-5 leaves soaked in water for overnight & water taken early in morning.**

**Edible use : Fruits are eaten**

**Misc : Wood is used for house construction.**

***Syzygium aimini (L) Skeels in U.S. dept. Agric. Bur PI Industr. Bull. 248:25. 1912*** *Myrtums cumini* ***L. Sp. PI. 471 1753***

**Common Name:** ***Jambhul***

**Nativity-**South East Asia

***Trees, bark thick, rough. Leaves elliptic-oblong or elliptic or ovate, subcoriaceous, close veined. Flower white, sessile or shortly pedicelled, crowded in heads on ends of laxly punicled-cymes. Berries, oblong or ovoid, purple, fleshy.***

***Fls. & Frts.: March-June.***

**Distrib.:** ***Common in villages & occasional in forests.***

**Uses: Medicinal**

1. ****Kidney Stone. Fruits directly eaten for dissolving kidney stones, (or) Fruit powder taken 1 spoon with water twice a day for 15 days to dissolve kidney stone.***
2. ***Stomach ache: One tea spoon powder of stem bark with pinch of salt taken orally for stomach ache.***
3. ***Toothache: Leaf juice is used for gargling and for teeth ache bleeding gums.***
4. ****Body ache and Rheumatism: One tea cup juice of handful stem bark with goat milk taken orally twice a day for 15 days.***
5. ***Tonic and Blood purifier: 40-60 ml extract of stem bark with goat milk in equal proportion taken orally twice a day for 15 days.***
6. ****Bone fracture: One table spoon powder of stem bark with 7*** *Piper nigrum* ***seeds powder taken twice a day for 30 days.***
7. ****Piles: One small glass decoction daily morning for 10 days.***

**Edible use : Ripe Fruits are eaten**

**Vet : Loose motions : One liter extract of 50gm fresh stem bark given orally a day thrice until cure.**

**Misc : Wood is used for making agriculture implements and house construction.**

**LECYTHIDACEAE**

***Conroupitu guianensis*** **Abul. PI. gui. 2: 708, t. 282. 1775; Pradhan in Singh el al. Fl. Maharashtra. St. Dicot. 2: 23. 2001.**

Common Name: **Kailashpati**

**Nativity** -Tropical America
**Large trees, usually unbranched straight trunk bark thick rough . Leaves crowded at the ends of branches, elliptic, serrate. Flowers in pendent racemes. Fruits large**
**FIs. & Frts.:** **Throughout the year.**
**Distrib:** **Cultivated in gardens.**
**Edible Uses:** **Fruits are edible**
**Misc:** **The flowers used to scent perfumes and cosmetics. The hard shells of the fruit are sometimes used as containers.**

**LYTHRACEAE**

***Lawsonia incrmis* L. Sp PI. 349.1753.**
**Common Name**: **Mehendi**
**Nativity** - Middle East
**Shrubs, spiny. Leaves sessile, lanceolate. Flowers white, in terminal & axillary cymes. Capsules globose.**
**FIs. & Frts.:** **June-December.**
**Distrib:** **Common in hedges & villages.**
**Uses:** **Medicinal**
1. **Tuberculosis: Paste of handful of tender leaves with seven *Piper nigrum* seeds taken early in the morning once a day for two weeks to treat tuberculosis.**
2. ***Clod & Fever: 10ml juice of leaves with equal amount of milk taken orally once a day for 3 days.**
3. ***Loose motion: Leaves with *Cuminum cyminum* seeds, sugar & "karjura' *Phonenix dactylifera* dried fruit taken equal proportion boiled in butter taken orally daily thrice for 2 days.**

**Misc:** **Coloring material from used to dye hands & nails**

**PUNICACEAE**

***Punica granatum* L. Sp PI. 472. 1753.**
**Common Name:** **Dalimbs**
**Nativity** -Asia
**Shrubs or small trees. Leaves oblong-lanceolate. Flowers red. Fruit a berry with numerous seeds surrounded by juicy pulp.**
**Fls. & Frts.:** **August-November.**
**Distrib.:** **Planted for its fruits.**
**Uses:** **Medicinal**
1. **Cooling effect: 'Sharbat' prepared by barks & root which is used as cooling.**
2. **Loose motion. Flowers paste with rice washed with water made 10 gm pills taken 1 pill twice a day for three days.**
3. ***Jaundice: 50-60 ml juice of fruits taken orally twice a day for 10-15 days.**

**Edible Use:** **Fruits are eaten.**

**SAPOTACEAE**

***Manilkara zapota* (L.) van Royen in Blumea 7:410. 1953; *Achrus sapota* L. Sp. PI. 2:470 1762.**
**Common Name**: **Chiku**
**Nativity** -Asia
**Evergreen trees. Leaves alternate, elliptic to elliptic-lanceolate. Flowers white. Berries globose. Seeds ellipsoid, black.**
**Fls. & Frts.:** **More or less throughout the year.**
**Distrib:** **Cultivated for its fruit.**
**Edible Use:** **Ripe fruit is edible.**
***Mimusops elengi* L. Sp. PI. 349. 1753**

**Common Name**: **Bakul**

**Trees evergreen. Leaves elliptic. Flowers white, fragrant, solitary or in clusters of 2-6. Berries ovoid, yellow when ripe, Seeds solitary, compressed, ovoid, shining, brown.**

**Fls. & Frts.:** **January-March.**

**Distrib.:** **Planted as a avenue tree.**

**Uses:** **Medicinal**

**Tooth decay and tooth ache: Decoction of stem bark used for gargling daily thrice a day for tooth decay.**

**Edible Use:** **Ripe fruit is edible.**

**APOCYNACEAE**

***Alstonia scholaris* (L.) R. Br. Mem. Wem. Nat. Hist. Soc. 1: 76.1811;** *Echites scholahs* **L. Mant. PI. 53. 1767. Common Name: Saptaparni**

**Nativity** - MalAsia

**Trees. Leaves whorled, obovate or oblong-oblanceolate. Flowers greenish-white, in umbellately branched, capitates cymes. Follicles cylindric. Seeds compressed, rounded with hairy fringe at both ends**

**Fls. & Frts.:** **December-March.**

**Distrib:** **Cultivated along the road sides & house gardens.**

**Uses:** **Medicinal**

**"Intestinal worms: 10-20 ml leaf extract or 1 teaspoon powder of inner stem bark**
**taken orally once a day for 3 days.**

**BIGNONIACEAE**

***Spathodea campanulataV*. eauv. Fl. Oware Benin 1: 47, t. 27. 1805; Cooke, Fl. Pres. Bombay 2: 410. 1958 (Repr.); Londhe in Singh et al. Fl. Maharashtra St. Dicot 2: 584. 2001.**

**Common Name**: **Pichakari, Akash Shevga**

**Nativity** - Colombia

**Evergreen or semideciduous trees. Leaves opposite or in whorls of 3, 1-pinate; leaflets 3-19. Flowers in erect, many flowered dense racemes. Calyx leathery, boat-shaped, dark brown tomentose. Corolla campanulate; lobes undulate margined, acute.**

**Fls. & Frts.:** **January - May.**

**Distrib.:** **Grown in parks, gardens and roadsides.**

**Uses:**

1. **Stem bark is used as a paste for wound healing.**
2. Flowers are applied to ulcers.
3. Timber is used for paper making.
4. Hunters reported to extract poison arrow poison from seeds.

***Jacaranda acutifoliu*** Humb. And Nonpl. **PI.** Acquin. 1: 59. t. 17. 1806; Londhe in Singh et al. Fl. Maharashtra St. Dicot. 2: 581. 2001.

**Common Name:** Nilmohar

**Nativity-** Brazil & NW Argentina

Deciduous trees.Leaves opposite, 2-pinnate, pinnate 14-24 pairs with as odd terminal which is longer and acuminate; leaflets elliptic-oblong.Flowers in loose, terminal, panicles.Corolla dark blue or pink.Capsules suborbicular. hard, dark brown or black.Seeds many, winged.

**Fls. & Frts.:** March - October.

**Distrib.:** Grown as avenue tree and in gardens

**Uses:**

1. The flower extract was screened for its use as an acid base indicator in various acid titrations.
2. *Jacaranda acutifolia* flower extract alone can serve the indicator in weak acid and weak base titration, where generally mixed indicators are employed.

***Tabebuia argentea*** (Bur. and Schum.) Britt. In Sc.Surv. Porto Rico & Virgin Isl. 6: 197.1925; Londhe in Singh et al. Fl. Maharashtra St. Dicot 2: 584. 2001. *Tecoma argenteaBur.* and Schym. in Mart. Fl. Bras. 8 (2): 332. 1845.

**Common Name:** Silver trumpet

**Nativity**-Paraguay

Deciduous trees. Leaves opposite, digitate; leaflets 5. Flowers in terminal, captitate racemes. Corolla rubular-funnel sharped; limb irregularly spreading; lobes obtuse.

**Fls. & Frts.:** March - April.

**Distrib:** Grown in gardens.

**Uses:** Ornamental

**VERBENACEAIE**

***Tectona grandis*** L. f. Suppl. 151.1781.

**Common Name:** Sag

**Nativity** -Indonesia

Trees, Leaves elliptic or obovate, upper surface glabrous & rough, lower surface stellate grey or pawny tomentose inflorescences of erect, terminal panicles. Flowerswhite. Drubs subglobose.

**FIs. & Frts.:** August-December.

**Distrib.:** Abundant in dry deciduous forests.

**Uses:** **Medicinal**

1. *Cramps & Rheumatism: 20-30 ml decoction of stem & wood powder taken orally once a day for 1 week.
2. Stomach ache: 1 tea cup extract of stem bark twice only.
3. For promoting fertility: 1 tea cup extract of root bark with 7 *Piper nigrum* seeds powder & 7 oil drops given orally.

**Misc:**

1. Wood is good quality timber, used to making agriculture implements, furniture, house construction, walking sticks & musical instruments.
2. Leaves are used to making plates.
3. Flowers used in religious ceremonies (Ganesh Chaturthy)

**MORACEAE**

***Artocarpus heterophyllus*** **Lam. Ency. 3: 210. 1789; Laxmi and Venkanna in Singh et al. Fl. Maharashtra St. Dicot. 2: 930. 2001 . A** *mtegrifolia* **auct. Non L. f. 1781; Grah. Cat. 192. 1839; Hook.f. Fl. Brit. India 5: 541.1886; Cooke, Fl. Pres Bombay 3: 158. (Repr.)**

**Common Name**: **Phanas**

**Nativity** -South East Asia

**Large, deciduous trees. Inflorescence from main branches, enclosed by glabrous, deciduous, leafy scales.Male flowers in heads. Perianth 2-lobed. Female protruding. Syncarps oblong-globose, perianth, thick, fleshy. Seeds elliptic-oblong.**

**FIs. & Frts.:** **January - March.**

**Distrib:** **Cultivated in gardens for their fruits.**

**Uses:** **Medicinal**

1. **The leaves of** *Artocarpus heterophyllus* **tree are useful for curing fever, boils and skin diseases. When heated, they prove useful in curing wounds.**

2. **To heal ulcers, the ash of** *Artocarpus heterophyllus* **leaves is burnt with corn and coconuts hell and used either alone or mixed with coconut oil.**
3. **The roots** of *Artocarpus heterophyllus* **tree forms the remedy for skin diseases, fever and diarrhea.**
4. **The latex of fruits is can be mixed with vinegar to heal abscesses, snakebites and glandular swellings.**

**Edible:** **Ripe fruits are eaten.**

**Misc:**

**The wood of** *Artocarpus heterophyllus* **tree is widely used in manufacturing musical instruments, furniture, doors, windows and roof constructions.**

***Ficus benghalensis* L. Sp. PI. 1059. 1753.**
**Common Name: Wad**
**Nativity-**Asia
**Trees, with numerous aerial roots from spreding branches; twigs. Leaves ovate. Figs sessile, axillary, paired, ripening, orange-red, dipressed-globose. Tepals free, 2-3 in male, 3-4 galls & female flowers: anthers shortly mucronate.**
**FIs. & Frts.:** **April-June.**
**Distrib:** **Common along road sides in villages & towns.**
**Uses:** **Medicinal**

1. **Stomach ache: 5 drops of latex mixed with small amount turmeric powder, made into small pills taken orally twice a day for 2 days.**
2. *** Spermatogenesis:** *Phonix dactylifera* **seeds are taken out from fruits & plants latex is filled in it & kept overnight & 2 fruits eaten for about 15 days to promote spermatogenesis & reduce sterility. Same is also considered as tonic.**
3. **Tonic: Tender prop roots extract are given as tonic to children.**
4. ***Colic: 10 gm tender leaves crushed with rice & taken in equal proportion, add milk, crushed & taken orally once a day until cure.**
5. ***For promoting fertility: Tender prop roots with** *Azadirachta indica* **seeds taken in 2:1 proportion crushed with human milk, made in to 2gm pills 1 pill taken twice a day on third day to 4th day during menses period.**
6. **Foots cracks: Latex applied externally until cure**
7. **Eye infection & good vision: Latex with sugar applied on layer twice a day for 15 days.**
8. **Boils on head: Ash of matured leaves with** *Lawsonia inermis* **leaves and catechu taken equal proportion applied externally with coconut twice a day for 3 days.**
9. **Blood dysentery: 1 tablespoon of latex with jaggery taken orally with milk twice a day until cure.**

**Vet:** **Bone fracture inner bark wrapped over fracture arm and tied from outside & extract of propped given orally** *Vi* **liter twice a day until cure.**

**Misc:**

1. **Timber for house construction & used as fuel**
2. **Leaves are used for making plates.**
3. **Leaves used in religious ceremonies.**

**CASUARINACEAE**

**Casuarina equisetifolia** ***L. Amoen. Acade. 4: 143. 1759.***
**Common Name:** ***Sum***
**Nativity-**Madagascar

*Tall tree, braches modified into clododes. Leaves reduce to scales. Flowers small. unisexual monoecious. Carpophores pubescent, cone like.*

**FIs. & Frts.:** *February-March*
**Distrib.:** *Cultivated on field edges.*
**Uses:** *Wood is used for house construction*

**STRELITZIACEAE**

***Ravenala imidagascariensis*** *J. F. Gmel. Syst. 567. 1791; Baker in Hook.f. Fl. Brit. India 6: 198. 1890; Cooke, Fl. Pres. Bombay 3: 250. 1958 (Repr); Lakshmi in Sharma et al Fl. Maharashtra St. Monocot. 90. 1996, Naik, Fl. Marathwada 2: 837. 1978.*

**Common Name:** *Traveler's palm*
**Nativity-** Madagascar

*Robust, tall arborescent herbs. Leaves distichous, closely setting, ovate-oblong, spreading, Flowers sessile, subzygomorphic, in compact monochasial cymes, each flower enclosed in bract. Stamens 6. Capsules linear-oblong.*

**FIs. & Frts.:** *October - January*
**Distrib:** *Commonly cultivated in gardens.*
**Uses:** **Medicinal**

1. *It is widely used in folklore medicine in the treatment of diabetes and kidney stone problems.*
2. *Seeds were reported to be antiseptic*

**ARECACEAE**

***Caryota urens*** *L. Sp. PI. 1189. 1753; Beck. & Hook f. in Hook f. FI. Brit. India 6: 422. 1892; Cooke, Fl. Pres. Bombay 3: 315. 1958 (Repr.); Lakshmi in Sharma et al. FI. Maharashtra St. Monocot. 1: 189. 1996.*

**Common Name :** *Bherli mad*
**Nativity-** Tropical Asia

*Large trees, covered with corky edges. Leaflets fasciculate or alternate, serrate-toothed on margins, margin irregularly lobed.Flowers numerous, in pendulous, many spadices. Dupes, reddish. Seeds 2, hemispheric, black, striated.*

**Fls. & Frts.:** *Throughout the year.*
**Distrib.:** *Frequent on walls of forts, in the forests.*
**Uses:** *Food, beverage, fiber, timber, ornamental.*

***Cocos nucifera*** *L Sp. PI. 1188. 1753*

**Common Name** : *Naral*
**Nativity-** Malaysia

*Trunk, annulate, thickened at the base. Leaves, leaflets equidistant, linear-lanceolate, spadix, stout, androgynous, simply panicled; branches bearing scattered female flowers towards their bases & numerous males above. Fruits-3 gonously obovoid or sub globose, green or yellowish.*

**Fls. & Frts.:** *Throughout the year.*
**Distrib.:** *Cultivated on field edges.*
**Uses:** **Medicinal**

1. *Wounds: Ash of external fibers of dried fruits applied with coconut oil.*
2. **Mouth ulcer: gargling by flower juice twice a day until cure.*
3. **Psoriasis: fruit fiber ash with snake fat "Kubusam" applied externally twice a day until cure of psoriasis.*
4. **Wounds due to burning: coconut oil with lime water taken in equal proportion boiled & applied externally until cure.*
5. **Sores on tongue : Fruits ash with few* ***Piper longum*** *seeds powder applied with honey until cure.*

***Edible Use :*** *Fruit endosperm eaten raw & also used various food preparation.*

***Vet :*** **Wounds: ash of fruits fiber applied externally until cure*

***Misc :***

1. *Leaves used in preparation roof of marriage mandapas & huts.*
2. *Dry husk used for making ropes.*
3. *Fruits offered to god & goddesses.*
4. *Leaves used for decoration during socio-religious ceremonies.*
5. *Leaves used for making brooms, mats & basket, etc.*

***Roystoneu regia*** *(H.B. & K.) Cook in Bull. Torreu Bot CI. 531. 1901; Naik. Fl. Maharashtra 2: 888. 1998.* **Oreodoxa regia H.** *B. &K. Nov. Gen. and Sp. 1: 305. 1815; Cooke, Fl. Pres. **Common Name:** *Bottle palm*

**Nativity-**Mexico & Central America

*Large trees. Stems annulate, bottle* shaped. *Leaves large crowded at the neds top,* petioles enclosing *stem; leaflets linear-ensiform. Flowers* gTeenish-*white, numerous in spathes. Spadices 3-4 simultaneously. Drupes small, elliptic ovate, stiated.*

**Fls. & Frts.:** *September - March*

**Distrib.:** *Commonly cultivated in gardens as avenue trees.*

**Uses:** **Medicinal**

*1 .They are also used as a treatment for diabetes.*

**Misc:**

1. *The seed is used as a source of oil and for livestock feed.*
2. *Leaves are used for thatching and the wood for construction.*
3. *The roots are used as a diuretic and for that reason they are added to* **lifey,** *a Haitian drink, by Cubans of Haitian origin.*

**Thrinax barbadensis** *Lodd. In Mart. Hist. Nat. Palm. 257. 1838; Blatt. Plams Brit. Ir Ceyl. 68. 1978 (Repr); Lakshmi. in Sharma et al. Fl. Maharashtra St. Monocot. 205. 1996.*

**Common Name:** *Fan shaped palm*

**Nativity-**North America

**Medium sized hermaphrodiate palm. Leaves fan-shaped, broadly orbicular. Flowers numerous, greenish-white in spadix. Spadices usually longer than leaves and pendent in fruiting. Seeds globose.**

***FIs. & Frts.:*** **September - December**

***Distrib.:*** **Commonly cultivated in gardens.**

***Uses:*** **Ornamental.**

***POACEAE***

***Bambusaarundinacea*** **(Retz.) Wild. Sp.Pl. 2:245. 1799;Hook.f. Fl.Brit. Ind.7:395. 1896;Blatt. And McC, Bombay Grass. 283. 1935; Cooke, Fl. Pres..Bombay 3:569. 1958(Repr.) Laksmi. In Sharmaet al.Fl. Maharashtra St. Monocot. 412.1996. Bambusa arundinacea Retz. Obs. Bot. 5:24. 1788.**

***Common Name :*** **Kalak.**

**Nativity-** Myanmar

**Perennials. Culms tufted, 24-25 m high, erect, branched, armed; nodes prominent. Culms-sheaths coriaceous, variable in shape Leaves linear-lanceolate, with stiff apex. Penicles compound, with loose clusters of spikelets on spicate branch lets. Spike lets oblong, 3-6 flowered Grains oblong**

***FIs. & Frts.:*** **December-January.**

***Distrib:*** **Wild or cultivated forming dense strand.**

***Uses:*** **The interior stalks or stems (bamboo hol!ows)of female plant containing silicious concretions(deposit) called tabasbir (bamboo**

**Manna) in the interior of stem of B.arundinaceae; young shoots, leaves, articulations, seeds and roots.**

***Bambusa vulgaris*** **Schrad.in Wendl. Collect. PI. 2:26,147,1810; Hook. f.,Fl. Brit. Ind., 7:391.1896:BlattandMcC, Bombay Grass. 3:282.1935; Cooke, Fl. Pres. Bombay 3:570. 1958 (Repr); Lakshmi. in Sharma et al. Fl. Maharashtra St. Monocot 413. 1996.**

***Common Name :*** **Bamboo.**

**Nativity-**South East Asia

**Perennials, Culms tufted. Terete, 6-15 mhigh, erect: nodes hardly raised with usually a ring of brown hairs. Leaves linear-lanceolate, apex twisted. Penicle large, with clusters of spikelets.**

***FIs. & Frts.:*** **Rare, once in every 20 years.**

***Distrib :*** *Cultivated in region.*

***Uses :***

**Medicinal**

1. *Bombusa vulgaris has historically been used to treat coughs and excess mucous and help alleviate fever.*
2. *The prebiolic xylloligosaccharides found in Bombusa vulgaris may contribute to in improved intestinal health and reduced risk of digestive disorder.*

**Other**

1. *Bamboos used for building houses and bridges.*

**RESULTS**

**In Ihe present work, total 48 species of trees belonging to 21 families of angiosperms have been reported from college campus. Present work is the result of intensive ethnobotanical explorations of herbaceous plants of New Arts commerce college campus Ahemednagar district made during the period from 2019 to 2020. In Ahemednagar district few workers have done ethnobotanical work on some selected and small parts of the district. Pradhan and Singh (1999) have worked out flora of the district. In the present study, ethnobotanical information is collected on 48 trees species belonging to 21 families of angiosperms have been reported from college campus. Out of the 48 trees species collected, Polypetalae have12 families and 30 species, Gamopetalae have04 families and 07 species. Apetalae have 01 families and 03 species, included Monocotyledone have 03 families and 08 species have been collected.**

**Table 6.1 - Differentiation of Dicotyledons and Monocotyledons in the area of study**

| Sr. No. | Class | Subclass | Family | Species |
|---|---|---|---|---|
| 1 | Dicots (d) | Polypetalae(p) | 12 | 30 |
| | | Gamopetalae (g) | 04 | 7 |
| | | Apetalae (a) | 02 | 03 |
| | | Total (p + g + a) | 18 | 40 |
| 2 | Monocots (m) | | 03 | 08 |
| | Total (d+m) | | 21 | 48 |

**Table 6.2 - Number of dicot and monocot Species, Genera and Family**

| Number | Species | Genera | Families |
|---|---|---|---|
| **Monocots** | **08** | **07** | **03** |
| **Dicots** | **40** | **16** | **18** |

## CONCLUSION

Ahemednagar district is rich from ethnobotanical point of view. Indigenous people use several plants for medicine, food, house construction and other purposes. Their life is clearly related to the plants growing in nearby areas. Although, medicinal uses of plants reported in the present work is less known or new and infact are much less than what still remains with indigenous people.

Ethnobotanical explorations during the period from 2019 to 2020 in the present study area lead to the following conclusions.

A medicinal use in major literature adds significance to present work and indicates the need of thorough scrutiny or investigations for the active principles of these plants.

Such studies may provide information to the workers in the field of pharmacology and phytochemistry in screening of individual species, for particular disease. Further investigations on utilitarian plants to check their efficacy and safety are necessary, so that those can be further utilized for medicinal purposes in proper way.

The formulation herbal drugs either with single plant or a mixture of more than one plant, with appropriate mode of use and dosage should be encouraged. As the plants are being used successfully by the tribal.

# ROLE OF WOMEN EDUCATIONA IN MADRAS STATE- A STUDY

**Dr.G.Chandrasekaran**
Assistant Professor of History
Devanga Arts College
Aruppukottai
Virudhunagar District, Tamil Nadu

The spread of education brought about changes that were more fundamental in the case of women than men, "To men it brought a new conception of the world of its material resources,[1] ethical standards and political possibilities but to women it brought slowly but potently a new conception of themselves. If men reassessed themselves as citizens in a new India, women revalued themselves as human beings in a social order."[2] The influx of Western education into the country had its impact on women's emancipation.[3] This system of education introduced a new spirit of understanding, a better appreciation of life in the community and gave an impetus to rethinking of values. The individuals educated under this system openly criticised social evils such as early marriages, polygamy, dowry, infanticide, sati and temple dancing. They severely criticised the seclusion of women and their colossal illiteracy.[4]

Srinivasa Pillai, a great social reformer and his likeminded colleagues founded the 'Hindu Progressive Improvement Society' in November 1852 in Madras. Srinivasa Pillai, had a long record of service in various charity organisations including Monegar choultry, the Pachaiyappa's charities and the Madras Literary Society. The major aims of the society were the promotion of widow remarriage, the encouragement of female education and the upliftment of depressed classes. In 1864, 'Veda Samaj' was established in Madras, along the lines of Keshab Chandra Sen's *Brahmo Samaj of Bengal. The members of the Veda Samaj pledged their support to women's emancipation by providing female education; propagating widow remarriage, restraining child marriage etc. The Veda Samaj was reorganised and renamed as the Brahmo Samaj of South India *i n 1871. Theosophy started spreading in South India after 1881. The first branch of the Society in the South was founded in Tirunelveli. Later the Madras branch of the Theosophical society was formed with Ragunatha Rao as President and T.Subha Rao as Secretary.

In the midst of religious and communal fanaticism, some liberal minded Brahmins in the Madras Presidency advocated for widow remarriage. In 1874 the 'Madras Hindu Widow Marriage Association' was formed, to encourage the marriage of Hindu widows. Highly educated people like Rama Iyengar and Muthusamy Iyer became active members. A South Indian Conference, was convened by the Hindu Women's Marriage Association on 31st December 1884 at Madras, but the participation was restricted only to the graduates, presumably with a view, to enlist the support of the educated young men in the cause of social reforms. Some of the important resolutions passed in the conference were, that every graduate should promote female education and widow remarriage and discourage infant marriage.[5] Both the press and public platforms were literally used for spreading these ideas among the people. To some extent the role played by the journal Indian Social Reformer was remarkable. The journal was not satisfied with mere passing of resolutions advocating the education of women or condemning infant marriages. On the other hand the journal considered it as a "Sad waste", for it felt that the "urgent need was the reconstruction of the society" on the national basis of equality of sexes.

Veerasalingam (1848-1919) was a great pioneer in widow remarriage movement in the South. He started 'Widow Remarriage Association' in Andhra in 1880. He gave public lectures and wrote articles in many Telugu periodicals. Veerasalingam, performed the first widow remarriage in Rajamundry in 1881. He opened a 'widow's Home at Madras in 1900, another at Rajamundry in Q 1905 for the benefit of widows.[6] Widow remarriages were celebrated in different parts of the state under the leadership of various social reformers. In Madras Chentsal Rao and Raghunatha Rao were responsible for the spread of widow remarriage movement.

The persons who married the widows were mostly educated. Some of them came forward with the spirit of reform, some others for publicity and few for the sake of financial assistance which was offered by the Widow Remarriage Association. In Madras G. Subramania Iyer, a learned Brahmin and the founder of the news paper The Hindu in English and Swadesmitran in Tamil challenged the practice of perpetual widowhood and fought against it by conducting the marriage of his widowed daughter. His daughter Sivapriyammal lost her husband at her 13th age. From that time onwards he began to propagate for widow

remarriages. As a challenge to the society, he took his widowed daughter and a boy of his choice to Bombay in 1889, and conducted their marriage in Bombay. The marriage created some sort of antagonism into the minds of orthodox Brahmins against G. Subramania Iyer. But, the Brahmin community could not excommunicate him due to his hold on government and the public." But the work of social reformers and the government did not bear fruit owing to the deep-rooted religious faith and superstitious beliefs and social customs.

Poet Subramania Bharathi championed the cause of women in Madras Presidency. Periyar E.V. Ramaswamy broke with the Congress in 1925 on the issue of Brahmin-Non Brahmin problem and started Self Respect Movement with a view to bringing about an all-round change in the Tamil Society. He opposed the purdha system, and held that Purdha system would pave the way for the decline of the society. He encouraged widow remarriage, education of women and the careers of women.

The Western education had made the girls less particular about tradition, religious beliefs, caste rules and rituals. It has produced a situation in which young girls did not have the time to learn rituals from their mothers and grandmothers. The educated wife has less of traditional culture to pass on
to her children. For girls, the attainment of puberty is no longer manned by the elaborate ritual that characterised it a few decades ago. The shaving of a Brahmin widow's head, as part of the funeral rite for her dead husband has also largely disappeared. Widow Remarriage is no longer strongly disapproved. The native associations, voluntary organisations added impetus to this awakening. The beginning of the twentieth century witnessed the rise of a large number of women's organisations. Women themselves became conscious of their right to receive education and became more self reliant. A number of enlightened women then started establishing women's associations in different parts of the country with a view to carry out the social, political and cultural advancement of Indian women. Women's Indian Association, Madras, founded in May 1917 was the first organisation "whose aim was to be All-India in scope, to include as members all types of Women, who were residents in India and to birfd them together for mutual service and the good of the country. The Indian Ladies Samaj was organised in Madras during 1923-24. Its aim was to protect minor girls from undesirable associations and guardianship, and to educate and train them for an

independent and honourable profession. All these created some sort of awareness for the emancipation of women.

In 1929, the Subbarayan's ministry abolished the system of separate hostels for the Brahmins, Non-Brahmins and the Christian girls studying in Madras city and introduced the common hostel system where caste and religion were no criteria. Likewise hostels for widows were thrown open to all communities. Women's Indian Association, Madras, 1917 The Women's Indian Association, was started by Mrs.Dorothy Jinarjadasa at Adyar, Madras on 8th May 1917. She was sincerely assisted by an Irish lady Mrs.Margaret Cousins. Its first president was Annie Besant, and for eight years Dorothy Jinarjadasa remained its honorary secretary. The aims and objects of the association were the following:

1. To present to women their responsibilities as daughters of India.
2. To help them to realise that the future of India lied largely in their hands, for as wives and mothers they had the task of training, guiding and forming the character of the future rulers of India.
3. To bind women into groups for the purpose of self development and education, and for the definite service of others.
4. To secure for every girl and boy the right of education through schemes of compulsory primary education, including the teaching of religion.
5. To secure the abolition of child marriage and to raise the age of consent for married girls to sixteen.
6. To secure for women the vote for municipal and legislative councils as it was or might be granted to men.
7. To secure for women the right to be elected as members on all municipal and legislative councils.
8. To establish equality of rights and opportunities between men and women.[7]

The Association which had a central, organisation at Adyar, Madras, had grown steadily ever since. Within the first year of its conception thirty three branches were formed in many towns. Branches were formed wherever possible with a local secretary to arrange the work suitable to local conditions. Local branches were self governing and made their own arrangements and managed their own finance. Through correspondence with the head quarters secretary and through the official

magazine of the association Stri Dharma, the different branches and members were united with a sense of strength, courage and inspiration.

The association had a committee, consisting of a President, a Vice President, a General Secretary, a Treasurer and an Advisory Council of the Secretaries of all the branches. Branches of Women's Indian Association Tamil
Coimbatore, Enangudi, George Town, Madras, Kuttalum, Kumbakonam, Madurai, Mayavaram, Namakkal, Pollachi, Salem, Tanjore, Thirumiyachur, Trichinopoly, Vellore, Vettaikaranpudur and Viralimalai.[8]

The modern women are no longer bound by false standards of modesty and reserve. Owing to the growth of Female Education, she no longer considers feminine etiquette to be one of total subordination and helpless dependence on man. She has the confidence, born of ability, to compete with others on an equal footing. To accelerate the process of the emancipation of women, the educated elite among women were engaged in a variety of public activities. Annie Besant, Muthulakshmi Reddi and Kamala were the pioneers in this regard. The Movement was geared to securing equal rights in inheritance, marriage, requirement of the consent of both parties for marriage and the right to share equal responsibilities along with men in offices as well as in domestic affairs.

The Dawn of the Twentieth Century marked the beginning of a new era in
the annals of the History of Education of Women in the Tamil Country. During
the British Period, the diffusion of Western and Non-Hindu Ideas created a stir in the Tamil Country. The British Administrative System was based on the 'Rule of Law' and the reforms of Bentinck and Dalhousie and no wonder the Missionaries questioned the unequal treatment of the various sections in Hinduism. Further, the reformist zeal encouraged Mrs. Annie Besant to organise the Theosophical Society at Adayar near Madras. The Society stood for the Emancipation of Women in the Tamil Country. This was followed by the establishment of 'The Women's Indian Association,' and 'The South Indian Women's Association' which stood for the abolition of social evils and thereby helped the elevation of the status of women in the Tamil Country. Besides, the birth of a prose literature in the Tamil Country in the Nineteenth and Twentieth Century's served as a powerful weapon of thought and expression. The writings of Bharathiyar

and Bharathidasan gave new impetus to fight for their rights.[42] The emergence of Social Reformers like Periyar E. V. Ramasamy Naicker and Thiru V.Kalyana Sundaram created an atmosphere, conducive to Social Reforms in the Tamil Country. [43] While these measures paved the way for social reforms in general and the Emancipation of Women in particular, it was the introduction of Western System of Education that had created the climate for these reforms.[44]

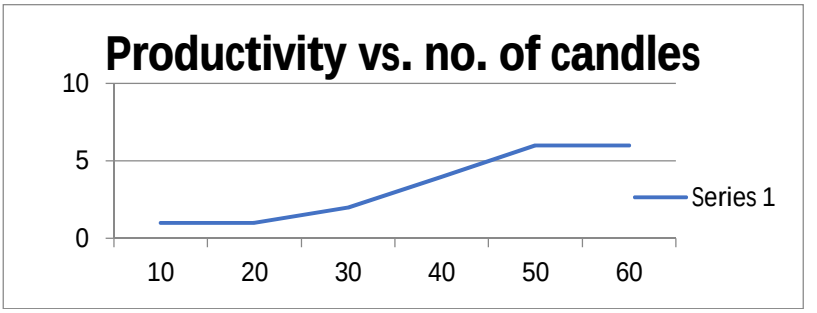
# INDUSTRIAL PSYCHOLOGY

**Dr. Vineet Kumar Purohit**
Associate Professor
Mahaveer Institute of Technology and Science
Jadan ,Pali

## Introduction

It is a branch of psychology came in the existence in 1901. It's the 3/4$^{th}$ of all the branches of psychology, to understand the human problem in job area. It's the result of tremendous expansion of industries. It deals with the process of the people to adapt survive and flourish. It is a broad field to understand mental processes and behaviours. It's useful in selection of workers, development and management to take safety measures, are the scope of this branch. Resist the changes is the human tendency. Not to accept and maintain 'Status – quo' and change is hurdle to them. Learning has some characteristics:



i. It changes behaviour if there is no change, there is no learning.
ii. Learning comes through experience.
iii. Change may last for some time.
iv. Thinking for other person, is also very important because it depends on how we are different from others.

## Hawthorne Experiments

These are the series of experiments to investigate many of the dependent variables amongst the workers. The most significant result of this is, the fact that workers get affected with these factors outside the job to the greater extent those who are in job itself and organise into informal social groups.

Hawthorne Studies can be divided into five parts.

i. **Experiments on illumination:** In this experiment, workers in certain groups were tested for the productivity on the bases of light produces by different number of candles and finally the result was that the numbers of candles were changed to high production.

ii. **Relay assembly test room:** The initial purpose of this experiment was to exercise more direct control over the workers that could have influenced the performance by dividing people in small groups in separate room away from regular working force. It's simple and high repetitive. It requires an accurate rate of production. It has two parts.

a) Second relay assembly test room
b) Mica Splitting test room

In which the bases of wage payment remain at the same individual pace rate but changes in working condition are similar to test room experiments.

iii. **Mass interviewing programme:**
It's an interview process that is done for the improvement in supervision to improve moral. It's helpful for securing the information provided by employees.

iv. **Bank wiring observation room:**
This part of Hawthorne experiment is done to get more exact information about social groups within the company. It was obtained to get information from large number of employees.

v. **Personal counselling:**
All the four studies indicate lack of accomplishment, relationships of employees and importance of this work fifth study is an effort to bring this important area into focus. There were two objectives, first was non-authoritative and impartial to diagnose the problem of employees and teach them to work in supervision. The second was to improve the method of communication within the company.

## Work Place

Environment and features of this affects it. The problem of high production and making to work more pleasant has been approached through the introduction of change in milieu.

There is a fundamental difference in this approach which in high in efficiency is attained as a result of time motion studies. Generally it's related with the size of work area other approaches are refine selection tech to high efficiency. There are many more factors responsible that can affect efficiency which are as follows:

i. **Music in industry:** Music during repetitive factory work results in a slight increase in production. There is a need amongst office workers. Employee may affects to get influence by the music to receive drastic positive, effects to success. Music broadcast by radio requires minimum investment but it has a disadvantage also. FM stations generally have less numbers for the industrial use.

ii. **Noise:** It is a distracter and interfering with efficiency in an experiment to determine the effects of noise for example, a typist become used to the clatter of the machine because it's a necessary part of its work where is a person sitting next to him gets irritated. Reports about noise tells us whatever is irritating is harmful. It may not be taken emotionally otherwise it may curtail the production and bring deafness in some situations.

iii. **Colour:**
Colours give a very important sensation in the mind of workers to work. It's an article which can remove your tiredness and increase production. We can receive greater scientific results with safety measures thorough colours in the factory. The evidence on the relation between colour in industry and increase the production is based upon data. It is most important factor.

iv. **Miscellaneous:**
Cafeteria, snack bar, library, soda fountain, sand witch and ice cream such things always create problem to management but it's for psychological relaxation for people.

v. **Light (Illumination):**
Artificial lighting can't match up with the day light because important parts of lighting which is considered is intensity, glare, location and combo of artificial and natural light.

**Leadership**

It is seen in all organisations. This is an essential group. Every employees or employer need a leader. Elective selection is totally dependent on management to assess and evaluate workers. Top management means big boss, middle management is boss, front management are supervisors. These three work on different level of duties.

**Leadership Criteria:**

Are you respected by everyone?
Are your rules are followed?
Do you look out for employees?

Do workers like you?

There are two approaches to study leadership:

i. **Trait approach:** In this we study about simple people having Quite Simple logics for success good leaders correspond good people only.
ii. **Behavioural approach:** This leadership has
We see enthusiasm among people they must have super intelligence, initiative power aggressiveness.

**Types of Leadership**

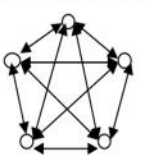
➔ **Imperial:** In this we talk of experience of individual. Generally they have:
i. Wide variety of examined group behaviour.
ii. Principles of leader behaviour.
iii. Tested theory of their investigation.

➔ **Humanistic:**
It's the II group in leadership theory. It talks about employees who have developed their modals in more inductive fashion. This theory is lacking infactual support, its difficult to evaluate workers on these theories.

**Organisation Culture**

Organisational psychology occupies itself with the study of organisational processes. It talks about development theories and its behaviour to improve any organisation. It is closed on one of its boundaries to human relation psychology. It's touched with experimentation psychology.
Organisation is group of worker who meet twice or thrice in a day. They have different mentality, taste, and working ability and so on.

**Organisational Structure:**
Any organisation is linked in three different types of linkage system:



i. **Serial:** In it, each unit is linked with next unite with each side.

ii. **Radial:** In this, each unite is connected to central unit.

i. **Circular:** Each unit is linked to each other for betterment of productivity.

**Exchange Theory**

The essential element of this theory is to see the operation of organisation as the establishment of balance between workers and management.

**Group Theory**

Group theories are those which take the pts of you about human relation, co-operation, and friendliness in primary group it's critical to a successful organisation because management had to made aware of the importance of social aspects of work and its influence upon the success.

**Value Theories**

The conflict of value systems, because many theories tell us value theories are totally different from each every individual in any organisation, to determine the effectiveness and Stability of the organisation system.

**Structural Theories**

An organisation is not a machine and it is inappropriate to imply mechanistic theories on it.. Organisation should be taken as living organisms as they are dynamic, adaptive to change and highly responsive to the world around them.

**Situational Theory**

Many theories of organizational behaviour have taken the situation as the focal point for solving the conflict between individual at organizational goals. It may be some attempts to shape the tasks to fit the organization.

## Conclusion

Industrial Psychology demands change in attitudes and outlooks of the employees. One importance of IP is to govern the employee's behaviour in workplace, school and colleges. Learning is very important in Psychology

**Abstract**

The unique aspect of the temples of India lies in the stories that they have to tell. Every temple can be called a storehouse of multitudes of myths and legends that are distinctive. These myths and legends not only evoke wonder but also compel the people to think. Chengannur Mahadeva Temple, located in the Alappuzha district of Kerala is a home to many exciting legends that break the existing stereotypes in the Hindu tradition. This temple also has a *Bhagavathi* temple that celebrates the menstruation of the Goddess Parvathy. Nature, myth and divinity combine together in this ritual where the idol is believed to menstruate and blood stains are spotted in the *udayada* of the Goddess. Instead of believing it a taboo, from the ancient times people celebrate this as a sacred event that is a symbol of fertility, marriage and birth. This festival is known by the name *thriputharattu.* Other than this, the temple houses several other interesting myths that amaze the listeners. The temple is a perfect example of worshipping the Female power of nature. This paper analyses the menstruation myth and festival that surrounds the Chengannur Mahadeva Temple. This paper also explains the other myths associated with this temple and the importance of nature that is brought out by the eco-narrative of the myths and legends that live through this temple

**Key Words:** Eco Narrative, Menstruation Festival, Sacred, Mythology, Landscape,Ecofeminism

## Introduction

"Myth basically serves four functions. The first is the mystical function,... realizing what a wonder the universe is, and what a wonder you are, and experiencing awe before this mystery....The second is a cosmological dimension, the dimension with which science is concerned – showing you what shape the universe is, but showing it in such a way that the mystery again comes through.... The third function is the sociological one – supporting and validating a certain social order.... It is the sociological function of myth that has taken over in our world – and it is out of date.... But there is a fourth function of myth, and this is the one that I think everyone must try today to relate to – and that is the pedagogical function, of how to live a human lifetime under any circumstances" (Campbell,1 988). The different enchanting phenomena in nature that couldn't be explained at a time when science was non-existing and mythology and legends served this purpose. Oral tradition has paved way for the transfer of mythical stories in the form of folktales and legends that give prominence to human attributes (through gods and goddesses) and explores the relationship between man and nature through the technique of legend mapping. The primitive and indigenous

people have worshipped nature and its beings and considered them as divine or sacred. This results in the merging of nature and myths thus creating a plethora of sublime rituals and ceremonies that become the background of many cultures and traditions. India is one such country that houses multitudes of exotic rituals and ceremonies that evoke wonder and excitement to the whole world. This paper tries to unravel the so called taboo of menstruation in India by bringing into light the legends and ceremonies surrounding the Chengannur Temple that is known for its rare 'menstruation festival' of Goddess Parvathy. A lot of myths surround this temple out of which this paper focusses on the *Thripputhu* festival of Goddess Parvathy. This unique festival not only celebrates the menstruation of goddess Parvathy, but also unearths the menstruation wisdom by breaking the existing taboos and stereotypes surrounding menstruation. It also gives human attributes to the goddess by believing the goddess to be menstruating which is a natural phenomenon in the female body.

**Unravelling the Myths and Legends of Chengannur Mahadeva Temple**

Chengannur Sree Mahadevar and Sree Parvathy temple is located in Chengannur, Alappuzha district of Kerala, in the southern bank of river Pamba. It is believed that this temple was built by the great architect Perunthachan, the son of Rishi Vararuchi. According to the legend or *ithihasa*, all *devas*, *asuras*, sages etc assembled in Kailash for witnessing the sacred event of the marriage between Lord Shiva and Goddess Parvathy. This made all the weight of the world get accumulated in one side and this besca a matter of worry to the *Thrimurthi's* (Brahma, Vishnu and Shiva). And to bring balance to the world, they asked sage Agasthya to go to Shonadri (present day Chengannur) and meditate. Agasthya was reluctant to do so as he would miss the auspicious marriage but agreed to do so when Shiva promised to visit him in Shonadri along with Parvathy after the marriage.

After the marriage Lord Shiva and Parvathy came to Chengannur to meet Agasthya but during this time the Goddess came of age and her first menstruation started. Everyone was ecstatic as a woman's first menses was celebrated like her first wedding. The Goddess' thripputhu (menses) was celebrated like a festival with all the festivities and rituals. The temple was constructed after this as a reverence to this incident as the place was declared as an auspicious place. The idol of Lord Shiva was installed facing the east and Goddess Parvathy facing the west. On one occasion the head priest noticed a red stain in the udayada (inner skirt) of the Goddess and he took the cloth to his wife and the women of the house. The ladies inspected the cloth and confirmed that it was menstrual blood. The idol of the Goddess was shifted to another room where she was given all the needed devotion and care by the village women. On the fourth day, the idol will be taken to the Pamba river accompanied by aarattu (a sacred procession) by placing the idol on the back of an elephant and given a ritualistic bath in the river. Idol is bathed in oil, milk etc. After the bath, the Goddess is taken to the main temple and installed there again. It is believed that conducting the pooja with natural products and bathing the Goddess in the river water will wash away all the tiredness caused during the menstrual flow and thus refreshes the idol. Nature and beings of nature play an important role in all the rituals surrounding the thripputhu aarattu. Earlier blood stains were seen every month but now-a-days the Goddess bleeds only once in three or four months and it gives rise to the thripputhu aarattu.

At a time when menstruation is believed to be a taboo, this ritual and the people of this area believe that this is a very powerful event and praying to the Goddess during this time can cure diseases like infertility, irregular periods and can also solve marital discourses. They believe menstruation to be a life giving process and thus celebrate it. The udayada of the Goddess with the blood stain is considered as a very auspicious possession to own and thus people from far away places visit this place to buy this clothe. Once, a British resident named Mr Munro laughed at this ritual and stopped all grants for the ritual, as a result his wife started bleeding heavily and no doctors could make her alright. At last the village people advised him to pray to the Goddess and apologize. After offering the prayers, his wife was cured just like a miracle.

According to another myth, there was a small rock in the place of the temple and once a tribal women was sharpening her knife in that rock and suddenly she saw blood blowing from that rock. She was shocked and informed the people. The residents decided to construct a temple and treat the rock as sacred. Some believe that the place got it's name Shonadri from this incident. The next myth is centered around Lord Shiva and Sathi devi. Sathi once attended an Yajna conducted by her father Daksha. But her father insulted Shiva and this broke her. She immolated herself because of the sorrow and thus burnt herself. Shiva was heartbroken and started to do the thaandava (which had the power to destroy the world) carrying the body of his wife. Mahavishnu cut the body of Sathi into 108 pieces with his Sudarshana Chakra in order to stop the wrath of Lord Shiva and thus save the world from destruction. It is believed that the different parts of her body fell on different regions and the 108 regions came to be known as Shakthi Peeths. Shonadri was the place where the womb of the Goddess fell. The idol was first made in stone and then was remade in panchaloha (5 kinds of metals) to save the idol from a predicted fire.

Chengannur temple is not the only the temple in India with a menstruating Goddess idol. Kamakhya Temple in Guwahati is also known for the Kamakhya Devi who is believed to menstruate every year in the month of Ashaad (June). She is also called as the 'Bleeding Goddess' as the idol turns red every year. There is also another speciality with this temple as the sanctum sanctorum of this temple consists of the Female reproductive organ which is called the 'mythical womb' with the vagina of the Goddess. This is one of the Shakthi Peeths in the myth of Shiva and Sathi as it is believed that it is at this place that Sathi Devi's womb and vagina fell. The people of this place also celebrate the menstruation festival of the Goddess in all colour and splendor. They even celebrate it as the time for women and young girls to celebrate, wear new clothes etc.

Shonadri was selected for the Sacred meditation by rishi Agasthya to balance the world due to its natural landscape and due to its location in the banks of river Pampa. Shonadri itself means 'red mountain'. Nammalvar, the great poet has sung about this temple. What gives more prominence to this temple is that all the myths associated with this temple connects the Female Goddess with the elements of nature, thus building a bridge between women and nature which gives forward the theory of Ecofeminism. Even the natural elements like rock, milk, mountains, animals like elephant that appear

in the myths related to Chengannur temple defines an eco narratives that defines the mythical truth.

**Conclusion**

At a time when modernity has conquered culture, skylines has conquered nature and greed has conquered humanity, people go behind taboos that can even be the base of existence. When the thoughts of people are blurred by stereotypes, these myths and legends of the ancient times function as eye openers through several cultures and ceremonies that worship the importance of processes like menstruation. Even the myths related with this temple are related with the five elements of nature i.e. the panchabhootas. Water, fire, earth, wind and sky work as purifying factors in the rituals and stories thus defining the sacredness of nature. This legends are myths are not only stories but also convey the truth that menstruation itself is a life giving process which regenerates life and sustains humanity. It also throws light on the aspect of how nature and women coexist as one embracing the state of motherhood which needs to be celebrated and worshipped rather than bullied and hided. So it is best said that "The female form lends itself best to represent matter because both create life within themselves. The male form lends itself best to represent soul because both create life outside themselves" (Pattanaik,2008). Menstruation should not be treating as an impurity rather it should be celebrated as an event of fertility and life. Instead of isolating menstruating women from the mainstream they should be taken care of with all reverence during this time as they are in a state of regeneration. This paper thus opens the scope of further study of the ironical fact of restriction of women from entering sacred places even when this state of being they are going through can even be called sacred.

**Dr. Taorem Surendra Singh**
Assistant Professor (Supervisor)
D. M. College of Teacher Education
Imphal (Manipur)

**Abstract**
An attitude plays a great role in our life. The positive attitude is the prime factor for a successful life. So, the positive attitude of the teachers play a pivotal role in teaching-learning process, which will leads job satisfaction as well as effective teaching too. Teacher training being provided at teacher educational institutions will lead the fullest development of positive attitude among teacher Trainees of B.Ed. course. The trainees who are admitted to the course need positive attitude towards the course for maximum development of skills during the training. Thereby, those trained teachers will bring out the quality education as they are so serious of their profession. It is therefore, this study was conducted to find out the level of attitude among the admitted B.Ed. trainees whether all trainees are having positive attitude towards the course. The study also tried to compare the level of attitude among trainees to find out the college best college where trainees are more positive than other college. The study also tries to find out some of the suggestive measures to improve the level of attitude among the trainees for better quality education in the schools.

**Key terms used:** Attitudes, B.Ed. Student Teacher, Teaching Profession etc.

**INTRODUCTION:** Teaching is a complex activity. It is a process in which students are provided with a controlled environment for interaction with the purpose to promote a definite learning in them. Teaching involves a search for meaning in the world. It is a life project, a calling that is organizing Centre of all other activities. Teaching is past and future as well as present. It is background as well as foreground. It is depth as well as surface. Teaching is pain and humor, joy and anger and dreariness'. Teaching is world building. It is an architecture and design. It is purpose and moral enterprise. It is way of being in the world. Teaching breaks through the boundaries of the traditional job. And it is the process that define all life and teaching itself.

Teaching involves human nurturance, connectedness, warmth and love. (Hargreaves, 1994). The word "**Attitude''** is defined within the framework of social psychology as subjective or mental preparation for action. It is outward and visible postures and human beliefs. Attitudes determine what if individual will see, hear, think

and do. They rooted in experience and do not become automatic, routine conduct. As defined by Allport (1935), "Attitude is a mental or neural state of readiness, organized through experience, exerting a directive or dynamic influence upon the individuals response to all objects and situation with which it is related". An attitude towards teaching profession is an emotionalized tendency, organized through teaching experience to react positively towards teaching. It is a learned emotional response, set for or against teaching. Individuals will have a positive attitudes towards those objects which enable them to achieve the values held and form negative attitudes towards object which hinder the achievement of values.

**REVIEW OF RELATED LITERARTURES:**

**(1) ROY (1991)** studied the relationship between teacher attitude and teaching efficiency. **Objectives:** i) to know attitudes of teachers towards teaching profession teaching at different level. ii) To check the effect of teachers towards teaching profession. **Main finding: (**i) There was a positive relationship between them. (2) **Cornelious (2000)** conducted a study on a study of teacher effectiveness in relation to attitude towards teaching profession. **Findings:** i) There was a significant positive relationship between effectiveness and their attitudes towards teaching profession. ii) There was close correlation between male teacher effectiveness and their attitude towards teaching profession. (3) **Rao (2008)** studied the development and application of a scale for measuring attitudes towards the new pattern and education and empirical validation of its psychometric properties. **Main findings:** i) There was a significant gender difference in the attitude towards teaching science ii) female general, were significantly more positive than the males in their attitudes iii) there was a significant living area difference in the attitudes scores. (4) **Maurya (2011)** in a study of the relation between teachers' attitudes and teacher efficiency of **university** and pre-university lectures. **Objectives:** i) To study the attitudes and teaching efficiency ii) To see the sex differences in teaching efficiency. **Main findings of the study:** i) External surroundings contributed a great deal in formulating teaching attitude. ii) Frequent changes in the curriculum adversely affected teaching efficiency. iii) Attitude and academic achievement were not significantly related and (iv) sex difference existed both in teaching proficiency and adjusted. (5) **Marcus (2016)** ''The attitude of teachers towards creative learning and teaching" Objectives**:** to study the attitudes of teachers of higher secondary stages towards teaching. ii) to compare the attitudes of teacher, up to the age of 30yrs and other 30 yrs. of higher secondary stage towards teaching. **Findings:** I) there was no significant difference in the attitude of teachers of higher secondary stages towards teaching profession. (6) **Joan and Pilley (2000)** study on bureaucratism of college teachers and their attitude towards teaching profession. **Findings:** In this study, it was represented that, the age and experience of college teachers appear to have definite positive relationship with their attitudes towards the teaching profession; as age and experience increase, their attitudes towards teaching profession grew more favorable, the teachers who had developed sound attitudes towards the teaching profession were relatively more traditional and impersonal. (7) **Reddy (2005)** studied the attitudes of student teachers and success of student teachers, and reported that attitude of teachers do not significantly influence the success of

student teachers. (8) **Birendra Singh (1999)** a study of the attitudes of teachers of Assam university towards higher education. (9) **Kumar (1995)** in a study found that there is significant difference in the attitude of male and female teacher trainees towards teaching profession. (10) **Sucheta (2014)** Effect of teacher education programmed on the attitude of teachers towards teaching profession. (11) **Nirmala (2017)** studied attitude of married lady teachers of Mizoram University towards the teaching profession. (12) **Ramakrishna (1980)** revealed through his study, that women teachers have a significant and more favorable attitude towards teaching than men teachers . (13) **Bhandarkar (1980)** in a study on polytechnic teachers attitude towards teaching profession and its correlates, found that attitude towards teaching profession is not significantly related to the qualification of the teachers . (14) **Saraswat of Agra University in (2009)** studied on attitudes of trained high school teachers of Aligarh towards their professional training and the student perception of their teachers. (15) **Mishra (2015)** A study of the attitudes of teachers working in Government –Aided conventional Sanskrit vidyalayas of Varanasi towards teaching profession. (16) **Goyal (2000)** A study of the relationship among attitudes, job satisfaction, adjustment and professional interests of teacher education in India. **Findings:** There was no significant difference in the attitudes and professional interest of different categories based on sex, age, qualification, and experience. (17) **Singh Ajit (2008)** studied on "secondary school teacher's attitudes towards teaching in relation on their classroom behavior". **Finding:** i) coefficients of correlation range from 0.8 to 0.13. None of the correlation coefficient is significant. Thus shows that teachers' attitude towards teaching and their teaching behavior are not related. ii) There is no significant relationship between teachers' attitude towards teaching and the indirectness of their teaching verbal behavior. (18) **Maurya (2009)** "A study of the relation between teacher's attitude and teacher efficiency of university and pre- university lectures'' **Main findings of the study**: i) External surrounding contributed a great deal in formulating teaching attitude. ii) Frequent changes in the curriculum adversely affected teaching efficiency. iii) Attitudes and academic achievement were not significantly related and iv) sex differences existed both in teaching proficiency and adjustment.

**CONCLUSION**: It can be concluded that the topic of the study is the new area of the study as no one has conducted the same study before as the proofs are above.

**JUSTIFICATION OF THE STUDY:** With the enrolment of the right to education (RTE) act, 2009, from April 1, 2010, on the one hand and implementation of the Sarva Shiksha Abhiyan (SSA) on the other, enrolments in primary education have been increasing considerably, as a result, huge number of students will be looking for enrolment in the secondary education sector. To meet the challenge of "number, quality and equity'', large scales input in terms of teachers and other infrastructural facilities will be required. Considering this fact, the government of India launched the Rashtriya Madhyamik Shiksha Abhiyan (RMSA) in 2007 for universalization of access to an improvement of quality at the secondary and higher secondary stage.

To effectively implement the programmed for Universalization of secondary education, we need inter alia, competent teachers; we need to select the right type of teachers who have positive attitudes and desirable teacher like qualities. Teacher

training institutions have initiated "half – heartedly" some schemes for stirring and stimulating the student – teachers who enter their portals for receiving professional training. A teacher's attitude not only affects his behavior in the classroom but also influence the behavior of his students. Hence the availability for the right type of teachers having positive attitudes towards their profession is highly called for. This will make learning more effective and productive. In the present study, an attempt is being made to find out the extend of attitudes of student teacher towards teaching profession.

The findings of the study that would be emerging from this study will help us to understand the attitudes of teacher trainees thereby enabling us to inculcate favorable attitudes in the student teacher by changing the organizational climate of teacher training institution and also by enriching the social emotional climate of their classroom teaching.

**STATEMENT OF THE PROBLEM: "A Comparative Study On The Attitudes Of B.Ed. Student Teacher Of Two B.Ed. Colleges In Imphal West District Towards Teaching Profession".**

**DEFINITION OF KEY WORDS USED:**

a) **Attitudes:** In psychology, attitudes are a psychological construct, a mental and emotional entity that inheres in, or characterize a person. They are complex and an acquire state through experiences. It is an individual predisposed state of mind regarding a value and it is precipitated through a responsive expression towards a person, place, thing, or event (the attitude object) which in turn influences the individual thoughts and action.

b) **B.Ed.:** A bachelor of education (B.Ed.) is a graduate professional degree which prepares students for work as a teacher in the schools, through in some countries additional work much be done in order for the student to be fully qualified to teach.

c) **Student Teacher:** A student who is studying to be a teacher and who, as part of the training, observes classroom instruction or does closely supervised teaching in an elementary or secondary school.

d) **Teaching Profession:** The act of person who teaches the profession of a teacher.

**e) RKSDCE:** Raj Kumari Sanatombi Devi College Of Teachers' Education.

**f) DMCTE:** Dhanamanjuri College Of Teacher Education.

**Objectives of the study:**

1. To find out the overall level teaching attitudes of B.Ed. student teachers of DMCTE and RKSDCE towards teaching profession.
2. To compare the attitudes of male and female B.Ed. student teachers of DMCTE and RKSDCE towards teaching profession.
3. To compare the teaching attitudes of arts and science student teacher of DMCTE and RKSDCE towards teaching profession.
4. To compare the overall attitudes of DMCTE and RKSDCE towards teaching profession.

**Hypothesis of the study:**

1. There is no significant overall level of teaching attitudes of B.Ed. Student teachers of DMCTE and RKSDCE towards teaching profession.
2. There is no significant difference between the attitudes of male and female B.Ed. student teachers of DMCTE and RKSDCE towards teaching profession.
3. There is no significant difference between the attitudes of arts and science student teachers of DMCTE and RKSDCE towards teaching profession.
4. There is no significant difference between the overall attitudes of DMCTE and RKSDCE towards teaching profession.

**Delimitation of the study:** The study was delimited to the attitudes of Pre-Service and In-Service student teachers of DMCTE and RKSDCE towards teaching profession during the session of 2019 - 2020.

**METHODOLOGY**: The descriptive survey method was employed in the proposed study. P**opulation:** All the B.Ed. student teachers of D.M college of Teacher Education,Imphal and R.K Sanatombi Devi College of Education Imphal constituted the population of the present study. S**ample:** For the present study, the investigator used stratified random sampling techniques to choose the sample of the study. Distribution of the sample of the study is shown below:

**Table No:1: Showing The Distribution Of The Sample:**

| D. M. College Of Teacher Education, Imphal | | | | R.K. Sanatombi College Of Teacher Education | | | | Total |
|---|---|---|---|---|---|---|---|---|
| DMCTE-40 | | | | RKSDCE-40 | | | | 80 |
| Male-20 | | Female-20 | | Male-20 | | Female-20 | | |
| Arts 10 | Science 10 | Arts 10 | Science 10 | Arts 10 | Science 10 | Arts 10 | Science 10 | |

**Tools Used:** For the present study the investigator constructed a self-developed questionnaire for the purpose of collecting the views of B.Ed. student teachers of DMCTE and RKSDCE towards the teaching profession. This questionnaire consisted of 25 questions relating to identify the professional attitudes of the student teachers.

The questionnaire contained 25 items under the 3 parameters of teaching effectiveness as per NCTE norms namely:

1. **Competency.**
2. **Commitment and**
3. **Performance.**

The dependent variables during the data collection were:

1. Gender (male / female ) student teachers of DMCTE and RKSDCE
2. Discipline in which they study ( arts/ science)

**Time duration for data collection**: the duration of 30 minutes was given to all the student teachers of the two colleges in order to choose the right answer however most of the trainees were responded within less than 30 minutes.

**Scoring Key:** The scoring key of the questionnaire provided to the student teachers of the two colleges was in the form of 2 points scale (yes/no) under Thurnstone scale.

**Statistical Techniques:** The collected data was put in tabular form to make the process analysis easier. For the analysis and interpretation, the following statistical techniques were used:

1. Percentage.
2. T – Ratio/ T- test and
3. Graphical representation and interpretation.

**THE ANALYSIS AND INTERPRETATION OF THE RESULT IS PRESENTED IN FOUR SECTIONS:**

**OBJECTIVE -1: To Find Out The Overall Teaching Attitudes Of B.Ed. Trainees Of DMCTE And RKSDCE Towards Teaching Profession.**

| SL. NO. | Q.NO. | RIGHT RESPONSE | % | WRONG RESPONSE | % |
|---|---|---|---|---|---|
| **(a) COMPITENCY** | | | | | |
| 1. | 1. | 79 | 98.75 | 01 | 01.25 |
| 2. | 2. | 80 | 100.00 | 00 | 0/000 |
| 3. | 3. | 75 | 93.75 | 05 | 06.25 |
| 4. | 4. | 74 | 92.5 | 06 | 07.50 |
| 5. | 5. | 79 | 98.75 | 01 | 01.25 |
| 6. | 6. | 80 | 100.00 | 00 | 00.00 |
| 7. | 7. | 80 | 100.00 | 00 | 0.000 |
| 8. | 8. | 78 | 97.50 | 02 | 02.50 |

**Table No. 2: Showing the Overall Level of Attitudes of B.Ed. Trainees Of Two Colleges**

**OVERALL CONCLUSION:** It can be concluded that the overall level of teaching attitude of B.Ed. trainees of two colleges comes at 76.44 (95.55%), which is very high as the overall average in term of teaching attitude of B.Ed. trainees towards teaching profession. It is therefore, the **first hypothesis** constructed for testing "There **is no significant overall level of attitudes of all student teachers of two colleges"** is

rejected as the result is so high at 95.55%. However, the lowest level has found in the parameter of competency as compare to others aspects of teaching attitude.

**OBJECTIVE- 2: To compare the attitudes of male and female student teachers of DMCTE and RKSDCE.**

**Table No: 3: To Compare The Attitudes Of Male And Female Student Teachers Of DMCTE And RKSDC:**

| Sl. No. | N | Sex | Mean | SD | SED | T- test | df |
|---|---|---|---|---|---|---|---|
| 1 | 40 | Male | 23.67 | 0.78 | 1.98 | 03.56 | 78 |
| 2 | 40 | Female | 22.77 | 1.40 | | | |

**@ Remark – significant**

**INTERPRETATION:** It can be observed from the above table No: 2 that the level of teaching attitudes of B. Ed trainees of two colleges between male and female are found to have mean score of 23.67 and 22.77 with standard deviation of 0.78 and 1.40. The ratio of the two mean score comes out to be with standard error of 1.98 which is greater than the level of significance at 0.01. Therefore the second hypothesis of the study "There is no significant difference between the level of the attitudes of male and female" trainees of the two B. Ed colleges is rejected as there is difference between the level of teaching attitudes found between male and female student teachers of these colleges. The level of teaching attitudes of male and female are found at the average of 23.67 (94.68%) and 22.77 (91.08%).

**OBJECTIVE-3 To compare and attitudes of arts and science student teachers of DMCTE and RKSDCE towards teaching profession.**

**Table No: 4: Showing the comparison of teaching attitudes of arts and science student teachers of DMCTE and RKSDC towards teaching profession.**

| Sl. No. | N | Subject | Mean | SD | SED | T-test | df |
|---|---|---|---|---|---|---|---|
| 1 | 40 | Science | 23.31 | 1.19 | 0.24 | 0.69 | 78 |
| 2 | 40 | Arts | 23.12 | 1.24 | | | |

**@Remark: Insignificant**

**INTERPRETATION:** It can be observed from the above table No: 3 that the level of teaching attitudes of science and Arts student teachers of DMCTE and RKSDC are found to have mean score of 23.31 and 23.12 with standard deviation of 01.19 and 01.24.The ratio of the two mean scores comes out to be with standard error of 0.24, which is greater than the level of significance at 0.01. Therefore the 3rd hypothesis of the

study **"There is no significant difference between the attitudes of science and Arts student teachers of DMCTE and RKSDCE towards teaching profession" is accepted** as there is no difference between the level of teaching attitudes found between science and arts student teachers of the two B.Ed. colleges.
In addition, the level of teaching attitudes of science and arts are found at the average of 23.31(93.24%) and 23.12(92.48%), which are very high teaching attitude.

**OBJECTIVE-4 : To compare the overall attitude of DMCTE and RKSDC towards teaching profession.**

**Table No. 5: Showing the comparison of teaching attitudes of student teachers of DMCTE and RKSDC towards teaching profession.**

| SL.NO. | N | College | Mean | SD | SED | T-test | df |
|---|---|---|---|---|---|---|---|
| 1 | 40 | RKSDCE | 23.50 | 0.78 | 1.98 | 1.69 | 78 |
| 2 | 40 | DMCTE | 23.05 | 1.47 | | | |

**@Remark: Insignificant**

**INTERPRETATION:** It can be observed from the above table that the level of teaching attitudes of student teachers of DMCTE and RKSDCE are found to have mean score of 23.50 and 23.05with standard deviation of 0.78 and 1.47. The ratio of the two scores comes out to be with the standard error of 1.98 which is greater than the level of significance at 0.01. Therefore the **fourth hypothesis** of the study **"There is no significant difference between the overall level of teaching attitudes towards teaching profession'' of DMCTE and RKSDC is accepted** as there is no difference between the level of teaching found between the trainees of the two B.Ed. colleges. The level of teaching attitudes of DMCTE and RKSDC are found at the average of 23.5(94%) and 23.05 (92.2%).

**MAIN FINDING OF THE STUDY**:

1. It can be concluded that the overall level of teaching attitude of B.Ed. trainees of two colleges comes at 76.44 (95.55%) which is very high. It is therefore, the **first hypothesis** constructed for testing "There is no significant overall level of attitudes of all student teachers of two colleges" is rejected as the result is so high at 95.55%. However, the lowest level has found in the parameter of competency as compare to others aspects of teaching attitude.

2. The **second hypothesis** of the study "There is no significant difference between the attitudes of male and female" trainees of the two B. Ed colleges is rejected as there is difference between the level of teaching attitudes found between male and female student teachers of these colleges. The level of teaching attitudes of male and female are found at the average of 23.67 (94.68%) and 22.77 (91.08%).

3. The **3rd hypothesis** of the study "There is no significant difference between the attitudes of science and Arts student teachers of DMCTE and RKSDCE towards

teaching profession" is accepted as there is no difference between the level of teaching attitudes found between science and arts student teachers of the two B.Ed. colleges.

4. The **fourth hypothesis** of the study "There is no significant difference between the overall level of teaching attitudes towards teaching profession'' of DMCTE and RKSDCE is accepted as there is no difference between the level of teaching found between the trainees of the two B.Ed. colleges.

**REMEDIAL MEASURE SUBJECT TO THE HYPOTHESIS OF THE STUDY:**

1. In regards to first hypothesis of the study, that "There **is no significant overall level of attitudes of all student teachers of two colleges"** is rejected as the result is so high at 95.55%. However, the lowest level has found in the **parameter of competency** as compare to others aspects of teaching attitude. More improvement is required in this regards.

2. In connection with the **2nd hypothesis** of the study, it can be suggested that both male and female student teachers of the two colleges need to improve the level of teaching attitude towards teaching profession as average level of teaching attitude has found out at 23.67 (94.68%) and 22.77 (91.08%) respectively.

3. As far as the **3rd hypothesis** of the study the attitude of both science and arts student teachers of two colleges have a high positive attitude towards teaching profession at the percentage of more than 92%. But it also suggested that teaching attitudes of the student teachers of the two colleges need to improve more.

4. In relation to **4th hypothesis** of the study it can be suggested that teaching attitudes of student teachers of the two colleges need improvement. Because the average teaching attitude level of the two colleges came out only 92% of the total score.

**REMEDIAL MEASURES FOR OVER ALL IMPROVEMENT OF TEACHING ATITUDE OF TEACHERS TRAINEES OF B.ED COLLEGE:**

Attitudes of student teachers towards teaching profession are an area of research concerned with the relationship between the teacher's performance and student's achievement i.e. if the teachers possess positive attitudes towards teaching profession and having a high teaching skill then he or she will give her best practice and strategies to meet the challenging demands of his career, which involves imparting knowledge and developing essential skills in the students. The present educational scenario of the new millennium has become prone to stressing more on quality than on quantity whether it is teaching or research or evaluation or management in all fields of life. The quality of education depends to a great extent on the quality of the teacher; unless we bring quality in teacher we cannot expect quality in education.

Hence attitudes of teachers towards teaching profession can do an effective work. Positive attitudes towards teaching profession can enable the teacher to perform their

normal duty and social duty in a competent way. They can work for the welfare of the students with dedication and devotion. It a necessity for different section of teachers may be at school, college and universities. However the attainment of quality will be a mirage without adequate knowledge of the attitudes of teachers towards teaching profession who will disperse the knowledge.

This study brought out to the forefront of all student teachers commitment, satisfaction, and professional self- esteem; perceive status and interest to stay in teaching profession in DMCTE and RKSDCE. From the present study and their findings it had been concluded that student teacher generally possess positive attitude towards teaching profession but need to improve in competency level as it found low in competency of the student teachers.

## Abstract

Malamud, though a writer who produced serious novels, he is regarded as the most renowned Jewish-American writer, who had his word too on the effects of the ugly truth of the historical depressing movements of his society. In his novel 'The Assistant', he did not fail to bring his often repeated element of his characters search towards something better and the transcendence of their characters too. The main character is portrayed by Malamud with bare truth of how frail and flimsy his character is, who is often is driven by uncontrollable carnal desires. But the character is also described in a way wherein he gains sympathy from the side of the readers, when he is shown to have a deep innate desire to win his battle against his frail character. Towards the end he is shown as evolved to the one who is full of Fortitude.

**Keywords:**Anti-Semitism, Jewish Literature, Malamud, The Assistant, Transcendence.

The most acclaimed Jewish-American author, Bernard Malamud, is viewed as one of the most conspicuous writer, who can be classified as well known personas in the Jewish American writing. This scholarly sort of literature has birthed from the recorded development in the history that began in the year 1930s. This sort of composing is outstanding for its change of sad and comic components. Brooklyn conceived writer, paid attention to up composing when he began to catch wind of the revulsions of the Hitler drove Holocaust amidst World War II. He likewise began to peruse with extraordinary intrigue the Jewish convention and history. Practically the entirety of his works can be said tinged with the impacts left by those nearby readings of the aforementioned points.

Aside from various books, he additionally gave his hand a shot composition of short stories as well. He likewise packs up surprisingly numerous honours during his profession, comprehensive of, the most acclaimed Pulitzer prize, Gold Medal of the American Academy and Institute of Arts and Letters, and two or three National Book Awards. Also, as in the standard way, Malamud's fiction consistently implores a tender affirmation of the confinements and guarantees of human life that can help associate the complex alienations inside and in the midst of men.

Malamud's fiction is typically sorted out around moral issues and emergencies of development. He consolidates authenticity and imagery, just as disaster and satire, regularly with the assistance of legendary and model underpinnings. He utilizes dream that is once in a while extraordinary however which all the more frequently, as in The Assistant, gives practical happenings a nature of enchantment and custom.

From his Jewish foundation, Malamud determines a harsh diversion that regularly shows up in the self-joke of his characters yet it is additionally sympathetic to oneself as well as other people. His merciful beautiful reasonableness mixes with a feeling of beauty accomplished through torment. Malamud has announced that "All men are Jews," without a doubt an analogy for the comprehensiveness of estrangement, enduring, and the ethical impulse for men to make the absolute best of their lives inside the constraints and ambiguities of human presence. This ethical impulse is a strict assignment in that it requests an equivalent work for the salvation of oneself as well as other people; to be sure, one is inconceivable without the other. Malamud, nonetheless, has once in a while made explicit Jewish social settings, more often than not liking to look at the strains of Jews uncontrolled in gentile environment.

In his second novel, ‘The Assistant’, Malamud came back to the avenues of his childhood and, as though roused by the need to determine an extreme good essentialness from sorts of enduring he once saw, he shows us a youngster's effective commencement to the requests and cutoff points of life under abusive conditions.

Malamud utilizes ‘The Assistant’ to address a portion of the themes from ‘The Natural’ yet sets the novel in a migrant setting with solid Jewish primary characters. The tale figures out how to summon the

convention of Yiddish legends while keeping up Malamud's preparation in old-style writing and theory. The fundamental character of the novel, Morris Bober, for instance, can be deciphered from the two customs. A few pundits have indicated Morris Bober being an adaptation of the schemiel, a conventional model from Yiddish old stories who goes about as an amusing saint, utilizing light amusingness and incongruity to mellow a generally brutal world. Simultaneously, different pundits have recommended Morris Bober as the exemplification of the existential "I-THOU" reasoning portrayed by Bober's nearby namesake, Martin Buber. Both of these elucidations appear to be fitting and they show that Malamud's tale mirrors his ethnic familial foundation, while additionally keeping up the scholarly convention in which he was prepared. Malamud consistently protested being known as a "Jewish writer," since he has discovered the term excessively restricting. Malamud's primary reason as an essayist, as he clarifies, was "to shield human progress from obliterating itself". All things considered, he worked for humanism—and against scepticism".

The Assistant recounts to the tale of a foreigner food merchant, Morris Bober, who lives and works in Brooklyn, New York. Bober emigrated from Russia in his adolescent years and met his significant other Ida in New York. Their basic food item as of late has fallen on tough occasions because another store has opened over the road and is taking their clients. To remain above water, the Bobers additionally depend upon the wages of their little girl, Helen who fills in as a secretary.

On the opening day of the novel, two men burglarize Morris' basic food item and thump him oblivious with a hit to the head. Following his damage, a man named Frank Alpine lands in the area. Forthcoming has originated from a harsh life in the West to begin once more. At the point when Morris re-opens the store, Frank shows up every morning to assist him with dragging in the overwhelming milk containers. In the long run, Frank inquires as to whether Morris would let Frank work for nothing so Frank could gain proficiency with the exchange. Morris says no and Frank vanishes. Not long after Morris sees that a quart of milk and two rolls are taken from his conveyances every morning. Following seven days, Morris cautions the police since he can't discover the guilty party. On the following day, Morris discovers Frank Alpine resting in his basement. Plain confesses to taking the milk and

bread out of craving. Morris feeds Frank and gives him a chance to rest in the basic food item for the evening. The following morning, Morris slips while hauling in the milk and goes out. Straight to the point salvages him at that point puts on the food merchant's cover and starts working in the store.

During the two weeks that Morris recoups, Frank figures out how to acquire substantially more cash than Morris had done. At the point when Morris returns, Frank moves upstairs to a little room off a condo that an Italian couple, the Fusos, lease. Since business is so fruitful, Morris, in the long run, needs to pay Frank. Straight to the point feels remorseful about being paid in light of the fact that obscure to the food merchant, Frank has been taking cash. Moreover, it was he and Ward Minogue, a kid whose father is a nearby analyst, who had ransacked the staple.

Helen as of late lost her virginity to Nat Pearl a neighbourhood Jewish kid whose guardians possess a sweet store and who is going to Law School, yet she disregarded him in the wake of discovering that he just needed sex. The other nearby Jewish kid in the city, Louis Karp, recommends that Helen wed him, yet she isn't intrigued. Candid courts Helen by meeting her at the library, which she visits two times every week. In the end, they start getting to know one another and even kiss. At the point when Frank recommends that they contact more, Helen reveals to him that she can't engage in sexual relations with somebody except if she is certain that she adores him.

Morris Bober appreciates working with Frank and the two men recount stories to one another during the day. At some point, Morris begins to associate Frank with taking since incomes don't rise to what Morris imagines that they ought to be. He starts watching Frank intently. Blunt, simultaneously, is overwhelmed by his feeling of remorse and chooses to reimburse all the cash he has taken. He puts six dollars back in the register one day, yet when he understands that he will require some cash for that night, he takes a dollar back. Morris gets him and is shattered. All things considered, he requests Frank to leave.

That night, Helen goes to meet Frank late in the recreation centre. She has concluded that she cherishes him and will have intercourse with him. At the point when she gets to the recreation centre, an alcoholic Ward Minogue, whom she knows from grade school, attempts to assault

her. Straight to the point shows up and protects her, however, continues to assault her himself.

The next day, Morris Bober nods off in his loft with the radiator dim, flooding his rooms with gas and practically killing himself. Blunt and Nick Fuso spare him. Morris contracts pneumonia and needs to go to the medical clinic. Candid keeps the store open for the weeks when Morris is wiped out. Business is horrendous in light of the fact that two Norwegians have quite recently revived the contending basic food item and every one of the clients have gone there. Straight to the point gives the majority of his own reserve funds to the basic food item and works throughout the night at an alternate activity to keep it above water. In any case, when Morris comes back to the shop he makes Frank leave. Morris himself at that point attempts to spare the business by securing another position, however, he can't. A baffling man seems one evening offering to torch the store with the goal that Morris can gather the protection cash, yet Morris turns him down. Later Morris attempts to light such a fire himself, yet almost consumes himself to death before Frank shows up and safeguards him. Morris again requests Frank out.

One night, Ward Minogue, who has been determined to have diabetes and who is acting frantically, sneaks into the Karp's alcohol store through a crushed spirit window. In the wake of getting alcoholic, Ward unintentionally sets the store ablaze. Karp's store and building are destroyed. The following day, Karp, who has protection, offers to purchase Morris' store and staple so he can revive. Morris feels glad and goes out to scoop snow for the people on foot, despite the fact that he neglects to wear his jacket. Soon thereafter, he falls wiped out and bites the dust three days after the fact from pneumonia.

After Morris' passing, Frank Alpine begins running the store. He works throughout the night at an alternate activity and has a go at everything to make the store work, yet circumstances are difficult. In any case, he concludes that he needs to pay for Helen to go to school. Toward the finish of the book, Helen has turned out to be friendlier to Frank and appears to be prepared to acknowledge his idea of educational cost. Straight to the point he has changed absolutely ending up totally legit and particularly like Morris Bober, whose store and ways of thinking he presently grasps. In his last demonstration, Frank Alpine goes to the

medical clinic, has himself circumcised and after Passover turns into a Jew.

All through the novel it is seen how frail the characteristic built up of the main character Frank is portrayed by the Novelist. When he is frail, he struggles to the core to reframe his moral and ethical standard to that which is acceptable to the society in which he lives in. Despite the fact that he has stolen from the grocery of Bober, only out of poverty and hunger, he is viewed as an example of the every other normal Jack or John of the public. When the weak internal framework of the people is viewed with speculative eyes then all might appear loose and immoral but with a humanistic eye it would be a pathetic view.

Whatever is the stories' woven pattern, the way the character transcends from a frail character to the one which is remade with fortitude and moral strength. Frank's change in the behavioural patterns towards the end shows how he paves his own ways towards a one which is straight in the moral perception. It is also noted that when he took up the responsibility of the store itself after the demise of the then owner, it made him to change his entire standard of his living itself. He even started to take up his master as his role model and even went in to the extreme of becoming a proper Jew by undergoing Circumcision. This change can be viewed as a pattern created in his life that puts everything in an order of the life which was always battered by his frail carnal nature.

# GENETIC VARIABILITY IN YIELD AND YIELD RELATED TRAITS IN SOME MAIZE (Zea mays L.) GENOTYPES IN EASTERN HARARGE, ETHIOPIA

**Abebe Gebre**
College of Natural and Computational Sciences
Department of Biology
School of Graduate Studies
Haramaya University

## ABSTRACT

Twenty five maize genotypes were evaluated in randomized complete block design for genetic variability and association between agronomic traits at Haramaya, HU campus. Data were collected on 20 quantitative traits. The analysis of variance showed that the mean squares due to genotype were highly significant ($p<0.01$) for all trait studied, which indicates the existence of sufficient genetic variability and the potential for selection and improvement for the traits. The high phenotypic and genotypic coefficients of variations were observed for PHT, EHT, KT, AGM/ha and GY/ha. Also the difference between genotypic and phenotypic coefficients of variation were low in the traits for days to75% maturity, leaf width, ear diameter, number of rows per ear and harvest index indicating less environmental influence on these traits. High heritability estimates were obtained from days to75% maturity, days to silking, plant height, leaf width, number of nodes per plant, 1000-kernels weight, kernels texture, above ground biomass, grain yield per hectare and internodes length. These traits, therefore, may respond positively due to selection. Estimates of genetic advances as percent of mean at 5% selection intensity ranged from 3.6% for number of plant at harvest to 76.4% for above ground biomass. Genotypic correlation coefficients were found to be higher in magnitude than that of phenotypic correlation coefficients, which clearly indicated the presence of inherent association among various traits. At phenotypic level days to silking, days to maturity, plant height, ear height, number of ears at harvest, internodes length, ear length, days to anthesis, leaf width and number of nodes per plant was observed to have positive and highly significant ($P<0.01$) correlation with grain yield per hectare and negative and highly

significant (P<0.01) correlation with harvest index. However, low and positive phenotypic association were observed between number of ears at harvest and plant height, number of nodes per plant , days to maturity, days to silking and days to anthesis. Path coefficient analysis at phenotypic level based on grain yield as dependent variable revealed that days to anthesis, days to maturity, ear height, leaf width, number of nodes per plant, number of ears at harvest, above ground biomass and harvest index showed positive direct effect. The genotypic path analysis also indicated that above ground biomass and harvest index showed positive and significant correlation, therefore, these traits are more important than other traits for the genetic improvement of maize for yield.

## 1. INTRODUCTION

The center of origin of maize is the Mesoamerican region probably in the Mexican highlands, from where it spread to the rest of the world (Paliwal, 2000 and Farnham, 2003). Archaeological records and phylogenetic analysis suggest that domestication began at least 6,000 years ago (Piperno and Flannery, 2001; Matsuuka, 2002). Maize spread around the world particularly to the temperate zones after European discovery of the Americas in the 15$^{th}$ century, (Paliwal, 2000 and Farnham, 2003).

Maize is one of the most important crops in the world. It is used as a human food, livestock feed, for the different alcoholic and none alcohol drinks production, building material, and as fuel. It is also used to produce medicinal products such as glucose as well as an ornamental plant (Bekric and Radosavljevic, 2008).

Maize was introduced to Ethiopia by the Portuguese in the 16$^{th}$ or 17$^{th}$ century (Haffnagel, 1961). Since its introduction, it has gained importance as a food and feed crop.

Maize growing areas in Ethiopia are broadly classified into four ecological zones based on altitude and annual rainfall. These are the high altitude moist zone, which receive 1200 to 2000mm annual rainfall with an altitude of 1700 to 2400 meters above sea level (m.a.s.l), the mid-altitude moist zone (1200-2000 mm annual rainfall with an altitude of 1000 to 1700 m.a.s.l), the low–altitude moist zone with less than 1000

m.a.s.l and 1200 -1500 mm annual rainfall), and the moisture stress zone with 500 to 1800 m.a.s.l and less than 800 mm annual rainfall. Currently, it is a major crop in Ethiopia in terms of production, consumption and income generation for human beings. The total annual production and productivity exceed all other cereal crops, though it is surpassed by teff in area coverage (EARO, 2000).

Maize breeding in Ethiopia has been ongoing since the 1950's and has passed through three distinctive stages of research and development (CIMMYT, 1998). These are from 1952 to 1980, the main activities were the introduction and evaluation of maize materials from different part of the world for adaptation to local condition, from 1980 to 1990, the work was focused on evaluation of inbred lines and development of hybrid and open-pollinated varieties, and from 1990 to the present, the main activities were (a) extensive inbreeding and hybridization, (b) development of early maturing or drought tolerant cultivars, and (c) collection and improving of maize with adaptation to highland agro ecologies. As a result various improved hybrids and open-pollinated varieties were released for large-scale production, especially for mid-altitude zones. The high land maize breeding program was started in 1998 in collaboration with the international maize and wheat improvement center (CIMMYT, 1998).

The main goal of all maize breeding programs is to obtain new open pollinated varieties (OPVs), inbred lines and from them hybrids and synthetics that will outperform the existing cultivars with respect to a number of traits. In working toward this goal attention needs to be paid to grain yield as the most important agronomic traits (CIMMYT, 1998).

Grain yield is a complex quantitative trait that depends on a number of factors. It's highly influenced by environmental conditions; has complex mode of inheritance and low heritability. Because of this, during selection for grain yield, attention is given first to determine mean values, components of variance and the heritability of yield related traits in order to establish the best selection criteria (Mohamed, 1993)

Besides, knowing the correlations between the traits is also of great importance for success in selection to be conducted in breeding

programs, and analysis of correlation coefficient is the most widely used one among numerous methods, (Yagdi and Sozen, 2009).

Success in any crop improvement or breeding program depends upon the selection of suitable parents, a thorough knowledge of genetic variability, heritability and type of gene action. In addition traits upon which selection of parents is based should be known. Relatively higher estimates of genotype coefficient of variation for grain weight, plant height, ear placement, kernel rows per ear and number of grains per row along with high heritability suggest that the selection can be effective for these traits (Rezaei, 2004).

A number of studies in maize have been conducted to elucidate the nature of association between yield and its components which identified traits like ear length, ear diameter, kernels per row, ears per plants, 100-seed weight and rows per ear as potential selection criteria in breeding program aimed at high yield. Some studies have been undertaken on seed maize production in different parts of Ethiopia (Rezaei, 2004).

According to Yoseph, (2005) who reported in his study on phenotypic diversity for morphological and agronomic traits in traditional Ethiopian highland maize accessions, highland maize varieties may be grouped into a number of completely or partially isolated populations, which may be adapted to different highland conditions. Legesse, (2007) also reported in his study on genetic diversity of maize inbred lines by AFLP Markers that seven pairs of AFLP primers identified 499 scorable fragments out which 81.7% were polymorphic and the diversity varying from 0.35 to 0.71. The above are among the limited studies made on maize genetic diversity in Ethiopia. The currently proposed study involves maize germplasm which were not used by other researchers for similar studies and will contribute positively to the area of study. Thus, this study was undertaken to find out the nature and magnitude of genetic variability for different traits in maize genotypes with specific objectives to:-

- Estimate the nature and magnitude of genetic variability for the yield and yield related traits in maize genotypes.
- Estimate the phenotypic and genotypic coefficient of variation, heritability and genetic advance of some agronomical traits.

- Assess the extent of association between traits among themselves and yield.

## SUMMARY, CONCLUSION AND RECOMMENDATIONS

### Summary and Conclusion

The progress of crop improvement program depends on the choice of the breeding material, the extent of variability and the knowledge of quantitative traits with yield and yield related traits. In view of this, a study was conducted with the objective to assess the genetic variability and association between agronomic traits in some maize genotypes.

Analysis of variance showed the presence of highly significance differences among the tested genotypes for the 20 traits considered which indicates the existence of sufficient genetic variability and there was less coefficient of variation in all of the traits indicating good precision in the conduct of the experiment.

The ranges of mean values for most of the traits were large showing the existence of variation among the tested genotypes. Phenotypic coefficients of variation (PCV) were found to be higher than genotypic coefficients of variation (PCV) for all traits. The two values differed slightly indicating less influence of the environmental factors. The highest phenotypic and genotypic coefficients of variations were observed for plant height, ear height, above ground biomass, grain yield per hectare and kernels texture. Days to75% maturity, leaf width, ear diameter, no. of row per ear had the least phenotypic and genotypic coefficients of variation.

Higher heritability values were obtained for days to75% Maturity, days to silking, plant height, ear height ,leaf width, number of node per plant, number of tassel branch,1000-kernels weight ,kernel texture ,above ground biomass, grain yield per hectare, internodes length and moderate estimates of heritability were observed for number of ear at harvest ,number of rows per ear, harvest index, number of kernels per rows, ear diameter and ear length .

Genetic advance expressed as percentage of mean (GAM) was high for days to silking, days to anthesis, ear height, plant height, kernel texture, internode length, above ground biomass and grain yield per hectare. Low estimates of genetic advances expressed as percentage of mean were

observed for harvest index, and number of ear at harvest, number of plant at harvest and number of ear per plant.

Grain yield showed positive and significant genotypic association with days to anthesis, days to silking, days to75% maturity, plant height, ear height, leafwidth,1000-kernels weight, number of node per plant ,above ground biomass ,inter node length ,and ear length. At phenotypic level days to silking, days to Maturity, plant height, ear height, number of ear at harvest, internodes length, ear length, days to anthesis, leaf width and number of nodes per plant was observed to have positive and highly significant ($P < 0.01$) correlation with grain yield per plant and have negative and highly significant ($P < 0.01$) correlation with harvest index.
Plant height indicated positive and highly significant associations with ear height, number of nodes per plant, internodes length, ear length, leaf width, above ground biomass per hectare and showed negative and highly significant correlation with harvest index.
The path coefficient analysis at phenotypic level based on grain yield as dependent variable revealed that days to anthesis, days of maturity, ear height, leaf width, number of node per plant, number of ear at harvest, above ground biomass and harvest index showed positive direct effect.
The maximum positive genotypic direct effect ingrain yield was observed in above ground biomass yield followed by harvest index, internode length, number of kernels per row, number of ears at harvest and leaf width.
The genotypic path analysis also indicated that negative direct effects were recorded for days of silking, number of kernels per row, number of plant at harvest and ear height.

### 5.2. Recommendations

The result indicated the existence of genetic variability in the maize genotypes studies and this can be exploited in the breeding program. It can also be seen that genotypes BH-660 and BH-661 from among the hybrid varieties and Gibe-1, Gibe-2, Pop-22, Alemaya composite from among the open pollinated varieties gave good high grain yield under Haramaya condition indicating their potential usefulness.

Thus, based on the results obtained the following could be recommended.

- To use plant height, maturity traits, above ground biomass as selection criteria for yield improvement in maize.
- To utilize of genetic variability observed for future maize improvement program and
- Seed production and distribution can also be recommended of the above identified varieties to farmers in Haramaya area.

# मानव-चिन्तन शक्ति अनबूझे सवालों पर निरन्तर चिन्तनशील-भगवान बुद्ध का अमर इतिहास

**भूमिका-**

चिन्तन के इतिहास में महाकारूणिक भगवान बुद्ध का स्थान सर्वोपरि है। मानव सभ्यता के इतिहास में ईश्वर का सन्देश देने हेतु उनके पुत्र का अभी अवतार नहीं हुआ था और न ही खुदा का संदेश लेकर कोई पैगम्बर ही धरती पर अवतरित हुआ था।

मानव-चिन्तन शक्ति अनबूझे सवालों पर निरन्तर चिन्तशील थी। आर्यावर्त में आरण्यकवासी अग्निहोत्री अपनी तय और ज्ञान से इन अनबूझे सवालों का उत्तर पाने की पूर्ण कोशिश कर रहे थे, परन्तु अभी तक 'गीता का प्रादुर्भाव नहीं हुआ था और न ही 'बाईबिल' और 'कुरान' प्रकाश में आई थी। भारतीय चिन्तन परम्परा में तीन वेदों की उत्पत्ति हो चुकी थी और विचारों के इस युग में इस भू-भाग पर कई वाद प्रचलन में आ चुके थे। सारी दुनिया में कर्मोवेश चार वर्गों का

प्रकटीकरण हो चुका था। भारतीय समाज में वे क्षत्रिय, ब्राह्मण, वैश्य और शूद्र नाम से संज्ञावान हो चुके थे। मानव-मस्तिष्क को मेधा की जिज्ञासा के बुलबुले अपने पूर्ण यौवन में थे, ऐसे उथल पुथल के विचार जगत व व्यवस्थित होते समय में लोक परलोक जन्म मरण कर्म और कर्मफल तथा कर्त्ता और नियन्ता के सवालों से मनुष्य का मन कौतूहल से भरा था इन सभी परिस्थितियों और मानसिक बाध्यताओं ने संस्कृति के लिए नया रास्ता खोल दिया था। ऐसे समय में मानव सभ्यता की एक मानव के रूप में 'महामानव' की प्राप्ति हुई, जो सारी दुनिया की आलोक बनकर विश्व में दे दीप्यमान हुआ और सारी दुनिया को प्रकाशित किया भारत का सिरमौर बनाने वाले इस विश्व आलोक भगवान बुद्ध का जन्म लगभग 563 ई. पूर्व कपिलवस्तु में लुम्बिनी वन में वैशाख पूर्णिमा के दिन हुआ था।

**सिद्धार्थ के जन्म और उस समय की परिस्थिति**

सिद्धार्थ के जन्म का कथानक विविधाताओं से भरा पड़ा है। परन्तु यह एक सर्वसम्मत सत्य हे कि वे न तो किसी ईश्वर के अवतार थे और न ही किसी खुदा के पैगम्बर थे वे मानव पुत्र थे और मानवता उनका पैगाम था। इतिहास बताता है कि उनके जन्म के समय में भारत में जहाँ एक और सामन्ती राजशाही पनप रही थी, वहीं प्रजातन्त्रीय प्रणाली भी आजामई जा रही थी। समकालीन राजनीति का राज्य 'गण' के नाम से विख्यात था और ऐसे ही सोलह ''जनपदीप गणराज्य भारत में अपनी समृद्धि के लिए प्रसिद्ध थे। उनमें से एक 'शाक्य' गणराज्य भी था। शाक्यों की राजधानी 'कपिलवस्तु' थी गण के अधिपति को गणपति या राजा कहा

जाता था। शाक्य गण में प्रजातन्त्र प्रणाली थी और उनके राज्य में सुख और समृद्धि थी। राजा शुद्धोदन की रानी का नाम महामाया था, 'महामाया' अपने मैके देवदाह के लिए सुसज्जित पालकी में रवाना हुई, बीच रास्ते में लुम्बिनी वन-पड़ता था शाल वृक्षों से हरा भरा यह वन में महामाया को प्रसव वेदना की अनुभूति हुई। इसी वन में शाक्य वंश के पुत्ररत्न की प्राप्ति हुई यही शाक्य सिंह आगे जाकर विश्व आलोक बुद्ध कहलाये।

राजा शुद्धोधन राजकुमार की प्रवृत्तियाँ, उम्र और उनके बारे में की गई भविष्यवाणियों को लेकर चिन्तित थे। समय बीतता गया, राज कुमार वैवाहिक जीवनमें बंध चुके थे, परन्तु उनका मन फिर भी ध्यान सुख में लगा ही रहता था, शुद्धोधन के मन में अन्तर्द्वन्द्व की आग तेज हो चुकी थी।

संन्यासी सिद्धार्थ एक बेहतर मार्ग की खोज में चल दिये वह अपने उद्यान, खेत, आचार्य आलार-कालाम के आश्रम में की गई साधना पर चिन्तन करते हुए इस निष्कर्ष पर पहुँचे कि इस साधना के द्वारा ही वे परम सत्य को पा सकते है अत: वे घोर तपस्या के लिये निकल पड़े और यह निश्चय किया कि अब वे किसी आश्रम में नहीं जायेंगे राजगृह में कुटी बनाकर तपस्या की साधना करने की ठानी थी। उनका शरीर मुर्झा गया आँखे धँस गई शरीर हड्डियों का कंकाल मात्र रह गया इस आत्म दमन से भी उन्होंने मार्ग को नहीं पाया उनकी साधना का वर्णन बौद्ध साहित्य में बड़े ही मार्मिक ढंग से किया गया है। पीपल के वृक्ष के नीचे तपस्या करते हुये सात सप्ताह गुजर चुके थे पूर्णिमा का चन्द्रमा आज फिर

अपनी चांदनी में खिल रहा था चन्द्रमा की बढ़ती कला के साथ ही बोधिसत्व का ज्ञान पूर्ण हो रहा था। उनको अचानक आन्दातिरेक हुआ सद्धर्म की प्राप्ति हो गई उन्होंने पाया–धम्म सत्य है अन्तिम सत्य है जीवन का अस्तित्व अवधि रूपी कड़ी से गुरू होता है जीवन के विकास की कड़ियाँ गिनी, उन्हें स्थिर किया– वे द्वादश निदान के रूप में व्यक्त हुई। उन्होंने पाया कि अविधा या अज्ञान से इस संसार रूपी सागर में रचनात्मक और सुव्यवस्थित उत्तेजन होते हैं जिनसे बोध या भावनाएँ उपजती है। ये छः अवयवी छः आयतनों– पाँच इन्द्रियों और मन (बुद्धि) का विश्वास करते है छः आयतन वस्तुओं के स्पर्श में आते हैं। अस्तित्व की तृष्णा वस्तुओं से मोह पैदा करती है, मोह स्वार्थ का वर्धन और पुनः ग्रहण करता है स्थार्थ नये जन्मों में जारी रहता है। स्वार्थ जनित पुनर्जन्म दुख जरा, रोग और मृत्यु के कारण है। वे विलाप चिन्ता और निराशा उत्पन्न करते हैं।

उन्होंने इनके अस्तित्व के बाद निवृत्ति का मार्ग अवधारित किया और चार आर्य सत्यों को पहचाना और प्रतीयसमुत्पाद का अभिज्ञान प्राप्त कर निर्वाण प्राप्त किया। वे अब सम्यक् सम्बुद्ध हो गये। तथागत बुद्ध ने बुद्धत्व प्राप्त करते समय ये उदान गाथाये कही जन्म जन्मान्तर से मैं निरन्तर संसार में दौड़ रहा हूँ शरीर रूपी घर बनाने वाले की खोज में जन्म रूपी श्रृंखला में पड़ता जा रहा हूँ। हे घर बनाने वाले मैनें तुझे देख लिया है अब तू पून शरीर रूपी घर को नहीं बना सकेगा तेरी सभी कड़ियां गई है और शिखर भी बिखर गया है चित्त संस्कार रहित हो गया है और तृष्णा निर्मूल हो गई है।

बुद्ध ने उपदेशों का सार एक शब्द धम्म में आ जाता है मोटे रूप में 'धम्म' शब्द पालि भाषा का तकनिकी शब्द है और भगवान बुद्ध के सिद्धान्त का मूल केन्द्रबिन्दू है।

बौद्ध धर्म में एक और महत्वपूर्ण सत्य निश्चित रूप से उभरता है और वह है- जो बाहर या मानसिक क्रियाएँ हें वे बिना कारण के नहीं है सभी के लिए कुछ ना कुछ कारण अवश्य रहता है। किसी कारण के बिना किसी भी घटना का आविर्भाव नहीं होता है कारणता के इस सिद्धान्त को बौद्ध धर्म में प्रतीत्यसमुत्पाद के नाम से जाना जाता है, प्रतीत्यसमुत्पाद के नियम में बारह अंग है और तीन काण्ड (भाग) है।

बारह अंग इस प्रकार है ⟶ अविधा ⟶ संस्कार ⟶ विज्ञान ⟶ नामरूप⟶ षडायतन⟶ स्पर्श⟶ वेदना⟶ तृष्णा⟶ उपादान भव ⟶ जरामण।

इसके तीन (काण्ड) भाग होते हैं-

अविधा और संस्कार - अतीत पूर्व भव में

जाति और जरामण - अपर भाव में अर्थात भविष्यत् भव में

शेष मध्य के आठ अंग यथा विज्ञान, नामरूप, षडांपतन, स्पर्श वेदना, तृष्णा, उपादान और भव में अर्थात् वर्तमान भव में व्यवस्थित है

**सिद्धार्थ से बुद्ध बनने की यात्रा (ज्ञान प्राप्ति यात्रा)**

ज्ञान की खोज में सिद्धार्थ सर्वप्रथम वैशाली पहुँचे यहाँ वे अलाम् कलाम के आश्रम में गए यहाँ पर तप की क्रिया उपनिषदों की ब्रघ विद्या की शिक्षा प्राप्त की।

वैशाली से राजगीर के पास रूद्रकराम पुत्र आश्रम पहुचे यहाँ पर उन्होंने भोग का ज्ञान प्राप्त किया। राजगीर से उरूवेला गए एवं मोहना तथा निरंजना नदी संगम पर 6 वर्ष तक तपस्या की एवं मोहना तथ्ज्ञा निरंजना नदी संगम पर 6 वर्ष तक तपस्या की परन्तु ज्ञान प्राप्ति नहीं हुई बाद में उन्होंने सुजाता नामक स्त्री से खरीर खाकर अपना व्रत तोड़ा।

35 वर्ष की आयु में निरंजना नदी के किनारे बैशाख पूर्णिमा की रात्री में पीपल वृक्ष के नीचे सत्य एवं ज्ञान की प्राप्ति हुई।

**अनोम नदी**– घर त्यागने के बाद घोड़े एवं सारथी को छोड़ा

**वैशाली**– अलार कलाम से तप क्रिया एवं उपनिषद के ज्ञान की प्राप्ति।

**राजगीर**– रूद्रकराम पुत्र से योग ज्ञान की प्राप्ति

**उरूवेला**– निरंजना नदी तट पर बैशाख एवं ज्ञान का आलोक प्राप्त।

ज्ञान प्राप्ति के बाद उरूवेला का यह क्षेत्र बोधगया एवं सिद्धार्थ बुद्ध कहलाये।

धर्मचक्रप्रवर्तन– गौतम बुद्ध के ज्ञान की प्राप्ति के बाद प्रथम उपदेश एवं दीक्षा दिए जाने की घटना धर्मचक्र प्रवर्तन कहलाती हैं नोट– गौतम बुद्ध ने अपना

पहला उपदेश एवं दीक्षा आदि पतन सारनाथ में दिए इनका उल्लेख संयुक्त निकाय में मिलता है प्रथम उपदेश में ही गौतम बुद्ध ने चार आर्य सत्यों को बताया।

चार आर्य सत्य- 1. दुख - दुख है

2. दुख समुदय - दुख का कारण है
3. दुख निरोध - दुख का निदान है
4. दुख निरोध गामिनी प्रतिवदा - दुख निदान के उपाय- अष्टांगिक मार्ग इसका संबंध चौथे आर्य सत्य से है।

प्रथम आर्य सत्य - दुख प्रथम आर्य सत्य है के अनुसार संसार में सभी वस्तुएँ दुखमय है प्रथम आर्य सत्य में जन्म एवं मरण के चक्र को दुख का मूल कारण बताया गया है।

दुसरा आर्य सत्य - दुख समुदाय दुसरे आर्य सत्य के दुख उत्पन्न करने का मूल कारण तृष्णा को बताया गया है।

तीसरा आर्य सत्य - दुख निरोध गामिनी प्रतिपदा चौथे आर्य सत्य में गौतम बुद्ध ने दुख के उन्मूलन का मार्ग बताया है यही अष्टांगिक मार्ग कहलाते हैं।

**समयक् दृष्टि** - वस्तुओं को वास्तविक स्वरूप का ध्यान रखना।

**समयक् संकल्प** - आसक्ति, द्वेष, हिंसा से मुक्त विचार।

**सम्यक् वाचा** - अप्रिय वचनो का परित्याग

**सम्यक् कर्मान्त** - दान, दया, सत्य, अहिंसा, सत्कर्मो का अनुसरण

**सम्यक् अजीव** – सदाचार के नियमों के अनुकूल जीवन जीना

**सम्यक् व्यायाम** – विवेकपूर्ण प्रयत्न करना

**सम्यक् समाधि** – मन अथवा चित्र का एकाग्रता

**बौद्ध संघ की स्थापना** – गौतम संघ का संगठन गणतांत्रिक प्रणाली पर आधारित था। संघ में प्रवेश पाने के लिए कम से कम 15 वर्ष की आयु का होना आवश्यक था माता-पिता की आज्ञा आवश्यक थी।

संघ के सदस्य / अनुयाई दो वर्गों में बँटे थे।

1. भिक्षु / भिक्षुणी – वे संन्यासी जीवन वाले लोग थे।
2. उपासक / उपासिकाएँ – ये ग्रहस्थ जीवन में रहकर बौद्ध धर्म अनुसरण करने वाले लाग थे।

संघ की सदस्यता सभी जातियों के लिए सुलभ थी। संघ में प्रवेश के समय त्रिरत्न (बुद्ध, संघ, धम्म) में विश्वास करने की शपथ लेनी होती थी।

बौद्ध भिक्षुओं के लिए आवश्यक दस शील (सिद्धान्त)

- ❖ दूसरे के धन की इच्छा न करना।
- ❖ झूठ नहीं बोलना
- ❖ हिंसा से दूर रहना
- ❖ मादक द्रव्यों का सेवन न करना

- ❖ व्यभिचार नहीं करना
- ❖ संगीत एवं नृत्यों में भाग नहीं लेना
- ❖ सुगंधित द्रव्यों का उपयोग नहीं करना
- ❖ असमय भोजन नहीं करना
- ❖ सुखप्रद विस्तर पर नहीं सोना
- ❖ किसी प्रकार के द्रव्य का संचय न करना

**संघ के अधिकारी** – नवकम्मिक : निर्माण से संबंधित अधिकारी

भण्डागारिक – खान पान से संबंधित अधिकारी

कप्पिकारक – क्रम करने वाला अधिकारी

चीवन – वस्त्रागार का अधिकारी

आरम्भिक – आराम से संबंधित अधिकारी

चैत्य एवं विहार में अंतर– चैत्य एक प्रकार की समाधि स्थल थे इन समाधि स्थलों में महापुरुषों को शवदाह के बाद उनके घातु अवशेषों को सुरक्षित रखने के लिए इन समाधियों में भूमि के अन्दर गाढ दिया जाता था एवं ऊपर एक भव का निर्माण किया जाता था ये उपासना के केन्द्र थे।

विहार – चेत्यो के पास ही बौद्ध धर्म के भिक्षुओं को रहने के लिए आवास स्थानों का निर्माण कर दिया जाता था ये आवास स्थान ही विहार कहलाते थे ये आवास के केन्द्र थे।

बौद्ध धर्म के दर्शन- बौद्ध दर्शन क्षणिकवादी है। बौद्ध दर्शन अन्त शुद्धिवादि है बौद्ध दर्शन कर्मवादी है कर्म का आशय कादिक कामीक व मानसिक चेष्टाओं से है।

बुद्ध के शिष्य - तपस्तु व मल्लिक (प्रथम दो अनुयाई) पंचवर्गीय ब्राह्मण, सारिपुत्र, मौदगल्लापन, राहुल (पुत्र), नंद, सौतेला भाई, उपालि, आनन्द, जीवक, बिम्बिसार, अजातशत्रु, प्रसेनजित, महाकश्यप।

बुद्ध की प्रमुख शिष्याएँ- महा प्रजापति गौतमी (सौतेली माँ) यशोधरा (पत्नि), नंदा सौतेली बहन, आम्रपालि, विशाखा क्षेमा, मल्लिका।

बौद्ध धर्म के संरक्षक राजा- बिम्बिसार, अजातशत्रु मगध के राजा, प्रसेन्नजित कोशल के राजा, उदयन वत्स नरेश, प्रघोत्त अवन्ति नरेश, अशोक व दशरथ मौर्य वंश कनिष्क कुजाण वंश, हर्षवर्धन पुज्यभूति वंश, सहसी वंश, पाल वंश।

**बौद्ध धर्म की लोकप्रियता के कारण**- धार्मिक वाद विवाद से अलग रहा इस कारण जनसामान्य आकर्षित वर्ण व्यवस्था की निन्दा करने से निम्न वर्गों का समर्थन प्राप्त, बौद्धसंघ सभी जातियों के लिए खुला था। ब्राह्मणवाद के विरोधी लोगों का बौद्ध धर्म की ओर रूचि बुद्ध का व्यक्तित्व व उपदेश प्राणाली उपदेश की भाषा पालि जनसाधारण की भाषा थी। संघ की स्थापना, महत्वपूर्ण शासकों का सहयोग इत्यादि।

बौद्ध धर्म की विशेषताएँ और इसके प्रसार के कारण – बौद्ध संघ का दरवाजा हर किसी भी जाति का क्यों न हो, संघ में प्रवेश का अधिकार स्त्रियों को भी था जिससे उन्हें पुरुषों की बराबरी प्राप्त होती थी ब्राह्मण धर्म की तुलना में बौद्ध धर्म अधिक उदार और अधिक जनतांत्रिक था।

**अनीश्वरवाद**– बौद्ध धर्म ईश्वर की सत्ता को नहीं मानता है इसके अनुसार संसार कर्मो का चक्र है। यह कार्य चक्र ना ही कही से शुरू हुए है और न ही कभी खत्म होगे। यह कार्य किसी और ने नहीं अपितु मनष्यु ने ही शुरू किए है।

**शून्यतावाद**– शून्यता महायान बौद्ध संप्रदाय का मुख्य दर्शन माना जाता है। इसके अनुसार संसार की किसी भी वस्तु पर किसी का कोई अधिकार नहीं है सभी पदार्थ या वस्तुएं सत्ताहीन है इस दर्शन के अनुसार मनुष्य अपने कर्मो को पूरा कर उसी प्रकार मोक्ष और शन्ति प्राप्त करता है जैसे तेल और वाती समाप्त होने पर दीपक शांत हो जाता है।

**अनात्मवाद** – अनात्मवाद सिद्धान्त इस बात पर प्रकाश डालता है कि आत्मा जैसे कोई चीज नहीं होती जिसे हम आत्मा समझते हैं वह दरअसल आंतरिक चेतना है।

**क्षाणिकवाद**– संसार में कोई भी चीज सदैव के लिए नहीं रहती जो इंसान जन्म लेता है वह मरता अवश्य है जो पेड़ फल देता है वह खत्म भी हो जाता है कमया हुआ पैसा खर्च भी हो जाता है यानि जीवन में कोई भी चीज कुछ क्षण के लिए ही रहती है।

जो समाज में चेतना को पैदा करता है ज्ञान के विभिन्न उपागमों में से धर्म भी एक है धर्म एक महत्वपूर्ण व्यवस्था है और ज्ञान का एक साधन है। बुद्ध के उपदेशों का सार एक शब्छ धम्म से आ जाता है धम्म शब्द पालि भाषा का तकनीकी शब्द है, बुद्ध ने धम्म को उदघाटित किया, जगत में प्रकाशित किया, यह निर्विवाद है भगवान बुद्ध द्वारा उपदिष्ट धम्म वस्तुतः हमारे अस्तित्व की व्याख्या प्रस्तुत करता है भगवान बुद्ध ने मानव अस्तित्व की व्याख्या प्रस्तुत करता है भगवान बुद्ध ने मानव अस्तित्व के मूल तत्वों की खोज की उनमें अन्तर्भूत नियमों और उपनियमों की जानकारी प्राप्त की और आम लोगों को उनकी भाषा में समझाया।

बुद्ध ने अनुयायीयों के मुख्य स्थान- लुम्बिनी यह स्थान नेपाल की तराई में ईसा पूर्व 563 में राजकुमार सिद्धार्थ गौतम का जन्म यही हुआ था हालाँकि, यहाँ के बुद्ध के समय के अधिकतर प्राचीन विहार नष्ट हो चुके हैं केवल सम्राट अशोक का एक स्तम्भ अवशेष के रूप में इस बात की गवाही देता है कि भगवान बुद्ध का जन्म यहाँ हुआ था इस स्तम्भ के अलावा एक समाधि स्तुप में बुद्ध की एक मूर्ति है

**बोधगया**- करीब छः साल तक जगह-जगह और विभिन्न गुरूओं के पास भटकने के बाद भी बुद्ध को कही परम ज्ञान न मिला इसके बाद वे गया पहुँचे आखिर मे उन्होंने प्रण लिया कि जब तक असली ज्ञान उपलब्ध नहीं होता, वह पिपल वृक्ष के नीचे से नहीं उठेंगे इसके बाद करीब छह दिन छह रात एक पिपल

वृक्ष के नीचे भूखे प्यासे तप किया आखिर में उन्हें परम ज्ञान का बुद्धत्व उपलब्ध हुआ सिद्धार्थ गौतम अब बुद्धत्व पाकर आकाश जैसे अनंत ज्ञानी हो चुके थे जिस पिपल वृक्ष के नीचे वह बैठे उसे बोधि वृक्ष यानि ज्ञान का वृक्ष कहा जाता है उसी गया को बोधगया के नाम से जाना जाता है।

**कुसीनगर**– बौद्ध अनुयाईयों का बड़ा पवित्र स्थल है भगवान बुद्ध कुशीनगर में ही महापरिनिर्वाण को प्राप्त हुए कुशीनगर के समीप हिरण्यवती नदी के समीप बुद्ध ने अपनी आखिरी सांस ली।

**दीक्षा भूमि** – नागपुर महाराष्ट्र राज्य के नागपुर शहर में स्थित पवित्र एवं महत्वपूर्ण बौद्ध तीर्थ स्थल हे बौद्ध धर्म विद्वावान बोधिसत्व डॉ. बाबासाहब अम्बेड़कर ने भारत में बौद्ध धर्म का पुरुत्थान किया, यहीं पर डॉ. अम्बेड़कर ने बौद्ध धर्म की दिक्षा ग्रहण की बौद्ध धर्म पूर्णत: वैज्ञानिक और परिपूर्ण का भण्डार है, जो प्रत्येक वैज्ञानिक के मस्तिष्क एवं सामान्यजन की मेधा को सन्तुष्ट करने में सक्षम है हमने भौतिक पदार्थ या द्रव्य की व्याख्या बौद्ध धर्म के अनुसार की जिसमें यह पाया कि हमारा शरीर भौतिक पदार्थों की सूक्ष्मतय इकाई से बना है।

अभिधम्म साहित्य में मन और शरीर के बारे में कई मान्यताएँ विशेष स्थान रखती है बौद्ध धर्म के अनुसार चार ही परमार्थ है वे इस प्रकार है चित्त, चेतसिक, रूप निब्बाण बौद्ध वाङ्मय में आत्मा तथा परमात्मा ने तो व्यवहार सत्य है और न ही परमार्थ सत्य है रूप का वर्णन हम पहले ही कर चुके है, एवं चित्त तथा चेतसिक का वर्णन अभिधम्म कोश के अनुसार ही करने का प्रयत्न करेंगे। चित्त,

विज्ञान और मन आदि ऐसे शब्द है जो बौद्ध साहित्य में जगह–जगह आये है कोई भी प्रवृत्त चित्त अनेक चेतसिकों में से कम या वेश कुछ चेतसिकों या चैतो का समूह ही है। चित्त या मन कहते उसी को है जिसमें चेतसिक रहते हैं चित्त और चेतसिक या चित्ता और चैत के उत्पत्ति, विरोध, आलम्बन, वस्तु आदि एक ही होती है बिना चित्त के चेतसिक देखने में नहीं आते हैं। और बिना चेतसिकों के कही भी प्रवृत्त चित्त देखने में नहीं आता है। इसलिए चित्त और चेतसिकों के बीच कही भी कोई पार्थक्य की रेखा खींचना सहज नही हैं।

**मन आत्मा नहीं**– बौद्ध दर्शन में आत्मा नाम के किसी तत्व की स्वीकारोक्ति नहीं है बौद्ध साहित्य के अनुसार आत्मा का अस्तित्व नहीं है आत्मा शब्द संसार का सामान्य प्रयोग है।

स्कन्ध जड़ है और इनके अतिरिक्त चेतन सत्ता वाला कूटस्थ आत्मा नहीं है चेतना विज्ञान आदि के लिये बौद्ध धर्म में कूटस्थ आत्मा नहीं है चेतना विज्ञान आदि के लिये बौद्ध धर्म में मन मनस आदि शब्दों का प्रयोग हुआ है यह मन या चित्त बौद्ध धर्म में परमार्थ है परन्तु यह आत्मा नहीं है। मन का कोई भी घटक आत्मा नहीं है मन अपनेआप में कोई स्कन्ध भी नहीं है यह अरूपी स्कन्धों का पूंजीभूत है जो अपनी विषयवस्तु से अलग नहीं है साधारण रूप में हम यों कह सकते हैं कि मन एक ऐसा पर्दा है जो चैत या चेत्तसिकों या इन तत्वों से बनता है और इनके अलग भी उसकी सत्ता है वह एक तत्व है।

**मन के घटक**– मन के संगठन में स्कन्धों में से चार स्कन्ध वेदना, संज्ञा, संस्कार और विज्ञान प्रधान है अत: मन की वास्तविक स्वरूप रचना को जानने के लिए इनको जानना जरूरी है।

**वेदना स्कन्ध**– हमारे व्यवहार का जो संवेदना पक्ष है उसको इस स्कन्ध के रूप में संगृहीत समझना चाहिये वेदना क्या है? इसकी परिभाषा करते हुए अभिधम्म कोश में आचार्य बसुबन्धु कहते है कि वेदना अनुभव है। जब कोई वस्तु सुखकारी प्रभाव पैदा करती है तो सुख वेदना है, जब वस्तु दुखकारी प्रभाव पैदा करती है तो अदुखासुख वेदना कहते हैं।

**संज्ञा स्कन्ध**– मन या चित्त की रचना करने वाला दूसरा तत्त्व है संज्ञा स्कन्ध। जो हमारे व्यवहार पक्ष के प्रत्यक्षीकरण प्रक्रियाओं से सम्बन्धित है अभिधम्मकोश की कारिका में इसे इस प्रकार से कहा जाता है।

**संस्कार स्कन्ध**– मन के जो घटक अभी तक बताये गये हैं, वे तथा विज्ञान स्कन्ध के अलावा जो घटक है वे बौद्ध मनोविज्ञान में संस्कार स्कन्ध की व्याख्या पाते हैं।

**विज्ञान स्कन्ध**– मन के निर्माण में चौथे महत्वपूर्ण घटक विज्ञान स्कन्ध है। बौद्ध धर्म में चित्त, मन और विज्ञान एक ही अर्थ के वाचक है, परन्तु आधुनिक मनोविज्ञान की दृष्टि से बौद्ध धर्म में उनके सूक्ष्म भेद भी दर्शाया गया है।

**निष्कर्षत:**– बोधि की प्राप्ति से लेकर महापरि निर्वाण–पर्यन्त करूणा के अनन्त सागर भगवान बुद्ध संसार के प्राणियों के कल्याण के लिए अपने मार्ग का

उपदेश देते रहे बोधि की प्राप्ति के पश्चात् प्रारम्भ में ही उन्हें इस प्रकार की धारणा उत्पन्न हुई कि अपने द्वारा खोजे गये मार्ग को विश्व को बताया। बुद्ध के ये उपदेश मौखिक ही थे उपदेश के समय उपस्थित स्मृतिमान तथा बहुश्रुत भिक्षु इन्हें याद कर लेते थे बुद्ध के परिनिर्वाण के पश्चात् इनके संग्रह की आवश्यकता हुई तो त्रिपिटक रूप में ये संग्रहित हुए त्रिपिटक का अर्थ होता है तीन पिटारियाँ बुद्धवचन की भाषा बुद्ध ने किसी विशेष भाषा का आग्रह न करके बुद्धवचनों को अपनी-अपनी भाषा में सीखने और धारण करने की अनुमति प्रदान कर दी थी। पालि शब्द को भाषा के अर्थ की अनुमति प्रदान कर दी थी। पालि शब्द को भाषा के अर्थ की अनुमति प्रदान कर दी थी। पालि शब्द को भाषा के अर्थ में व्यवहृत करते हैं और इसमें बौद्ध-धर्म के थेरवाद का सम्पूर्ण त्रिपिटक एवं अनुपिटक साहित्य प्राप्त है। प्रारम्भ में यह शब्द मूल बहुवचन अथवा त्रिपिटक के लिए प्रयुक्त होता रहा और बाद में यह उस भाषा का घोतक हो गया जिसमें बुद्धवचन प्राप्त है। इस प्रकार भाषा के अर्थ में पालि शब्द का प्रयोग नवीन ही है, विशेषकर उन्नीसवीं शदी से इसका व्यापक प्रचार ही रहा है आज भी जिस भाषा को पालि की संज्ञा से अभिहित करते हैं इसका परम्परा से प्राप्त नाम मागधी है।

हम प्राचीन भारतीय आर्यभाषा के विकास-क्रम पर विचार करे तो इसी निष्कर्ष पर पहुँचते हैं कि वैदिक भाषा निरन्तर विकास पथ पर अग्रसर होती गई। जितनी ही भाषा बदलती गई उतना ही हमारे परवर्ती पूर्वजों की अपने पूर्वजों की भाषा और कृतियों के प्रति अधिक लोकोत्तर श्रद्धा बढ़ती गई और उन्होंने इसकी

रक्षा के अनेक उपाय किये फिर भी बोलचाल की भाषा आगे बढ़ती ही गई समय बीतने के साथ लोगों को इसकी चिन्ता हुई कि इस भाषा को कैसे सजीव तथा सुरक्षित रखा जाए इसलिए उन्हें वेद मन्त्रों को कैसे सजीव तथा सुरक्षित रखा पद जटा धन आदि नाना क्रम से उच्चारण तथा कंठस्थ करके सुरक्षित किया वहाँ उस भाषा की भीतरी बनावट के लिए अपनी-अपनी शाखा के प्राप्ति शाठप बनाये। तब बुद्ध छठी शताबदी में उत्पन्न हुए इन्होंने साहित्यिक भाषा को छोड़कर प्रचलित तथा उपयुक्त होने से लोकभाषा में ही लोगों को उपदेश दिया कुछ लोगों ने बुद्धवचनों को प्राचीन भाषा को ही अपनाया और आगे यथासंभव प्रयत्न उसे अधिक स्थाई भाषा में उसे सुरक्षित करने का प्रयास किया।

**Abstract**

श्रीलाल शुक्ल जी हिन्दी साहित्य के प्रमुख साहित्यका, भारतीय लोकतांत्रिक व्यवस्था में हजारों किस्म की विसंगतियों ओर विडम्बनाओं को क़रीब से देखते रची गाई एक दुर्लभ कृति ''बिसामपुर का संत ''है। श्रीलाल शुक्ल ने विनोबा भाव के नेतृत्व में चालर्य गए भूदान यज्ञ और ग्रामदान आंदोलन आदि इस पृष्ठभूमि में लिखा गया है। यह एक बेजोड़ उपन्यास '' बिसामपुर का संत ''है, इस पर भूदान - यज्ञ आदि पर शुक्ल जी के विचार कुछ इस प्रकार के हैं।

**1. विषय** - भावे की प्रेरणा से जयप्रकाश नारायण जैसे कई बडे समाजवदी नेता इस आंदोलन से जुडे भूदान आंदोलन का उद्देश्य पुरे देश का शद्धार करना था जिसमें समाज में सबको साथ लेकर आगे बढना था। भूदान आंदोलन सिर्फ भूमि का वितरण नही था बल्कि एक प्रक्रिया थी जिसके अंतर्गत समाज के सभी वर्गों के हितों की रक्षा की गयी थी।

**2. भूदान, ग्रामदान, उद्योगदान, जीवनदान और विचारदान वाले विनोबाभावे का जीवन और व्यक्तित्व परिचय**

विनोबा भावे जी का समय 11.9.1895 से 15.11.1982 तक माना जाता है। विनायक नरहरि भावे को 'विनोबा' का यह नाम महात्मा गांधी ने दिया था, नई पीढ़ी के लोग अकमर इस बात का यकीन नहीं कर पाते कि भारत जैसे देश में लोगों ने अपने ही गांव-समाज के भूमिहीन लोगों के लिए जमींने दान में दी होंगी। भारत के मौजूदा सामाजिक, राजनीतिक और वैचारिक वातावरण को देखते हुए सचमुच उनके लिए यह यकीन करना आसान भी नहीं है। लेकिन भारत और विनेबा के जीवन की इस सच्ची कहानी से गुजरना उनके लिए भी कम रोमांचक नहीं होगा।

विनोबा के व्यक्तिगत जीवन के बाकी प्रसंगों की कहानी फिर कभी परिचय के रूप में भी अभी केवल इतना कि गणित और वैज्ञानिक अध्यात्म को अपने जीवन और चिंतन का आधार बनाने वाले विनोबा एक मौलिक विचारक, आजीवन शिक्षक और अहिंसक कर्मयोगी थे। किसी ने उन्हें आचार्य विनोबा कहा, तो किसी ने संत विनोबा और कईयों ने तो उन्हें ऋषि विनोबा और बाबा विनोबा तक कहकर संबोधित किया, लेकिन भारतीय समाज के एक बडे हिस्से के लिए वे केवल उनके अपने विनोबा रहे। गांधीजी के जाने के बाद भारतीय समाज के सभी तबकों ने जिस पर सहज और सबसे अधिक भरोसा किया, जिसकी तरफ मार्गदर्शन के लिए देखा, वह निर्विवाद रूप से विनोबा ही कहे जा सकते हैं। ऐतिहासिक शख्सियतों का मूल्यांकन आनेवाली पीढियों के लिए आसान नहीं होता क्योंकि इसके लिए महज दस्तावेजी सबूत ही काफी नहीं होते, इसके लिए तटस्थता, विनम्रता, वैचारिक अनेकांतता और गहरी संवेदनशीलता के साथ-साथ स्वयं अपने जीवन के स्तर पर भी अनुभूतिजन्य प्रयोगशीलता की जरूरत होती है । विनोबा के जीवन को देखने के लिए 'श्रद्धा' और 'भक्ति' के प्रचलित नमूनों से ऊपर उठना होगा, क्योंकि विनोबा स्वयं ही ऐसा सोचते थे । उन्होंने किसी को भी उपना गुरू मानने और किसी को भी अपना चेला बनाने से इनकार कर दिया था।

**3.भूदान यज्ञ की समिधा - ''बिसामपुर का संत''**

भूदान यज्ञ की चर्चा, शास्त्रों, स्मृतियों, पुराणों आदि में न मिलेगी। आचार्य विनोबा भावे उसके आदि प्रस्तोता थे, वही उसके आदि प्रस्तोता थे, वही उसके पहले अधीष्ठाता वही यजमान थे। इस यज्ञ के बारे में सादिश था - 'हवा और धूप एक की नही, सबकी है। वैसे ही जमीन भी। 'कुछ दिन पहले तेलंगाना के छोटे खेतिहरों और खेत मजदूरों ने ऐलान किया था कि अब वह नहीं, उकने खेत भी जाग गए हैं। दान पात्र में दो गावों का ब्यौरा दिया गया था। इसमें से आधे से ऊपर जमीन ऊसर-बंजर - बीहड थी।

भूदान यज्ञ के दिनों सर्वोदय के लिए अनेक नौजवानों ने अपने जीवन का दान कर दिया था। सन् 1950-51 में साम्यवदियों के नेतृत्व में भूपतियों के खिलाफ किसानों का व्यापक आन्दोलन चल रहा था। हालकि भूदान आंदोलन गांवों में एक जटिल आर्थिक और सामाजिक दुर्व्यवस्था को कोई उल्लेखनीय व्यावाहारिक और स्थाई समाधान नही दे पाया

श्रीलाल शुक्ल ने भूदान आंदोलन का संकेतात्मक संदर्भ 'सूनी घाटी का सूरज' तथा 'रागदरबारी' में दिया है, किंतु उसकी सटीक समीक्षा ''बिसामपुर का संत'' में की है। वह समीक्षा उपन्यास में कुछ इस प्राकर प्रस्तुत है - एक ओर हिंसा और लाभ के ऊपर सौहार्द और सहज मानवीय उदारता की विजय के रूप में देखा गया है और इस रूप में उसे सामाजिक विषमता के निवारण का एक अमोध अस्त्र समझा गया है दूसरी और प्रगति विरोधी क्रान्ति विरोधी और बडे भूस्वामियों का पोशक मानकर इसकी अपेक्षा की गई है। पूरी कहानी भूदान यज्ञ और कुंवर जयंती प्रसाद सिंह के इर्द - गिर्द धूमती है।

**4.भूदान आंदोलन का इतिहास** (( Bhoodan Andolan History in Hindi))

देश में स्वतंत्रता के बाद सामान्य कृषक वर्ग को कई समस्याओं का सामना करना पड़ा था, जिसमें भूमि की कमी काफी बड़ी समस्या थी, इसके समाधान हेतु ही भूदान आंदोलन अस्तित्व में आया, ये आंदोलन कोई एक दिन, महीने या वर्ष तक चलने वाला आंदोलन नहीं था, इसमें पूरा एक दशक लगा था । इस मिशन की चर्चा देश के बाहर भी हुयी थी और इसे काफी सराहना भी मिली। आंदोलन के संस्थापक विनोबा भावे के बारे में न्यूयॉर्क टाईम्स में भी छपा था ।

कब शुरू हुआ था?(when did started) 18 अप्रैल 1951 को

कहां शुरू हुआ था? (Where did started)नालगोंडा क्षेत्र में

किसके नेतृत्व में हुआ था ?Who was the founder and leader of this movement) विनोबा भावे

**5.भूदान आंदोलन का उद्देश्य** (Objectives of the Bhoodan Movement)

भूदान आंदोलन का उद्देश्य पूरे देश का उद्धार करना था जिसमें समाज में सबको साथ लेकर आगे बढना था। भूदान आंदोलन सिर्फ भूमि का वितरण नही था बल्कि एक प्रक्रिया थी जिसके अंतर्गत समाज के सभी वर्गों के हितों की रक्षा की गयी थी। भावे ने कहा था कि हम समाज की आर्थिक समस्याओं के कम करना चाहते हैं। भूदान आंदोलन का लक्ष्य देश के पिछडे और शोषित वर्ग को मुख्यधारा में लाना था।

सामाजिक और राजनीतिक परिप्रेक्ष्य में देख जाए तो इस आंदोलन का घोषित उद्देश्य शक्ति का विकेंद्रीकरण करना था, जिसमें गाँव-गाँव तक शक्ति की पहुँच हो, सबका संपति पर अधिकार हो और मजदूरी इत्यादि मामलों में किसी भी तरह की असमानता नहीं हो।

**6.किसने शुरू किया था ?**(Who started it)

आचार्य विनोबा भावे ने भूदान आंदोलन की शुरूआत की थी, विनोबा जी ने गांधीजी के साथ स्वतंत्रता संग्राम में भाग लिया था और लगभग ५ वषज्ञ जेस में बिताये थे। गांधीजी की हत्या के बदा भावे को ही उनका उत्तराधिकारी माना जा रहा था लेकिन उनके उद्देश्य काफी अलग थे, उन्होंने देश के गरीब और भूमि विहीन वर्ग के हितों की रक्षा

की जिम्मेदारी ली थी। भावे ने उनके आदर्शों और सिद्धांतों को आगे बढाते हुए भूमि सुधार कार्यों में विशेष योगदान दिया था । 1951 में भूदान आंदोलन के लिए विनाबा भावे ने हजारों मीलों की पदयात्रा की थी और भू-दाताओं से जमीन दान करने की अपील की थी। भावे की प्रेरणा से जयप्रकाश नारायण जैसे कई बडे समाजवादी नेता इस आंदोलन से जुडे।

**7.भूदान आंदोलन कब और कैसे शुरू हुआ था ?**(When and where did Bhoodan Andolan started)

अ) 18 अप्रैल 1951 को जब विनोबा भावे ने नालगोंडा श्रेत्र के पोचामपेली गाँव में प्रवेश किया जहां कम्युनिस्ट का कब्जा था, तो वहां के भूमि विहीन और पिछडे वर्ग के लोगों ने उनका स्वागत किया, विनोबा ने अछूत कहे जाने वाले लोगों से संवाद बढाया तो उन्होंने भावे को कहा कि यदि उन्हें कुछ भूमि दी जाए तो उनकी स्थिति बेहतर हो सकती हैं, लेकिन सरकार उनके लिए ऐसा कुछ नहीं कर रही हैं। इसके बाद जब वो लोग उनसे ८० एकड जमीन से जुडी समस्टा के बारे में दिशा - निर्देश लेने आये तो विनोबा ने ये सुझाव दिया कि यदि सरकार जमीन की समस्या हल नहीं कर पा रही दो ग्रामीण एक -दूसरे की मदद कर सकते हैं। इस तरह रामचन्द्र नाम के व्यक्ति ने अपनी भूमि दान की, और उनसे प्रेरित हो अन्य भू-मालिकों ने भी १०० एकड़ जमीन दान करने का वादा किया।

आ) 1951 में तीसरी वार्षिक सर्वोदय कांफ्रेंस शिवारामपल्ली में हुयी थी, ये गाँव हैदराबाद से थोडी दूर पर स्थित था। उस समय तेलांगना में कम्युनिस्ट विद्रोह चल रहा था, जिसमें धनी भू-मालिको द्वारा गहीबों के शोषण का विरोध हो रहा था । 11 अप्रैल 1951 को 24 घंटे चली कांफ्रेंस में ये निष्कर्ष निकला कि विनोबा देश में उन क्षेत्रों का दौरा करेगे, जहाँ पर कम्युनिज्म ज्यादा हैं। उस समय ये एक बहुत ही बड़ा और साहसिक निर्णय था ।

इ) आंध्रप्रदेश में घटित हुयी इस आकस्मिक घटना ने भूदान आंदोलन की नींव रख दी । भावे ने कहा कि लालच ही भूमि पत एकत्व अधिकार कारण हैं यदि लोगों में लालच कम हो जाए तो ना केवल सबकी मदद की जा सकेगी।

**8.आंदोलन का प्रसार** (The Movement Expands)

अ) पहली बार हुए भूदान ने विनोबा को पूरे देश में इस आंदोलन को आगे बढाने को प्रेरित किया। अगले कुछ वर्षों में भावे ने इस आंदोलन को एक नई दिशा दी, और उन्हें काफी सफलता भी मिली । भावे ने गाँव-गाँव पद-यात्रा की, जब वो किसी गाँ में पहुँचते तो वो भू-मालिकों से उनकी कुल सम्पति की जानकारी लेते और उन्हें भू-दान के लिए प्रेरित करते। भू-मालिक उपनी इच्छा से कुछ भूमि विनोबा भावे को दे देते और भावेजी अपने कार्यकर्ताओं की सहायता से इस भूमि का पुनःवितरण करवाते। इस तरह भूदान कार्यकर्ताओं की देखरेख में प्राप्त हुयी भूमि वापिस जरूरतमंदों में बांटी जाती थी। इससे गरीब किसान जमींदार या सरकार पर निर्भर होने की जगह अपने लिए काम करने को सक्षम हो जाते थे।

आ) कुछ लोगों का मानना था कि दान दी जाने वाली जमीन बंजर, पथरीली और कृषि के लिए अनुपयुक्त था, लेकिन आंदोलन के अनुसार कोई भी जमीन अनुपयोगी नहीं थी । बावे कहते थे कि भूमि की उपयोगिता से कही ज्यादा ये जरूरी हैं कि लोग एक दूसरे की मदद के लिए आगे आ रहे हैं, और अपनी संपति समाजिक कारणों के लिए दान कर रहे हैं, और यही तो क्रान्ति का बीजारोपण हैं। वैसे भी खहाब गुणवता वाली जमीन का उपयोग चारागाह, वनीकरण और बेघर लोगों को बसाने में किया जा सकता है।

इ) इस तरह भूदान से शुरू हुयी बात ग्रगमदान तक पहुंची और कई लोग गाँव के गाँव दान करने को आगे आये, वास्तव में ये सब सर्वोदय अभियान का हिस्सा था, जिसमें समाज के हर वर्ग के नवजीवन का उदय हो रहा था।

ई) भारत के लगभग ५० मिलियन भूमि-विहीन कृषकों के लिए विनोबा जी ने ५० मिलियन एकड भूमि दान करने का लक्ष्य बनाया था दिससे कि १ एकड भूमि प्रत्येक किसान को मिल सके। यदि कोई किसान का परिवार ५ सदस्यों वाला हो तो ऐसे परिवार के हिस्से में ५ एकड भूमि आ सके । उन्होंने भूमि संपन्न लोगों से आह्वान किया कि

वो अपनी भूमि का छठा हिस्सा भूमि - हीनों को दान कर दे। एक अनुमान के अनुसार उस समय लगभग ३०० मिलियन एकड़ कृषि युक्त भूमि थी जिसे दान दिया जा सकता था ।

**9.आंदोलन की समाप्ति**

विनोबा भावे ने भूमि विहीन लोगों के लिए पूरे देश में भूमि-वंचितों तक भूदान आंदोलन पहुंजाने का निर्णय किया था, इसलिए जो आंदोलन निजी स्तर पर शुरू हुआ था वो राष्ट्रीय आंदोलन बन गया। लेकिन १९७१ की शुरूआत में इसका महत्व बदलने लगा एव भूदान की जगह ग्रामदान का चलन बढा, इस दान में किसी गाँव का अधिकतर हिस्सा ग्रामीणों में सभी परिवारों को बराबर बाँट दिया जाता था, हालांकि भूदान तब भी हो रहा था लेकिन कम हो गया था।

वैसे भूदान आंदोलन गैर-आदिवासी इलाकों में नहीं पहुंच सका था, इसलिए भी समय के साथ कमजोर हो गया था। हालांकि आंदोलन में कई उतार-चढाव आये लेकिन १९६९ में भूदान तक लगभग ४ मिलियन एकड भूमि दान की जा चूकी थी।

इसके अतिरिक्त संपतिदाव, श्रमदान, जीवनदान (आंदोलन में अपना जीवन देना), साधनदान (कृषि कार्यों के लिए साधन-उपकरण दान देना) जैसे कई कार्यक्रम हुए। वैसे संपति दान भूदान के साथ शुरू नही हुआ था लेकिन भूमि विहीन लोगों के पास इस भूमि पर काम शुरू करने के लिए साधन नही थे इसलिए संपतिदान अस्तित्व में आया। आचार्यजी ने कहा कि वो शुरू से जानते थे कि ये समस्या आयेगी, लेकिन जडों को मजबूत करना जरूरी होता हैं, शाखाएं स्वतः निकल आती हैं, और ये बात सबको पता थी कि समस्या की जड भूमि की कमी होना है। इस तरह भूदान आंदोलन से ना केवल भूमि विहीन लोगों को भूमि की कमी होने हैं। इस तरह भूदान आंदोलन से ना केवल भूमि विहीन लोगों को भूमि मिली बल्कि गाँधीवादी विचारधारा का विस्तार भी हुआ।

**उपसंहार**

भारतीय लोगतांत्रिक व्यवस्था में हजारों किस्म की विसंगतियों और विडम्बानाओं को करीब से देखते रची गई अनेक दुर्लभ कृतिय इन के समकालीन जीवन में सर्वोत्तम उपन्यास, व्यंग्य-निबंध रचनाऐ और आलोचना, निबंध आदि के हिंदी सुप्रसिद लेखक श्री लाल शुक्ल जी के बारे में शोध प्रबंध प्रस्तुतकर एम. फिल. पि.एचडि उपाधि पाकर एक शोधार्थी के रूप में मेरा जन्म भी सार्थक हुई ।

बिसामपुर का संत समकालीन जीवन की ऐसी महागाथा है जिसका फलक बडा विस्तीर्ण है जो एक साथ कई स्तरों पर चलती है। एक ओर यह भूदान आंदोलन की पृष्ठभूमि में स्वांतत्योत्तर भारत में सत्ता के व्याकरण और उसी क्रम में विनोबा भावे के नेतृत्व में चलाये गए भूदान यज्ञ और ग्रामदान आंदोलन का प्रसंग आया है ।

## Introduction

Importance of physical fitness is nurtured only when man exhibits his innocence to stand as a complete individual in the society. The society believes that to lead successful life one should attain victories in all his ventures. But success should not be assessed through number of victories; it should be assessed only through pains and problems that you overcome.

It is only through physical fitness one can achieve the conservation of energy, during work, sense of humor, the reality of personality. Apart from being gaining mental toughness to face even failures as a part of victory, which definitely plays a major role in our life which everybody expects to meet success for the ultimate satisfaction?
